Hercules Motor Car Co. Plant Bid In for $20,800

NEW ALBANY, IND., Aug. 14—The property of the Hercules Motor Car Co. was sold here to-day by County Sheriff Charles W. Long. The plant was bid in by E. B. Stotsenburg, attorney for the bondholders, at $20,800. The value of the property is estimated at $40,000. For the present, it was announced following the sale, the plant will be occupied by the Hercules Sales Co., which has it under lease from the receiver. The Hercules Sales Co., which has its headquarters in Louisville, Ky., took over the patterns, name of the car and blueprints of the Hercules Motor Car Co. the first part of this year, while the Kentucky Wagon Mfg. Co. is manufacturing Hercules cars, an agreement to that effect having been made in March with the Hercules Sales Co.

It is rumored that the plant will pass into the hands of the Kentucky Wagon Mfg. Co., the Ford Motor Co. or the Studebaker Corp.

The property consists of 6½ acres, on which are half a dozen two-story and three-story buildings, together with the machinery of the plant.

The sale was made on a decree issued by Judge John M. Paris in the Floyd Circuit Court in a foreclosure suit of the Fidelity & Columbia Trust Co. of Louisville, trustee for first mortgage bondholders, against the Hercules Motor Car Co., the Hercules Sales Co. and others. The term "others" includes about 100 stockholders in various parts of the country, who hold stock certificates to the amount of $110,325.

The bonds amount to $19,865; the judgment is for $20,658.76, including interest and attorneys' fees, which, with court costs and the expense of the sale, bring the aggregate up to $21,285.02. The amount realized does not quite cover the judgment and costs.

—

Elwood Iron Works Petitioned

CHICAGO, ILL., Aug. 14—An involuntary petition in bankruptcy was filed today in the Indianapolis federal court against the Elwood Iron Works, Elwood, Ind. This concern planned to manufacture the Elco 30, rights to which later were secured by the Bimel Buggy Co.

Bay State Headlight Regulation

Measure Probably Will Go Into Effect Oct. 1—Test 40 Dimming Devices

BOSTON, MASS., Aug. 14—The regulation of motor headlights in Massachusetts will probably go into effect about Oct. 1, or shortly thereafter, according to the present plans of the Massachusetts Highway Commission. At the headlight test a few nights ago there were forty cars with devices put through a series of maneuvers over various roads. First the cars were started through one of the long avenues of the Country Club where there are no lights. Chairman Sohier and Commissioners Synan and Kemp of the Highway Commission stood in the road and halted the cars. The three men stood about 30 ft. in front of each machine when it stopped and then noted how far up on their bodies the lights threw their rays. Then they stood on the roadside and asked the drivers if they could see them with their lamps.

The cars were then sent around the avenue and out on the main street near the grounds. There the commissioners with their engineers and other officers of the department together with an advisory committee of motorists rode in every machine around several streets, some lighted and some dark. They made notes of how the lights work in picking out objects; how the dimmers responded to the control, etc. Some devices were operated by a pedal, others by hand, and others were merely the lens or globes in the headlights. There were men with devices from Detroit, Chicago and Los Angeles.

The advisory committee is to meet next week and draw up a report to submit to the highway commission, and the latter body will then formulate some regulation which will become law when the Governor and council approves of it after it is advertised throughout the State.

—

45,000 Cars for Detroit

DETROIT, MICH., Aug. 14—No separate record being kept for any city, the exact number of automobile licenses issued thus far this year to residents of Detroit could not be determined at the office of the Secretary of State, but the number is estimated by officials to be nearer 36,000 than 35,000. This means that thus far this year between 12,000 and 13,000 new cars have been registered by Detroiters. Officials estimate that by the end of 1916 Detroit will have from 45,000 to 50,000 automobiles.

Haynes 100% Stock Dividend

Capital Increased from $600,000 to $1,200,000—Factory Runs Night and Day

INDIANAPOLIS, IND., Aug. 16—At the annual meeting of the stockholders of the Haynes Automobile Co., held Tuesday, Aug. 10, a resolution was adopted declaring a stock dividend of 100 per cent, increasing the concern's capitalization from $600,000 to $1,200,000. A resolution increasing the number of directors from nine to eleven was adopted.

The year just closed has been the most profitable the company has ever enjoyed. The factory has been running day and night for months. Last Saturday every stockholder received a dividend of 22 per cent.

The company has announced it will immediately spend $250,000 enlarging its plant. It will erect a four-story machine shop, a three-story paint shop and a large test barn. It will also expend $75,000 for new machinery. The new buildings will be of steel and brick. They will increase the floor space of the plant about 150,000 sq. ft. and will enable the company practically to double its output of cars.

—

Largest Edition of National Used Car Market Report Out

CHICAGO, ILL., Aug. 16—The sixth edition of the National Used Car Market Report has now been sent to its subscribers and is the largest edition so far published by the Chicago Automobile Trade Assn., which controls its issue. The present edition has 123 9 by 12-in. pages as against 119 9 by 10-in. pages in the previous number. The sixth edition lists the names and values of 154 gasoline passenger cars and 14 electrics. The national system of obtaining valuations is continued with the addition that Minneapolis prices are also quoted in the new edition bringing the list of cities from which information is drawn in compiling the report to Boston, New York, Philadelphia, Cleveland, Baltimore, New Orleans, Chicago, St. Louis, Minneapolis, Kansas City and San Francisco. Each of these cities is the center of a zone in which the prices given for used cars are noted.

—

Studebaker's ½-Year Earnings Estimated at $6,300,000

NEW YORK CITY, Aug. 16—Studebaker earnings for the ½ year are being estimated in trade circles here and in Chicago at nearly $6,300,000. The second half should be better, because the plant improvements are largely completed. The corporation requires approximately $900,000 for its preferred dividends. Net earnings, therefore, of $6,300,000 for six months would leave $5,400,000 for $27,000,000 common stock. This is equal to 20 per cent for the six months, or at the rate of 40 per cent for the full year.

—

Few Market Changes

NEW YORK CITY, Aug. 17—The markets this week declined. Steel on Wednesday rose 50 cents. The failure of the anticipated renewal in the demand for copper during the past week resulted in a decline of 1 cent, with the market weak. Tin futures showed greater activity when consumers, as anticipated, entered the market for August and September shipments. Lead was inactive, with the market weak. Producers marked down quotations and buyers are still absent due to the effect of overproduction. The cottonseed oil market is in an unsettled state, with a heavy undertone. Trading was very dull owing to the cheapness of competing products and the difficulty of trading with foreign countries. Trading was active in crude rubber yesterday though there was no material change in prices. Gasoline rose 1 cent on Friday, making the price per gallon 14 cents. The rest of the markets remained quiet with no changes.

—

Overland $750 Delivery Commences to Come Through Plant

TOLEDO, OHIO, Aug. 14—The new Overland delivery cars are commencing to come through the Willys-Overland plant in regular production. The chassis used is identical with the model 83 touring car and the body a very strong one. Steel is used for most of the body where possible and strength is well combined with light weight. Special care has been taken to insure that the rigidity of the body shall be maintained, however roughly the van may be used. The rear doors have a spring-controlled locking device which holds them tight against vibration and the finish of the bodies is excellent. The car is not intended for heavy work but should be eminently suitable for the needs of retail trade where the loads are moderate and everything depends upon speedy delivery of small parcels to customers.

—

Canadian Ford Stock Has Sold Up to $1,500

DETROIT, MICH., Aug. 17—Stock of the Ford Motor Co. of Canada, Ltd., has recently sold at $1,500 a share, as the records of the Detroit Stock Exchange show. The par value of the stock is $100. On Dec. 17, 1914, the stock sold at the lowest price it had been selling for more than a year, $475 a share. The sale made July 26 shows an increase of 216 per cent in the last eight months.

How the stock has increased in value is best shown by the following table:

Date	Last Sale	Bid
December 17, 1914	$475	$475
January 21, 1915	475	475
February 5, 1915	475	500
March 2, 1915	525	500
March 27, 1915	525	550
April 6, 1915	525	600
April 14, 1915	625	600
April 30, 1915	700	700
May 18, 1915	700	750
May 19, 1915	925	800
May 21, 1915	925	900
May 29, 1915	925	950
June 19, 1915	925	1,000
June 29, 1915	1,250	1,100

Dodge Plant Raises Town Population

DETROIT, MICH., Aug. 7—Here is a good and strong example of what the automobile industry really means to a community. In 1910, when the census of the village of Hamtramck, a suburb of Detroit, was taken, it showed that there were 3559 inhabitants. The plant of Dodge Bros. is located there and at that time the concern did not make automobiles, and employed between 600 and 700 men.

Last year it was decided by the U. S.

Tires Reduced Temporarily 25 Per Cent

W YORK CITY, Aug. 16—The Gau-
re Corp. has reduced its tire prices
r cent, effective only for this week.
llowing prices are given on a few
popular-sized tires:

	32 x 3½	34 x 4	36 x 5
...ad	$15.11	$20.29	$28.65
... .	18.19	24.34	34.27

more than two tires will be sold
ne purchaser and orders received
on of Aug. 21, will not be exe-
except at full list price.

—

Crawford Now in Detroit

T, MICH., Aug. 14—Chief Engi-
S. Crawford of the Cole Motor
Indianapolis, is now a Detroiter.
the fact that the largest part
terials and parts used by the
pany come from Detroit it has
d advisable and more satisfac-
have the chief engineer of the
in closer touch with these con-
which parts and components
ased. All designing work will
done here in Detroit, which is
reason of the removal.

Security Prices Higher

Sturdy Demand in All Stocks —Willys-Overland Makes High Mark

NEW YORK CITY, Aug. 16—Substantial gains in the security markets occurred last week. The gains this week range from a half to thirty-eight points. The losses were light, ranging from one-quarter to three points. The highest gain was noted on Wednesday when Willys-Overland rose thirty-eight points. This rise was the feature of the market. The next highest gain was made by Studebaker, a rise of fifteen and a quarter points. General Motors was also a feature, with a fifteen-point gain. There were also noted many substantial gains in the tire markets, the highest of which was Kelly-Springfield second preferred, which rose twenty points. The rest of the rubber gains were heavy, ranging from one to fifteen points. The Detroit issues also showed very large gains, General Motors common being the feature of the market with a twenty-point rise. Reports of good earnings brought Studebaker common up fifteen and a quarter points. The inactive stocks remained quiet; the only gain that occurred was that of the Atlas Drop Forge Co., making a rise of two and a half points.

—

Air Spring Co. Formed in Bradford

BRADFORD, PA., Aug. 12—Articles of incorporation of the Bradford Air Spring Co. have been applied for. This company has been building and testing on a small scale for the last three years, and now will start producing on a larger order. The directors of the company are J. A. Fraunheim, W. W. Hughes and F. M. Nash, the offices being located in the Schoenblom Building at Main and Kennedy Streets.

The company controls several patents on pneumatic springs for vehicles. The spring itself is automatic. The air is pumped into the cylinder by the motion of the car, and as each spring is individual, three of the wheels may ride on the road and only one be raised when the car comes in contact with an impediment. The individuality of each spring permits of uneven distribution of the load in a car without affecting the level position of the body.

In addition to the plant of the Bradford company, the shops of Bovaird & Co. will be utilized for the present.

—

Wayne Wheel & Bow Elects

WAYNE, MICH., Aug. 14—At a meeting of those interested in the recently organized Wayne Steering Wheel & Bow Co. the following officers were elected: William Wetherell, president; J. C. Coleman, vice-president; A. A. Snyder, treasurer; Miss E. John, secretary. The board of directors consists of the first three named officers and C. Papke, V. Vallance, E. Hoops and H. Ditmer.

Twenty-Seven Entries for Elgin

Eleven Contestants for C. A. C. Cup Race and Sixteen for Elgin Trophy

CHICAGO, ILL., Aug. 17—Twenty-seven entries have been received for the fifth annual Elgin road races which will be run over the 8.36 mile Kane County course on Friday and Saturday of this week. The Chicago Automobile Club Cup event, which will be held Friday, and for which cars of a piston displacement of 300 cu. in. or less are eligible, has attracted eleven nominations while there will be sixteen contenders for the Elgin trophy in Saturday's event for which the maximum piston displacement is set at 450 cu. in.

Many Stars Entered

With the exception of Dario Resta and Bob Burman, the Elgin meet has attracted the majority of the stars of America's speed firmament and the two races, each of which will be 301 miles in length, promise to be bitterly contested and faster than those of last year when Ralph De Palma averaged a fraction better than 73 miles per hour in scoring a double victory with his Mercedes.

De Palma Defends Trophies

De Palma will be on the starting line to defend both of the trophies that he captured last August. He will have some stubborn opposition for among his challengers are Earl Cooper, winner of the 1913 American road-racing championship; Gil Anderson, the pioneer of the Stutz team who captured the Elgin trophy 2 years ago; Barney Oldfield, the master driver of the world in his Delage, and Eddie O'Donnell, the star of the Duesenberg forces.

Ten for Both Days

Ten of the drivers will appear on both days of the speed carnival, the entrants of the following cars believing that their mounts have sufficient stamina to withstand the high-speed test of 602 miles; De Palma's Mercedes, Bragg's Stutz, Cooper's Stutz, Anderson's Stutz, Henderson's Duesenberg, O'Donnell's Duesenberg, Brown's Du Chesneau, Patrick's Mercer, Alley's Ogren and Oldfield's Delage. In fact, the Cornelian, to be driven by Frank Justen, is the only car in the C. A. C. Cup race that has not been entered in the Elgin trophy contest.

Six for Elgin Cup Only

Six cars have been groomed solely for Saturday's speed battle as follows: A Duesenberg, which probably will be driven by Eddie Rickenbacher; Andy Burt's Stutz, Scott's Anderson special, Otto Henning's Mercer, Fred Robillard's Lozier and George Buzane's De Dietrich.

Ralph Mulford, who captured the 300-mile race on the Des Moines speedway 10 days ago, originally was scheduled to drive the third Duesenberg Saturday, but yesterday wired the promoters that it would be impossible for him to compete because of a business engagement in New York. An effort is now being made to induce Eddie Rickenbacher to take the mount. The Elgin course is faster than ever before, according to the drivers, who predict that the winners will be forced to average better than 80 miles an hour in order to annex the major portion of the prize money. The roads have been widened, rolled and oiled and two of the four turns have been reconstructed since last year.

The prize money for this year's races is the same as last year, $3,000 each day, but the Elgin promoters have introduced an innovation in that they will give $100 to each driver completing 100 miles and $200 to each driver finishing 200 miles, provided they do not run one, two, three and therefore are not eligible to participate in the division of the regular purse, which will be split $1,800 for first, $700 for second, and $500 for third.

—

Practice Starts at Elgin

ELGIN, ILL., Aug. 14—Practice for the Elgin races Aug. 21 and 22 started on the 8-mile course lying in the outskirts of Elgin. The track is immeasurably superior to former years and an average speed of 80 m.p.h. may not be impossible if weather conditions are favorable. The course has been oiled for several weeks and times made over it in practice were well above those of last year. Speeds of over 100 m.p.h. are being maintained on the straightaways.

ENTRIES FOR ELGIN FIRST DAY

Car	Driver	Car	Driver
Mercedes	De Palma	Du Chesneau	Brown
Stutz	Bragg	Mercer	Patrick
Stutz	Cooper	Ogren	Alley
Stutz	Anderson	Cornelian	Justen
Duesenberg	Henderson	Delage	Oldfield
Duesenberg	O'Donnell		

SECOND DAY

Car	Driver	Car	Driver
Mercedes	De Palma	Anderson Special	Scott
Stutz	Bragg	Du Chesneau	Brown
Stutz	Cooper	Mercer	Henning
Stutz	Burt	Mercer	Patrick
Stutz	Anderson	Ogren	Alley
Duesenberg	Henderson	Lozier	Robillard

20,814 Cars in Oregon

SALEM, ORE., Aug. 14—Figures compiled by the Secretary of State show that at the close of business July 15, 20,814 automobiles had been licensed since the first of the year. This figure is more than 4000 in excess of the entire registration for 1914.

$250,000 Speedway for Louisville

2-Mile Oval Planned — 300 Acres Bought—Ready for Race by Spring

LOUISVILLE, KY., Aug. 14—If the present plans of local capitalists and men from Cincinnati and Indianapolis are carried out, Louisville will have a $250,000 motor speedway, with a 2-mile oval course. Property aggregating 300 acres has been purchased and leased immediately south of and adjoining the Douglas Park race track, and it is proposed to construct a track which will attract the leading stars in the automobile racing field.

Incorporation of the Louisville Automobile Speedway and organization of the controlling company will be completed within 30 days, it is announced, and work will be started on the course within the following 30 days. Although it is declared to be possible that the first meet will be held in October, if the course can be completed by that time, the promoters announce that the speedway will be in shape for a big meet by spring.

The plans of the company call for the erection of a grandstand having a seating capacity of 10,000 persons. This stand will be arranged so that others can be added if needed.

Big Men Behind It

George L. Martin, of the real estate firm of Mueller & Martin, is one of the principal promoters. He secured the ground for the speedway. Interested with Mueller and Martin in the speedway project are Carl G. Fisher, originator and president of the Indianapolis Motor Speedway; Louis Seelbach, president of the Seelbach Hotel Co.; Patrick J. Hanlon, former vice-president of the American Tobacco Co.; Frank Fehr, president of the Frank Fehr Brewing Co.; Basil Doerhoefer, a local capitalist, and J. H. McKee, a Cincinnati capitalist.

With the exception of a tract of 55 acres leased from the J. F. Callaway estate for a term of years, all of the property was bought. Stonestreet & Ford, engineers in the Louisville Trust Building, are working out plans for the course, which will be designed to overcome defects apparent in other speedways. Built of 2 x 4 timbers set on end, it will enable drivers to attain a speed of 90 to 95 miles an hour.

It is proposed to offer purses of similar proportions to those given in Indianapolis and Chicago, aggregating probably $50,000, thus attracting all the speed kings whose performances have drawn great crowds to the Indianapolis and Chicago races. Accommodations will be

ided for out-of-town motorists. s will be held at least one each year. e controlling company will be in- rated with a capital stock of ,000, this sum covering the amount for fourteen pieces of land included e 300 acres and for the cost of ruction.

CITY, Aug. 13—Members mobile Club of America have a plan to organize a de- of armored automobiles.

Detroit to Have Show Building

—

Auditorium 165 by 330 Ft. To Be Built — Next Detroit Show May Be Held There

DETROIT, MICH., Aug. 16—At last Detroit is to have an exhibition building and to local automobile dealers, especially to C. C. Starkweather, formerly president of the Detroit Automobile Dealers' Assn. and who is manager of the local branch of the Buick Motor Co. most of the credit is due for the success in launching the organization.

Upon property facing 205 ft. on Woodward and Cass Avenues and 450 ft. on Antoinette Street, there will be erected an auditorium and convention hall 165 by 330 ft. The hall will have a seating capacity for at least 24,000 people and it is expected that the next Detroit automobile show will be held in it.

The organization is known under the name of Merchants' and Manufacturers' Auditorium and will be incorporated. C. C. Starkweather is president; Walter Wilmot, who has been in charge of the local automobile shows for many years, is vice-president and general manager; W. J. Gordon, president of the Gordon Auto Sales Co. is treasurer and H. C. Bulkley, of Campbell, Bulkley & Ledyard is secretary.

On the street frontages the building is to be two stories high, 60 ft. deep on Woodward and Cass Avenues and 40 ft. deep on Antoinette, this for the purpose of providing a number of stores or show rooms 20 ft. wide for automobile supply dealers and manufacturer's agents or automobile dealers.

The interior of the exhibition hall will have two mezzanine balconies which may be used at show time for parts and accessory exhibits and which ordinarily will provide space for manufacturers agents and others.

Work on the new building is to be started within 30 days and it is expected that it will be ready by Jan. 1.

—

Mulford Special Stars on Track

FLEMINGTON, N. J., Aug. 13—A Mulford Special, driven by Ira Vail of Brooklyn, starred in the four 5-mile events and a pursuit race held at the ½-mile track here to-day, by taking three firsts and two seconds. In the Australian pursuit race, Joseph Lambert's mechanician, Amos Miller, in a Stutz was seriously injured when their car crashed through the fence in the final lap. Vail won this race.

Vail took first in the special invitation race with Lambert second, the time being 6:18. The next 5-mile event was for cars under 30 cu. in. piston displacement, which was won by Vail, in 6:39½. The fastest time of the day was made by Theobold in a Mercedes, who won the free-for-all in 6:15½. Lambert's Stutz won the 5-mile handicap in 6:19.

—

5-Day Business Tour To Replace Wisconsin Reliability Run

MILWAUKEE, WIS., Aug. 14—To take the place of the annual Wisconsin reliability tour, admittedly a stimulant for motor car sales in Wisconsin, and to advertise the fall motor show to be held Sept. 13 to 17 in connection with the Wisconsin State Fair here the Milwaukee Automobile Dealers, Inc., will conduct a 5-day tour covering approximately 1000 miles Aug. 23 to 28. The pathfinder, an Overland, returned Saturday, Aug. 14, and reports unprecedented interest in the run. The tour will be purely of a business and social nature, with no contest features, and at least seventy-five cars are expected to participate. The exact mileage of the route is 965, and embraces every city of consequence in southern, eastern, western and the central part of Wisconsin.

—

Trying Out New Denver Traffic Rules

DENVER, COL., Aug. 14—Three new traffic regulations are being tried out in Denver under ordinances just put into effect, following a recent avalanche of fatal and otherwise serious accidents involving motor cars, other vehicles, street cars and pedestrians.

One prohibits cars from parking on streets in the business section with either of the inside wheels farther than 2 ft. from the curb, or the front line of the car closer than 4 ft. to the rear line of the car next in front. This restriction applies especially to the business streets having street car lines, where crowded conditions have become a menace to all kinds of traffic.

Another requires headlights on all bicycles and motorcycles while in motion, and rear lights on all carriages and all other kinds of vehicles, whether moving or standing, with the exception of vehicles used for transporting oil or gasoline. These headlights must show a white light visible a distance of 50 ft. in the direction of travel, and the rear lights must show a red light visible 20 ft. to the rear. All vehicles loaded with materials projecting from the rear must carry the red signal light at the extreme rear point of such projecting materials.

The third establishes marked courses for pedestrians to cross the streets inside the curb line at street intersections, and prohibits crossing an intersection at an angle or crossing a street in the middle of a block. White lines in both directions form a square for vehicle traffic at all street intersections in the business district, and pedestrians are not allowed inside this square.

Predict Rise in Crude Oil Price

Scarcity Will Affect Gasoline Price, Say Texas Oil Men —650,000 Bbl. Yearly

HOUSTON, TEX., Aug. 13—It is the expressed opinion of leading oil operators of Texas that there will be a big increase in the price of light crude oil, suitable for refining, during the next few months. In consequence of the growing scarcity of the product the prices of gasoline will naturally show a corresponding raise. W. H. Gray of Houston, who has made a study of the situation, said:

"The world is now using approximately 650,000 barrels of lubricating and light crude oils daily. If the present rate of increase of consumption of these oils continues for seven years there will be at that time a total of more than 1,000,000 barrels used daily. Of the present consumption Texas produces about 40,000 barrels daily and Oklahoma about 325,000 barrels daily. The balance of the daily production comes from the Eastern fields. Of course, new fields of light crude oil may be found that will make a change in the situation which the consumers and operators are now facing. Prospecting for such fields is going on in many parts of the world. Unless the production is materially increased prices will rise."

—

Dunkirk Leads Europe in American Cars and Trucks

DUNKIRK, FRANCE, July 24—American automobiles are to be found in this town in greater number and wider variety than in any other place on the Continent of Europe. This is due to the fact that while Dunkirk is a French town, it is also an important military center for both the Belgians and the British. The town is actually within sight of the Belgian frontier, and as there is now no big town in Belgium left to the Belgians, Dunkirk forms a most convenient refuge.

The British Army Service Corps is making a big use of Peerless trucks; the Canadians also have a number of Peerless. The French in this neighborhood are mostly supplied with trucks and cars from their own factories, although not far from here there are a number of 2-ton Whites used almost exclusively for carrying troops to and from the trenches. The Belgians have enough American automobiles to run a New York show: Fords, King, Overland, Krit, and other light rigs, used mostly for ambulance work; Pierces predominate in trucks, and Italy has supplied them with a number of Fiats and Diattos. These Italian cars are mostly touring car chassis. Since Italy came into the war the Belgians have had much trouble in getting spare parts for their Italian cars.

The Pierce 2-ton trucks are looked upon as a luxury. All drivers I have been able to talk to are delighted with them—but are unanimous in kicking against the governors. As the officers insist on governors being fitted, and would not allow them to be taken off under any condition, the drivers' kicks are altogether ineffective. All the Belgian drivers are speed mad, and they dislike being held down to 20 kilometers an hour by a little governor which they cannot take off.

—

St. Louis Gasoline Cut Raises Crude Oil Price

ST. LOUIS, MO., Aug. 14—The alleged war of the Standard Oil Co. against independents in St. Louis will be called to the attention of the Independent Petroleum Marketers Assn. of the United States at its annual convention in Milwaukee, Wis., on Aug. 25 and a reciprocal slap at John D. Rockefeller's company will be demanded by the local dealers.

Announcement to this effect was made here to-day by F. C. Bretsnyder, president of the Bell Oil Co. and an officer in the national organization. The fight during the last eighteen months has brought the retail price of gasoline down from 17½ cents a gal. to 8.9 cents a gal., a cut of almost 50 per cent and has raised the price of crude oil 25 per cent, Mr. Bretsnyder said.

While the price of gasoline has been reduced in many eastern cities also, local dealers claim that nowhere has it been cut so frequently and deeply as in St. Louis. Almost invariably the cuts of 1 cent each were first announced here by the Standard Oil. The Pierce Oil Corp. soon followed and the smaller dealers fell into line.

—

N. Y. Safety First Society Recommends New Laws

NEW YORK CITY, Aug. 12—The Safety First Society of New York to-day concluded an investigation of street accidents during several months by recommending to the Board of Aldermen to pass ordinances on the following:

Providing for the elimination of dazzling head and side lights on automobiles.

Requiring parallel parking at the curb for all vehicles of the delivery type.

Requiring the use of mirrors on all motor vehicles in Greater New York.

Requiring owners of all motor vehicles with chain drive to inclose the chains with suitable guards.

Making it a misdemeanor for any person to "hitch on" or trespass upon a motor truck or horse-drawn vehicle, unless employed by the owner of such vehicle.

The society also favored provision in buildings for runways for loading and unloading vehicles so as to relieve street congestion.

—

135,000 Cars for Michigan

LANSING, MICH., Aug. 14—Officials of the Secretary of State's Department have been indulging in some figuring as to what the new Michigan automobile tax law will mean to the state in the way of revenue. Basing their estimates upon the issuance of 135,000 license numbers, and the average tax per car at $12, the state would receive a minimum of $1,620,000 from the owners or users of automobiles during the first year the new law is in force. This would be more than double the amount estimated when the law was discussed.

The Newell Smith automobile tax law which goes into effect Jan. 1 provides for a tax of 25 cents per horsepower plus 25 cents per each 100 lb. of weight. Up to the end of this week more than 102,000 tags have been issued for 1916 cars, and at the rate they are being applied for the officials believe that 135,000 cars will be licensed by the end of the year.

—

Gasoline Up 1 Cent in New York City

NEW YORK CITY, Aug. 17—Gasoline went up a cent to-day, from 13 to 14, delivered to the garageman. The Standard Oil Co. and the Texas Co. both raised. The last previous raises were: Standard, July 27, from 12 to 13; Texas, July 28, from 12 to 13.

—

Ohio's New Laws in Effect

COLUMBUS, OHIO, Aug. 13—The announcement is made by the Ohio Automobile Department that the new laws governing the operation of automobiles in the State, passed by the Ohio Legislature at the last session are now becoming effective.

The law making it a felony to change a manufacturer's serial number or to have a car with a changed number in his possession became effective July 29. The law permitting the transfer of number plates from one car to another by the same owner by the payment of a fee of $1 became effective Aug. 1. The law reducing the fees for registering manufacturers and dealers from $20 to $10 became effective July 25.

—

Donaldson, Sr., Killed in Race

SPIRIT LAKE, IOWA, Aug. 13—R. E. Donaldson, owner of the Emden car, which finished in eleventh place in the Indianapolis 500-mile race, and father of H. G. and L. C. Donaldson, both of whom participated in the race as mechanics, was killed instantly in an automobile race here this afternoon. The sons won first and second places.

Martin Body to Add—The Martin Metal Co., Wichita, Kan., builder of metal automobile bodies, is planning an addition to its plant.

Covert to Build—The Covert Motor Vehicle Co., Lockport, N. Y., has let a contract for a three-story and basement, 44 by 96-ft. factory building.

Hancock Co. Adds—The Hancock Mfg. Co., Charlotte, Mich., manufacturer of automobile sundries, is completing the erection of a brick and steel addition to its plant, 80 by 160 ft., doubling its capacity.

F. W. D. Extending—The Four Wheel Drive Co., Clintonville, Wis., is erecting a large addition to its present factory, to cover an area of 100 by 185 ft. New machinery and equipment will also be purchased.

To Make Bodies—The Nineveh Coach & Car Co., Nineveh, N. Y., has increased its capital stock and will erect additional buildings for the manufacture of automobile bodies. New equipment will also be installed.

Western Supply Enlarges—The Western Auto Supply Manufacturing Co., Bellingham, Wash., will construct a 50-ft. addition to its plant and install new machinery, including testing machine, generator, cylinder boring machine, etc.

Moreland Truck Doubles Capacity—The capacity of the Moreland motor truck factory is to be more than doubled. This will mean that more than 100 motor trucks of this make are to be manufactured in Los Angeles every month. This company is also prepared to spend $1,500,000 each year in bringing the Los Angeles plant up to its full capacity. Moreland distributing and service stations are to be established in all the important towns of southern California.

Chester Rubber Adds—The Chester Rubber Tire & Tube Co., Chester, W. Va., a subsidiary of the New York firm, is erecting extensive additions to its plant, which is expected to increase its capacity about eight times.

New Akron Tire Co.—A new tire-making plant will be established in Akron, Ohio, by the Western Tire & Rubber Co. A three-story building, 60 by 150 ft., will be erected and a power plant will be installed.

Overland Warehouse Started—Construction of the Willys-Overland $250,000 warehouse plant in the Midway, St. Paul, has been begun. Excavation is being done with an immense crew of men, steam shovels and dinky trains.

Simple Engine Co. Moves—The Simple Gas Engine Co., Brainerd, Minn., has moved its offices and works to Ashland, Wis., and is now producing a line of internal combustion engines. The company occupies the former plant of the Ski Mfg. Co., and its foundry work is done under direct supervision at the Nelson Roen Foundry Co. C. A. Anderson is general manager and chief engineer.

To Make Carbureters, etc.—Thomas Spence, president, and W. G. Spence, vice-president of the Rundle-Spence Mfg. Co., 100 Second Street, Milwaukee, manufacturing plumbers' and steamfitters' supplies, are the moving spirits in the organization of the Turbo Motor Devices Co., capital stock $30,000, which intends to manufacture and market a number of appliances for internal combustion engines, including a carbureter. Associated with the Spence interest in the new concern are M. L. Fykse and L. M. Smith.

Linde Air Products' Milwaukee Plant—The Linde Air Products Co. of New York has purchased a large factory site at Thirty-eighth and National Avenues, Milwaukee, and will at once establish a branch plant to serve Milwaukee and Wisconsin users of welding and cutting apparatus. The site is 150 by 700 ft. and is located on the joint belt line railroad. The building will be of concrete and brick, one-story, 150 by 250 ft. in size and cost about $50,000. Until now the Chicago branch has been supplying this territory, but the growth of the use of the oxygen welding and cutting process, together with the use of the equipment for cleaning gas engines, necessitated the establishment of a direct branch in the heart of the Milwaukee manufacturing district. The new shop will be ready by May 1 and there will be 100 operatives engaged for its operation. The Linde company, an $18,000,000 corporation, recently was licensed to do business in Wisconsin.

The Automobile Calendar

Aug. 20-21	Elgin, Ill., Road Races.

The Week in the Industry

Smith Sales Mgr.—A. J. Smith has returned to automobile circles in San Francisco, and has taken the position of sales manager with the Reliance Automobile Co., northern California distributors of the King car.

Schramm Resigns from Packard—R. I. Schramm, until recently assistant advertising manager of the Packard Motor Car Co., Detroit, Mich., recently resigned to become distributor in Ottawa, Canada, for the Ford Motor Co. of Canada, Ltd.

McKenzie Goes to Portland—L. E. McKenzie, formerly in charge of the Studebaker interests in Pittsburgh, has been appointed assistant manager of the Portland branch, succeeding Clete Mulick, who has been transferred to the San Francisco Studebaker branch.

Knoble Hyatt Assistant Advertising Mgr.—Cliff Knoble, formerly with the National Cash Register Co., Dayton, Ohio, where he was connected with the advertising department, has been appointed assistant advertising manager of the Hyatt Roller Bearing Co., Detroit, Mich., and will assist Advertising Manager W. E. Biggers at the Detroit headquarters.

Bunnell Heads Portland Chalmers—Portland, Ore., has been chosen as the executive headquarters for the Chalmers Motor Co., with Marc Bunnell as district manager. The territory will consist of the field north of California and west of the Dakotas. In the immediate future Mr. Bunnell will open up factory offices in Portland. The Chalmers agency for Oregon and Washington will be retained by the veteran dealer, H. L. Keats.

Garage

Regal to Move—The Regal Motor Co. of Boston, Mass., has signed a lease to occupy part of the new building just erected on Commonwealth Avenue and Beacon Street, Boston, Mass., the other sections of which will be used by the Reo and Hupmobile agencies.

Willard Branch in Cleveland—A new branch of the Willard Storage Battery Co. has been opened by the company in its home city of Cleveland. The location selected for this branch is 2027 Euclid Avenue. Full equipment for recharging, repairing and renewing has been installed, and a complete stock of batteries is carried. Thus the new station will be a great convenience, not alone for car owners, but for dealers.

Motor Men in New Roles

Conrad Resigns from Pullman—H. W. Conrad has resigned as sales manager of the Pullman Motor Car Co., York Pa., taking effect July 31.

Brodhead Joins N. Y. Marmon—Walter Brodhead has been made manager of the Marmon used car department in New York City.

Willemin Makes Hupp Change—A. B. Willemin, who has been with the Hupp Motor Car Co., Detroit, Mich., for the past 3 years, and who was director of purchases, has been appointed assistant general manager.

Remsen Gets Studebaker Promotion—A. H. Remsen has been appointed assistant office manager of the Studebaker Corp., Detroit, Mich. He was previously connected with the parts order department.

Baeder Stewart-Warner Rep.—J. J. Baeder has been appointed traveling representative for the State of Michigan by the Stewart-Warner Speedometer Corp., Detroit, Mich. He was heretofore with the Cleveland headquarters of the concern.

Merrill Winton Sales Mgr.—A. J. Merrill, who has been connected with the Los Angeles branch of the Winton Motor Car Co., has been elevated to the position of sales manager. Mr. Merrill fills the vacancy caused by the resignation of J. S. Wiese.

Sherbondy Resigns—F. P. Sherbondy, chief electrician for S. F. Bowser & Co., Fort Wayne, Ind., for the past 5 years, has resigned and has assumed the management of the Exide storage battery and service station, South Bend, Ind., now being established.

White Detroiter Eastern Rep.—The Detroiter Motor Car Co., Detroit, Mich., has appointed A. F. White its Eastern representative. His territory will include China, Japan, the Philippine Islands, India, the Federated Malay States, Burma, Ceylon.

Arner Heads Columbus Tire Co.—George A. Hasson & Co. is the name of a new tire concern located at 75 North Fourth Street, Columbus, Ohio, with G. A. Arner as manager and G. H. Fisher district sales manager. The company is agent for the Chester and Traveler lines of tires and tubes.

Sells Joins Chandler Agency—The Chandler Motor Car Co. of Los Angeles, Cal., has acquired the services of E. N. Sells. Mr. Sells has been placed in charge of the Chandler interests in Santa Barbara, Kern, San Luis Obispo, Ventura and Inyo Counties. Sells was formerly with the Earle C. Anthony forces and for the past 2 years was in charge of the San Francisco branch of the company.

Barnwell Waverley Mgr.—S. E. Barnwell, formerly sales manager of the truck department of the Kentucky Wagon Manufacturing Co., has been appointed manager of the Louisville office of The Waverley Co., 206 East Broadway. He succeeds K. A. Ridenor, who resigned several weeks ago to become assistant to Roy Potts, vice-president of the Madison Motor Co., Anderson, Ind.

Jenkins Master Carburetor Rep.—W. M. Jenkins, who left Los Angeles last summer to take up active work in the East when the Master Carburetor Co. opened the Detroit factory, has returned to Los Angeles as Pacific Coast representative of the Master interests with headquarters there. F. A. Hartwell, formerly with the Southwestern Carburetor Co. at Phoenix, Ariz., distributors for Master carburetors in Arizona, New Mexico and Texas, is now in charge of the new Master salesroom in Los Angeles, having been appointed city sales manager for the local branch of the Detroit factory, which supplies the Pacific Coast.

Dealer

More Room Needed—Mitchell & Smith, one of the big accessory companies of Boston, Mass., has been obliged to enlarge its quarters and has secured more space in the building 1090 and 1092 Commonwealth Avenue.

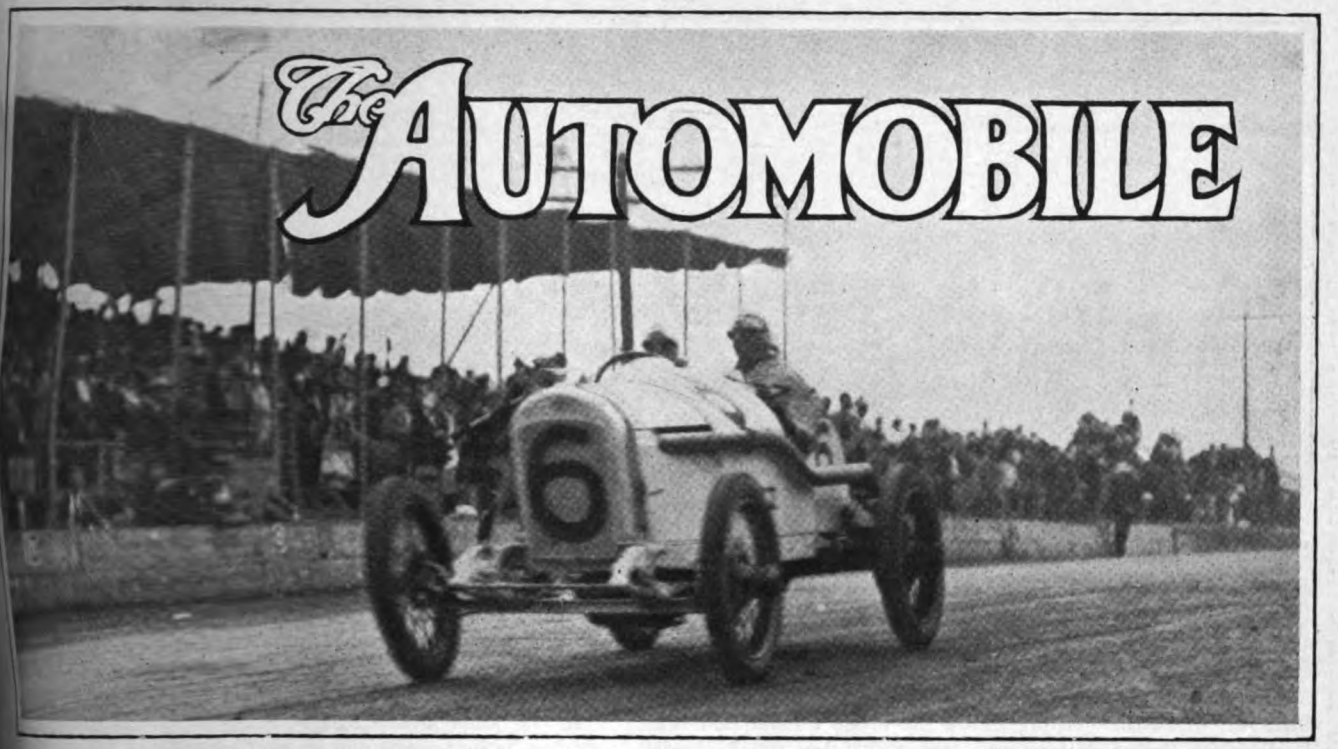
Stutz Moves Again—The Becker-Stutz Automobile Co., which took over the Stutz in Boston, Mass., last week and moved to 911 Boylston Street, has again moved, this time to 793 Boylston Street, where it has the entire building.

Oldsmobile Service Station—The Oldsmobile Motor Co., Boston, Mass., has just leased the building on Landsdowne Street, Cambridge, formerly used by the Buick Co. as a service station, and it will maintain a repair department there.

Lee Takes On G. M. C. Truck—Don Lee, Los Angeles, Cal., will handle the General Motors Co. truck line in California in the future. Lee now represents the largest and most complete line of any California dealer. He has the Cadillac for the entire State and the Oakland for northern California.

Vol. XXXIII New York—Thursday, August 26, 1915—Chicago No. 9

The Automobile



Gilbert Anderson's Stutz getting the flag at the finish line on the winning lap of the Elgin national trophy race

Stutz Cars Triumph at Elgin Road Races

Cooper and Anderson Take First and Second in Both Races—Elgin Trophy Won at 77.256 M.P.H.—C. A. C. Cup at 74.979

ELGIN, ILL., ROAD RACE COURSE, Aug. 21—Stutz racing cars came into their own in road racing to-day and yesterday when the new sixteen-valve racing cars took first and second places in the 301-mile race Friday for the Chicago Automobile Club trophy; and to-day, Saturday, when Stutz finished first and second in the Elgin national trophy for the same distance, both races being run over the eleven 8.38 mile road race course lying on the outskirts of Elgin.

Friday Earl Cooper won from a field of nine starters averaging 74.979 m.p.h. with his team mate Gilbert Anderson second averaging 73.859 m.p.h., the two defeating such road racing masters as Barney Oldfield, who was driving in his new Delage and De Palma who had trouble with his Mercedes that captured both races a year ago and each broke a valve rocker arm, covering a little over 100 miles.

To-day, Saturday, Stutz more than duplicated its Friday performance, Anderson and Cooper again finishing one, two, with a Duesenberg driven by O'Donnell third and De Palma's Mercedes fourth.

While yesterday saw Elgin road records fall, to-day's race toppled existing records like the proverbial house of cards. Anderson averaged 77.256 m.p.h., over 2 miles higher than the Friday pace, and Cooper at 76.258 m.p.h. was also well ahead of all previous marks; in fact, to-day was record-breaking day as all four cars finishing averaged over 75 m.p.h. This speed is best realized when compared with the 1914 mark of 73.5 and yesterday's mark of 74.97.

The Winners at Elgin

Elgin National Trophy

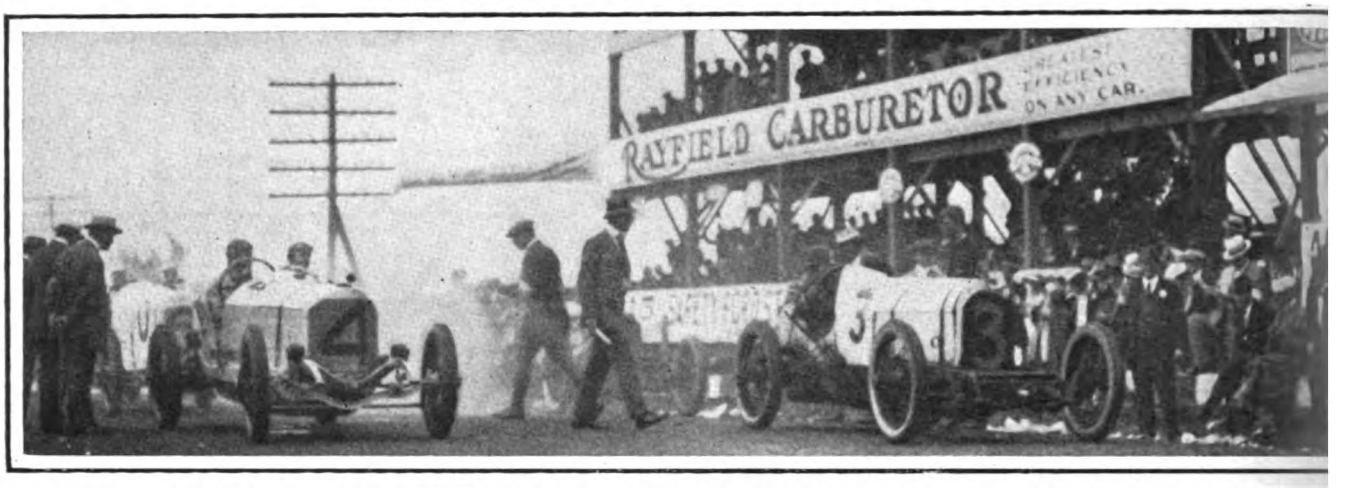
Car	Driver	M.P.H.
Stutz	Anderson	77.256
Stutz	Cooper	76.258
Duesenberg	O'Donnell	75.769
Mercedes	De Palma	75.690

C. A. C. Trophy

Car	Driver	M.P.H.
Stutz	Cooper	74.979
Stutz	Anderson	73.859
Delage	Oldfield	72.467
Ogren	Alley	71.163
Duesenberg	O'Donnell	70.836

A Spectacular Finish

To-day's race for the Elgin National trophy with the $4,200 cash divided among the winners was not only the fastest ever held on the course but one of the most spectacular finishes in the



Start of the sensational 301-mile race for the Elgin national trophy held on the Elgin, Ill., road race course Saturday, August 21

history of American road racing. The four finishers all completed the 301 miles inside a 5-min. interval. Anderson was first over the tape. He carried No. 6 and thus had 1 min. road lead over Cooper carrying No. 8. De Palma carrying No. 4 was second car to cross the tape but he had a road lead of 2 min. on Cooper, the cars being started at intervals of 30 sec. Approaching the finish Cooper had been leading De Palma, but on the second last lap the Mercedes passed the Stutz, and the grandstand wondered if the Stutz lead could be overcome. When De Palma hove into sight over the top of Briton's hill a quarter mile from the grandstand where the finish line was everybody watched the scoreboard to see where Cooper was, the moving figures showed him close behind. A few seconds later De Palma got the checkered flag at the grandstand and scarcely had he received it when the white Stutz shot into view over the hill crest. It was Cooper. 10 sec. more he, too, had the black-and-white flag and was in second place.

Two finishers had flashed across the tape at over 100 m.p.h. in less than 15 sec.

But this was not the end. It was not certain whether De Palma was to be third or not. The Duesenberg driven by O'Donnell was in the home stretch. He carried No. 5 on his hood, meaning that he started just 30 sec. back of Mercedes No. 4, so that w De Palma crossed the tape O'Donnell had 30 sec. left to c the tape and still capture third money. Again all eyes on the crest of Briton's hill, watches were in all ha seconds were being counted. But there was not long pense. Scarcely had the starter's flag dropped to the gr than the score board figures showed O'Donnell nearing crest, a second more and he shot over it. Ten seconds he finished. He had captured third place. There was e time enough for him to cross the tape and when he waved off he had just nosed into third place by 15 sec. De Palma's Mercedes.

Rest 30 Miles Behind

Thus within the short space of 4 min. and 51 sec. the four cars had finished; the other four cars still ru were over 30 miles back, and the race was declared of remaining cars being fla It was the most ex finish that road-race siasts have been treate many years, one of th instances in road rac fitting climax to a breaking day.

Friday's race was spectacular. Early race it was a forego

Fastest Laps Over 8.38-Mile Course in Elgin National Trophy Race, Held Saturday, Aug. 21

CAR	DRIVER	LAP	TIME	M.P.H

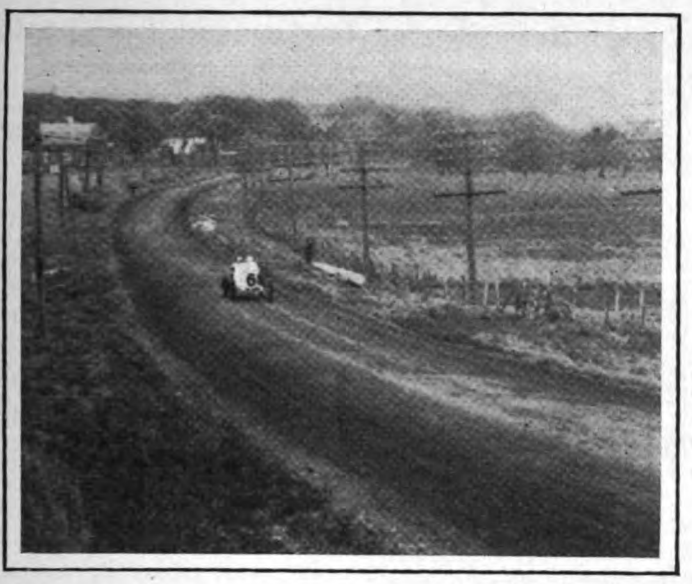
clusion that Stutz cars had it all their own way from the early miles, De Palma stopping at 40 miles to repair a broken rocker arm and losing over 1 hr. There was no hope of his even being a contender but he went out for some of the 100-mile cash that was offered: In the meantime Barney Oldfield was experiencing some of his customary bad road racing luck. He stopped at the end of the first lap to change a right rear, his pit men doing poor work with the hand jack, the stop taking 73 sec. This handicapped him and it was soon seen that his new Delage, which was in its second American contest, was not yet tuned up and would not be able to battle on even terms with the Stutz makes. Barney's fastest lap was 6:36 as compared with 6:31 for the Stutzes. The two Duesenbergs were setting a little slower pace, the fastest lap being 6:37, leaving the real honors of the day to the two Stutzes. The Ogren driven by Thomas Alley eventually landed in fourth place, putting the Duesenberg fifth. The other five cars that started had dropped out by this time, for various causes, which are given, for the most part, on pages 366 and 367, where the mechanical and tire troubles are reviewed.



Rounding hairpin curve on the 8.38-mile Elgin course, one of the places which required the most skilful driving

Racing Conditions Ideal

Racing conditions on the course were ideal for time except for high winds which held the cars back Friday; and Saturday the oiled road was slippery in places, owing to a heavy all-night rain Friday which lay in pools Saturday morning. Fortunately the high wind dried them, but the pace was not at record speed until the race was three-quarters over. As a result the lap record of 6:11 established last year by Spencer Wishart in the Mercedes was not broken, De Palma putting his Mercedes around in 6:15.85 for the second last lap Saturday, a pace of 80.5 m.p.h. Second honors went to O'Donnell's Duesenberg in 6:18, or 79.857 m.p.h. Anderson's Stutz made the third fastest in 6:19, or 79.642 and Cooper was fourth in 6:26 or 78.206 m.p.h. The race was not a question of fastest laps but rather one of well-sustained speeds with the minimum of stops at the pits. Both races were gray-matter ones rather than matters of maximum speed and brute strength. It was measuring up and carefully balancing tire endurance with motor speed possibilities.

New Tire Record

Never has a road race of such distances been run with so few tire stops. Adding the races of both days gives a total mileage of 603.66. Anderson's Stutz made this entire distance without a single tire stop, a new road tire record. He used Silvertown cords. Cooper made but one tire change in both days, this being made the first day at 250 miles. O'Donnell's Duesenberg made but one change in both days. De Palma did not make a single change in his Mercedes which covered 477 miles in the two days. Oldfield was the tire Jonah changing one the first day and four the second, a total of five. Of the other cars which were slower only one or two tire changes were made.

The entire race was a great demonstration of cord tires, which made their American debut in a road race, the Elgin course being a typical country gravel road with a well-oiled surface. The road was scarified last fall, all loose stones removed and the surface dragged regularly. Over a month ago it was oiled and to all intents and purposes is a typical road, wide enough in all places for two cars to pass and in many places wide enough for three cars to race abreast at 100 m.p.h. It must be remembered in connection with this tire performance that the track was cool. The sun scarcely shone on both days and the all-night rain Friday left the road particularly cool for Saturday.

Tires Not the Weak Links

Notwithstanding road and weather conditions it cannot be said that now tires are the weak links in racing and that

races are lost by them. The two Stutzes on both days traveled 1207.32 miles and made only one tire change. Take the four cars Anderson-Stutz, Cooper-Stutz, O'Donnell-Duesenberg and De Palma-Mercedes and only three tires were changed by all four in the two days of racing, totalling 2287 miles or one change for every 763 miles, a remarkable record as compared with a few years ago. Of these four cars all but O'Donnell used cords, the latter fabrics. All told only fourteen tires were changed on both days of racing with nine starters one day and twelve the next. Not a single front tire was changed.

Few Mechanical Troubles

For 602 miles of racing crowded into 2 days there were very few mechanical troubles yet Cooper's Stutz was the only car to go through both days without having to raise the hood or give a single thought to mechanical details, a phenomenal record and one that would indicate that the sixteen-valve construction has been well handled by the Stutz company; and further that the high-speed motor has finally taken its place as a reliable factor in racing in this cou Anderson made one stop of 2 min. the first day at the with what apparently was valve-spring troubles.

De Palma's Troubles

De Palma had his Mercedes out for the first time sin wrecked the crankcase at Indianapolis in May. Since th has had a new crankcase, new pistons, new connecting and new wristpins. The trouble of a broken rocker arm due to a too thin section in one place. The second day h difficulty with his car at high speeds, due to the shoc sorbers being out of adjustment, the car not riding wel

O'Donnell's Duesenberg made but one stop for a loo celerator spring. Chandler's Duesenberg stopped due back fire in the carbureter; and Henderson's Duese had more serious troubles, first breaking a valve rock Friday and a timing gear case on Saturday.

Oldfield's Delage Not Tuned Up

Barney Oldfield's Delage with its valves opened and by cams, in short, positively-opened and positively valves, is not yet tuned up properly but ran both days out a stop for mechanical troubles until the last lap second day. This is the only motor in this country mechanically-closing valves, a construction which ins definite valve opening at all speeds. It was first used ago in the French grand prize race.

Course Tests Cars

All of these troubles are minor ones, not concern the major problems of design involved in the leadin tions of high-speed racing motors such as sixte motors, high-speed characteristics, lubrication, igni carburetion. A road race does not test the motor as as a speedway race in that there are two right-angl on the Elgin course, which mean momentary motor r the other hand, these turns are good tests for the bra the constant curving of the course is a severe test for running gear parts and steering gear and connectio

Management Excellent

Race management throughout was the best that desired. Soldiers guarded the entire 8.38 miles a tators were kept back of the road fences and not a cross the course at any point. Around the entire co a series of telephone stations connected with the sc at the grandstand, this board showing by moving fi course of each car around the route on every lap. grandstand could see when leaders changed place part of the course. The Chicago Automobile Cl conducts the race for the Elgin Road Race Assn. the entire affair in a highly creditable manner. T the race was announced by a series of megaphone to the grandstands but all around the course, the in being furnished by telephone from the grandstan

straw was used to protect the cars at the two right-angled turns in case they should skid.

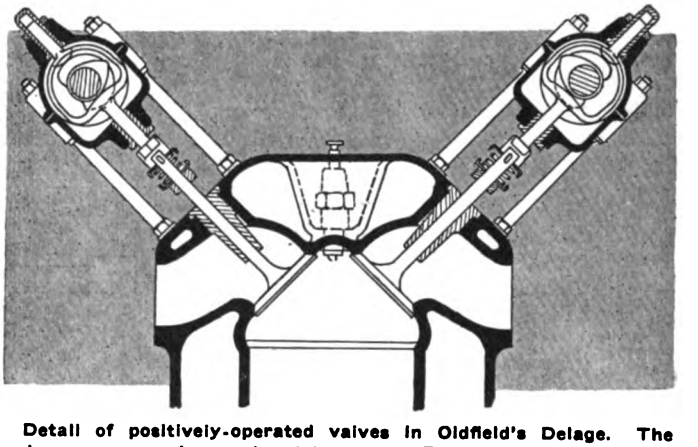
Weather Affects Attendance

Unfortunately, owing to the weather the attendance was much smaller than in former years, scarcely more than 25,000 witnessing Saturday's race. It rained all Friday night and was raining in Chicago, 38 miles away, nearly all day Saturday, thus preventing thousands from attending. The central west has had a wet season for the last three months. Because of this it is thought that the Elgin Road Race Assn., which manages the race, will be practically $15,000 behind on both days. Cash prizes aggregating $8,000 were given. The winner each day received $2,000; second man $650 and third $350. Each car completing 100 miles received $100 and those completing 200 miles $200.

In the Way of Equipment

Both Cooper and Anderson used Bosch magnetos and plugs; O'Donnell used a Bosch magneto and Rajah plugs and Oldfield used a Mea magneto and Rajah plugs. Cooper and Anderson both had Stromberg carbureters, Oldfield used four Claudels and O'Donnell used Master on Saturday and a Schebler on Friday. Cooper and Anderson both rode on Houk wire wheels and Oldfield and O'Donnell rode on Rudge-Whitworths. All four used Hartford shock absorbers.

The Stutz cars driven by Cooper and Anderson had aluminum alloy pistons, while O'Donnell's Duesenberg used magnalium and Oldfield's Delage, steel. In the way of tire equipment the two Stutzes used Silvertown cords, O'Donnell used Riverside and Oldfield, Firestones. For lubrication Oilzum was a favorite, being used by all four drivers mentioned as was Dixon's grease.



Detail of positively-operated valves in Oldfield's Delage. The valves are opened and closed by cams. The Elgin contest is the first road race in which this type of valve operation has appeared

Cord Tires Score in Road Racin

Anderson Goes Through Both Days on Same Set, Covering 603 Miles—Few Changes—Little Mechanical Trouble

ELGIN, ILL., ROAD RACE COURSE, Aug. 21—Cord tires invaded a new field in the C. A. C. and Elgin National classics to-day and yesterday when they had their first tryout in actual road racing. Anderson, Cooper, De Palma and Henning carried Silvertown cords and Robillard in the Lozier had a cord tire of Marathon make. Anderson, who finished first in the 450-in. event to-day and second in the 300-in. race of yesterday, rode on the same tires throughout both races though he had different cars. They looked as good at the end of the 603 miles of the two-day meet as they did at the beginning.

Cooper went through the two days with one tire change, which was caused by a horseshoe nail picked up Friday. De Palma likewise had a puncture which necessitated a tire change, but all of his casings looked good for double the distance; in fact, there is only one mark showing on De Palma's tires and this came from his vigorous braking when he overran the turn to-day.

Cars Better Balanced

Tires on the whole stood up very much better this year than they have in previous races. This cannot be credited entirely to the tires, for the course is so much smoother than it has been previously that less tire wear was to be expected. The day was cool, as has been the case in previous Elgin meets which would be accountable for less heating and consequently longer life of the tires. Another factor is that the cars, particularly the speedier ones, are better balanced each year so that they hold the road better and thus relieve the tires of added strain.

Friday's race saw only three tire changes, the two of De Palma and Cooper already mentioned, one of Oldfield's who changed at the end of the first lap. The Saturday race was more prolific in tire trouble than was the Friday one. This was to be expected inasmuch as many of the tires were used on the second day that had gone through the first day's 301 miles. Also, the average speed was over 2 m.p.h. faster on Saturday, a difference that would make quite an appreciable lessening of tire life. Altogether there were eleven cars changed Saturday.

Not a Front Tire Changed

O'Donnell made a change on the back stretch, Oldfield replaced four, Robillard lost one by a blowout, Chandler lost two, and Henderson in the Duesenberg lost three. I worthy of note that not a front tire was changed at the during the two days' racing.

Delage Has Positively Operated Valves

Elgin was the first road race in which a positively-cl valve motor has been used. This is the Delage which field drove. It is unique in that there is no necessity valve springs. A cam insures the opening of the v also the closing, a feature that makes it similar to the sl valve engine, where the uncovering and covering of the p is positive. With this arrangement it is possible to inc the speed of the engine as the valve spring is one of limiting factors in motor speed in poppet-valve eng There is a single overhead camshaft with eight pairs of and for each valve there is a three-arm rocker, one of v is connected direct to the stem valve and the two o are in contact, one with the opening and the other wit closing cam. This is illustrated on page 365.

Little Pit Work

There was an unusually small amount of pit work d this year's Elgin classic, but in a number of case troubles which brought the cars into the pits were of

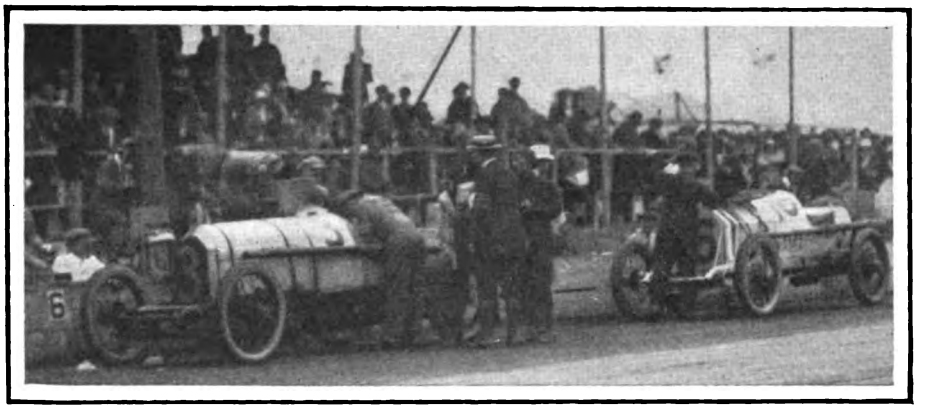
*Saturday's race.

serious nature that they required rather unusually long stops, so that there was a car undergoing repairs of some sort most of the time.

To take up the troubles of the individual tires in the Chicago Automobile Cup race on Friday, we find that Cooper came into the pits on only two occasions, the first time when he halted for 21 1/5 sec. to take on gasoline and tightened up the shock absorbers. The second and last stop was when he changed a right rear tire which was punctured by a horseshoe nail. This held him for 33 sec. so that the Californian's total time lost at the pits was less than 1 min.



In spite of the few mechanical troubles, the pit men had plenty to do. Some of the troubles which brought the cars to the pits required a long time to repair

Anderson, his team mate, likewise made but two stops. The first one was at 167 miles when he took on gasoline, getting away in 20 sec. After he had run over 200 miles he came into the pit missing on one cylinder. After looking at the ignition and valves Anderson started out without doing any work to remedy the trouble and finished on three cylinders in second place.

Eddie O'Donnell, in the Duesenberg, made only one stop and this was at the end of 206 miles when he took on fresh supplies of gasoline and water; at the same time he attached the accelerator spring which had become loose.

Oldfield First to Stop

Oldfield in his Delage made the first stop of the day, when he changed a right rear tire at the end of the first lap. He made a halt for gasoline and oil after running 217 miles.

De Palma made three stops and lost a total of 1 hr. and 15 min. before he finally retired with a broken rocker arm. When he first came in it was on three cylinders after he had run about 35 miles. The rocker was giving him trouble but after spending 5 min. and 30 sec. at the pit he got away without doing anything other than changing two spark plugs. The next lap, however, which took nearly 13 min., ended at the pits with the rocker arm broken and De Palma waited while a mechanic went to his garage in town after another rocker arm. By the time the new one was fitted 1 hr. and 9 min. had elapsed. De Palma, however, started out to finish 100 miles with a view to running-in the motor, which had new pistons and also to get some practice for the next day's event. He was out of the race to all intentions when his first trouble developed.

Henderson's Duesenberg was a contender until it came in with a stuck valve and broken valve spring and went out of the race.

Tom Alley also was running well and made only one stop while he took on supplies and changed a broken spark plug. Alley managed to put the Ogren into fourth place but finished on three cylinders, the other, missing on account of a broken rocker arm.

Cooper Had No Troubles

In Saturday's race, Cooper was shown to be the only one who was immune from mechanical troubles among the finishers of the two days' racing. Cooper went through the 603 miles of the two events without lifting the hood of his car. His only stop on the second day was in the twenty-second lap when he refilled the gasoline tank in preparation for his dash for the checkered flag. He did not spend much time at the pits, getting away 13 sec. after his wheels came to a standstill. His team mate, Anderson, also hesitated only once, this was a pause of 17 sec. while a gasoline can was upended over his tank.

O'Donnell lost a few seconds more, being held 36 sec. while he took on gasoline and oil in the twenty-fourth lap. De Palma lost 16 sec. in the twenty-third lap while he refilled his gasoline tank.

Oldfield made three stops, changing four tires altogether. The first one was in the fifth lap when he changed the left rear, the second he changed the right rear and took on gasoline and oil, and the last time he put on some Pirelli tires which had studded treads.

In the 2-days racing at Elgin in 1914 there were eighty-eight pit stops, forty-seven of these being made on Friday during the Chicago Automobile Club cup race and forty-one on Saturday in the Elgin trophy contest. It was remarked at the time that there were but sixteen stops for tires on the first day and but seventeen on the second.

Cars in the 2-Day Road Races at Elgin, Ill., on Friday and Saturday, August 20 and 21

Brass and Bronze—Offsprings of Copper—Part II

Nine Alloying Substances Added to Copper-Tin and Copper-Zinc Alloys for Special Purposes—Lead, Manganese and Phosphor Especially Important

By J. Edward Schipper

BRONZE and brass are the two major members of the family of copper alloys. Zinc and copper as has been pointed out form brass. Tin and copper form zinc, thus zinc and tin are the two leading alloying substances of the non-ferrous family. The qualities of these have been shown, but besides these great leaders in the non-ferrous family there are many other members which have important relations to the qualities of the alloys of which they form a part. Copper is the mother metal and brass and bronze the two leading offsprings, but besides these there are many others which are modified by the use of additional alloying substances and which merit attention in the study of the make-up of the non-ferrous family.

Before leaving zinc a word to summarize what it does with copper in the composition of brass may be of use. In the first place it is generally accepted that brass is a mixture and not a compound. The addition of the zinc gives to copper, which is proverbially one of the hardest metals on earth on tools, the quality of being readily worked. In fact yellow brass is so readily worked while cold that thousands of pieces an hour are turned out on fast machinery without any lubrication of the cutting tools. Many articles are made under a drop hammer while cold, and brass is even rolled while in that state. An interesting method of working brass which is rendered possible by the zinc is spinning. A tool pressed against a rapidly rotating or spinning piece of brass gives it an entirely new shape and it can be burnished to take a fine polish by the pressure and friction of a smooth steel tool.

Kalchoids—The Connecting Branch

So far the non-ferrous family has been divided into two separate branches, the bronze on one side including the alloys of copper and tin and the brass on the other composed of the alloys of copper and zinc. These are the two distinct offsprings of the mother metal copper, but between them there is another class which forms the connecting link between the brass and bronze being composed of copper and both tin and zinc. These are known as the Kalchoids. By varying the content of copper, tin and zinc, an endless number of permutations and combinations are possible, but the metals between certain zones of content have characteristics which are of immense value. The alloys in this class include the strongest and hardest combinations which can be effected with copper as a base. At the same time, ornamental metals can be made from different combinations, an imitation gold being produced with a copper percentage of 81.5, zinc 18 and tin .5. Another ornamental metal which is used for decorating small fire arms, etc., is composed of copper 80, zinc 17 and tin 3. Medals, brass buttons, and an endless variety of other useful articles are made from the Kalchoids which have have been christened thus after the Greek Kalchos.

Metals known as white brass, and government bronze, and several other metals in common use, belong to this classification of copper-tin-zinc metals. They can be varied to such a great extent and furnish such a large number of possible metals that the field of experimentation has always been of interest. It is said that Sir F. Chantrey actually formed a razor blade as hard as tempered steel from a metal composed of 76 per cent copper, 12 tin and 12 zinc. Some idea of the way the copper-tin-zinc alloys vary can be had from the accompanying table given by Thurston, page 370.

Nine Important Alloying Metals

Copper, tin and zinc are the three leaders in the non-ferrous family, but they are not the only members which con-

their share to the bewildering variety of combinations possible. In fact, what can be done with the three alone has only been touched upon lightly. The tabulations which are given in connection with these three alloys do little more than scratch the surface of a possibility. But there are other alloys in this great family which have their influence and perform certain duties for specific purposes and some of them which are of great importance such as lead, antimony, manganese, phosphor, aluminum, nickel, bismuth, silicon, and others have marked effects which render them of value.

Lead when used on the brass branch of the non-ferrous family tree is found in the metals which are desired for easy working. Thus lead is found in yellow brass, sheet brass, for brazing, red, gilding, coldworking, free-cutting and other cases where easy working is desired. On the bronze side, the lead is found in the metals which are used for bearing purposes. It is mixed with copper and tin to form so-called babbitt and is included in the formula for phosphor bronze. These are soft and hard bearing materials which are used in connection with steel shafting and where it is desired to have a non-abrasive and good friction quality of bearing material.

Lead a Softener

The qualities of lead give a ready clue to what it might be expected to do with other metals. It melts at about 625 deg. Fahr. becoming soft and pasty at about 617 deg. It has a specific gravity of 11.25 and a tensile strength of 1600 to 2400 lb. per square inch. It has very little elasticity and flows under a slight strain. In structure it is crystalline as will be noted by the fracture on breaking. When added to a copper-zinc alloy it allows the resulting material to be readily cut, but it cannot be added blindly as when present in certain quantities the metal becomes difficult to handle. For instance, when added up to as high as 10 per cent with copper 60 and zinc 30 it is difficult to obtain a homogeneous mixture. This is shown by the fact that the metals crack and segregate

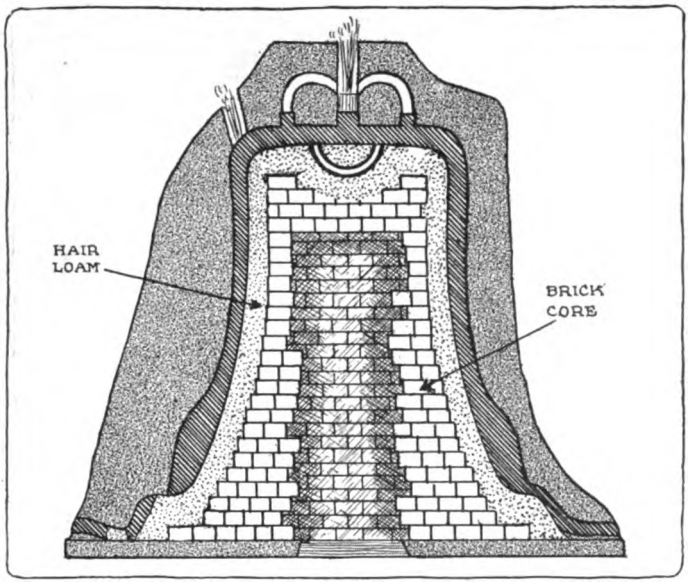
Thurston's Matls. of Engrg.



Arranging for the casting of a huge bell, one of the time-honored uses for bronze

on rolling. With lead 2.5, zinc 37.5 and copper 60, the cutting qualities are excellent, but the material can only be hot-rolled and forged with difficulty.

In a word, lead is the softening element. It lends the qualities of mildness to the alloys of which it forms a part. Having a nature that can almost be classified as plastic, it lends this quality to the metals with which it is mixed. When mixed alone with copper, as it is in some type metals, it is more or less unstable and will separate readily. When in combination with copper and tin or, in other words, when forming part of a bronze it forgets its plastic disposition and makes the bronze durable and capable of resisting wear. Some of the white metals for bearings contain anywhere between 0 and 80 per cent lead although the original babbitt does not contain any. It is however, an ingredient in many of the main bearing materials in automobile work.

Antimony a Hardener

Antimony finds its best uses on the bronze side of the non-ferrous family. Here it is of particular value due to its hardening influence on tin. In itself it is a brittle, bluish white metal with a laminated structure having a specific gravity of 6.8 and melting at 842 deg. Fahr. Having the hardening influence on tin it is of great value in the bearing metals and in fact was one of the constituents of the original babbitt which was composed of copper, tin and antimony. In bearing metals it is most frequently used between 4 and 6 per cent. According to most authorities the good influence of antimony ceases when it is used in the proportion of about 18 per cent and above this it should not be employed.

Like other members of the non-ferrous family antimony is of ancient lineage being known to the early Greeks and being referred to in the Old Testament. It has always been of value as a hardening agent and forms a part of the metal used in the making of printing types. It is of great value in this as it imparts to the metal the quality of expansion upon solidification thus permitting of a sharp impression of the mold.

Phosphorus a Bronze Tonic

Phosphorus, the poison of steel, is a veritable tonic when added to bronze. The introduction of this member into the family lends a strength and purity to what may be called the heavy duty bronzes that could never be reached without it. Phosphor bronze has been used for many years and in it the phosphorus acts as a flux increasing the purity by acting as such and furthermore lending its friendly offices in the closer amalgamation of the tin and copper. By adding small proportions of phosphorus to copper in the form of a phosphoret of copper or tin, the oxides of copper which are generally present as an impurity are removed by deoxidization, with the result that the grain of the resulting alloy is much finer.

(To be continued)

Properties of Copper-Tin-Zinc Alloys

No.	Copper	Tin	Zinc	Remarks
1	100	100	100	Very white, brittle, subject to liquidation.
2	100	50	50	Very white, but finer grain.
3	100	25	50	Yellowish tint, hard, fine not malleable.
4	100	25	25	Brittle.
5	100	20	20	Brittle, hard, yellow.
6	100	16	16	Brittle, hard, yellow, close grained.

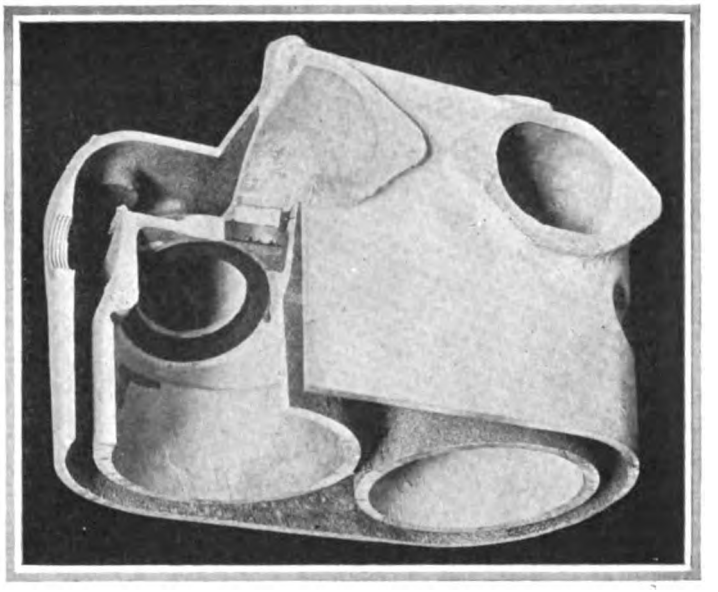
Sawn-up section of large aluminum motor for aeroplane work. The dark rings are the cast iron valve seats which were given a thin coat of copper before making the casting so that the aluminum and iron have become almost welded together



Another view of the section shown at the left of the accompanying illustration, showing uniform thickness of the walls of the casting both as regards the main bores and the jacket. The iron ring has a dove-tailed circumference

Aluminum Aeroplane Motor Casting

Close Contact Between Cast Iron Valve Seat Rings and Aluminum Body Shown in Sawn-Up Cylinders

A VERY large aluminum motor for aeroplane propulsion is about to be tried out by one of the leading engine manufacturers and the photograph hereunder shows the method of construction. There are to be two valves per cylinder, arranged in the head and operated, apparently, from long push rods.

The first casting made has been cut up in order to see how the cores had stood up and the remarkably interesting thing about it is the extraordinary close contact between the cast iron rings which will form the valve seats and the aluminum which retains them in place. Each ring is cut with a dove-tailed circumference and there are a few notches to guard against any tendency the ring might have to revolve while being machined. Before making the casting the iron rings are given a thin coat of copper and the sawn-up casting shows that the aluminum and iron have become almost welded together.

In examining the castings which are in pair form, it seems absurd to be able to pick up the block with one hand for the bore is about 5 in. and the stroke a good deal more than this. Very even thickness of wall is another striking feature of this casting, both as regards the main bores and the jacket.

Why Aluminum Means Economy

SIDNEY, OHIO.—Editor THE AUTOMOBILE:—The problem of eliminating weight in automobile construction is being considered very seriously. A number of engineers have already adopted the use of aluminum alloy to cut down weight. Pistons of this material are being used very successfully and cylinders should also be used of the same material.

If a motor 3⅛ by 4 or 4½ was constructed of aluminum alloy instead of the present material used in some motors, it would cut down the weight 75 lb., which would mean about 3% hp. more efficiency. Figuring that there are now 3,000,000 in use, it would make 11,002,050 lb. of unnecessary weight to be carried around, also figuring labor, machine work and cost of handling, the extra 75 lb. weight at 7 cents per pound would mean a loss to manufacturers of $787,500, besides a great many thousand dollars' worth of tires needed to carry this weight.

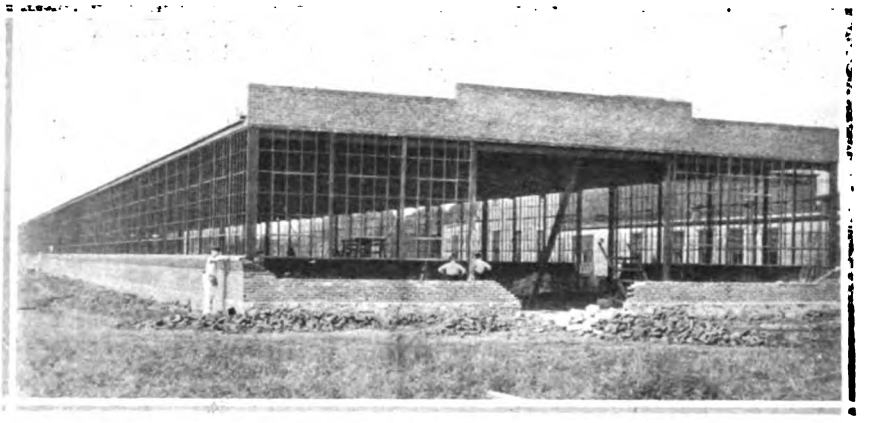
It is surprising to see how fast automobile engineers are progressing. Only a few years ago there were no motors built under a 4 by 4 and up. The speed of these cars would be about 32 to 40 miles per hour, and they would do about 16 miles on a gallon of gasoline. There are motors 2⅞ by 4½ that are able to make 35 to 45 miles per hour and 20 to 22 miles on a gallon of gasoline, in a car weighing 1700 to 1800 lb.

If we continue to progress in the future as in the past a great deal will be accomplished.—GEO. BAILEY, Superintendent Automobile Department, Bimel Buggy Co.

Automobiles for Scout Work in War

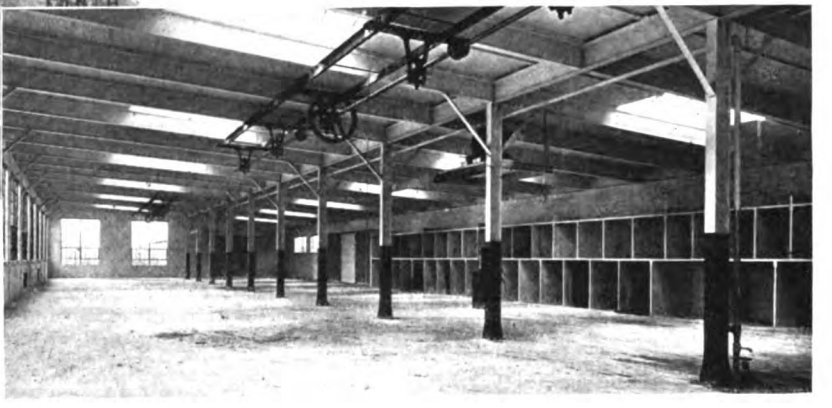
REPORTS from the battle front in Europe are to the effect that while aeroplanes are greatly used for scout work, automobiles are even more extensively employed in this capacity. Often these cars are equipped with portable stands which permit their occupants to elevate themselves to a considerable height above the surrounding territory and thus secure a wider horizon for their reconnoissance. Frequently the cars are driven into clumps of bushes or trees, which serve to screen the observers while at their work.

Three Factory Additions—Building a Speedway



The building illustrated above is the most recent addition to the factory of the Mercer Automobile Co., Trenton, N. J. This structure, which is of steel and glass construction, is now rapidly nearing completion and when it is finished will be used to house the paint and final assembly departments. The building measures 60 by 400 ft. and is one story in height, giving 24,000 sq. ft. of additional floorspace to the Mercer plant

Above — Five-story addition to the factory of the Federal Rubber Mfg. Co., Cudahy, Wis. The new building will add 50,000 sq. ft. to the manufacturing facilities of the Federal company. Most of this space will be devoted to the manufacture of automobile castings



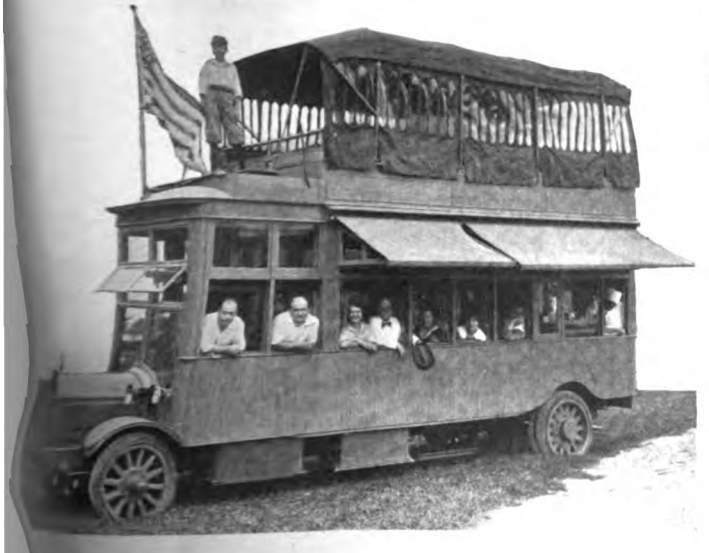
New assembly department of the Russel Motor Axle Co., North Detroit, Mich. This is 60 by 192 ft. and adds 11,000 sq. ft. to the Russel factory's floor space. The axles to be assembled in this building will be largely those of the internal gear drive type. This structure is designed to form one-half of a building which, when completed, will be 120 ft. wide. It is planned to complete this before the end of the year

Building the Twin City Motor Speedway. The illustration shows how the work of excavation and the grading and surfacing of the track are being carried on at the same time to facilitate the completion of the course. Note the grandstands under construction and nearly completed in the background. This course is near Minneapolis and St. Paul, Minn.

Dodge Bros. Artificial Test Hill, Sand Pit and Speedway

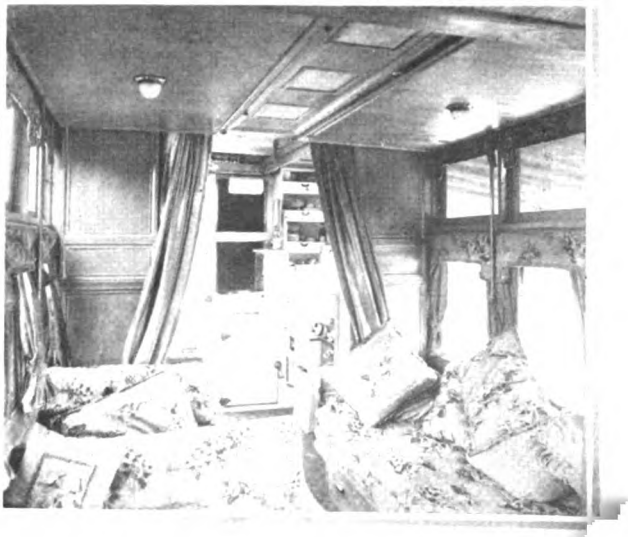
Dodge Bros., Detroit, Mich., have completed a ½-mile speedway, test hill and sand pit on the factory grounds for the purpose of keeping their test men off the public streets and roads. The hill is 542 ft. long by 30 ft. wide and has two approaches with varying grades. Over 215,000 ft. of lumber is used in the track, on which no pedestrians are allowed

Automobile Land Yacht on Way to Coast

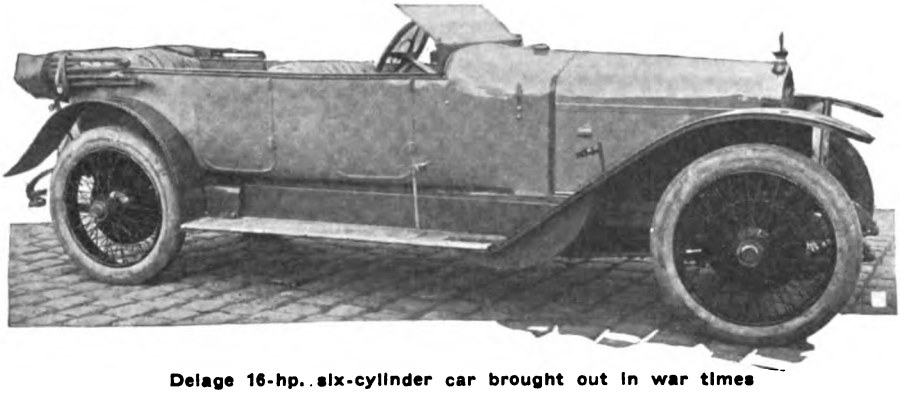


The above illustration shows the automobile land yacht, as its owner has it, built for Roland R. Conklin of New York and Huntington, L. I., which left last week on its way to San Francisco. As president of the New York Motor Bus Co., Mr. Conklin developed the idea of converting such a body and mounting it on an omnibus type chassis fitted with a 60 hp. motor. The machine, which is fitted with every possible convenience, is divided into three compartments; the forward one 5 ft. long containing the driver's seat, tank and crew's berths; the center compartment, illustrated at the right, is 10 ft. long and contains a bed-couch, two armchairs convertible into a bed and four berths which raise up to the ceiling when not in use; the kitchen is in the rear. Inside dimensions of the body are 21 ft. length, 7½ ft. width, and 6½ ft. height. Floors are of cork and a double gearbox giving nine speeds forward and three reverse is used

One of the new Beardsley electric roadsters manufactured in Los Angeles, Cal., which is claimed to do better than 30 m.p.h. and to be good for 85 to 100 miles per charge



Racing Influence in Delage Design



Delage 16-hp. six-cylinder car brought out in war times

New Six-Cylinder, 16-H.P. Has Front Wheel Brakes Double Carbureter and Exhaust Unusual Manifold

RACING experience has been very largely drawn on in the design and construction of the new six-cylinder 16-hp. Delage. The new model has been completed during the war period, and such arrangements have been made that as soon as hostilities come to a close the car will be manufactured in big series. At the present moment Delage, like all other European automobile manufacturers, is so occupied with war material that it is impossible to produce big quantities of touring cars. The car is the work of engineers who have made all the Delage racing cars for the last seven years. The object has been to embody all the lessons learned with small, high-efficiency motors, and at the same time produce a car of simple design capable of being handled efficiently by the ordinary motorist.

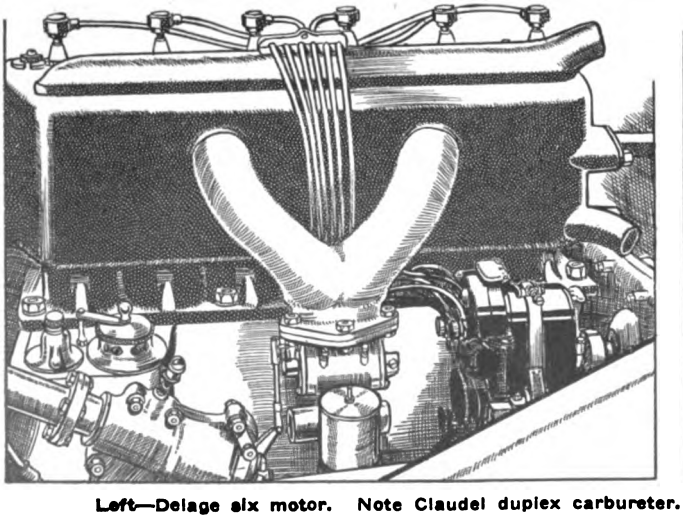
48 Hp. at 1800 R.P.M.

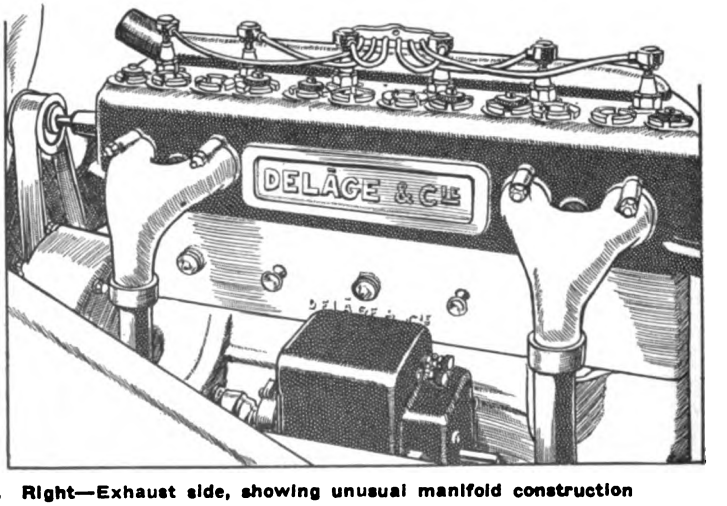
The cylinders measure 75 by 150 mm., 2.9 by 5.9 in. bore and stroke, giving a cubic capacity of 244 in. At 1800 revolutions the horsepower is 48; at 2100 revolutions 55 hp. is obtained. With a total weight of 4100 lb., the load being equivalent to an ordinary touring body and six passengers, the car has been tested to give an average of 68.9 m.p.h. over the measured kilometer. The tests were made over a 3-mile stretch of ordinary road, the run being made in both directions and the average taken, thus eliminating any advantage which may have accrued from wind or gradient. Fully equipped with touring body, spare wheel, windshield, fenders, headlights, top, and carrying five passengers, a test run of 140 miles was made at an average speed of 46.6 m.p.h. A similar test over more hilly country showed an average of 43 m.p.h. over a distance of 125 miles. These tests were made under ordinary touring conditions, on French roads, no allowance being made for examination of passes by military guards, grade crossings, or the passage through villages.

Externally the motor follows standard design, being a block casting with inclosed valves on one side. To get the best form of combustion chamber the valve stems are inclined outward, and the valve pocket is placed close up to the cylinder barrel. The crankshaft is carried in four plain bearings; pistons are steel forgings, unusually light, and fitted with two rings. Connecting-rods are I-section, machined over all. These cars are to be supplied complete with electric lighting and electric self-starting equipment. The electric generator is carried between the crankcase hangers, on left-hand side of motor, but sufficiently low not to interfere with accessibility of valve springs. The high-tension magneto and water pump are on the opposite side, the pump being ahead of the timing gear housing and the magneto to the rear of it. Non-adjustable silent chains are used for driving camshaft, magneto and generator. The electric motor is under the floorboards, engaging with external gear cut on flywheel.

Unusual Exhaust Manifold

Arrangement of exhaust manifold is somewhat unusual. There are four ports, to which a couple of branched manifolds are bolted, the exhaust pipes having a straight drop just ahead of the crankcase hangers. Delage claims to have overcome usual carbureter difficulties inherent to six-cylinder motors by the use of a double carbureter, as developed on racing models. The car is certainly remarkable for its rapid acceleration. The duplex carbureter is a Claudel production,





Left—Delage six motor. Note Claudel duplex carbureter. Right—Exhaust side, showing unusual manifold construction

uniting two carbureters with a common float chamber. The two tubes and jets are side by side, although independent, and have a common throttle. A Y-shaped intake manifold connects up the two portions of the carbureter with the two ports on right-hand side of motor, the gas passages being surrounded by the circulating water. This model marks Delage's conversion from thermo-syphon to pump so far as stock cars are concerned. Thermo-syphon, however, had never been used on Delage racers. Lubrication is pressure throughout, including direct feed up the connecting-rod to the wristpin.

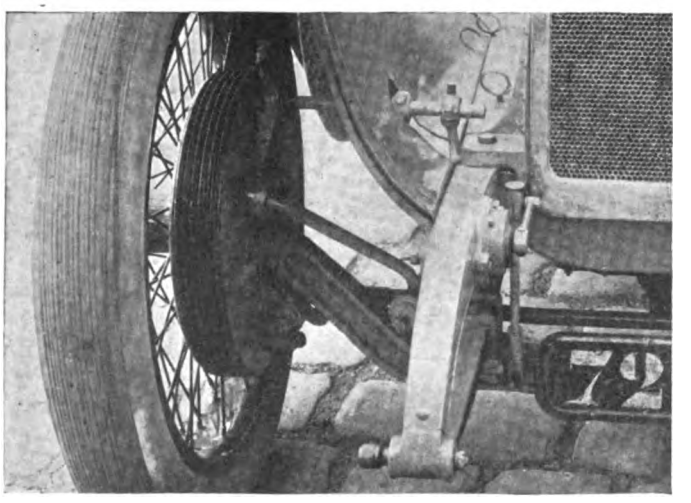
Motor and Gearbox Separate

In designing this new model Delage has decided against unit construction of motor and gearbox. He admits its apparent simplicity, but objects to its lack of balance, the weight being thrown too far forward except when a closed body or full load of passengers are carried. Motor and gearbox are thus separate, and carried on a subframe.

Leather-faced cone clutch has been abandoned in favor of plate clutch lined with Ferrodo. Gearbox is of same design as on racing cars, shafts being short and hollow and ball bearings used throughout. In final drive the only difference between this model and the racing cars is that the differential housing is cast steel instead of aluminum. The bevel driving pinion is supported in ball bearings front and rear, and the drive shafts are hollow. Drive is taken through the rear springs, which have a width of 2.5 in. and a length of 52 in. In the racing models rear springs are semi-elliptic; on the touring cars they are five-eighths elliptic; in each case they are underslung.

Front Wheel Brakes

Another innovation for which racing is responsible is the use of front wheel brakes. They are of exactly the same design as those on last year's Grand Prix racing models, when the hilly and winding nature of the course made braking an important factor. Brake drums are ribbed to assist cooling



Front wheel brakes on the new Delage, a racing adaptation

and are machined all over; shoes are aluminum, lined with Ferrodo. The pedal operates the road wheel brakes and the lever acts on the brake to rear of gearbox. Delage engineers are so satisfied with front wheel brakes, even in the hands of ordinary users, that it is possible the differential brake will be abolished. At present its only use is to hold the car when left on a gradient.

Aluminum Dashboard

An aluminum dashboard is fitted, with the gasoline tank bolted within it. This design makes the tank independent of any portion of the bodywork and facilitates the work of the coach builder. This model will be produced in three chassis lengths; ordinary for full touring car; extra long for closed bodies, and short for sporting type, this latter being sold with a guarantee of 65 m.p.h., but declared to be capable of much more.

Adjustable Stop on O'Kill Indicator

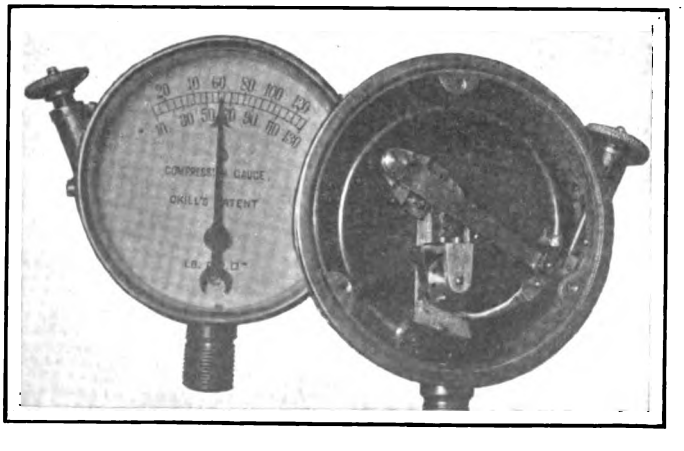
THE accompanying illustrations show an improvement on the O'Kill indicator embodying all the principles of the piston and spring pressure indicating device in that it is provided with an adjustable stop which eliminates all motion of parts and consequent inertia errors when the instrument is adjusted at the instant of taking a pressure reading.

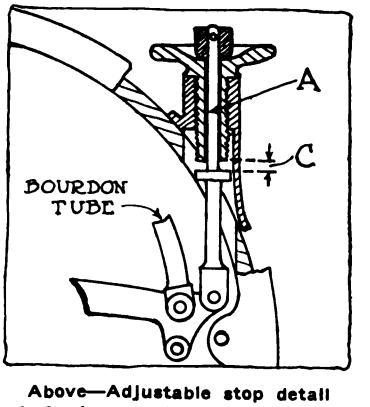
From the working diagram it will be noted that the end of the Bourdon tube is constrained to move in a definite path and the index finger can be made to travel over the entire face of the compression dial by rotating the milled nut shown at the side of the gage. Referring to the sectional drawing, the milled nut together with the rod A which slides through it, constitutes a double stop for the end of the Bourdon tube.

The small amount of clearance at C allows the tube end to move and to vibrate the index finger through a small arc when the gas pressure in the tube and motor cylinder is greater than the tension given to the tube by the milled nut. Thus when the gage is correctly adjusted on a running engine, the finger is at rest, all inertia effect being eliminated and no shaking of the needle is noticeable.

This dial gage, while not as yet placed on the market, neither in America nor abroad, is patented in this country under number 1,042,958; Oct. 29, 1912.

The O'Kill indicator, which was first described by Prof. W. C. Marshall in THE AUTOMOBILE for May 29, 1913, has been greatly improved and simplified in form since that time when it measured 7 in. in height with a maximum diameter of 2½ in., being entirely different in appearance from the up-to-date instrument illustrated herewith. The latest improvement described above, the adjustable stop, should prove a feature of added convenience.





Above—Adjustable stop detail

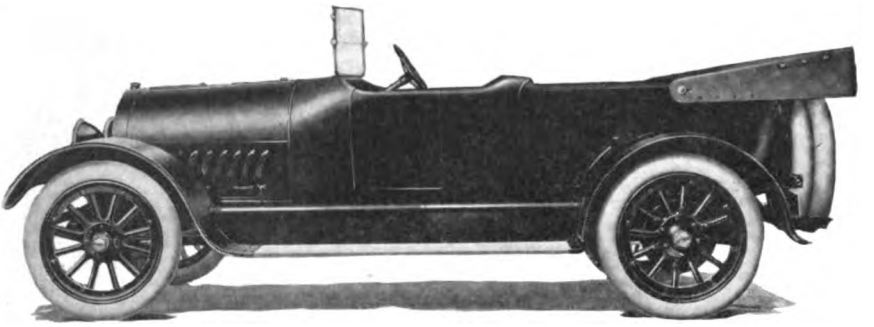
McFarlan Cars Larger for 1916

Single Chassis with Either 4½ by 6 or 4 by 6 Motor Is Continued—Price $90 Higher—New Spring Suspension —Aluminum-Alloy Pistons



Seven-passenger McFarlan for 1916 which sells, completely equipped, for $2,990 with a 4½ by 6 six-cylinder motor and at $2,680 when fitted with a 4 by 6 six-cylinder motor

BY the clever application of engineering skill the riding qualities, appearance, balance and speed of the McFarlan for 1916 have been greatly improved by the McFarlan Motor Car Co., Connorsville, Ind. While the policy of the concern of marketing one chassis with either a large or smaller six-cylinder motor installed is continued, there have been some material changes of unusual interest and of such a nature as to cause the unfamiliar motorist to pronounce the 1916 model entirely new. Because of the very nature of the alterations, a price increase has been made necessary, and now the large McFarlan, which is equipped with a 4½ by 6 motor, is listed at $2,990 instead of $2,900, and the smaller model, the same in every respect with the exception of the motor size, which is 4 by 6, is listed at $2,680, an increase of $90 over the former model.

Flat Cantilever Suspension

While the motor is more powerful because of changes in the interior, and while there have been changes made in the drive and body, that of utmost importance is the new form of rear spring suspension which almost approaches in design that used by the English Rolls-Royce. In the McFarlan, cantilever springs are used, but instead of these being arched they are perfectly flat and further are shackled at both ends. They take no drive and torque stresses and hence the double shackling is possible. In the Rolls-Royce the flat spring is used, but the rear portion is under the axle and operates between rollers, while in the McFarlan the spring is fastened on top of the axle housing and uses a shackle for play instead of the rollers.

This form of suspension allows the springs to be flat under normal load, and an exceptionally easy riding car is obtained because of the comparatively slow return after the wheels have encountered an obstruction. Furtherance of the easy riding is also obtained by making the springs long and wide, the dimensions being 58 in. and 3 in. There are fourteen leaves.

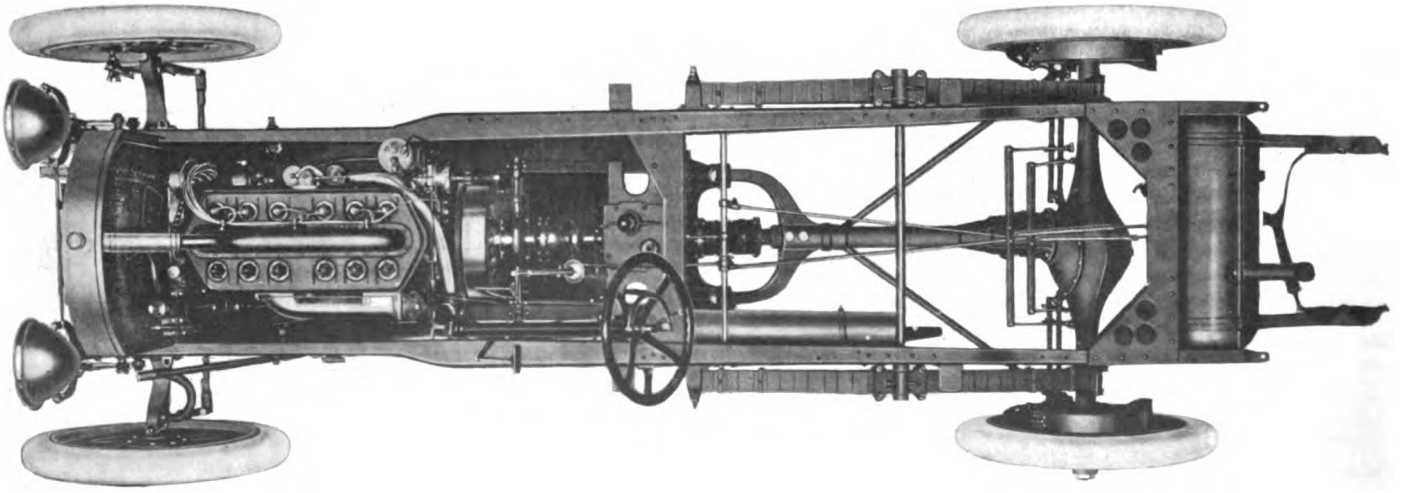
Frame Is Stronger

As in all cases where a cantilever supplants a three-quarter elliptic, frame strengthening is necessary, and in the McFarlan a reinforcement has been placed along the line extending from the front shackle to the oscillating point. The pin here upon which the spring is fulcrumed is of 1¼ in. diameter and extends across the frame.

With the new spring suspension there has been a better all-round balance obtained by removing the gearest from the rear axle and placing it amidships upon a sub-frame and at the same time bringing the motor down to rest upon this sub-frame instead of in the regular frame channels. A general stiffening of the whole assembly has been brought about by this re-arrangement of units and in conjunction with the new cantilevers give a car which is extremely free from air riding, that is the wheels stick to the ground even in rough going. Riding qualities have been improved two-fold over the previous model with the three-quarter suspension.

Aluminum Alloy Pistons

The motor still is a T-head design with block cast cylinders, but its speed capabilities have been increased to some degree



Plan view of McFarlan six chassis for 1916, showing new flat cantilever spring suspension. Note cross rod to insure strength

because of the fitting of aluminum-alloy pistons instead of cast iron and lighter rods, although the latter have the same section. Just what maximum speed now is obtainable is yet an uncertainty, but one will not be far from correct by saying a good one-third greater speed is possible.

Now that the r.p.m. is greater than before, it has been thought advisable to install a plunger pump, driven from the exhaust camshaft, this pump forcing oil directly to the four main bearings. The pistons and cylinders are lubricated by constant-level splash as before. The carbureter still is a Stromberg and the feed as before by a short manifold to the valves. These are 2 in. in the clear and have cast-iron heads.

Cranking Motor on Right

While the cranking, lighting and ignition system remains of Westinghouse make, there have been changes in location, the cranking motor now being on the right side instead of the left and turning the engine over by means of a toothed flywheel instead of through a train of gears connecting with the crankshaft at the forward end. It also is lower than in the 1915 model.

The combination generator and ignition apparatus is on the left as before, but it is lower so as to offer less restriction in making valve tappet adjustments and stands slightly further away from the motor. The latter change has been necessary because the water pump formerly an integral part of the crankcase now is a separate unit driven directly from the timing gears. Pump capacity is 10 per cent greater than in 1915.

The separation of the pump as a portion of the case has been done to make replacement easy, in the remote event that is necessary. The water pump shaft continues to drive a two-cylinder O. B. air pump.

Aluminum Cone Clutch

In the cone clutch there has been but one alteration, a change from a pressed-steel cone to one of cast-aluminum. The clutch is a leather-faced type of 14 in. diameter and 4 in. face with twelve flat springs under the leather. Now that there has been a weight reduction in the cone there is a lower turning momentum and hence less chance for spinning with its consequent harsh gear changing.

Propeller Shaft Inclosed

The gearset, which as previously stated, is amidships on a sub-frame, is a Brown-Lipe using ball bearings instead of rollers and a squared shaft of 1⅝ in. diameter, making it lower than before. It uses a four-point mounting and drives an inclosed propeller shaft, the tube having a wide-flared end as before. This tube, braced by rods running to the axle housing, takes both drive and torque.

Axle Knuckles Castered

There is only one other mechanical change of importance and that is the front axle knuckles are castered slightly as against being straight as used in 1915. This has helped to make the front wheels hold to the ground.

The wheelbase still is 132 in., but the tires fitted now are Firestone cords 36 by 4½ in.

A visit to the McFarlan factory is convincing evidence that the concern makes a detail study of body design. A large portion of the factory is devoted to the building of all types, including special creations which many buyers consider, together with those which the company uses as stock equipment.

Other Body Lines

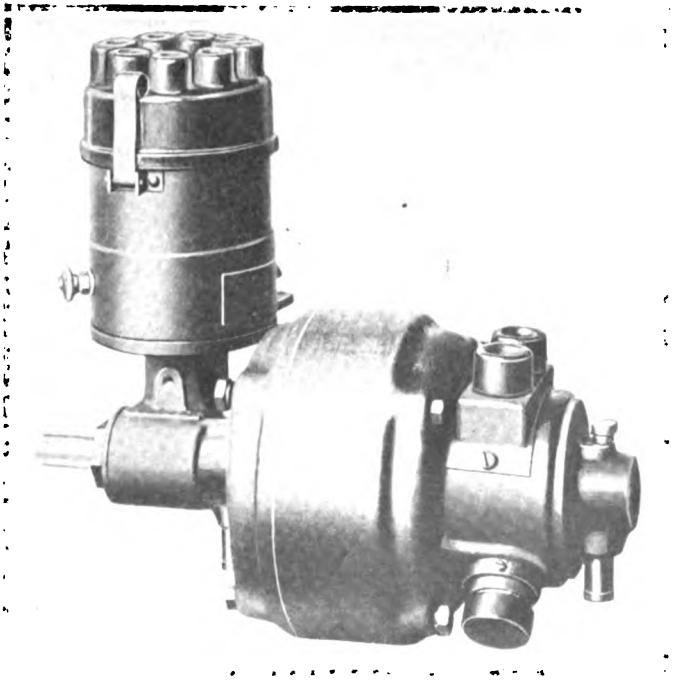
The standard body for 1916 is a seven-passenger design, showing detail improvement over the previous design, this being especially true of the front portion. While the body still is a double-cowl design, it is hung lower than before and has a better rounding out of the cowl and hood. This has been helped by widening the cowl, and by raising it the leg room in front has been increased. The rounded front has called for a new design of radiator and windshield, both of which harmonize better with the rest of the design. The upholstery has a wider piping, but is of the same material as before.

McFarlan Cubist roadster, a new body type for 1916

Westinghouse Ignition for Eights

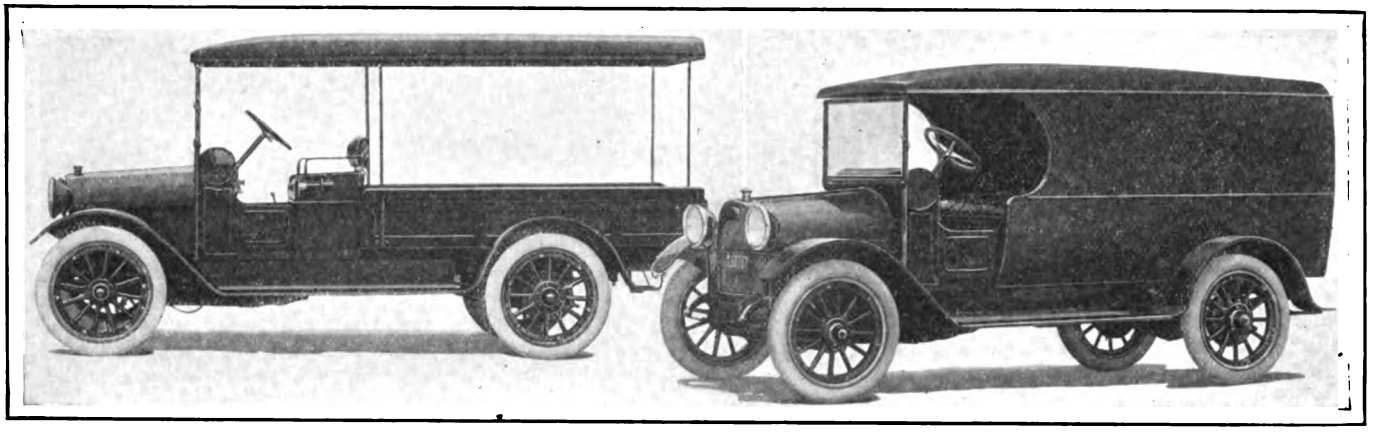
To accommodate the needs of eight-cylinder motors, the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., has brought out a distributer to suit its vertical type of ignition and which will provide current for an eight-cylinder motor. The outfit comprises a vertical ignition unit, an ignition switch, a ballast resister and the battery. These equipments are made to operate on a 6 or 12-volt circuit and are suitable for four, six or eight cylinders.

The Westinghouse vertical ignition unit is made up of four essential parts, namely: the interrupter, the condenser, the induction coil and the distributer, contained in one housing. The ignition switch is a simple single pole; the ballast resistor, which is part of the equipment, is in series with the primary circuit. Its use prevents burning of the contact points. Any standard make of battery may be used.



Westinghouse vertical ignition unit mounted on lighting generator for eight-cylinder cars

Electric System on Reo ¾-Ton Truck



The new Reo ¾-ton delivery wagon with open express body

The same chassis equipped with full panel delivery body

THE Reo Motor Truck Co., Lansing, Mich., has brought out a ¾-ton delivery car having a normal capacity of 1500 lb. and a maximum capacity including the weight of the body of 1800 lb. It is designed to run at a speed of 22 m.p.h. and is mounted on a 120-in. wheelbase with standard 56-in. tread.

The price of the complete truck with the standard express body and canopy top is $1,075 f.o.b. Lansing and for the chassis only, including the equipment but minus the express body, driver's seat, canopy top, windshield, is $1,000 f.o.b. Lansing.

Motor 4⅛ by 4½

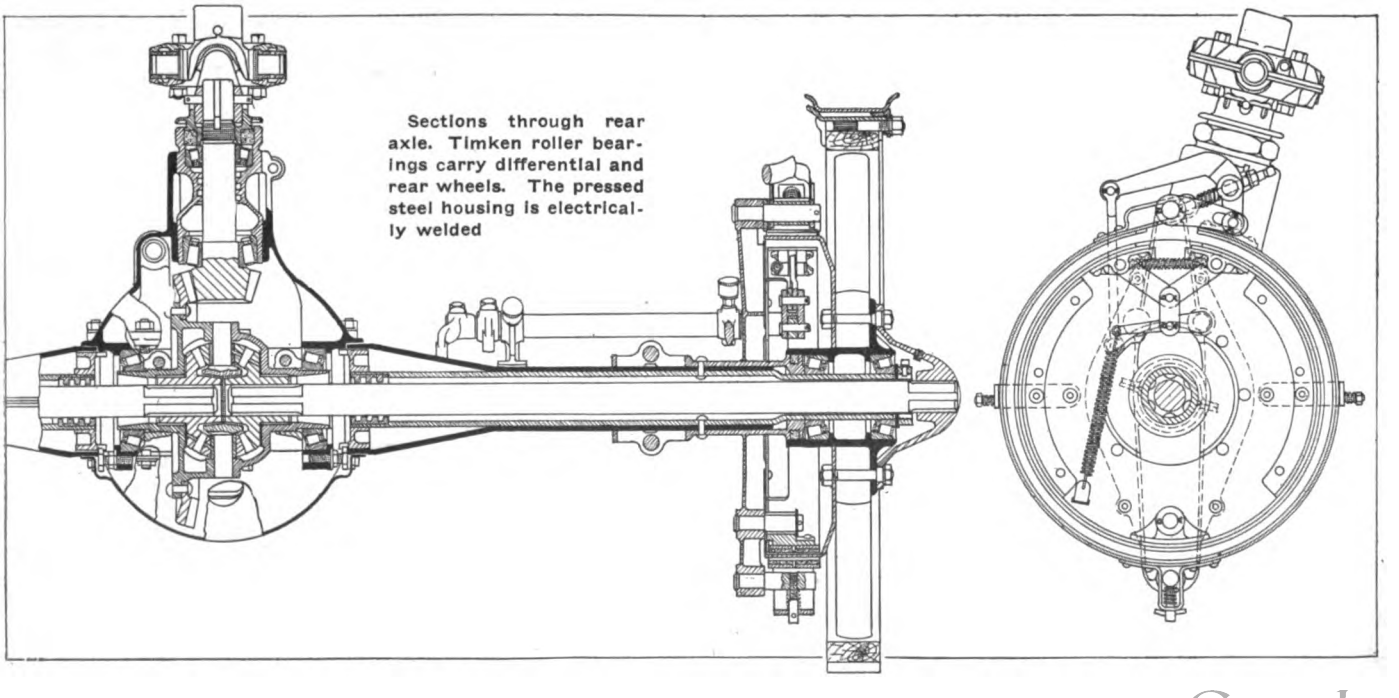
The motor has a nominal rating of 35 hp. It is a pair-cast 4⅛ by 4½ four having the heads integral. The valves are the conventional 45-deg. poppet, having a clear diameter of 1¾ in. The inlet valves are mounted in the head and the exhaust on the side. The pistons are of gray cast iron provided with two three-piece rings delivering the drive to I-section drop-forged connecting-rods 9½ in. long with 1¼ by 2¼-in. bearings lined with babbitt. The crankshaft is a drop forging from manganese steel, heat treated and ground to size. The main bearings are lined with nickel babbitt, each 1½ in. in diameter with a 2¾ length in front and center and 4 in. long in rear. These bearings are adjustable from the exterior of the crankcase. The camshaft carries the cams forged integrally running in die-cast bearings. The timing gears are helical.

Oiling is combination force-feed and splash. The reservoir is in the crankcase bottom and feed is by a plunger pump under pressure to the main bearings and timing gears. The cylinders are lubricated by splash.

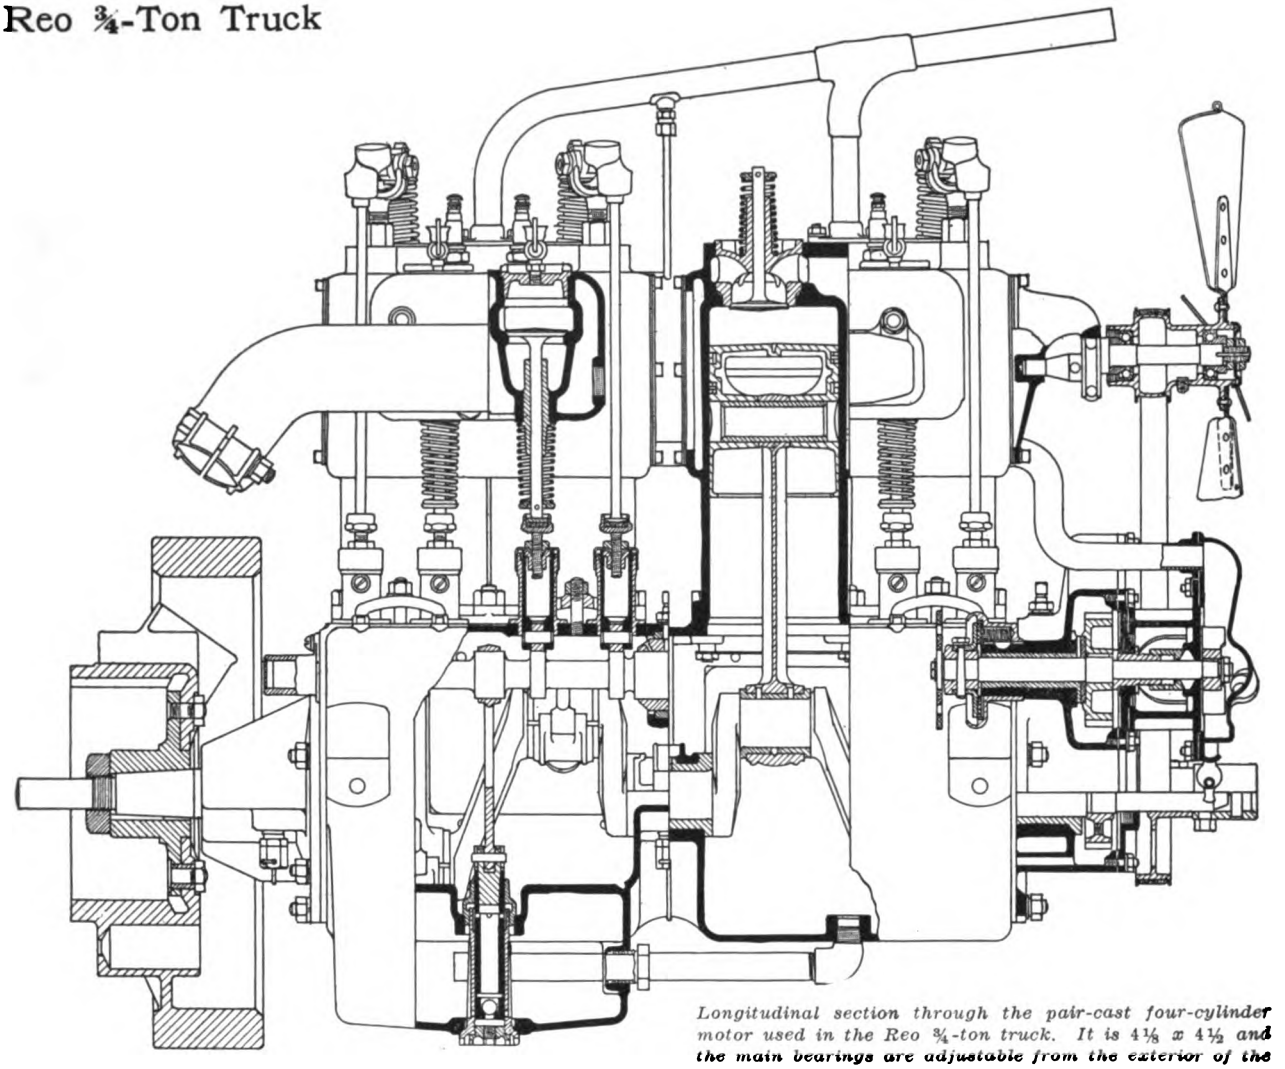
Carburetion is by a Johnson float-feed automatic water-jacketed carbureter fitted with an air intake connected with a stove on the exhaust and provided with dash air control.

Ignition is provided by a Remy generator, which also furnishes current to the storage battery for lighting and starting. The entire electric system is operated at 6 volts and is a two-unit device with the starting motor mounted over the front end of the gearset. The car has head lamps with dimmers and also an instrument and tail lamp.

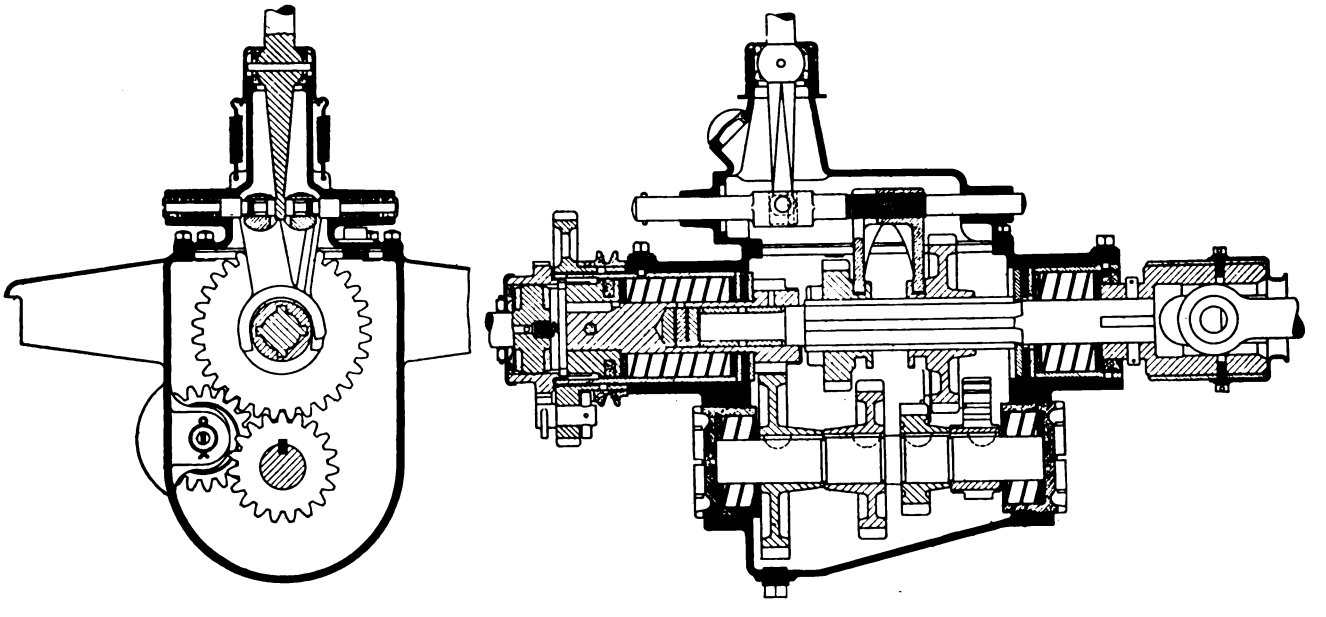
From the motor the drive is taken through a thirteen-plate dry-disk clutch through a three-speed sliding selective gearset provided with case-hardened gears having ⅞-in. face width. The axle ratio is 4 to 1 on high speed, 7.2 to 1 on second and 14.8 to 1 on low.



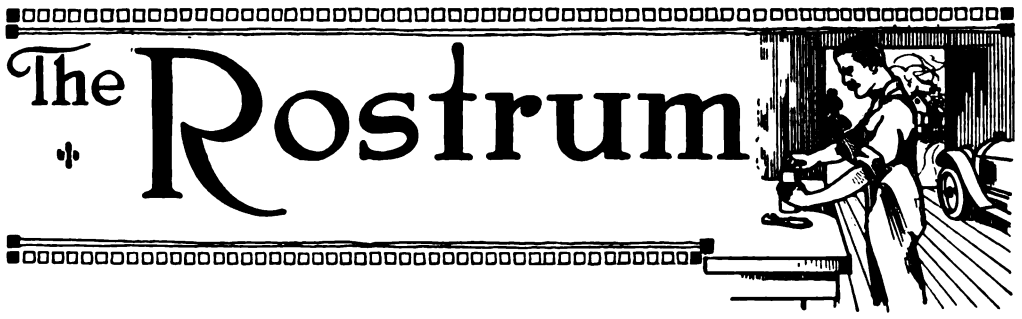
Reo ¾-Ton Truck



Longitudinal section through the pair-cast four-cylinder motor used in the Reo ¾-ton truck. It is 4⅛ x 4½ and the main bearings are adjustable from the exterior of the crankcase



The three-speed selective gearset is carried throughout on roller bearings and is arranged to provide center control, being mounted amidship on a subframe. The gears are case-hardened and have a ⅞-in. face width



Suggests Wider Turns at Corners

EDITOR THE AUTOMOBILE:—At most street intersections the radius of the curb at the street corner is such that a motorist desiring to turn the corner finds it impossible to describe an arc of turn that will enable him to maintain a moderate rate of speed and still keep his machine on the proper side of the pavement while turning into the cross street. The radius of the curb curve is usually but little over a foot, hence the driver cannot commence to turn until he has practically passed the corner. Increasing the radius of the corner curve up to, say, 12 or 14 ft., will permit most types of cars to turn a corner at the same distance from the curb as when driving down the street.

Changes such as suggested by the accompanying sketch, Fig. 1, have been made at several street intersections in Chicago, notably at Lincoln Parkway and Diversey Boulevard, and at Devon and Evanston Avenues.

How materially the possibilities of making the desired turn within the proper confines are facilitated will be seen by referring to the sketch. The double dotted lines show the curb at the usual street corner, while the double solid lines back of these illustrate what has been accomplished at the two localities mentioned—the change at Lincoln Parkway and Diversey Boulevard being shown in an accompanying photograph.

Without such construction a driver following the line *A* in the direction noted by the arrow, and turning into the intersecting street, would have to cross its center line and could not pass two cars coming toward him as indicated by the arrows *B*. Increasing the radius of the curve, as shown by the solid lines, permits the driver to follow the arc of the curb and thus keep to the right of the center line of the street where he properly belongs. This is clearly illustrated by the line *C*.

Such an improvement is particularly desirable on boulevards or where other streets intersect with boulevards. It is likewise desirable at intersections of narrow streets. This subject deserves the attention of engineers in charge of street improvements, and the practice suggested should be universally adopted, if for no other reason than to increase safety.

Chicago, Ill. W. M. V.

Battery Voltage Determines Circuit Voltage

Editor THE AUTOMOBILE:—I have a 1914 Case 25 which has a Westinghouse electric system and storage battery. My battery is out of order and I want to have it adjusted. Will I have to disconnect my generator or can I connect the generator to the lights without harming the generator or lights?

2—If I can use the generator without the battery, please give a diagram of how this can be done.

Geren, Miss. P. P. M.

—The winding of this generator is such that the series and shunt fields oppose one another with the values so proportioned that with the battery connected in circuit the charging rate is determined by the specific gravity of the electrolyte in the battery and the car speed in m.p.h. The battery voltage determines the voltage of the entire electrical circuit. If the battery were to be removed this voltage would attain a very high value approximating 28 to 30 volts since the differential effect of the field winders cannot be obtained unless current is flowing through the series field to the battery.

It is suggested that you use another battery while the present one is being repaired in case you desire to drive at night, and if you desire to drive only in the daytime successful operation may be secured by withdrawing one brush from the brush holder. If you do this you should take great care to replace the brush in exactly the same manner as it is removed after your battery has been reinstalled.

2—This question is answered in the preceding paragraph.

Information on Owen Magnetic Car

Editor THE AUTOMOBILE:—In a recent issue of THE AUTOMOBILE I read an explanation and description of the Owen Magnetic car. I would like to know where this car is built and by whom, as we are very much interested.

Quincy, Ill. EDGAR J. R.

The Owen Magnetic chassis was described in THE AUTOMOBILE for July 15, page 102. It is manufactured by the Owen Magnetic Car Co., 1760 Broadway, New York City.

Twelves Are Small But Powerful

Editor THE AUTOMOBILE:—Who builds the new Fiat radiator?

2—Who built the 1913 Regal including the frame?

3—Who manufactures the Weidely motor?

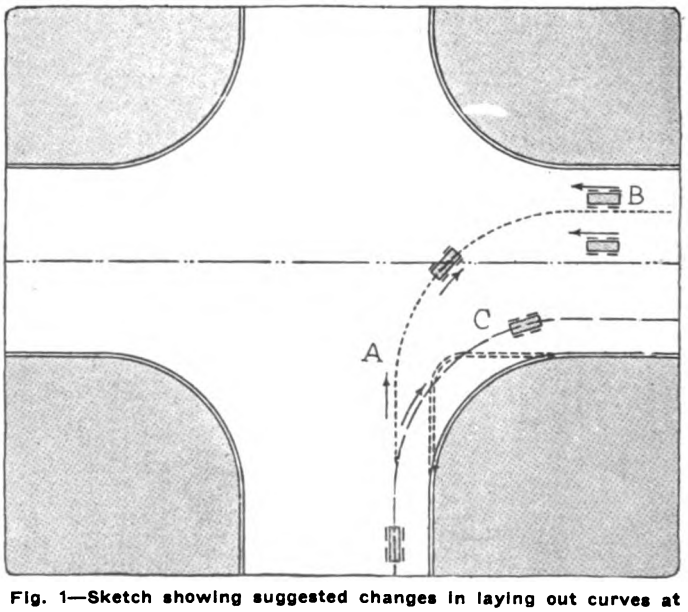


Fig. 1—Sketch showing suggested changes in laying out curves at street corners

Proper curb radius to allow of turn at medium speed

Improper radius which causes vehicles to swing to the wrong side

—What company manufactures hoods for the Fiat and Singer respectively?

—Has any motor builder yet brought out a small, light twin-six motor?

—How many small eight-cylinder engines are there, and who builds them?

Bridgeport, Conn. W. J. B.

—The makers of the Fiat radiator are known only to the Fiat Co. and to these makers as the information is held confidential by them.

—The 1913 Regal car was built practically entirely by specializing concerns and assembled by the Regal Motor Car Co. at Detroit. The frames were manufactured by the A. O. Smith Co., Milwaukee, Wis., from Regal dies.

—The Weidely motor is manufactured by the Weidely Motor Co., Indianapolis, Ind.

—The Fiat hood is manufactured by the Fiat Co., Poughkeepsie, N. Y., and the Singer by the Singer Motor Car Co., Long Island City, N. Y.

—The twin-six motors announced this season have all been of the small and light variety. It must be remembered that even with a small horsepower per cylinder a twelve-cylinder motor would be very powerful. For instance, if each cylinder were capable of developing only 4 hp. a twelve-cylinder motor of this size would have 48 horsepower. By small eight-cylinder motors it is difficult to know what you mean as all of the eights so far as small bore, long stroke, high speed designs with small piston displacement considering the number of cylinders. Some of the later cars such as the Briscoe are using eight-cylinder units, however, which are quite small and these are manufactured by motor specialists. Eight-cylinder motors in small size can now be purchased from any of the larger motor manufacturers.

Referee Can Disqualify for Smoke

Editor THE AUTOMOBILE:—The Galax, Va., Fair Assn., is planning an automobile race during the County fair, Sept. 1, 2 and 3.

If there is a set of rules for sale will you please give me the name and address of the company who can furnish this to me? Would thank you if you would tell me whether a car should be ruled off the track on account of the engine emitting too much smoke, and if a driver should be put off the track for cutting across in front of the car that was about to pass.

Mt. Airy, N. C. C. O. S.

You can secure a set of rules from the American Automobile Association, 437 Fifth Ave., New York. This association has charge of all the sanctioned races held in this country and its rules are followed in all the official races. According to the rules of the A. A. A. a car can be ruled off the track by the referee if in any way it endangers the safety of other contestants or spectators. Should a car be smoking to such an extent as to fall under this head it could certainly be ruled off the track. A driver who cuts in front of another trying to pass him is certainly acting in a way which should merit disqualification and it would be the duty of the referee to disqualify him.

Improper Gear Adjustment Causes Hum

Editor THE AUTOMOBILE:—Kindly advise me how I can eliminate a noise occurring in the differential on a Mitchell 1914 car model A.

Would like to know how to adjust this so that I will not have to buy a new gear.

Westville, Conn. A. R.

—The only adjustment of the rear axle gears necessary is to obtain the proper mesh of the two driving gears. If these gears get out of proper adjustment there will be an excessive humming noise in the rear axle.

To adjust the gears remove the plate at the top rear of driveshaft housing. Turn the adjusting collar by placing a tool in one of the small holes through the collar, turning the collar to the right meshes the gears tighter. It is a very good plan to make this adjustment while driving the car on a smooth road. Adjustments can easily be reached by removing the floorboard in the tonneau.

Sandpaper Leaves Commutator Mica High

Editor THE AUTOMOBILE:—I have had trouble with my Rushmore generator. The ammeter shows only a slight current. After I clean off the commutator with sandpaper it seems to work all right for a short time, but very soon the old trouble sets in. Have had the car in a shop undergoing the same treatment for this trouble, but with no success.

San Francisco, Cal. C. P. GRIFFIN.

—The difficulty which you are having is no doubt due to a rough commutator. Cleaning with sandpaper while it cleans the bars of the commutator, will leave the mica high, with the result that the brushes make imperfect contact and the commutator bars soon burn black. The only way to correct this trouble is to remove the armature and have the commutator turned down in a lathe. There is also a possibility that the brushes which you are using are too soft.

Economic Causes of the War Traced to Mushroom Growth of German Industries

Picture of Teuton States as One Vast Money-Making Trust Whose Suction Tentacles Circle the Earth

A Lecture by Henri Hauser, Professor at the University of Dijon and Correspondent of the Institut de France, reported by A. Dumas, Editor of Le Génie Civil

CONTRARY to the common opinion that the war is solely due to the military party, Professor Hauser shows clearly that it was through an excessive and especially a too rapid development of the industries and commerce of Germany that the war became if not a necessity for her government at least such a favorable prospect that the temptation of resorting to it could not be resisted. In the unanimous enthusiasm, he says, with which this people greeted the bloody dawn of armed conflict the voices of the commercial and industrial classes were not the least clamorous. Financiers, factory managers and even workingmen figured in the front ranks among the defenders of imperialism.

The economic causes played a predominating part in the explosion of July, 1914. It is perhaps not true, as has been so frequently contended, that Germany was menaced with overpopulation and stood in urgent need of colonies. But it is not, in fact, necessary to know if Germany was really choking. She thought she was choking and acted in a haunting fear of constrictive forces whose hold she wanted to break at any cost. Mr. Hauser undertakes to explain this "pathological phenomenon of collective psychology."

I—Evolution of the German Industries

What strikes one first of all in the evolution of the German industries is the real grandeur of the phenomenon. There is something impressive in the spectacle of this people which forty years ago scarcely counted in the geography of world economics and which just before this war had managed to become one of the great forces. With a foreign commerce amounting to nearly 5,000 million dollars in volume it ranked second among commercial people, following England. It had become second in the production of castings and of iron, beating England, second also in the production of steel. Its merchant marine, which was inferior to ours [the French] in 1870, was outclassed in 1913 only by those of England and the United States.

Genius for Organization

We have admired all of that. Should we, because Germany has now dishonored herself by crimes, deny our previous admirations? No, for us Frenchmen the truth remains always the truth. It is therefore not difficult for us to recognize that the German people have given proof of remarkable qualities since the foundation of the Empire. The leading quality was a determined enthusiasm for work, not a feverish spell which raises mountains in a few days but the tenacious patient labor of every day, regular and systematic. Ostwald is right when he attributes to the Germans the sense and the spirit for organization. They have brought to perfection the art of utilizing men, of putting each in his place, of getting the maximum performance from every individual. If the genius for great discoveries seems to have deserted their soil of late years, they are past masters in the industrial application of scientific discoveries. As has been often said, it is the union of the laboratory and the workshop which has created the German wealth.

Next to the union of shop and laboratory there should be mentioned the utilization by commercial managers of the research work of economists, geographers and historians. For the methods which they applied to the production of a new aniline color they also brought to bear on the search for markets and on the organization of trade channels. The German chemist and the German commercial traveler marched at the same gait to accomplish the conquest of the earth.

Leap from Poverty to Wealth

The rapidity of the German evolution has been almost catastrophic. From the complex of agricultural states sprinkled with industrial spots which comprised the *Zollverein* (customs union) in 1870 the industrial Empire has risen in a few years by a sort of historical face-about without any of that slow secular preparation which characterizes for example the English growth of power. Industrial Germany is a consummation in which Time has no share. Among the captains of industry, as nearly everywhere in modern Germany, the upstart abounds.

The following facts illustrate this industrial development: In 1893 the consumption of pig iron per capita did not quite reach 99 kilograms per year; in 1899 it was 155. The coal consumption passed from 1940 to 2740 kilograms. During the same time the production of iron and castings climbed from less than 5 million tons to more than 8; that of charcoal from 95 millions to 136. The increase of production was so intense during this period that it seemed unsound, and the great commercial crisis of 1901 had to be weathered. But the poor country had become, of a sudden, a very rich country. In 1895 the income from the fortunes of the Empire was estimated at somewhat above 4,000 million dollars; in 1913 the corresponding valuations fluctuated from 8,000 to 10,000 millions, and German wealth was estimated at 64,000 millions, of which nearly 2,000 millions was deposited in commercial banks and 3,600 millions in savings banks. These were the figures to which Dr. Helfferich, director of the *Deutsche Bank* and now Prussian minister of finance, pointed with pride on the occasion of the twenty-fifth anniversary in the reign of William II.

(Other figures from the *Journal de Génève* of Aug. 1, 1915, give an idea of the enormous increase in the commercial operations of Germany which has taken place during the past few years. The imports and exports of merchandise and precious metals were as follows, in round millions of dollars:

	Imports.	Exports.
1909	1771	1371
1911	2001	1645
1913	2241	2040

Adding the figures for imports and exports one obtains a trade volume for 1909 of 3,142 million dollars and for 1913

the sum of 4,281 million dollars, being an increase during these four years of 1,139 millions or more than 40 per cent.

Other figures are given by Edmond Thery and show that in ten years from 1903 to 1913 the volume of the foreign commerce of Germany passed from 2,863 to 5,217 million dollars, an increase of 82 per cent).

This sudden growth of German wealth has had the gravest influence upon the living conditions of the German people. The two most notable effects have been the gradual disappearance of the rural class and the sudden stopping of emigration.

Scarcity of Farm Labor

No conception could be more false than that of Germany as an overpopulated country. While the population has grown since 1871 from 40 to 70 millions and 800,000 new Germans see the light of day every year (despite a decreasing birth rate), this increase cannot be considered excessive, as 700,000 Slav laborers are engaged every year to work the large Eastern estates and large numbers of Italian, Croatian and Polish workmen are in demand for the mines and various enterprises in the cities.

The German emigration exceeded 200,000 annually from 1880 to 1883 but has now dwindled to 20,000, or about the same as the French.

There is, to be sure, a German migration, but it is interior, from the country to the towns, from the plough to the industries. Since 1895 the rural population has been less than half of the total; it is now 44 per cent. Out of 67 million Germans barely 17 millions are farmers or derive their living from agriculture. An enormous number of peasants quit the soil every year and find work in the colossal factories. This has brought the number of towns with more than 100,000 inhabitants to at least 45 and accounts for the armies of workingmen at disposal for the large concerns. The Mannesmann shops employ 15,000, Thyssen more than 30,000 and the Krupp works 73,000, almost two army corps. Germany has passed definitely from the type of the agrarian state to that of the industrial state.

II—The Needs of the Industrial State

Now, the industrial state has needs and exigencies which the agricultural state has not. The latter lives on itself and for itself, and it can live on itself. The industrial state is by nature "tentacular," to use Lamprecht's term, being specially founded upon the importation of commodities and raw materials and on the export of the manufactured products. It requires first of all the importation of foodstuffs. It is calculated that about 20 million Germans out of 67 millions depend for their nourishment upon foreign harvests and foreign cattle. The industrial state has need of certain materials which are either not produced at all within her boundaries, as in this case for example cotton, or which exist there only in insufficient quantity, as for example iron. By reason of the enormous development of its iron and steel industries the German Empire, while remaining rich in fuels, depends for its ore in ever increasing degree upon Sweden, Spain, North Africa and France. It is this fact which explains her ardent lustfulness for the Briey valley.

Cotton in bales represents the largest single import article of the Germans, amounting in value to more than $125,000,000. The cotton industry employs more than 1,500,000 workers and turns out goods valued at over $250,000,000.

Credits in Place of Capital

The industrial state needs capital and though Germany has become prodigiously rich the German industries remain terrible gluttons for capital. They absorb it as fast as it can be provided, to use it in building new works and replacing old machine tools. In the formidable battle in which Germany has engaged herself she is condemned to gain victories every day, for any defeat and in fact any let-up would be mortal. She swallows new capital before it is born, so to say, since she anticipates it through credit. Corporations with imposing capitals which lean on the industrial banks, the latter drawing upon the central banks and especially on the *Deutsche Bank*, and these large banks in turn absorbing all the country's available wealth and to some extent foreign capital as well—all this is a marvelous financial edifice but frail. The very denials of German financiers prove that the influx of foreign money is not negligible.

Socialists Turned Imperialists

Further, Germany needs customers even more than capital. Despite its increase in numbers, its rapidly growing wealth and taste for high living the German people is incapable of digesting all of the enormous production of German factories. It must more and more be sold abroad.

Everything conspires thus to turn Germany into a Tentacle State, to make it push its trade into all corners of the world. The country's financial staff must have recourse to world politics to replenish its capitals, to pay the wages of its workers; the proletariat depends upon them in order to have steady work and to satisfy its growing wants. Therefore the German socialism has become imperialistic.

III—Industry and World Politics

Among the means for developing exports the leading one is the system of bounties. Since the German industry must work more for the foreign than for the home trade, it is logical to sell at low prices abroad, sometimes even to sell at a loss, in order to gain new outlets and discourage all competitors. Thanks to the grouping in *Kartells* (trusts) of the principal economical forces, nothing is easier. In 1902 the coke syndicate forced the German consumer to pay 15 marks per ton at the same time as it conceded the price of 11 marks on large foreign sales. In the latter half of 1900 the wire syndicate made sales abroad at 14 marks per 100 kilograms while the home price was 25. It lost 859,000 marks on the foreign turn-over but made a profit at home of 1,177,000 marks. The difference was net gain. But in this instance, for that matter, the trick was overdone, for speculators managed to buy back the German wire abroad and to resell it in Germany with profit.

The Precarious Treaty System

The bounty system is supplemented by that of commercial treaties which favor the entry abroad of commodities and travelers and which secure a moderation of the customs tariff for German products. Such was the tenor of the German-Russian treaty of 1904, which tended to turn Russia into an economic colony of Germany. In the interior politics it is the avowed object of these treaties "to compensate by means of increased wages for the increased cost of foodstuffs" or, in other words to maintain the balance of interests between the industrial population of the West and the agrarian population of the East.

Hungry for Iron

To fend off an iron famine it was necessary to secure control of new ore deposits, and for this purpose numerous German corporations, more or less disguised, acquired mining properties in the Briey basin [the principal iron mining region of northern France, now occupied by the German army]. Thyssen, the great German iron king, not only installed himself there but sent his prospectors as far as Diélette, near Cherbourg, to search for ore—even under the sea—and he contributed to the erection of the ore smelters at Caen. He finds the double advantage in these operations of securing our ore and of selling us coke—an advantage in which, however, the French operators are also beneficiaries.

With iron from Lorraine and Normandy and the coal of Westphalia under control, Germany can dominate the world, says Mr. Hauser. And to assure such domination it is of importance to remove all competition, to install the German

industry in the very heart of rival countries. The extraordinary manipulations by which the German operators worked themselves into French chemical and electrical works were described before the war began. At Neuville-sur-Saône it was the *Badische Anilin und Soda Fabrik* of Ludwigshafen which under a French name furnished alizarine for dyeing French miltary trousers red, and perhaps the same company moreover inspired the press campaign in favor of this dangerous military color which was conducted with a grand display of sentimental argumentation. What else was the *Compagnie parisienne des couleurs d'aniline* but a branch of Meister, Lucius & Brüning of Hoechst? It has been told how a Darmstadt company manufacturing pharmaceutic preparations came to Montereau to establish a branch factory and kill a similar French factory which had been established there, and how the *Allgemeine Electricitäts Gesellschaft* pounced upon Rouen, Nantes, Algiers, Ora and Chateauroux.

Secret Invasions Everwhere

Similar conquests were engineered at Sevilla and Granada in Spain, at Buenos Aires, at Montevideo, at Mendoza, at Santiago and Valparaiso, while the other large German electrical company, the Siemens-Schuckert, installed itself at Creil. Turkey, Russia, Italy, Switzerland fared the same as France. A few weeks ago a Swiss journal enumerated the following enterprises. *Société anonyme pour l'industrie de l'aluminium* at Neuchatel with 8 German, 1 Austrian and 6 Swiss directors; *Banque des chemins de fer orientaux* at Zurich, with 8 German, 1 French, 1 Belgian, 1 Austrian and 5 Swiss directors; *Banque pour enterprises électriques* at Zurich, with 15 German as against 5 Swiss directors; *Société des valeurs des metaux* at Basel, with 10 Germans against 5 Swiss. It is notable that the capital stock is mainly in German hands while the bonds, whose modest rate of interest does not tempt the Germans, are placed in Switzerland. "Thus," concludes the *Gazette de Lausanne*, "the money of the Swiss bondholder serves to nourish the German enterprises which come into our own country to compete with our national industries."

Italy Under Tribute

In Italy's case a remarkable study of the subject has been published by Giovanni Preziosi in a series of articles now appearing in pamphlet form under the title: *La Germania alla conquista dell'Italia* (Germany at the Conquest of Italy). The question is in fact of a war of conquest, and one conducted with an admirable sense for organization. At the center there is a financial general staff constituted by the *Banca commerciale italiana;* of course *italiana*, as the companies established in France are *francaises* or *parisiennes*. This is only a little bit of Germanic strategy in which we find the very image of the Tentacle State. By installing itself in the directorates and practising, by means of a system of secret emoluments, a plan for commercial espionage which ruins stubborn opponents over night, it has been able to absorb by slow degrees the economical energies of a whole people, their credit establishments, their navigation companies, their industrial enterprises. It has been able to corrupt the political life, to unmake ministers and to control elections. Here, as in Switzerland, the German or pseudo-Italian banks "act as suction pumps in Italy and as force pumps for Germany." Italy, while rated as a poor country, furnishes capital for rich Germany.

IV—The Hand of the State

Mr. Hauser furnishes some data on the manner in which the prestige and force of the Empire are placed at the disposal of financiers in order to uphold the politics of economical conquest.

To make of the German nation, of the state, an instrument for German expansion is the object of the politics whic German economists have so fittingly termed *Handels un Machtpolitik* (commerce and power politics). The blendin of the two objects [commerce and power] appears nowhe more clearly than in the report delivered in London in Fe ruary, 1914, by Sir Edmund Goschen on "An Official Germa Organization to Influence the Press of Other Countries What a situation it discloses!

Reptilian Press Bureaus

The *Norddeutscher Lloyd*, the *Hamburg-America*, t *Deutsche Bank*, the *Diskonto Gesellschaft*, the A. E. G., t Siemens-Schuckert, Krupp, Gruson, etc., form together private corporation which is subsidized by the Imperial Offi of Foreign Affairs. In alliance with the Wolff Bureau, t corporation has for its object "to promote the industr prestige of Germany abroad." It furnishes foreign journ gratis or at a nominal price and in their own language kinds of information relating to Germany and favorable Germany. It suppresses this service when the recipients not prove themselves docile. "To react against tendenti news regarding Germany or attacks upon her and to spr knowledge of the true situation of German industries" is ostensible program. In other words, an organization for dustrial espionage, to use the term employed by Prezi placed under the control of the Empire.

The Little German Books

Russia is for Germany a reservoir of labor and a mar If Russia in 1917 should refuse to renew the disastr treaty which was forced upon her during the unfortu period of the Jananese war, if she should discontinue the isting system of passports for agricultural laborers, w would become of the capitalistic agriculture—more and n industrialized, more and more in the hands of banking stitutions—of the large estates in Brandenburg, in Po ania and in Prussia?

France is for Germany a banker and a furnisher of What a temptation to go and grab with both hands in wool stocking which now on occasion is tied up so jealo What a temptation also to go and get rectified the erro moderation committed in 1871! As early as 1911 the *Ga du Rhin et de Westphalie* gave voice to the opinion tha ore deposits in Lorraine and in Luxenburg ought to be u the same government as those of Westphalia and the valley.

As for England, the direct competitor of Germany i the markets of the world, and maker of the same proc she is the enemy that must be downed. Has she not ad the habit, and made France adopt it too, no longer to money to poor states except with the accompanime good commercial orders? The time is passing when German business could be done in Turkey with Briti French gold. The rivals of Germany are learning to pr *Handels und Machtpolitik* themselves. But what will h to Essen, Gelsenkirchen and the whole immense indu city that Westphalia has become, if the Roumanian Greeks, the Serbs order their cannon and their armor their rails or their locomotives at Glasgow or at Creu

War seemed preferable to Germany to this econ crush, and the hand of iron took the place of the glove.

Situation of Russia, France and England

Little by little the idea of the necessary war, of the desirable war, took possession of the industrial classe proof is found as far back as 1908 in a popularizer-t Prof. Paul Arndt, one of those little 1 mark which serve to shape German public opinion. All of reproach ourselves for not having read enough of thes books which would have warned us of the peril. In thi

let the author opens with a pæan to German greatness followed by a chapter on "The Dangers of Germany's Participation in World Economics." He shows that such participation would increase the dependence of Germany upon foreign countries and render her vulnerable at sea as on land. If the international relations should be disturbed, there would then be "many workingmen without bread, many depreciated stocks for reasons which in great degree would escape all control by Germany," having their origin in countries which "could seize the occasion to weaken Germany." And with prophetic hypothesis he describes the effect of a blockade. But he accepts the risks of independent world politics without hesitation. "Surely," he writes, "if we want to be and remain a great people, a world power, we expose ourselves to serious conflicts. But this should not deter us. There is a profound truth in the saying that man becomes weakened by peace. Often the appeal to arms is needed to shake a world which has become stupefied in apathy and effeminacy. The battlefield appears often to those who see far and deeply as a blessing for humanity."

There is thus exposed, says Mr. Hauser in conclusion, the fatal mechanism of things by which the too-rapid industrialization of Germany has led us all into the German war. If one were to doubt the part played by the economical causes, or rather the peculiar psychosis superinduced by these factors, it would be sufficient to observe in what manner the Germans in their day dreams imagine the victory of Germany. It is an industrial victory—the forced wedlock of German coal with foreign iron. It is the reduction of the other peoples to the rôle of perpetual vassalized customers of the German factory. The German dream is a business dream, a romance of the office.

V—The Fatality of Mushroom Growth

According to this dream the war shall also solve the colonial questions. As will be remembered, during the tragic days last July (1914) Chancellor Bethmann-Hollweg offered England the integrity of European France but refused to guarantee the colonies, especially northern Africa [with larger iron ore deposits].

The dream has vanished. The giddy edifice has crumbled, and once more the old proverb has been confirmed: Time does not spare what is made without its help (*Le temps n'épargne pas ce qui s'est fait sans lui*).

Longuemare Carbureter Now Made in America

New Model Has Slight Changes in Jet and Throttle—All Models 40 Per Cent Lighter than Last Year

THE Longuemare carbureter, which up to the present has been manufactured abroad and imported here, is now to have an American model, arrangements for manufacture at Syracuse, N. Y., having been completed by the Longuemare Carburetor Co., New York City. Some changes have been made to suit American requirements, and other changes which are general improvements in operation, fitting and assembling.

The waterjacket which surrounded the throttle has been dropped and there are two changes in the throttle valve. The opening *H* in the accompanying illustration through which the fuel is drawn in the idling position has been enlarged to permit a longer dwell, and another smaller hole at the left of *H* has been added to supply a little extra air when starting.

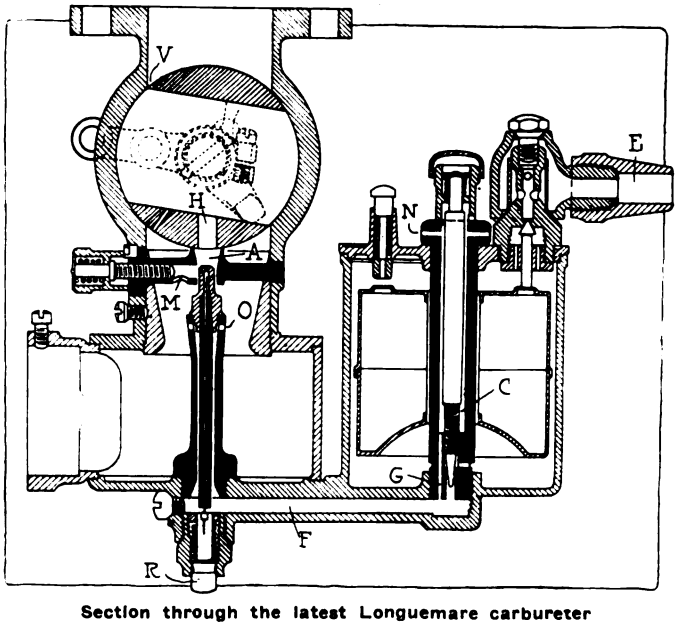
More Accessible Choke Tube

Other improvements are a more accessible choke tube which can now be withdrawn by removing a screw at the left, a swiveling connection of the float chamber to make the carbureter easily adaptable to any engine and the adoption of S. A. E. standard connections. The operation of the carbureter was described in THE AUTOMOBILE for Feb. 4, 1915, and remains practically unaltered. Gasoline enters by the needle valve through *E* and in passing the central adjustable needle at the base of the chamber fills the channel *F*. From here there is access to the compensating chamber *C*, which thereupon fills to the same level as the main float chamber. There are two jets, the main one *O* consisting of a few holes drilled horizontally at the top of the outer jet tube, and a central idling jet above it. Both are in direct communication with the channel *F*. When starting the throttle occupies the position shown with the opening *H* immediately above the idling jet. In this position there is practically no suction on the main jet. The air is drawn in past the idling jet through the inlet *M*, which is adjustable, the mixture passing the throttle by the small beveled opening *V*.

Automatic Fuel Regulation

When the throttle is opened the suction around the main jet increases but diminishes around the idling jet. A freer flow of fuel being always required at this moment the compensating chamber *C* empties into the channel *F* supplying the extra fuel demanded by pick up. As soon as the chamber *C* is empty, air is drawn in through the openings *N* and passing through *G* mixes with the gasoline in *F*. In doing so an emulsion is formed which renders vaporization easy on issuing from the jet. An automatic regulation of the fuel supply is claimed for this carbureter through the action of this additional air in the following manner: The natural tendency on high speeds is to increase the richness of mixture. By introducing air into the gasoline on its way to the jet the density of the mixture is lightened thereby retarding the increasing flow of fuel from the float chamber. Thus the virtual effect is a thinning of the mixture at high speeds.

A cleaning device for the idling is incorporated in the form of a needle operated by the push button *R* underneath the jet.

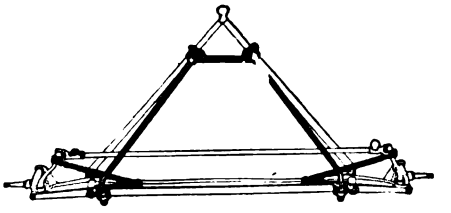


Section through the latest Longuemare carbureter

ACCESSORIES

Cox Ford Safety Pilot

THE Cox safety pilot for Ford cars is a front axle and radius rod support combined with an automatic steering device. It is claimed not only to prevent the radius rod bending out of line and consequent breakage of the axle under strain but also to materially strengthen the car and to make driving safer and easier. The radius rod support is attached to the front axle and clamped to the rods near the apex of the triangle formed by their junction. The automatic steering device is attached just inside the radius rod supports on the axle connecting with the clamp of the radius rod. It is a strong, tempered flexible spring which acts as a stabilizer, preventing the car from swerving on rough or sandy roads and relieving the strain of a continuous tight grip on the wheel. The combination attachment sells for $3.75.—Cox Brass Mfg. Co., Albany, N. Y.



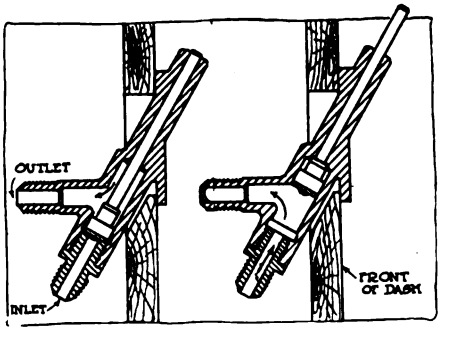
Cox safety pilot for Ford cars

Morris Dash Oil Indicator

The Morris dash board oil indicator is for the purpose of showing how the oil pump is operated. It is adapted for both gear and plunger pump or where the flow of lubricating oil is constant and in considerable volume.

As will be noted from the accompanying illustrations, the plunger projects through the dash and its height indicates the quantity of oil which is passing through the outlet. There is a piston at the lower end against which the oil impinges to raise the plunger. On the lower end of the piston is a leather cushion which acts both as a silencer and a washer, and also effectually prevents oil being forced past the piston rod in in case the delivery or discharge pipe should become choked.

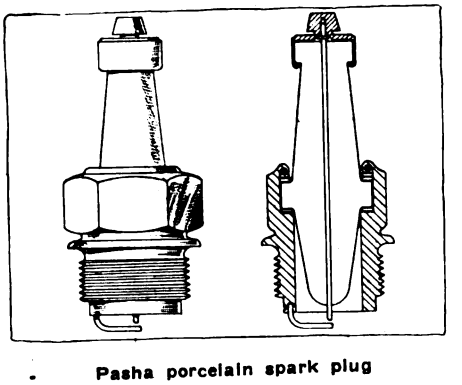
The flange for attaching the indicator to the dash can be of any desired diameter and at any angle to the axis of the plunger. The device is easily attached and is finished in nickel. The price is $2. —George W. Morris, Racine, Wis.



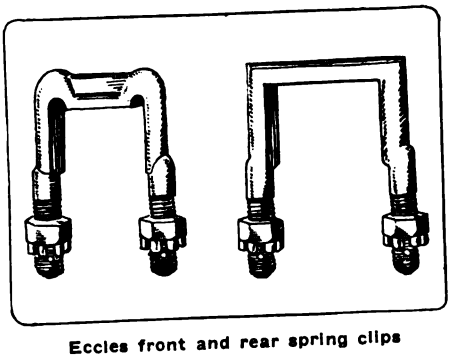
Morris dash board oil indicator

Pasha Spark Plug

A sectional view is shown herewith of the Pasha spark plug. As will be noted, the central electrode is in one piece solidly baked in imported hard fire porcelain. At the top is the brass cap for a clip terminal, and no screw is provided. The shell of the plug is curled over to hold the porcelain tightly in position with spring tension. The points of the electrodes are carefully finished, and in order to prevent leakage two copper asbestos gaskets are put above and below the porcelain flanges in the shell.—Pasha Spark Plug Co., Bloomfield, N. J.



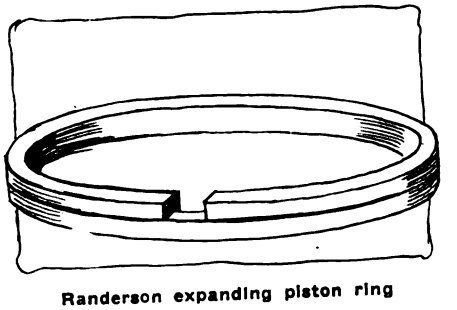
Pasha porcelain spark plug



Eccles front and rear spring clips

Eccles Spring Clips

Front and rear spring clips for automobiles with special attention to the requirements of the Ford model T are listed. The spring clips are made in all sizes to fit all makes of cars, and are of such dimensions as to provide equipment for any desired spring. The price varies with the size and the pattern. They are made in half oval, full oval and flat designs, and are threaded drilled for cotter pins and equipped with castellated nuts, a pair being furnished with each clip. Twenty-five of these are packed in a box, and a representative price for Ford cars is $75 per hundred.—Richard Eccles Co., Auburn, N. Y.



Randerson expanding piston ring

Randerson Piston Ring

This ring is designed to work against pressure on an entirely different principle than that employed generally in piston ring construction. The automatic ring idea is based upon making the ring act as a valve in the piston. The ring is so designed that when compression and explosion take place the ring is automatically expanded by the pressure which reaches back of the ring between the piston and the ring itself, thereby automatically expanding the ring against the cylinder wall. It is intended with the ring that no other ring need be installed in the piston.—Du Bois Machine Shop, Inc., Albany, N. Y.

Becco Tool Set

The Becco tool set consists of a steel case, with wood forms lined with felt and fitted with a selection of tools, each being held in place by a catch. The case is 15 in. long, 8 in. wide and 2 in. thick, and is finished in black enamel. The tools are as follows: Punch, cold chisel, cotter-pin remover, round file, flat file, file handle, large screwdriver, small screwdriver, hammer, large monkey-wrench, small monkey-wrench, three double-ended S-wrenches and a pair of combination pliers. Price, $7.75.

Becco wrenches are made in sets held together when not in use by a special clip. The wrenches are of flat steel, non-adjustable. Two sets are turned out. Set No. 1 consists of four wrenches, all double-ended and one having two openings in one end and one in the other and one having alligator jaws. The sizes are from 5/16 to 11/16, and there is also a small opening for gas-tank valves. The steel used is ⅛-in. thick. Set No. 2 has the same number of wrenches, but the sizes run from 5/16 to ¾; the alligator is the same size. The steel used is 5/32 in. thick. Set No. 1 is nickel plated and set

No. 2 is finished in black enamel. Price, set No. 1, 50 cents; No. 2, 65 cents.—Michigan Motor Specialties Co., Detroit, Mich.

Erickson Spring Separator

This tool spreads apart spring leaves and injects grease between them. It consists of a heavy steel rod with an adjustable sliding head, a stationary head carrying a screw and an intermediate sliding member movable toward or away from the adjustable head by means of the screw. As shown in the accompanying illustration, the screw-operated head has a hollow steel point which the screw forces between the leaves, the adjustable head being brought against the opposite side of the spring.

A large grease cup mounted at the top of the screw-operated head supplies the grease through the hollow steel point when turned, making a quick and clean job.

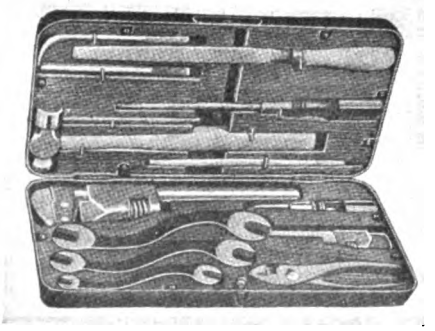
The screw-operated head is pressed out by a coil spring when the screw is backed off. The back head is adjustable for any width of spring. In case of breakage of the steel point, this can be readily renewed as it is screwed on. The device sells for $1.—P. E. Erickson & Son, Inc., Port Chester, N. Y.

Aderente Non-Blinding Device

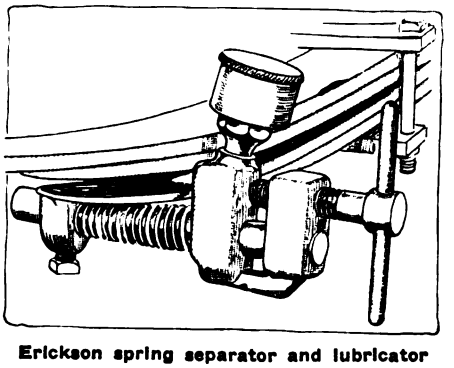
The Aderente is a non-blinding device which is so arranged as to cut out the glare and at the same time have many of the rays of light thrown directly ahead of the car in order to illuminate the roads. According to the manufacturer, the device is not a dimmer, but rather increases the power of the projected light by deflecting the rays to the road which would otherwise be thrown upwards or in a straight line ahead of the car, thereby blinding approaching pedestrians or drivers. The device is attached to the lamp door and although made of metal is said to have the appearance of cut glass. It does not require adjustment and does not have to be touched whether the car is being driven through the city streets or in the country. As the device is attached inside the door, it should not require frequent cleaning. The price per set of two, is $3.50 and in ordering it is necessary to give the overall dimensions of the glass and door.—Aderente Non-Blinding Device Co., Inc., Jersey City, N. J.

Smith Encased Joint Pliers

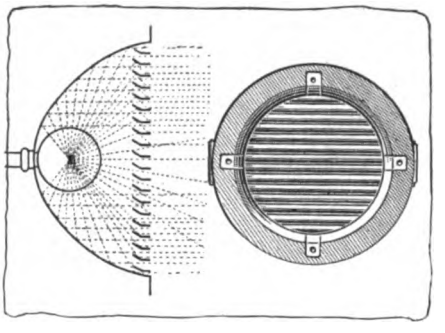
A new type of pliers, illustrated herewith, has been put on the market, having an encased joint, or one that is inclosed in contrast to the usual type which uses a lap joint and a rivet to hold the parts together. The new Smith pliers also employ a rivet but merely for the purpose of additional strength. Cutting can be done on both sides and it is claimed that a small diameter wire can be handled as well as one which fills the cutting slot.—H. D. Smith Co., Plantsville, Conn.



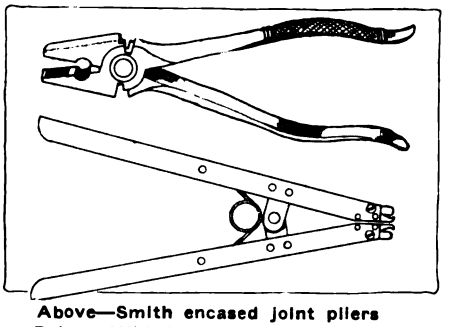
Becco automobile tool set



Erickson spring separator and lubricator



How Aderente non-blinding device operates



Above—Smith encased joint pliers
Below—Wilhelm piston ring remover

Vaughan safety signal on a car

Wilhelm Piston Ring Remover

The Wilhelm piston ring remover is designed to be of service in removing any style of piston ring. The device differs but little from the conventional type, depending for its spreading action on the bringing together of two rod ends, causing the opposite extremities to spread the ring ends, allowing the ring to be slipped over the piston top. As illustrated herewith, the Wilhelm consists of two bars pivoted to a common point near one end and connected by a spring which effects return action. The jaw is shaped so that it will not slip when used to spread diagonally split rings. Price is $1.—Wilhelm Smith Machine Co., Reading, Pa.

Vaughan Safety Signal

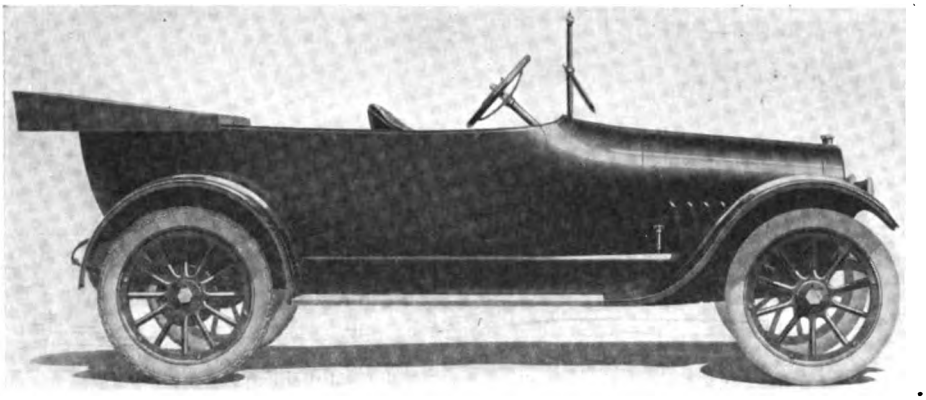
The Vaughan safety signal is of the rear-mounting type and is operated by a lever on the steering wheel, telling the driver of cars in the rear which way the machine which carries the signal is about to turn. The device consists of two plates mounted in a casing as illustrated, so that either side of the plates may be displayed. The words shown are: Turn Right, Turn Left, Slow and Stop, arrows being used to indicate the direction when the car is about to turn. Fiber gears in the casing operate the plates, Bowden wire connecting the gears to the control levers.—C. S. Vaughan, New Rochelle, N. Y.

Hertner Charging Outfit

The Hertner is a vertical motor-generator set with switchboard is for use in charging batteries from an alternating-current source. Being a motor-generator, it continues to run when the line voltage is cut off or drops for an interval, the generator acting as a motor with a slight draught of current from the battery until the line voltage comes on when the generator action is resumed.

In operation, the alternating current line is attached to the board, where it is controlled by a simple switch. The direct current line is at the bottom of the set. A feature of the Hertner outfit is the cooling fan mounted in the middle which is said to more than compensate for the slight amount of current used for this purpose by the results obtained.

In order to make the machine as well-balanced as possible and to make it run smoothly and also to render it possible to dismantle it readily, the motor and generator shafts are separate units and are connected by a coupling. A ball bearing immediately below this coupling supports both shafts midway between the top and bottom of the machine.—Hertner Electric & Mfg. Co., Cleveland, Ohio.



The new Paterson light six with high-speed motor listed at $985

New Paterson Six Chassis

Four Continued with Improved Body Lines — Six Sells for $985 — Uses New High-Speed Continental Motor

THE W. A. Paterson Co., Flint, Mich., will continue its well-known four practically unchanged for the 1916 season, the only alterations being in the body which has lines more in accordance with modern streamline ideas. The new six, however, is an entirely original job and the specifications show that it is remarkable value for the price of $985. The motor is a Continental 3¼ by 4½ in. and the body a seven-passenger with ample internal space and excellent finish. Wheelbase is 117 in., tires 32 by 4 in. and the equipment is extensive, one little detail of the latter especially worthy of mention being the utilization of the left front door pocket for tools most frequently needed. On lifting the flap of the door the most important tools are found, arranged each in a separate leather container so that any one required can be picked out in an instant.

Motor Is High-Speed Type

The motor has a formula rating of 25.4 hp. and a piston displacement of 224 cu. in. and is the type of Continental light six which was described fully on page 1130 of THE AUTOMOBILE for June 24, 1915. The engine is designed for high-speed operation, having its horsepower peak at about 2200 r.p.m. and developing 35 hp. at 1600 r.p.m. approximately. All the intake passages are integral, so the carbureter can be bolted directly to the casting, which is an excellent place from the warmth viewpoint and saves the need for a jacket. On the Paterson the standard carbureter will be a Stromberg, which seems to suit this motor very well.

Three-Bearing Crankshaft

There are three main crankshaft bearings, each being supplied with pressure oil from the plunger pump which is driven from the camshaft and located on the crankcase side. An oil lead also goes to the helical timing gears, and there are dip troughs for the connecting-rods. To eliminate vibration at the high speeds at which the motor is meant to be run, a large diameter has been chosen for the crankshaft, the main journals being 2½ in. The left side of the engine is absolutely clean, save for the carbureter and the oil filler, while the water pump and the generator are arranged on the right side in such a manner as to interfere as little as possible with the valve accessibility.

Not long ago attention was to the prevalence of heavy pre needed for the operation of clutc brake pedals on many cars. Th portant point has not been neg in designing the Paterson wit result that the effort needed to r the clutch or to apply the s brake is amazingly small; so lit fact, that a child could operate controls. The clutch itself is a type with leather face anc Warner gear provides the usual forward speeds, but here again of operation has been studied, s the gear shift lever moves p tionally as freely as the clutch This means that to change spee easy almost as to advance the lever which should make the Pa very much appreciated in mou ous districts.

From the gearbox there is a jointed shaft with its one un designed to take the torque That is to say the torque tube nates at a bearing on the driv just behind the universal, so th withstands the stress of torsion at the point where greatest (near the axle) and only transfers the stress driveshaft close up to the universal and where the st at its lowest.

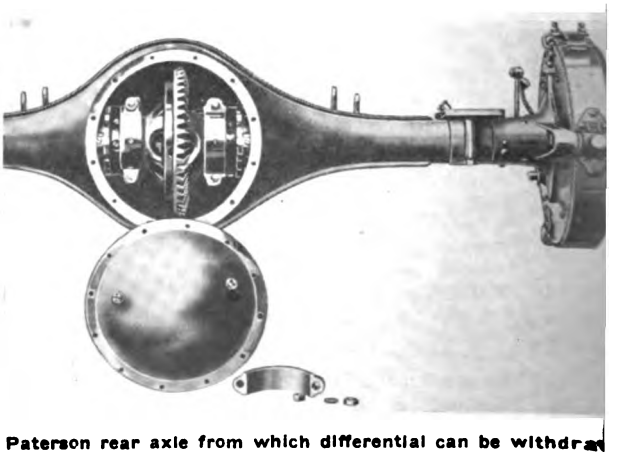
Rear Axle Accessible

For the rear axle a built-up construction is use differential and drive gears being mounted upon Ne parture bearings, while Hyatt roller bearings take c the support of the wheels and the driveshafts. These can be removed easily, and the differential taken out t the rear part of the housing, without removing th from the springs.

Rear springs are three-quarter elliptic with a large tude, giving easy riding, and the drive is taken throug front portions. The steering is laid out with good, s connecting links and is irreversible by virtue of the worm and nut gear which is adjustable for wear.

In the body, width of seat is the outstanding cha istic, this being above the average, and upholstery is

It is not quite certain at the time of writing, which electrical systems will be employed, but in either cas will be two units the generator having the igniti tributer integral.



Paterson rear axle from which differential can be withdra out removing the axle from the springs

Valve Accessibility

WHAT is the real value of accessible poppet valves? It is a question that many an automobile engineer would like to be able to answer, and a question that opinion answers in many different ways. In most engines, whether V-type or L-head, the accessibility of the tappets is not really good, not good in the way that a spark plug is accessible, or even as is the jet of a well-placed carbureter. It is not to be questioned that the efficiency and the [illegible] of a poppet valve motor depends very greatly upon the accuracy of tappet adjustment, and it is a fact that, however good the materials, tappets will not operate long without wear. Yet it is often argued that the average man never bothers himself about his valves and depends entirely upon his repairman to overhaul all the valves at once when they are very bad.

This introduces the speculation of whether a very [illegible] adjusted tappet would receive any more attention from most automobile owners than an en[illegible] inaccessible push rod mechanism, and it is [illegible] contested that accessibility is not worth while [illegible] it is not made use of.

This seems a poor sort of argument. That a tappet should require adjustment is a fundamental fault [illegible] engine, because the id[illegible]ine should [illegible] adjustments wha[illegible] need adj[illegible] as of co[illegible]or the ma[illegible] of any [illegible] that adju[illegible]ment ought to be rendered as easy as possible. It is surely the manufacturers' duty to make automobiles with the maximum of convenience for the type of owner who treats his machine as it ought to be treated. It is not good business to excuse a poor design by a statement of belief that the average user is mechanically inept.

1916 Car Prices

FROM January, 1912, till January, 1914, the average price of automobiles rose from a little less than $2,500 to a little above that amount. In January, this year, the price had fallen $600, and so far as can be judged at the present time January, 1916, will show at least an equal drop.

Studying the curve it suggests that the great changes in equipment which took place from 1911 to 1914 pushed the average price to a peak, and this was a natural development. As the electric starting motor and other refinements became more settled things, it was natural that there should be a falling off in price, but the fall from 1914 to 1915 must show more than this. It can be accounted for only on the assumption that the manufacturers found they had set the price too high for the average buyer and the drop which took place last year was provoked by the desire to expand the market.

Now there is a limit to everything, and it is probable that we shall find January, 1916, will show a low spot in the curve that will correspond in years to come, with the high peak of 1914. This is surmise only, but the idea is fostered by the striking success of medium-priced cars. Any good car can be sold if it is cheap enough, and five-passenger cars at less than $750 are bound to find buyers in very large numbers. Average price may fluctuate. It seems that the customer who wants to spend from $1,250 to $2,250 represents a large and permanent class so that there should be plenty of cars in this field for a long time to come.

Winning on Performance

THOSE who have waited to see how cord tires would work out in road races have the tire reports from the Elgin races, covering 600 miles spread over 2 days, a demonstration that indicates that the cord construction is apparently as well suited for high speeds on the average country road as on the brick or board speedways. The Elgin circuit is a typical country road, gravel surface well oiled, just such a road as can be found in thousands of places throughout the country.

One of the two winning Stutz cars made the 600 miles at an average speed of over 75 m.p.h. without a single change and the other Stutz changed but one tire in that distance. No longer are tires the determining factors in winning or losing they once were. In Elgin's 2 days of racing it was small mechanical troubles with cars, or lack of speed, that put certain cars back from first and second place. The winning cars won on good performance, freedom from mechanical troubles and not from handicaps imposed by tire troubles.

$1,200,000 Co. To Build Cars

Buyers of Pope Westfield Plant Form Westfield Mfg. Co.

BOSTON, MASS., Aug. 20—A certificate of incorporation has been issued at Boston to the owners of the Pope plant at Westfield, who recently bought the property at public auction for $725,000. The new company will be known under the name of the Westfield Manufacturing Co. and it will make automobiles. The capital is $1,200,000. The petitioners for the charter are Richard Mortimer, Jr., W. B. Cook, J. B. Donovan and Richard Gregg, all of New York. It is understood these men are only representatives of the real owners.

The time for completion of the purchase of the Pope plant has been extended 30 days by Judge Aldrich of the U. S. district court. New York interests, headed by E. Preston Courson, were to have paid $700,000 on Aug. 18, thereby completing the sale of the plant. The time has been extended until Sept. 16.

—

U. S. L. Gets Large Contracts

NEW YORK CITY, Aug. 21—The stockholders' protective committee of the United States Light & Heating Co. of Maine has issued a circular to holders of subscription-paid certificates of deposits for the stocks of the company, which states that all the claims against the old company have been paid and settled, excepting three or four, the validity of which is being contested.

The new company is now operating the plant and several new contracts have been secured. Two of the contracts call for $9,000,000 worth of starters, delivered over a period of 3 years.

—

Traffic Managers Meet Sept. 14

NEW YORK CITY, Aug. 23—For the purpose of taking up the matter of delays in transit of automobiles, and to arrange the classification on automobile parts, a meeting of traffic managers representing all the automobile factories in this country that are members of the National Automobile Chamber of Commerce, Inc., will be held at the Board of Commerce Bldg., Detroit, at 10 a. m., Sept. 14.

—

Little Giant Six-Wheeler

CHICAGO, ILL., Aug. 23—The six-wheeled motor truck manufactured by the Chicago Pneumatic Tool Co., Chicago, under license from the Trailer Transportation Co., New York City, is now ready for the market. It consists of a 1½-ton Little Giant chassis and a two-wheeled trailer coupled to the rear thereof. A fifth wheel upon the trailer supports most of the body load, the front end resting on the load platform of the truck upon a ball-race so that it is free to move in relation to the truck. The fifth wheel arrangement, in conjunction with the steering draw-bar attached to the end of the truck frame, causes the trailing wheels to track exactly with the rear wheels of the truck. Thus the driver takes his turns just as sharply with the trailer as he would with the truck alone, although the load space permits of material 40 ft. in length being carried.

—

Ross Motor Sales Co. Formed

DETROIT, MICH., Aug. 23—The Ross Motor Sales Co. has been organized with headquarters in New York City to take the entire output of the Ross Automobile Co., which announced an eight-cylinder car the first of the year. This sales company is made up of eastern men, and includes T. C. P. Forbes, recently resigned as sales manager of the Monarch Motor Car Co., G. S. Patterson, and M. W. Kerr.

This company will undertake the entire distribution of the Ross cars for a period of 3 years, undertaking the advertising and selling campaigns, and freeing the factory here of anything save the making of the cars.

—

Clearing House for Truck Concerns in New York

NEW YORK CITY, Aug. 21—Emerson Brooks, formerly vice-president of J. M. Quinby & Co., Newark, N. J., and more recently in the motor truck field, has evolved a plan of operations which should be of value to the industry. In addition to the regular representation of one truck company, he has adapted his office to act as a sort of clearing house for companies which have no metropolitan agents. By such arrangement, he makes it possible for out of town concerns to arrange deliveries through his office, and also to have their catalogs and literature on file there. THE AUTOMOBILE, in its January issues, published tabulated statistics of 370 makes of trucks, many of them not represented in New York and this new plan should prove a convenience to them, as well as a source of profit. Mr. Brooks is well known in the automobile industry, having served two terms as vice-president of the Motor Truck Club and one year as treasurer of the Automobile Club of America. His office is at 250 West Fifty-fourth Street.

Independents Raise Gasoline Price

St. Louis Firms Add 1.1 Cents to Figure—Standard Oil Unaffected

ST. LOUIS, MO., Aug. 21—After following the lead of the Standard Oil Co. nine times in the last 18 months by cutting the price of gasoline 1 cent each time, Independents here balked. They raised the price 1.1 cents this week.

The Pierce Oil Corp., which the Independents had termed an ally of the Standard Oil in stories of an alleged sham battle to freeze out the small dealer, announced increases in its gasoline prices soon after the smaller independents. The Standard, however, three days after the Independents' cut, had not yet brought down its prices.

The price of No. 1 gasoline was raised from 12.4 cents to 13.5 cents per gallon; No. 2 from 10.9 to 12 cents per gallon; No. 3 from 8.9 to 10 cents per gallon. These prices are for 10 gal. lots.

The Independent dealers say they expect the Standard Oil to follow their lead, and that they will continue to increase the price of gasoline until it is the same as before the so-called war, that is, from 15 to 17.5 cents per gallon according to grade.

The Independents denied that prices had been raised by agreement, although stories have been printed here of a recent secret meeting in Kansas at which it was said the increase was decided upon. There has been some talk of an investigation by State officials into these charges. Attorney General Barker announces that no request for an investigation has been received at his office and that until such a request is made his office for the present will not undertake an investigation.

—

Gasoline Advance in Eastern States

NEW YORK CITY, Aug. 23—Within the past week there has been a general advance of 1 cent a gallon in gasoline prices throughout New York State, New Jersey, New England, eastern Pennsylvania, and Delaware. The big companies are now selling gasoline wholesale in New York at 14 cents a gallon, compared with 11 cents in the early summer.

The Standard Oil companies affected by those changes are: Standard Oil of New York, Standard Oil of New Jersey, and Atlantic Refining Co. The Texas Co. and Gulf Refining Co. are quoting prices similar to the Standard.

The Independent oil companies in the St. Louis district have advanced the price of gasoline 1.1 cents a gallon to 13½ cents, for the best grades.

Yuster Axle Now Columbia

Combines Management of Output with Torbenson Co., Though Separate

CLEVELAND, OHIO, Aug. 20—The Yuster Axle Co., this city, manufacturer of automobile axles, has changed its name to the Columbia Axle Co. The business of manufacturing axles for high grade automobiles is to be carried on as heretofore, but a change of trade name has been thought advisable, owing to the withdrawal of W. L. Yuster from the company, and for the reason that arrangements have been made with the Torbenson Gear & Axle Co. of Newark, N. J., whereby that company has recently moved its entire plant, machinery, equipment and inventories to the Cleveland factory of the Columbia Axle Co. Hereafter the combined product of both companies will be manufactured under one management and overhead expense in the same shop. It is believed that this step will add strength and materially improve the facilities of both companies whose separate identities are to be maintained, and at the same time place the foundation for extensive extension of the business of each.

New Building

Consideration is now being given to plans for a new building, and new machinery is being purchased to take care of increased business.

—

Not Responsible for Disobedient Chauffeur in Accident

ST. PAUL, MINN., Aug. 14—The Minnesota Supreme Court has ruled that the owner of an automobile is not liable for the negligent acts of his chauffeur when committed while wrongfully operating the automobile outside the scope of his employment and, contrary to directions, on his personal affairs. E. A. Conrad of Minneapolis is relieved from payment of a judgment of $2,100 allowed J. B. Lee in the lower court. The latter was run down by the Conrad chauffeur. Conrad directed his driver to go home for supper and then come back after him. The chauffeur went eight blocks out of the way on a mission of his own, when the accident occurred. The upper court held that as long as the driver did not obey orders no liability rests on the owner.

—

Asks for Government in Mexican Disturbances

WASHINGTON, D. C., Aug. 21—War Department officials have been informed that Maj.-Gen. Frederick Funston, commanding the southern department, with headquarters at Fort Sam Houston, Tex., has a plan for using motor cars extensively in the transportation of troops and supplies in Texas. He has recommended the purchase of four machines for use in rapid transportation between various points where it is necessary to maintain patrols, etc., it being stated that the disturbed conditions, due to marauding bands from the Mexican side, as well as bands of outlaws located in Texas, result in urgent calls for troops to meet emergencies at different places and that quick means of transporting troops and supplies from points on the railroads to places where they are needed in emergencies are absolutely necessary if the best results are to be obtained. Several trucks and cars are now in service along the Mexican border.

—

Now the Cummins-Monitor Co.

COLUMBUS, OHIO, Aug. 20—In accordance with the announced plans of developing the four and the eight-cylinder Monitor by the Cummins Auto Sales Co., Columbus, papers were filed with the Secretary of State changing the name of the present corporation to the Cummins-Monitor Co. The plant, where the Monitor is assembled, is located at 402-404 Mount Vernon Avenue.

—

Texas Co. Earnings Gain $272,234

NEW YORK CITY, Aug. 23—The net earnings of the Texas Co. in 1915, the fiscal year ending June 30, shows an increase of $272,234, while the surplus decreased $242,647. The net earnings in 1915 amounted to $8,024,692 and in 1914 to $7,752,458. The company last year paid out $3,000,000 in dividends, compared with $2,550,000 in 1914.

Hupp Promotes Willemin

DETROIT, MICH., Aug. 23—A. B. Willemin, who has been director of purchases for the Hupp Motor Car Co. for three years, has been promoted to assistant general manager. He first entered the automobile field as purchasing agent of the Brush Runabout Co., later joining the Lion Motor Car Co. Subsequent to this he closed out the Elmore business for General Motors, and then came to Hupp.

—

Fuller & Sons to Add

KALAMAZOO, MICH., Aug. 23—At the last meeting of its stockholders, Fuller & Sons Mfg. Co., maker of automobile parts, voted to erect an addition to plant to take care of increasing business. This addition is to measure 100 by 61 ft., and four stories high. It is to be of reinforced concrete factory construction.

—

Trenton Body Builds

TRENTON, N. J., Aug. 23—Fitzgibbon & Crisp, Trenton, maker of automobile bodies, will build an addition to its plant.

N. Y. Exports to S. A. Gain $809,277

South America Receives $1,991,801 in Vehicles During Second Week of Aug.

NEW YORK CITY, Aug. 23—Passenger cars, to the value of $672,262, and commercial vehicles, at $1,319,539, left the port of New York during the week ended Aug. 14, 1915, as compared with only $182,524 in passenger cars, in the same period in 1914. During the month of July passenger cars, to the value of $72,350, were shipped from this port to the principal countries in South America. In point of value, Venezuela led with $19,189, with Argentina next with $16,858, Chile, $13,665, Brazil, $12,064, Uruguay, $6,154, Colombia, $4,260, and all other countries, $13,224.

—

European Cars Lead in Big Cities of South America

RIO DE JANEIRO, Aug. 19—This city and Buenos Aires contain a large number of high-priced European automobiles, a certain barometer of the great and extravagant spending by the rich in these two South American metropolises. In the camps and the other capitals are to be found cars of a cheaper type, and here the low-priced American-made machines are very popular. Not so many, however, can be seen in the above mentioned cities as European makes, and many others have a strong foothold on fashion, and this is an extremely hard custom to break. The necessity of economy may do what selling agents have not been able to accomplish.

Motoring is the foremost in the list of amusements in Rio de Janeiro. The Brazilians have spent money lavishly on improving their roads, especially the famous Gavea-Tijuca drive, that follows the rocky coast for miles, and then spurts up into the mountains. This drive is 60 miles long. In Brazil, as in other South American cities, there is no law prohibiting speeding. People crossing the streets must look out for themselves if they wish to take a chance of being run down when the traffic is going the opposite direction. If a man is run down by an automobile, he is to blame for being in the way, not the driver, and if he has damaged the machine he can be sued by the owner.

—

Houk to Add

BUFFALO, N. Y., Aug. 24—The Houk Mfg. Co., Buffalo, has completed plans for an addition to its plant at Elmwood Avenue and the New York Central Railroad Belt Line.

Trade Review of the Week

Detroit Plants at Work on Fall Business—Material Shortage Continues

DETROIT, MICH., Aug. 24—Last week appears to have been up to the average of output and sales with the majority of the car and parts manufacturers of this city. Intensive buying of cars has been resumed throughout the country, from the indications that have come to the sales departments, this probably having a direct relation to the improved weather conditions that now obtain.

Fall Outlook Excellent

The recent resumption of manufacturing activity by the Ford Motor Co. after a shut down for inventory—the customary thing with Ford—has had its effect on several other of the city's manufacturing plants, a large part of whose output is sold to the Ford company, so that it may be said that practically every plant in the city is now quite busy with the early fall business. The outlook for fall trade is regarded as excellent in all quarters, and everywhere there is a strikingly optimistic trend, all the big producers thinking that they will be able to make and sell enough more vehicles than last season to make up for the almost general reduction of prices.

In some quarters the shortage of raw materials is still worrying. One motor maker, for instance, says that he has been obliged to turn down many orders for engines because of the shortage. In some lines, he says, it will take many months to get a normal supply, and that it would be folly to accept contracts specifying dates of delivery, when he knows that the necessary material is not on hand, and will not be for some time. War business in steels, brass, aluminum, etc., curtails greatly the amount available for domestic use, and prices have felt the increasing demand. Pig iron, among others, is higher, and desired deliveries are hard to get. This shortage is apt to affect the smaller consumer before the large buyer, and the larger concerns are able to get fairly reasonable attention through their large buying power.

Dealers in this city and vicinity are well satisfied, on the average, with the amount of business either in sight or already closed. They say that there was a perceptible picking up during last week, with most of the days clear. People will not buy cars when the weather is bad.

New York Sales Good

NEW YORK CITY, Aug. 24—Sales conditions last week in this city showed the same inquiry on the part of prospective buyers as in former weeks. The dealers have the same complaint to make—completely sold out and no new cars in sight until the last of September. A few of the dealers were, however, more fortunate this week in the way of shipments. The Studebaker factory has adopted the plan of consigning two trainloads of new models each day to its branches, from which the cars are passed along to dealers. Accordingly last Monday, two trainloads started for the Atlantic coast, for distribution among dealers tributary to those branches. Tuesday two more trains were under way and on Wednesday another double trainload was sent out, this program to continue until each branch house will have received its quota of cars. The Maxwell agency received two carloads yesterday and expects that number each day to the end of the month. Sales to date this month for the Maxwell in this city have numbered sixty-nine. The Stutz agency received a fresh shipment from the factory but not enough to make full deliveries on, its sales last week numbering fourteen.

Influence of War

A few of the agents report slack business on account of scarcity of cars and also on account of the closing of the vacation period. Dealers state that there have been more people in this city this year than ever before, and consequently many sales have been made. Most of these visitors were people who usually go to Europe for the summer. This year, a majority of them have turned their attention to touring and while in this city, have bought new cars for that purpose.

The dealers, however, are expecting a rush for cars in about a month, when there will be a demand for winter models. Harry S. Houpt is anticipating this demand by having on exhibition on Sept. 1, a complete line of closed cars. The Pierce people state that most of their sales have been in closed cars. Sales last week numbered nine, as compared with one during the same period last year.

The Mercer company is sold out and will not be able to make deliveries until October, when the new series will be out. It states that if it could have had the cars, 100 could have been sold.

The Oldsmobile agency sold twenty-five cars last week. Shipments are fair.

Oklahoma's Prospects Rosy

OKLAHOMA CITY, OKLA., Aug. 20—The automobile buying possibilities in the State of Oklahoma this year are better than in the history of the new State. At present there are 32,000 automobiles in the State, according to the estimated figures of the State highway department. If abundant crops, he production of oil, gas, coal, lead, zinc other minerals have anything to do w automobile buying the business in Ol homa this year will grow by leaps bounds.

45,000,000 Bushels of Wheat

Wheat is a big money crop in O homa. This year the yield will re 45,000,000 bushels. It is selling for n than $1 a bushel, therefore the mo from this crop alone will be in exces $45,000,000. Oklahoma this year ra 80,000,000 bushels of corn, which br about $65,000,000 to the farmers.

Oil is Oklahoma's greatest m "crop." Oklahoma produces more than any other State in the union cording to the report of the State g gist. For two years the price o dropped off to 40 and 50 cents a ba but within the past two weeks the for crude oil has been advanced 20 a barrel, increasing the price to 60 c The history is, when the price of lowered, the buying companies dec the price 5 and 10 cents a barrel time. And, when it is advanced price is increased 5 and 10 cents a rel. The producers have resumed in all the fields of the State, in ant tion of dollar-a-barrel oil in the future.

Oklahoma coal sells for many n dollars every year; her zinc, and minerals, sell for millions; and th crop this year will bring in at $20,000,000.

During the past year, Oklahoma mobile dealers have enjoyed the b business in the history of the Sta

Oklahoma to Tax $25 for Failure t ister Cars

OKLAHOMA CITY, OKLA., Aug. Automobile owners of Oklahoma, who have failed to get a new 1915 tag, were warned by State Hi Commissioner George Noble to p tax on or before Sept. 1 or they subject to a fine not to exceed $25 warning was directed especially t mobile owners in Oklahoma who linquent.

"There are 500 or 600 cars in homa City that have not been tered," said Commissioner Noble

According to Mr. Noble, not mo half of the cars in Oklahoma ha registered with the highway depa On the records of his office th accounted for a few more than automobiles, 600 motorcycles a traction engines. Commissioner estimates that there are from 2 25,000 automobiles in Oklahom said, however, that he would not prised if there were 30,000 to 32, here. His first estimate placed t ber at the latter figure.

Niagara Four To Sell At $740

Niagara Automobile Co. Formed in Buffalo—Capital To Be $500,000

BUFFALO, N. Y., Aug. 24—The Niagara Automobile Co. has been formed here to manufacture the Niagara four-cylinder five-passenger car to sell for $740. G. H. Poppenberg is president of the company, with W. G. Miller as vice-president and general manager, and Albert Poppenberg, secretary and treasurer. The plant of the company, which is to be capitalized at from $500,000 to $750,000, will be located in Buffalo and it is the idea of the promoters to use materials produced either in Buffalo or its vicinity. The new car will be light in construction.

Mr. Miller was associated with the Pierce company and other automobile concerns for many years, while the Poppenbergs are local business men.

Have Personal Representation to Sell Cars in China

SHANGHAI, CHINA, Aug. 2—It has been demonstrated that in order to secure profitable results American firms which contemplate engaging in the export trade would do well first to secure personal representation in the market they intend to enter. A new firm entering the field would be somewhat handicapped if depended absolutely upon an advertising campaign to create a demand for its goods.

China is considered a great possible market for automobiles, and recently a representative of a prominent firm of automobile manufacturers in the United States, who is now visiting Shanghai, appears optimistic as to the future possibilities of this trade not only in China but in other countries of the Far East.

The smaller type of touring cars, those with four or five-passenger capacity, seem to be most favor. The touring car of seven or eight-passenger capacity, numbers among which are some of the real high-cylinder models, and the limousine, seem to be popular. There are 1,000 cars in Shanghai.

Vehicles in the State of Kansas Valued at $19,814,116

TOPEKA, KAN., Aug. 25—Some very interesting facts concerning the use of motor vehicles in Kansas are revealed by assessors' reports. Kansas is now taxing on $19,814,116 worth of motor vehicles, for instance, against a valuation of $6,192,224 7 years ago—since that time the valuation of horses has declined from $5,077,399 to $3,045,290, indicating the tremendous increase in the comfort and pleasure of the citizens from the availability of motor vehicles. It can fairly be estimated that fully $10,000,000 was spent for automobiles that would not have been spent for any sort of conveyance except for the development of the automobile. What this signifies for the added facility of inter-communication among the residents of the smaller towns and farms of Kansas, and their improved social and commercial conditions, can scarcely be estimated. The value of automobiles has jumped in the 7 years from $1,056,913 to $16,298,763, and their number from 2156 to 48,261. There were no motorcycles listed in 1908—their value now is $425,913. The value of bicycles has dropped from $57,912 to $44,145. There has been a small increase in the number of horses in the 7 years, from 1,035,878 to 1,053,753, and a decline of 400,000 in the number of cattle, to 2,393,427. Mules have increased from 169,526 to 274,826—and these figures are well to keep in mind in the next 7 years, during which the recent exploitation of tractors for farm use will be having its effect.

New 4-Wheel Drive Truck

ST. PAUL, MINN., Aug. 25—The Twin City Four-Wheel Drive Co. has bought the J. L. Ware patents for trucks. The company is capitalized at $500,000 and opened temporary quarters at 2324 University Avenue. The company has 200 ft. frontage of property in the vicinity, and plans are being drawn for a three-story office and factory building. Officers elected are: President, J. L. Ware, Minneapolis; vice-president, T. J. McDermott; treasurer, F. J. Drew, Minneapolis; secretary and general salesmanager, M. T. Roche. It is the intention to have trucks ready in 1916.

Russell Plant Making Shells

TORONTO, ONT., Aug. 20—The Russell Motor Car Co. of Canada has started the manufacture of shells for the British Army, a contract having been signed through the shell committee in Canada. This order will keep all the available plant working to capacity until about the end of the year.

Federal Rubber Holds Outing

MILWAUKEE, WIS., Aug. 23—Eight thousand two hundred and fifteen persons attended the annual outing given by the Federal Rubber Mfg. Co., Milwaukee, to its employees and their families at Waukesha Beach on Aug. 21. It was the largest outing ever given by the company, and one of the largest crowds that have ever attended a picnic given by any Milwaukee industry to its forces. It required eighty-two large interurban street cars to convey the crowd to the beach.

Hollier 8 to Double Output

Buys Plant of Harris Bros., Chelsea, Mich.—To Build 20,000 Cars

DETROIT, MICH., Aug. 25—*Special Telegram*—The Lewis Spring & Axle Co., Jackson, Mich., manufacturer of the Hollier eight, has purchased from Harris Brothers Co. the plant at Chelsea, Mich., which was formerly occupied by Flanders Mfg. Co., for the manufacture of motorcycles. The plant is completely equipped with machine tools, and can be put into manufacturing condition easily. The Lewis concern intends manufacturing complete cars both in this new plant and in main factory at Jackson. Purchase will practically double the Hollier output, making it possible to manufacture from 20,000 to 25,000 cars in the two plants.

Hamilton Beach Co. Will Build

RACINE, WIS., Aug. 21—The Hamilton-Beach Co., Racine, Wis., manufacturing small electric appliances of all kinds, will break ground in about 10 days for a plant of its own on High Street and the North-Western tracks at Racine. The company has been occupying leased quarters in the works of the F. J. Greene Engineering Works for several years, and recently was obliged to take additional space in the Racine Stool Co.'s plant because of an unprecedented rush of orders. The decision to build a plant of its own followed the receipt of several large contracts for electric motor devices from the automobile and sewing machine industries. Frederick Osius is general manager. The Green works, which have much to do with the automobile industry, will immediately occupy the space vacated by the Osius concern.

Globe Seamless Tubes Co. Adds 100 Men

MILWAUKEE, WIS., Aug. 25—The Globe Seamless Steel Tubes Co., Milwaukee, a large producer of steering gear tubing, boiler flues, axle shafts, driveshafts, etc., has added 100 men to its forces and extended its schedule to a 24-hr. day to meet the extraordinary demand for its goods. The principal source of the demand is from the motor car and farm implement industries.

7000 Cars in Manitoba

WINNIPEG, MAN., Aug. 20—Over 7000 automobiles have been registered in Manitoba this year, according to returns at the Parliament Buildings. This represents a considerable increase over the number registered during the same period last year.

Perlman Wins Decision in Long-Contested Demountable Rim Patent Suit

Court Decides Patent Shows Invention—Declares Standard Welding Co.'s Rim Infringes and Issues an Injunction—Orders Accounting

NEW YORK CITY, Aug. 19—Judge Hunt yesterday handed down a decision in favor of Louis Perlman in his suit against the Standard Welding Co., charging infringements of claims 8, 11, 12 and 13 of patent No. 1,052,270 covering demountable rim construction. The Court issued an injunction restraining the Standard Welding Co. from making or selling rims alleged to infringe Perlman's patent and ordered an accounting of the concern's profits therefrom.

Suit Filed in 1913

The patent No. 1,052,270 involved in the suit, which was filed Oct. 7, 1913, in the United States district court for the Southern district of New York, was issued to Perlman on an application filed June 29, 1906, which was a continuation of and substitute for an application filed May 21, 1906. The object of this patent, as outlined in Judge Hunt's opinion, was to provide "a demountable rim sustaining a tire capable of ready application to and removal from a fixed rim and felly of a wheel, the demountable rim being so constructed as to facilitate application and removal of the shoe. Means are provided for firmly and rigidly retaining the demountable rim on the fixed felly and rim while in use. The fixed rim has an annular flange on one edge. There are threaded apertures in the body of the fixed rim intermediate at its edges through which are threaded bolts formed with a frusto-conical entering end. The demountable rim, which is slid onto the fixed rim from the flangeless side of the latter, has conical or frusto-conical apertures into which these bolts enter and lock the demountable rim firmly in place. Locking nuts prevent the loosening of the bolts. The bolts serve as connectors between the wheel body and the demountable rim, and are adapted to exert outward pressure on the latter. The demountable, or tire-carrying rim, is made in two sections, each of which is cut away for a portion of its thickness, forming an annular shoulder, and one of which overlaps the other for the width of the cut-away portion, with the free edge of each lapping portion engaging the shoulder of the other. These shoulders are secured together by screws. Each section has at its outer edge a clincher flange curved to produce an annular groove to receive the annular beads of the tire shoe. The demountable rim has an aperture for the valve stem and the fixed rim and felly have a notch into which the stem enters. Short-stem lugs designed for use in connection with a detachable operating tool are employed to engage the tire tool and press it into position with its beads on the grooves of the flanged edges of the rim. The tire-carrying rim is of such diameter as to be easily slipped over the fixed rim, the valve stem as it enters the notch in the fixed rim serving as a guide for the proper positioning of the demountable rim on the fixed rim. When the radial bolts are screwed into the conical openings, and the nuts are tightened, the demountable rim is fast on the wheel. The bolts cause the demountable rim to be moved radially away from the fixed rim and also laterally against the annular flange of the fixed rim. A witness of the plaintiff testified that the bolts also serve to prevent the demountable rim from creeping or rotating upon the body of the wheel."

Perlman's Contention

According to the opinion, Perlman's contention was that each of his locking elements consists of a wedge acting against an inclined space of a demountable rim and driven by a power element which anchors the wedge to the wheel; that the fact that the inclined space is that of a conical opening is merely an incident not altering the dual action of the locking element; that the wedge is the tapered end of a bolt, and the bolt itself the power means; that the locking means consists of a series of wedges and that the bolts which carry the wedges are the actuators; that each bolt in the Standard Welding Co.'s device is threaded through the wood felly and fixed rim and has a movable rim which actuates the wedge and that there is but a reversal of parts with the same functions attained in the same way as with the movable bolt in a fixed nut actuating a wedge; that the immediate actuator of the wedge in the Standard Welding device is a nut threaded on the bolt and that there is no substantial distinction between moving a wedge by threading a bolt through a stationary nut, as in the Perlman device, and moving a wedge by threading a nut along a stationary bolt as in the Standard Welding construction.

Claims of the Defense

The Standard Welding Co., contended that in 1906 and 1907 with other manufacturers of automobile wheels and rims in this country, it began to make what is known as the "Old Style Continental Demountable Rim," the characteristic features of which are substantially those of the exhibit introduced by Perlman as the Standard Welding Co.'s wheel. The company also stated that the construction of this wheel was an adaptation of one previously produced commercially in Europe and particularly in France where it was known as the Vinet demountable wheel. The Standard Welding wheel has ordinary spokes and wood felly and a fixed metal felly band with an upturned flange on the inner side. There is an opening in the felly and band to receive the tire valve stem. The clincher demountable rim has a block fitting between two plates on the fixed rim so that they will not creep. The demountable rim has a series of holes for nuts for short-stem lugs and also with a valve stem hole. There are eight locking devices, these consisting of a bolt and a metal wedge, the bolts passing axially through the wood felly and each having a head on its inner end so shaped as to prevent its rotation. There is a nut on the outside end of each bolt. The wedges go between the demountable rim and the fixed rim and exert an inclined pressure upon the demountable rim radially away from the wheel body, spacing it from the fixed rim, and also press it laterally against the flange at the other end of the fixed rim. The wedges are propelled by threaded bolts, the immediate actuators being a nut threaded on a bolt.

Similarity of Construction

The Court ruled that "the same result is accomplished in both devices, a demountable rim is supported on a small amount of surface and is capable of ready application and removal, and yet is firmly locked on the fixed rim while in use. While in the case of one there is a bolt with a frusto-conical end which enters a conical cavity in the demountable rim, and in the other (a) a bolt which enters the felly axially and (b) a wedge plate, in each there is produced this effect: Radial pressure outward from the wheel body, and lateral pressure against the curved flange of the fixed rim is exerted on the demountable rim. The demountable rim of the defendant, like that of the plaintiff, is of rolled sheet metal, comparatively thin, capable of an amount of distortion, yet sufficiently rigid to carry the full load between the points of support. Again, the demountable rim of the defendant is cylindrical, like plaintiff's, is made so as to have certain spaced inclined surfaces engaged and locked by small wedges like plaintiff's and provided with locking wedges for engaging the rims at spaced points, the wedges being constructed to present the least amount of surface in contact with the rim.

"I can perceive no distinction in function between the two wheels and as a fact the question that presents itself is whether or not such a similarity exists between the patented device and the defendant's wheel to sustain the claim of infringement."

The Short-Stem Lug

The Court then takes up the question of invention in the use of the short-stem lug by Perlman, pointing out that long-stem lugs had been in use for some time previous to his conception of the possibility of the use of the short-stem variety by the use of a detachable handle and comes to the conclusion that "the device of Perlman was a practical solution of the problem of replacing a deflated automobile tire in a quick and easy way." The Court also mentions the early activity of Perlman about 1900 in endeavoring to devise a way of facilitating tire replacement on the road and reviews the steps of his invention, taking out of patent, etc. In regard to the alleged prior art cited by the defendant, the Court ruled that either of these were foreign to the matter or not of such a character as to invalidate Perlman's invention. As for Q. D. rim devices, the Court states that these are based upon having a close, continuous bearing contact with all possible surface of the tire against the bed, whereas the principle applied in the demountable rim art is just the reverse.

In reference to the French patent to Vinet, No. 347,651, issued Nov. 4, 1904, the Court says, "The plaintiff should not be defeated by reference to the Vinet patent because the evidence convinces the Court that the plaintiff has proved his invention as antedating the foreign publication of date March 18, 1905."

The opinion continues, "the evidence satisfies me that in 1903 plaintiff completed, and in 1904, in a successful way, operated his invention."

In reference to the steps taken by Perlman to obtain recognition from the patent office, the opinion says, "Many claims were presented and many canceled and yet I find no claim of the same scope as the claims of the patent and none, which, being conceded to be non-patentable, can be construed as an estoppel against Perlman's right of protection against infringement by a rim wheel, demountable, embodying locking elements placed to press the demountable rim radially outward and thrust it at right angles to the radial action in the final or operative position and to lock there tensioned during use, but capable of being readily released from tension, allowing the rim to assume a loose position before it starts to move off the wheel."

"I find claims 11, 12 and 13 of Patent No. 1,052,270, which are directed to the demountable rim locking means and the combination thereof, with a wheel body and its demountable rim, are infringed.

"Claim 8 relating to the wedge-shaped clamping plate for clamping the clincher bead of a tire, and the combination therein set forth, is for a device used with defendant's structure when the apertures and recesses of defendant's demountable rim are made use of at all. The evidence shows that the depressed portions in the median line of defendant's demountable rim, each of which is apertured centrally, is of no utility except when employed for receiving the nut of a short-stem lug with the stem of the lug extending through the aperture, and the apertures are used in no way other than to receive a short-stem lug. The combination set forth in Claim 8 is present in the parts furnished by the defendant as if the complete combination were sold by it.

Features of Invention

"Finally, Perlman's patent shows invention, completed by him in 1903. Two distinct features mark the inventions: (1) The demountable rim combination with its locking means; and (2) the short-stem lug combination for clamping the tire to the demountable rim. The invention claimed was based upon a provision for a demountable rim which is loose on the wheel when applied, but is locked by locking means which may be unlocked and thereby may restore the loose condition before commencing removal. This same combination has been adopted by defendant and the same combination as disclosed and claimed in the patent in suit has been taken. Plaintiff disclosed to the defendant the patented invention before defendant began to manufacture demountable rims.

"The evidence requires the finding of infringement and the granting of an injunction and accounting in usual form."

Claims in the Suit

The claims of the patent involved in the suit, 8, 11, 12 and 13 read as follows:

"8. The combination of a demountable rim having radially disposed clencher flanges, a tire shoe having beads engaging said flanges, a wedge-shaped clamping plate bearing against said beads and adapted when moved to force said beads against said flanges, and means accessible from the inside of the rim for drawing the clamping plate radially toward the rim."

"11. The combination, with a wheel body, of a demountable rim therefor, a locking element, have a tapering portion, that is adapted to be moved radially and to thereby exert pressure against the rim outwardly radially of the wheel body, and to act as a wedge laterally, said locking element having an engagement with the wheel body whereby it may be moved radially of the wheel body."

"12. The combination with a wheel and its felly of a demountable rim therefor, a locking element having a tapering end that is adapted to be moved radially and to thereby act as a wedge laterally and exert pressure against said rim radially of the wheel, said locking element having a threaded engagement with the wheel structure whereby it may be moved radially of the wheel."

"13. The combination with a wheel body, of a demountable rim therefor, and a locking element, having a tapering portion, that is adapted to be moved to exert pressure against the rim outwardly radially of the wheel body, and to act as a wedge laterally, said locking element having an engagement with the wheel body."

Detroit S. A. E. Is in Own Home

Headquarters Large Enough for Committee, Though Not for Section Meetings

DETROIT, MICH., Aug. 23—The Detroit Section of the Society of Automobile Engineers, though it has been located in its own headquarters since May, is making public announcement of the fact that its permanent headquarters are at 601 Kerr Building. While the new office is not large enough for the section meetings, it is of sufficient size for any committee gatherings, and a permanent office of this kind is of great value, the section previously having no established headquarters.

This is the first section to have a home of its own, and also one of the few to have a salaried secretary, the financing of this as well as the office being carried on by private subscription among the manufacturers.

New 1-Ton Garford

NEW YORK CITY, Aug. 24—The Garford Motor Truck Co., Lima, Ohio, has brought out a new 1-ton truck similar to the 1½-ton model. It differs from the worm-driven 3000-lb. vehicle only in the size and strength of principal parts. The main characteristics of the 1-tonner are: capacity, 1 ton; price, $1,450; wheelbase, 120 in.; tires, front, 34 by 4½; tires, rear, 36 by 4; drive, worm. The motor is located under the hood with the radiator in front and is the same one used in the ¾-tonner. It is mounted direct on the main frame and is assembled with the clutch and gearset in a unit power plant. The motor develops 19.6 hp., its bore being 3½ and stroke 5⅛.

Smith with Chalmers

DETROIT, Aug. 23—F. H. Smith, formerly with the Studebaker Corp., and later northwest district manager for the Hudson Motor Car Co., has joined the Chalmers Motor Co. as special representative.

Borie Heads Driggs-Seabury

Stevenson Board Chairman—Permanent Officers and Directors Elected

NEW YORK CITY, Aug. 25—The permanent officers and directors of the Driggs-Seabury Ordnance Co. have been elected as follows: Chairman of the board, John Stevenson, Jr.; president, A. E. Borie; vice-president and general manager, W. L. Wright; treasurer, H. H. Myers; and secretary, S. B. Pratt.

The board of directors is: A. E. Borie; G. W. Burleigh, director Lackawanna Steel Co.; E. C. Delafield, vice-president Franklin Trust Co.; James Imbrie, Wm. Morris Imbrie & Co.; J. C. Jay, Jr., vice-president Pennsylvania Steel Co.; John Stevenson, Jr., Sharon, Pa.; J. A. C. Stevenson, Sharon, Pa.; and W. L. Wright.

NEW YORK CITY, Aug. 19—In addition to the $500,000 non-cumulative 7 per cent first preferred, $500,000 non-cumulative 7 per cent second preferred and $3,000,000 common stock, the Driggs-Seabury Ordnance Co. has an authorized issue of $1,500,000 first mortgage 6 per cent serial bonds.

These bonds mature serially, $300,000 each year, starting Aug. 1, 1916, and are callable at 101 and interest.

Two series, 1916 and 1917, amounting to $600,000, have been sold at par. The remainder, $900,000, are being offered for subscription at 97 with a 10 per cent bonus in common stock. The second preferred stock is convertible at par into common stock at any time.

Cleveland-Ford Tire Co. Elects

CLEVELAND, OHIO, Aug. 19—J. L. Smith was elected president and P. C. Remick vice-president of the Cleveland-Ford Tire Co. at a recent meeting of the directors. Other officers elected were W. J. Leinbach, secretary-treasurer, and A. E. Pearce, general manager. The directors named were J. L. Smith, P. C. Remick, W. J. Leinbach, F. L. Kerr and A. E. Pearce. Work on the new factory, to be located at the north end of Benefit Street, Ashtabula, Ohio, will probably begin in a few days. The main building is to be 300 by 46 ft., with a wing 60 by 50 ft. It will have two stories and a basement. There will be a one-story power plant, 40 by 100, at one end of the main structure.

The first section of the building, which will be started soon, will be 170 by 46 ft., with a wing 60 by 15 ft., and a power plant 40 by 50. The building will be of brick and reinforced concrete.

Although the name of the company indicates that it will make nothing but Ford tires, this is not the case. Molds and cores for the larger sizes of tires have already been ordered, and it is thought this stock will be available within 60 days. The sizes to be manufactured will run up as high as 37 by 5½.

Overland May Show 1915 Gain of Nearly $3,000,000

TOLEDO, OHIO, Aug. 23—It is expected that earnings of the Willys-Overland company for 1915, its fiscal year having closed June 30, will show a gain of nearly $3,000,000, or 55 per cent over the $5,231,274 earned during the 1914 session. That would mean 35 per cent to 38 per cent on the common. In the last 2 months profits have been at the rate of over 50 per cent on the common stock.

Market Changes Few

NEW YORK CITY, Aug. 24—News of the sinking of the Arabic on Friday was the cause of a quick drop in prices in the markets which, although somewhat lower, were not unusually severe. The decline was soon checked, however, when it was learned that the passengers and the crew had been saved and the principal products which were under pressure on the first reports recovered sharply to within small fractions of the prices that were in force. The steel markets were somewhat quiet this the only gain taking place on W day when it rose 50 cents abov week's rating and continued thi throughout the rest of the week copper markets were easier. Co able interest was shown by the copper producers in the prospect diplomatic crisis with Germany result of the sinking of the Arabi copper producers held strong hop better inquiries from munition ma turers, and while they are assid quoting 17 cents and up for the n is a well-known fact that the fi will bring the price nearer to 16 Tin markets were very weak whe ing each day a downward tren noticed and at the end of the we $1.25 less than Monday's rating rest of the metal markets ma changes. The oil and lubricant kets were a bit unsteady. Wed Kansas crude oil rose 5 cents Thursday rose 10 cents more, the total rise 15 cents. Cottons was fairly active, closing lower ever. There was no improvement consuming demand while the s situation lent further discoura regarding the export situation. was a decline of 20 cents at the the week. There was no change rest of the markets.

Security Prices Are Dull

—

Loss of Arabic Checks Optimism — Losses Range from One-Half to Fifteen Points

NEW YORK CITY, Aug. 23—The heaviest decline in stocks since the Lusitania was sunk took place at the opening of the market to-day when news of the sinking of the Arabic was heard. While many stocks broke two to fifteen points the heaviest loss was sustained in the common stock of the Willys-Overland Co. which dropped fifteen points. Nervousness was evident throughout the commission houses, but heavy buying left the price list well above the lowest figures. Naturally, the stocks that had scored the most extensive advances in recent days were the heaviest sufferers.

Heavy Declines

Studebaker, which had risen more than thirty points in ten days, dropped back seven and a half points in the first sale, and General Motors fell nine points in a few days. Goodrich went down five points. In many respects the resiliency of stocks under the stress of bad news brought encouragement to partisans of the constructive side of prices. The rapid rise of certain war issues, stocks of companies which had received large orders for munitions, had called forth from market observers earlier in the week warnings that unfavorable developments might easily cause a serious setback. The decline was not considered of a grave nature, and the latter action of prices showed that urgent selling had quickly been checked.

The Detroit market was unsettled throughout the last hour of trading and was subjected to renewed pressure wholly apart from the Arabic incident. Reo Motor Truck Co. advanced from ninety-five to 107 points, a total gain of twelve. The rest of the active stocks remained quiet. In the inactive stocks the Ford Motor Co. of Canada made a gain of fifteen points. Atlas Drop Forge Co. rose two points. The bond markets were quiet with no trading in sight.

—

Ford's Washington Plant Started

WASHINGTON, D. C., Aug. 22—Work of excavating for the foundations for the new assembly plant of the Ford Motor Co., at Pennsylvania Avenue and John Marshall Place, has been started. The building will be six stories in height and will be 139 ft. on John Marshall Place and 165 ft. on Pennsylvania Avenue. The cost will be about $400,000. Pending the erection of the building the Ford Motor Co. has taken two floors of the Union Garage.

—

8200 Men on Packard Payroll

DETROIT, MICH., Aug. 20—The Packard Motor Car Co. is now employing a greater working force than ever before in its history. The payroll now totals about 8200 men, who are entirely devoting their attention to the various phases of the production of the new twin six and to the manufacture of the Packard truck.

Mass. Headlight Report

No Discrimination in Matter of Design—Height Limit 4 Ft.—10 Ft. in Front

BOSTON, MASS., Aug. 24—At a meeting of the advisory committee selected to aid the Massachusetts Highway Commission in framing some legislation to govern motor headlights the committee today busied itself with a draft of a report its secretary wrote out following the last meeting a week ago. It was voted not to recommend any particular device to the Highway Commission, but to make a general recommendation that would allow the use of devices of various kinds so that the owner of a car need not go to a lot of expense to equip his machine, and visiting motorists would not be held up relentlessly. Members of the committee told of experiments they made with ground glass, pieces of tissue paper, and paint on bulbs and lenses showing that it would be possible to alter the rays and still give light to see the road.

One of the main points discussed was the lighting of the sides of the road. So it was voted to embody this feature in the report. Another matter discussed was the use of the searchlights that are being used now by some motorists and which may be operated to swing up, down and all around anywhere. It was voted that the regulation should cover their use to prevent their being operated promiscuously other than to find the road at night. The report was finally put into shape and all five members of the committee signed it and it was forwarded to the Highway Commission. No member of the committee is identified with any devices so their report will carry some weight.

The Report

The report drafted by the committee and those who signed it are as follows:

"We, the undersigned, comprising the advisory committee in motor headlights, in the interest of public safety recommend a regulation by the Massachusetts highway commission prohibiting the use of any headlights and searchlights which shall project their rays to a greater height than 4 ft. along level ground; and requiring such lights to illuminate the ground from 6 to 10 ft. from each side of the car at a point 10 ft. in front of the vehicle.

"From our investigations we find that to comply with such regulations will not impose a hardship upon any owner of a motor vehicle, for there are innumerable inexpensive devices available for lowering the light rays, some of which may be easily made at home in a few minutes."

J. H. MacAlman, President Boston Automobile Dealers Assn. Prof. C. E. Stewart, Franklin Institute. Dr. Herbert T. Boyd, Bay State A. A. W. G. Renwick, Massachusetts State A. A. Lawrence G. Brooks, Highway Safety League.

The report was forwarded to the Highway Commission this afternoon. The commission will put some such regulation in force, and it will become a State law so that no city or town may then pass ordinances on the subject. It will not go into effect, perhaps, until late in the fall after the touring season is over so it will not affect visiting tourists to any great extent.

—

Springfield, Mo., Passes Glare Ordinance

SPRINGFIELD, MO., Aug. 20—The city council this week passed an anti-glare headlight ordinance providing penalties of a fine from $1 to $100 or jail sentence of from five to sixty days or both.

The new law provides that the uppermost ray of light from an automobile lamp must not be more than 6 ft. above the ground at a point 100 ft. or more ahead of the machine. The ordinance further provides that the center ray of light from any automobile lamp shall not deviate under any circumstances from a line parallel with the center line of the automobile. The latter clause prevents the use of revolving searchlights.

—

Seattle Taxi Ordinance Wrong

OLYMPIA, WASH., Aug. 16—The Supreme Court, in a decision finds that the Superior Court of King county at Seattle, was in error when it enjoined taxicab companies from stationing cabs and soliciting passenger and baggage traffic anywhere except in a restricted area specified in a Seattle city ordinance.

The city passed the ordinance naming the streets near depots and wharves where taxis could solicit business, and resorted to wholesale arrests of drivers when taxicab companies insisted on soliciting near depots on private ground owned by transportation companies, with permission of the companies.

—

100 Arrested for Headlight Glare

ST. LOUIS, MO., Aug. 20—One hundred automobile drivers and owners were arrested within a few minutes during one night here recently and were charged with violation of the new anti-glare ordinance. The first six of these to be tried in the police court were fined $6 and costs, but in each case the fine was stayed on the payment of court costs and the promise of the defendant never again to violate the ordinance.

Abbott Creditors Get Dividend

Amounts to 34% and Makes 90% Paid—10% More Coming

DETROIT, MICH., Aug. 20—Creditors of the Abbott Motor Car Co. have received a dividend of 34 per cent on their claims from the Security Trust Co., trustee. This makes a total of 90 per cent that has been paid back to the creditors, and within a short time another 10 per cent is to be distributed, making 100 per cent settlement.

This state of affairs was brought about by the Abbott company giving a mortgage in favor of its creditors. Then the Consolidated Car Co. succeeded the Abbott company and assumed this mortgage, agreeing to pay the trustee 40 per cent of its gross receipts monthly. By this method the mortgage is practically wiped out, and the Consolidated concern is said to be operating on a firm financial basis.

—

Detroit Body Creditors Meet Aug. 27

DETROIT, MICH., Aug. 20—Creditors of the bankrupt Detroit Body Co. will meet on Aug. 27 to take action on the petition of the Security Trust Co., trustee, to consider certain offers of settlement made by two concerns which are creditors of the Detroit Body Co. One of these, Richard, Halstead & Quick, has instituted an attachment suit on the property of the bankrupt, but it agrees to take 50 per cent and discontinue this attachment suit. The other, the F. B. Ensley Co., for which the Union Trust Co. is acting as receiver, has agreed to take 60 per cent of its claim and release the money it has garnisheed. The Security Trust Co. recommends that the former offer be rejected and that the latter be accepted.

Jitney Common Carrier in Wis.

—

Placed Under Control of Utilities Board — Must File Bond and Carry Sign

MILWAUKEE, WIS., Aug. 21—Wisconsin's jitney bus law is now a law, Gov. E. L. Phillip having given his approval to Chapter 546, Laws of 1915, passed Aug. 18. The bill places jitney buses under the control and regulation of the railroad commission of Wisconsin, commonly known as the State public utilities board.

The act provides that every firm, person or corporation operating any motor vehicle for hire and affording a means of local, street or highway transportation similar to that afforded by street railways is declared to be a common carrier, and is required to furnish adequate service at reasonable rates and to operate over such general routes or within such territory, and during such hours as may be reasonably required for the accommodation of the public.

In brief, the act requires that every person, firm or corporation operating any motor vehicle for the purposes above described, must file with the railway commission an indemnity bond issued by some authorized surety or indemnity company providing direct liability for all damages, not exceeding $2,500 for any one person or $5,000 for any one accident that may be recovered against the operator of such vehicle. If any such bond so filed shall become inoperative, such vehicle shall not be operated until a bond meeting the requirements shall have been filed.

The bond is to be accompanied by an application for acceptance by the railroad commission, stating the name and residence of the applicant, the general route, or the territory over which it is proposed to operate the motor vehicle described in the bond, the proposed hours of such operation, and the rate of fare to be charged for carriage therein. The commission is to determine if the route, territory, hours of operation, character of service and the rates are reasonable and adequate.

The commission is required to issue certificates and the holder must plainly mark his vehicle with the words, "Bonded Carrier" in letters not less than 2 in. high and lines not less than ¼ in. wide, followed by the number of the certificate. The mark may either be painted on the sides of the vehicle or fastened securely in a conspicuous place on the sides.

Carrying Capacity Limited

The law prohibits any such vehicle from transporting a larger number of passengers than the number specified in the bond as the carrying capacity. Every city, village or township within or through which any such vehicle may be operated is permitted to require local consent for its operation, and as a condition of such consent it may be required that operators pay a reasonable compensation for the repair and maintenance of pavements and bridges; compensation for the regulation of street traffic or any other expense occasioned by the operation of such vehicle.

The law provides a fine of not less than $10 nor more than $100, or a county jail sentence of not less than 10 days nor more than 90 days for violation of the act.

The Independent Jitney Bus Assn. of Milwaukee, the largest and strongest organization of jitney operators, has accepted the new law and will work under its provisions at once without protest.

—

Thompson Jitney Law Upheld

LOCKPORT, N. Y., Aug. 21—The Thompson jitney law has been upheld in this city by Justice C. H. Brown, of the Supreme Court, who has granted the Public Service Commission an injunction restraining the Lockport-Olcott Motor Bus Line from operation until it obtains a certificate of necessity from the State body and a license from the city of Lockport.

The court holds that the motor bus line is a common carrier for hire within the city limits and is thus amenable to the statute.

—

N. D. Registrations Number 23,175

BISMARCK, N. D., Aug. 21—In the State of North Dakota more than $20,000,000 is invested in automobiles. Up to July 31, 1915, State Secretary Thomas Hall reported 23,175 cars registered, with expectation of 1000 more before the end of the calendar year.

As compared with the same period in 1914, the gain in automobiles registered is 6433. Fees received from automobile registration this year to date are $69,525. Last year the amount was $53,793.

In 1914, after July 31, only 605 cars were registered, but the outlook for 1915 is much better. The population of the State is estimated at 625,000, or there is one car for every twenty-six persons.

Deaf Mute Cannot Drive in New Jersey

TRENTON, N. J., Aug. 20—A precedent has been established by the New Jersey Department of Motor Vehicles, which has revoked the driver's license of C. H. Over, Jr., of Asbury Park, a deaf mute. The ruling states that a deaf mute is not competent to operate an automobile. The use of special mirrors mounted on each side of the windshield of his car, so that he could see cars approaching from the rear on either side, was not sufficient.

35 Cars on Wisconsin 5-Day Tour

Business Replaces Competitive Feature — Schedule Calls for 22 M. P. H.

MILWAUKEE, WIS., Aug. 23—The 5-day sociability and business tour of the Milwaukee Automobile Dealers, Inc., started from the Hotel Wisconsin at 8 o'clock this morning. Twenty-five cars, including pilot, pacemaker and relief cars, were checked out on schedule time, and at least ten more cars are starting from Milwaukee to-day and to-morrow to join the tourists along the route.

As reported in THE AUTOMOBILE last week, the principal reason for the tour is to boost the annual Wisconsin State Fair, to be held at West Allis, Milwaukee, from Sept. 13 to 17, inclusive. Another reason is that no annual State reliability tour is being held this year, as for 5 years past, and the dealers require some fitting substitute to fill the gap. A third reason is that this is the psychological moment for stirring up and stimulating interest in the 1916 car of America, now out and ready for delivery.

The tour takes in the route traveled during the 1913 reliability tour of the Wisconsin State Automobile Association. The schedule is fast and averages about 22 m.p.h., allowing a maximum of ½ hr. at important points for the inspection of the cars by townspeople. At luncheon stops and night controls more time is given for this purpose. There is no competitive feature, and the tour is for show purposes only.

—

Rector Marmon Distributor in Northern California—Parker in Washington

INDIANAPOLIS, IND., Aug. 21—The H. B. Rector Co. has contracted to handle the Marmon exclusively in San Francisco and in the northern California territory. The agency for the Marmon car was formerly held by Walter C. Morris. Mr. Rector, the head of the new company, was sales manager for the Pierce-Arrow Pacific Sales Co. for several years.

A contract has also been closed with the Parker Motor Car Co. of Seattle as dealer for the Marmon in the State of Washington. The Parker company has been agent for the Pullman for several years.

—

Denver Co. to Distribute Hupp and Locomobile

DENVER, COL., Aug. 20—The Hupp Motor Sales Co., a $60,000 corporation, has been organized by W. R. Woods, P. E. Chamberlain and F. E. Simonton, Denver, to distribute the Hupmobile in Colorado and adjacent Rocky Mountain territory. They have opened temporary quarters at 220 Sixteenth Street, and are erecting a new building at 1260 Broadway. Belmont Walters, for some time traveling representative of the Hupp Motor Car Co., Detroit, is now employed by the new distributing agency to cover Colorado and a part of New Mexico and Wyoming. The new firm has also secured the agency for the Locomobile, which had not been represented in this territory for about 3 years.

—

Trying to Unionize Boston Repair Shops

BOSTON, MASS., Aug. 21—The labor officials are making a determined effort to unionize all the motor repair shops in Boston. For some time the organizers have been working quietly and they have succeeded in getting a number of places unionized. Other shops are partly so. The only demand they have made so far is for an 8 hr. day.

Some of the dealers have held out, however, and they intend to keep an open shop if possible. But the labor men are working along outside lines to accomplish their ends. In the case of one big distributor who sells cars and trucks and who refused to bother with the union, the officials went to some of the big concerns that bought his trucks. One of these was a brewery, and the beer people were told that they had better install their own repair shop and have it run under union conditions. This was done. Then they found a shop that was unionized, and to other owners of trucks whose employees were unionized, they sent word to have the repairs made at the union shop. So the service station of the dealer has been losing the repair trade on the trucks right along. This plan is being followed with other concerns.

—

Needham Tire Co. Busy

NEEDHAM, MASS., Aug 22—At the plant of the Needham Tire Co. the men are now working 16 hr. a day and plans are under way to make it a two-shift force. The company has had to install new machinery and the orders have been piling in so fast that the makers are working hard to catch up.

The company has been in existence about a year, but it has thrived so that plans have been made to erect a new four-story structure addition, and capital is available now for increasing the facilities to any extent that the officials desire.

Skilled workmen were hard to secure, and the factory officials decided to develop its own men and apprentices. In this way the plant has grown, and now an additional 1000 miles is being added to the guarantee.

Plan Boston Dealers' Syndicate

To Finance Dealers and Store Cars Pending Delivery to Purchasers

BOSTON, MASS., Aug. 23—Plans are under way to form a syndicate in Boston that will finance motor car dealers and store their cars pending the delivery of them to purchasers. W. J. McDonald, who is a real estate operator, is forming the syndicate, and the first move was to purchase property in Boston containing 275,000 sq. ft. It backs up on the Boston & Albany railroad. The plans call for the construction of an immense building with some 200,000 sq. ft. of floor space, and which will be capable of accommodating 1000 cars. It will be one-story, with plans for additional stories if needed later.

Spur tracks and loading platforms will be put in so that cars may be run right in from the freight trains and stored there. On their receipt the agents will be notified and then they may borrow money on the cars to finance their deals instead of going to banks. The warehouse will be fireproof and thoroughly modern. The syndicate will have a capitalization of $500,000.

At present some of the dealers are paying high rent for storage in buildings far removed from their plants, and this method will allow some of them to get along with less space in their regular headquarters, the space thus vacant being available for salesrooms or service departments. The location of the new warehouse is convenient, for it is not far from the big service station of the Packard, which marks the Western boundary of the motor district on Commonwealth Avenue. Full particulars have not been given out yet by Mr. McDonald, but it is expected that the plans will all be made public shortly. Stock in the enterprise may be offered to some of the dealers.

—

Robertson Not to Enter Racing Field

NEW YORK CITY, Aug. 20—A report that George Robertson was to return to the automobile racing field, and was entered in the coming meet at Sheepshead Bay, is without any foundation.

—

Speedway Practically Completed—Race May Begin at 1 P.M. —Denver Tour Postponed

MINNEAPOLIS, MINN., Aug. 21—With the Twin City Speedway practically completed, interest in the preliminary trials, Aug. 28, 30 and 31, is aroused. A nominal fee is to be charged spectators. A circuit of the 2-mile concrete track at a speed of 80 m.p.h. is necessary for entry in the 500-mile World's Derby on Sept. 4. The request that the race begin at 1 p. m. instead of 10 a. m. for the benefit of tradespeople and office clerks is being considered.

Entries to Aug. 21 were:

Car	Driver
Ogren	Tom Alley
Sebring	O. F. Haibe
Duesenberg	Ed. O'Donnell
Duesenberg	Pete Henderson
Duesenberg	Billy Chandler
Stutz	Earl Cooper
Stutz	Gil Anderson
Peugeot	D. Resta
Peugeot	Ralph Mulford
Peugeot	Robert Burman
Peugeot	John Aitkin
Peugeot	Howard Wilcox
Delage	Barney Oldfield
DuChesneau	W. W. Brown
Mercedes	De Palma

Three F. R. P. cars are expected, also Sunbeam team.

—

Denver Reliability Tour Postponed 1 Day

DENVER, COL., Aug. 20—The 860-mile reliability and economy tour scheduled to start from Denver through the mountains Sept. 6, has been postponed to start a day later. The change has been decided upon because of several Labor Day events thought liable to interfere with entries for the run. The tour will cover 6 days, with noon and night controls at Hot Sulphur Springs, Steamboat Springs, Meeker, Glenwood Springs, Grand Junction, Montrose, Gunnison, Salida, Canon City, Pueblo and Colorado Springs.

The official sanction of the American Automobile Association has been secured, and the contest will be conducted according to the regular A. A. A. rules, with necessary modifications to admit a wider range of cars than would come under the strictly stock-car requirements.

—

Three Mercers for Corona

CORONA, CAL., Aug. 18—The Corona road race is to be held Nov. 20. This decision was reached at the final mass meeting held at Corona Monday night.

The committee appointed to raise the money to finance the race reported that all the stock had been sold with purchasers anxious to secure more than they had been allowed to buy.

were appointed and instructed to incorporate the new racing organization.

Three Mercers were entered as soon as it was announced that there would be a race. G. R. Bentel of Los Angeles, entrant of the cars, announced that Eddie Pullen, winner of the last Corona race would be on hand to defend his title at the wheel of a Mercer.

It was suggested at the meeting that the race be stretched to 400 miles but the project was not well received and while the committee has the right to lengthen the course, it is at present assured that the 1915 Corona classic will be a 300-mile event.

—

Fisher Resigns from Sheepshead Bay Corporation—Harkness His Successor

NEW YORK CITY, Aug. 24—Carl G. Fisher, president of the Indianapolis Motor Speedway and of the Sheepshead Bay Speedway, has resigned as head of the Sheepshead speedway and H. S. Harkness, prominent in the early racing days, has succeeded him. Mr. Harkness will be remembered for his record drive on July 12, 1904, up Mount Washington, N. H., in a Mercedes, when he negotiated the 8-mile hill in 24:37 3/5.

—

Three Duesenbergs for Narragansett

NARRAGANSETT, R. I., Aug. 19—Eddie O'Donnell, Willie Haupt and Peter Henderson, all driving Duesenbergs, are entered in the 100-mile race to be held on the opening event of the new Narragansett Park Speedway, Sept. 18. A Bugatti, owned by C. W. Fuller of Pawtucket, is the other entrant. It will probably be driven by George Hill.

—

2-Day Race Meet for Spokane

SPOKANE, WASH., Aug. 16—The Spokane Interstate Fair has set aside 2 days Sept. 13 and 14 for automobile racing on the fair grounds. The purses offered are $1,000 a day to be divided into two classes. One purse each day of $600 will go to professional drivers, and $300 each day will go to local drivers and the balance or $100 each day will go to the winners of feature events.

Jim Parsons in his Parsons Special, Frank Elliott in a Gordon Special, Fred Barsby and F. Stratton are entered.

The race will be run under the sanction of the newly organized Inland Automobile Assn.

—

1916 Kellogg Pump Design Unchanged

ROCHESTER, N. Y., Aug. 20—The Kellogg Manufacturing Co. of Rochester, N. Y., announces that its different models of Engine Driven Tire Pumps will be continued in their original design for 1916. The bearings in the new pumps will be lined with babbit, bronze having been used in the past.

The Kellogg company is building an

Cleveland Ford Buys Land—The Cleveland Ford Tire Co., Cleveland, Ohio, has purchased 4 acres of land at Ashtabula along the New York Central Railroad, foot of Benefit Street.

Parts Concerns Not Affiliated—The Auto Parts Co. of Chicago announces that it has no branch houses and is not affiliated with any firm in the United States using the same name.

Simplex Adds—The Simplex Automobile Co., New Brunswick, N. J., has awarded contracts for the construction of a two-story, 70 by 100 ft. addition to its plant. The estimated cost is $20,000.

McClurg Rubber Plant to Work—E. A. Crawford has been discharged as receiver of the McClurg Rubber Co., Coshocton, Ohio. The company is installing equipment and plans to start its plant within a very short time.

Rush Delivery Leases Plant—The Rush Delivery Car Co., Inc., Philadelphia, Pa., has leased the recently constructed four-story and basement building at 1007 North Front Street for the manufacture of commercial vehicles.

Firestone Issues House Organ—The Firestone Tire & Rubber Co., Akron, Ohio, has begun the publication of a new house organ, *The Firestone*. It is intended for circulation among all employees and includes the many branches throughout the country.

Touraine to Add—The Touraine Company, Broad and Huntingdon Streets, Philadelphia, Pa., manufacturer of the Vim truck, has had plans prepared for a factory building 85 by 250 ft. to be erected at the northeast corner of Twentieth Street and Montgomery Avenue.

Duff Extending—The Duff Mfg. Co., Pittsburgh, Pa., manufacturer of the Barrett lifting jack, is building an extension to the main plant, 150 by 125 ft. With the addition the main building will be 625 ft. in length and 125 ft. in width. All equipment has been furnished and is being equipped.

To Rebuild Howard Rim Plant—Plans are already under way to rebuild the plant of the Howard Demountable Rim Co. of Trenton, N. J., which was completely destroyed by fire on Wednesday of last week. It is proposed to enlarge the plant and to make the new building fireproof throughout. It is planned to resume operations in the new plant within ninety days.

Mogul Truck Builds—Increased orders have caused the Mogul Motor Truck Co., St. Louis, Mo., to erect a large assembling plant on Forest Park Boulevard, west of Sarah Street. This building will be a modern daylight factory, with every known modern appliance to facilitate the rapid assembling of motor trucks. This company has purchased enough ground west of this new building to enable it to erect an addition for storage and repairs, which it contemplates building in the near future.

Studebaker's Enameling Plant Progressing—The Studebaker Corp., Detroit, is soon to occupy its new building being erected for the enameling and stamping departments. This is a structure 320 ft. long by 70 ft. wide and four stories high. It is to be known as Plant 27, and adjoins the Plant 3 group of buildings. The most modern type of quantity enameling apparatus is being installed. Air in the enameling room is to be washed and the walls are to be specially prepared to catch any dust or dirt in the air. A large bank of enameling ovens will take care of the drying of the dipped metal parts.

Hartford Machine Screw Adds—Additions to the plant of the Hartford Machine Screw Co., Hartford, Conn., are rapidly nearing completion. In May several old buildings, including the offices, were torn down to make room for two spacious new buildings—one a six-story structure, 206 ft. long by 465 ft. wide, and the other a large two-story building with a convenient railroad siding which improves shipping facilities considerably. These two new buildings will give a total increase in floor space of about 80,000 sq. ft. In addition to housing the new general offices of the company, designs for furnishing of which contemplate the most modern and approved equipment and efficiency devices, the new buildings will afford space for extensive additions to the manufacturing facilities of the plant. It is expected that the new buildings will be completely occupied and running to full capacity by the first of September.

The Week in the Industry

McGonigal Office Mgr.—S. A. McGonigal has been appointed office manager of the Studebaker Corp., Detroit, Mich.

Retzel Assistant Manager—D. H. Retzel closely associated for some time with the Mott Wheel Works at Utica, N. Y., in an advertising and sales way, has been appointed assistant manager of the works.

Boyd Baltimore Mgr.—F. M. Boyd has been made manager of the Tire Mart, Baltimore, Md., recently opened at 1419 North Charles Street. Mr. Boyd was formerly with the Knight Tire Co. as sales manager. E. C. Heid will succeed him.

Baker, Ford Dealer, Resigns—The oldest dealer in point of service with the Ford Motor Co., Detroit, Mich., L. C. Baker, head of the Ford agency at Jacksonville, Fla., has retired. The agency will be converted into a branch under the management of F. P. Fariss of Atlanta.

Hayden Resigns—Don Hayden has resigned as district manager for the Saxon Motor Co. and joined the Higgins-Sutherland Motor Co., Indianapolis, Ind. This company was recently organized to handle the Hupmobile and Saxon cars, having forty counties on each car in the central part of the State.

Dealer Seattle Chevrolet Dealer—Frank Dulmage, until recently a prominent automobile distributor of Portland, Ore., has established the Northwest headquarters for the Chevrolet car at Seattle and opened sales rooms at 1400 Broadway. His contract calls for the distribution of 1500 of the Chevrolet cars in the Northwest this season.

Velie Export Heads K. C. Velie—E. D. Export is president of the recently formed Velie Motor Co. of Kansas City, which succeeded the Velie-Thorp Motor Co. The latter company has become the Thorp Motor Co. and continues at the previous location at 1506 McGee St. The Velie Motor Co. of Kansas City is establishing itself at 1616 McGee St.

Spokane Ford Dealer—H. O. Bell, who has been identified with the automobile business in Spokane for the past 9 years, formerly wholesale manager for F. Graves, Ford agent in Spokane, has secured the Ford agency for Missoula, Mont., and contracted to dispose of 300 cars for 1915 and 1916. Mr. Bell originally from Indianapolis, where he entered the automobile business under C. L. Fisher.

Motor Men in New Roles

Forbes Resigns—T. C. P. Forbes, who has been sales manager of the Monarch Motor Car Co., Detroit, has resigned that position.

Romig Kearns Sales Mgr.—Reide Romig has been appointed general sales manager of the Kearns Motor Truck Co., Beavertown, Pa.

Hines Is New Pres.—H. J. Hines is the new president of the Toledo Machine & Tool Co., Toledo, Ohio. He has been general maanger for many years.

Folger Marathon Tire Rep.—C. M. Folger has been appointed Southeastern representative of the Marathon Tire & Rubber Company, with headquarters at Atlanta, Ga., and will travel that section.

Stokes Goes to Boston—W. S. Stokes, formerly identified with one of the big advertising agencies in Chicago, has gone to Boston, Mass., to join the sales force of the Oakland Motor Car Co. and have charge of the retail sales.

Bell King Sales Mgr.—Kenneth Bell, who was formerly with the Pasadena Studebaker agency and later with the Love Motor Car Co., Washington, D. C., has been appointed sales manager of the Grace Motor Car Co., Pasadena, Cal., agent for the King line.

Blakeslee Heads Midgley Agency—The Midgley Tire & Rubber Co. of Lancaster, Ohio, has closed with the Crescent Automobile Co. of Jersey City to represent it in the northern half of New Jersey. George Blakeslee is head of the Crescent Automobile Co.

Holton Farmack Sales Mgr.—Hoover Holton, connected with the sales department of the Briggs-Detroiter Co., Detroit, and prior to that sales manager of the Monarch Motor Car Co., has taken the position of general sales manager of the Farmack Motor Co., Chicago.

Newell St. Louis Sun Agent—J. E. Newell, of the Motor Car Co. bearing his name in St. Louis, will direct the sales campaign of the recently organized Sun Motor Car Co., Buffalo, N. Y., in Arkansas, Mississippi, Louisiana, southern Illinois, eastern Missouri and parts of Indiana, Kentucky and Tennessee.

White Detroiter Rep.—A. F. White of New York City, has been appointed Far Eastern representative for the Detroiter. His territory includes Burma and Ceylon, India, Federated Malay States, Strait Settlements, China, Japan and Philippine Islands. Mr. White has direct representation at all points named.

Hough Makes Change—P. R. Hough, formerly assistant manager of the Ford Motor Co.'s branch assembling plant at Denver, Col., has gone into partnership with H. E. Maines, Chevrolet and Monroe distributor. The new firm, under the name of the Maines-Hough Motor Co., is located at 439 Broadway.

Schreiber Resigns—A. O. Schreiber, who has been connected with the Saxon Motor Co. for the past year in the capacity of district representative for the state of Ohio, has resigned from that company to assume the management of the Loveland Co., Seventeenth and Euclid Avenue, Cleveland, which handles the Saxon exclusively.

Rose Heads Frisco Chalmers—L. H. Rose, formerly serving in the capacity of district and coast representative for the Studebaker, Maxwell and Lozier factories, has recently re-entered the automobile trade in the West, taking charge of the northern California distributing agency for the Chalmers car, with headquarters in San Francisco.

Fillmore Pasadena Ford Mgr.—E. M. Fillmore, formerly traveling representative of the Los Angeles Ford branch, has been placed in charge of the newly opened Pasadena branch of the Ford company. C. D. Tucker has been appointed assistant manager to have charge of the sales department. There are to be twenty-five men employed by the new branch, which is the largest automobile house in Pasadena.

Dornfeld Making Engine—J. F. Dornfeld, president of the defunct Dornfeld-Kunert Iron Works, Watertown, Wis., has purchased the assets and organized as the Dornfeld Iron Works. The company will make a specialty of extras and repairs on automobiles and has established a well-equipped department for this purpose. A foundry and machine shop is being conducted and the concern is manufacturing gas engines and gas producers.

Crockett Hardman Tire Sales Mgr.—W. A. Crockett has been named as sales manager for the Hardman Tire & Rubber Co., Bellville, N. J. For some time Mr. Crockett has been in charge of the Baltimore branch of the Hardman factory for some time, and before coming there was responsible for the placing of a number of Hardman branches around the country. He assumed his new duties the latter part of the week. The Baltimore branch of the firm is now in charge of C. B. Brooks, who has been assistant manager to Mr. Crockett.

Auction Sales in Montreal—Pearce & Lakser have opened up automobile auction rooms in Montreal, where they purpose holding weekly sales.

Dunlop Co. Adds — Sayer & Ford, Vancouver, B. C., distributors of the Dunlop Tire Co., have enlarged their premises, acquiring an extra store recently vacated by the B. & B. Automobile Co.

Vancouver Co. Moves—N. L. Tullis, of the Wood-Milne agency, is removing from 851 Pender Street West to nearer Granville Street, Vancouver, B. C., where he will have more commodious quarters.

Gets Large Territory—The Wentworth-Fosdick Co., that has just taken the wholesale distribution of the Dort, has part of Maine, southern New Hampshire and Vermont, Massachusetts, Rhode Island and Connecticut for its territory.

Ajax Branch in Spokane—R. W. Hoerner and J. R. Jones have established an Ajax tire factory branch in Spokane, Wash. Contracts closed by the Ajax company on the Pacific Coast this year are 135 per cent in advance of last year.

Takes the Rauch & Lang—W. S. Jameson, who has been identified with the Peerless sales force in Boston, Mass., for some years, has taken the Rauch & Lang electric line for New England, with salesrooms at 618 Commonwealth Avenue, Boston.

Savannah Supply Co. Opens New Department—An up-to-date automobile department has been put in operation by the Georgia Supply Co. at 14-16 West State Street, Savannah. The new department will be under the management of W. S. Blun, assisted by Mr. Hockley M. Garmany.

Porterville Garage Moved—The Central Garage, Porterville, Cal., formerly located on Second Street, has moved into the newly erected Smith building. The proprietors, Messrs. Eckard and Niles, have extended their factory connections also. They now have the agencies for the Paige, Overland and Ford lines.

Topeka Tire Co. Moves—The equipment Tire Co., Robbins Bros., proprietors, has moved from its location at 117 East Seventh Street to 930 Kansas Avenue, Topeka, Kan., where it has increased its equipment, and now has an up-to-date vulcanizing tire repair shop with free tire oil and gasoline service; the free gasoline service is within 5 miles of the city and the free tire is within 10 miles of the city.

Los Angeles Firestone Adds—In order to secure greater storage capacity, the Los Angeles, Cal., branch of the Firestone Tire & Rubber Co. has leased the room adjoining its location at 1239 South Olive Street with the second floor and basement. The Firestone branch will acquire 5000 additional feet of floor space. The local branch receives at least three carloads of tires from the factory at Akron weekly and storage room is required for from 9000 to 10,000 tires.

New Garage Co. in Winnipeg — The Great West Motor Co., Winnipeg, has been organized for the purpose of taking over the business of the Canadian Motor Co. which has gone into voluntary liquidation. The new company has leased the two garages controlled by the Canadian Motor Co., and will conduct a general garage and repair business but will handle no car agencies. The capital stock of the Great West Motor Co. is $50,000 and the concern will be under the management of H. De Cew.

Announces a Motor Street Cleaner—The Kindling Machinery Co., Milwaukee, Wis., manufacturing a line of horse-drawn street cleaning, sprinkling and washing machines, has brought out a motor-driven washer which is being tested by the street department of the City of Milwaukee. In a recent test one machine cleaned 110,000 square yards of asphalt pavement in an 8-hour run. The machine resembles a conventional motor truck type, the body platform being occupied by a large steel tank. Water is sprayed at the front end and just in front of the rear axle there is a revolving rubber blade roller which scrubs the pavement.

Recent Minnesota Garage Changes—a garage at Wentworth Street and St. Anthony Avenue, Midway, in which to store twenty-eight cars. The building is 80 by 88 ft., one story and brick. The Motor Transfer Co., 137 Eleventh Street, St. Paul, will occupy a new $65,000 garage at Temperance and Grove Streets, on Sept. 15. M. J. O'Connor is erecting a one-story garage at 138 Fourteenth Street for the Michaud Transfer Co., Seventh and Wabasha Streets, St. Paul. W. L. Harris, W. L. Harris Realty Co., Marquette Avenue and Sixth Street, Minneapolis, is erecting a public garage at 912-914 Third Avenue S., to cost $15,000. It is one story and brick. Simon Kruse, Hotel Radisson Co., Minneapolis, is erecting a garage adjoining the building at Second Avenue South and Seventh Street. It will be two stories. The Mutual Auto Co., 313-319 West First Street, Duluth, will occupy a new garage, Oct. 1, at Superior Street and Third Avenue East. The garage will have 5000 sq. ft. of space more than in the old quarters. President E. J. Filiatrault expects to have a Ford assembling plant there in twelve months.

Trade News from Denver—G. E. Hannan, 1210 Broadway, Denver, Col., distribtuor of the Crescent, Allen and Vulcan cars, has dropped the last two and taken on the Pullman to handle along with the Crescent. L. G. Palmer, 1515 Cheyenne Place, Denver, has taken over the business of the Western Mo Car Co., of which he was president, a is now distributor for the Paige clusively, having given up the Abb Detroit and the Willys and Garf trucks.

The Platt-Fawcett Motor Co., 1 Broadway, Denver, has dropped Chalmers and is now distributing Stearns and Mitchell. This is the f time the Stearns has been represente this territory for a year or more. H Maines, distributor for the Chevrolet Monroe, has moved from 1811 Glen Place, Denver, Col., to 439 Broadv where he has larger quarters. The change Auto Co., which recently op a used car and garage business at Broadway, Denver, reports a substa business in used cars. Warriner & C ran, agents for the Maxwell at Den have moved from 1624 Broadway to new Maxwell branch headquarters 1248 Broadway.

J. H. Callahan & Co., have open Cleveland Spring Cranker agency 1616 Broadway, Denver, Col. One m ber of the new firm is Bert Clark, merly agent for the Boston Starter Co. L. E. Kelton, forr Haynes salesman for E. J. Johnson secured the Haynes agency for Colo and has opened temporary headqua at 1616 Broadway, Denver. The West Auto Sales Co., Colorado dist tors for the King, Jackson and F have moved from 220 Sixteenth S to 1512 Broadway, Denver. A. W. F formerly manager of the Denver b of the Underwood Typewriter Co., new manager of the Colorado Moto Co., 1512 Broadway, Denver, distrit of the Reo, Saxon and Cole. Mr. recently made a record drive o miles over the mountains from D to Glenwood Springs by way of Col Springs, Ute Pass, Buena Vista, ville and Tennessee Pass in 11 hou 50 minutes in an eight-cylinder Col averaged more than 15 miles per of gasoline. Bert Clark and W. H. have formed a partnership to han Chevrolet on a sub-agency bas Denver, and have located at 1616 way. The Regal Sales Co. is the of a new partnership formed by Tibbals and C. E. Anderson as th ver local agency for the Regal, J and King. The Overland Auto C been doing a lively business since into its new quarters at 1200 Bro Denver, and reports the outlook able for selling 1000 or more cars Rocky Mountain territory duri 1916 season. The 1915 sales went the 600 mark, as against a littl than 300 for 1914. The Aut Sales Corp., Studebaker and F distributors, have moved fror Broadway, Denver, into new an quarters at 1504 Cheyenne Place care of increased business.

Marsh Co. Formed—The H. C. Marsh ...les Co. has been formed in Pontiac, ...ich., by H. C. and W. A. Marsh to sell ...omobiles and accessories.

...llard Branch in Toledo—A new ...ch of the Willard Storage Battery ...has been opened at 2027 Euclid Ave-..., Toledo. C. H. Rempes is manager.

...tle Chandler Moves—The North-... Motor Car Co., Seattle Chandler ..., has moved into new and more ...cious quarters at 1708 Broadway.

...kle Tire Co. Moves—The Hinkle ... Rubber Co., Columbus, Ohio, dis-...or for the Mohawk tires, has moved ... 1... East Gay Street into larger ...s at 179 East Gay Street.

... Chalmers Station in Newark—...almers Motor Co., Newark, N. J., ...arded the contract for the con-... of a new automobile station ...vice department on Broad street.

...and Co. in New Quarters—The ... Motor Co., Cleveland, O., is now ... quarters at 1844 Euclid avenue. ...pany handles the Lozier and ...nd is planning to take on the

... Dealer Moves—The Wilson ...Co., dealer in Maxwell and ...ars, 1014 Morton Street, Balti-..., will move to 605 West North ... T. W. Wilson, Jr., is head of

...altimore Battery Agent—The ...rcar Co., Cathedral and Chase ...altimore, has become the serv-...ales station for Philadelphia ...battery.

...neapolis Cadillac Building—...thwestern Cadillac Co. has ... ft. of frontage at 23 Ninth ..., Minneapolis, for a new build-... business. The building will ...ry concrete.

...os Angeles Tire Firm—J. S. ... John Boss have opened a tire ... vulcanizing plant at 723 ...e Street, Los Angeles, Cal. ... is to do business under the ... & Wiese.

...rt in Baltimore—The Tire ... North Charles Street, Balti-..., has opened. F. M. Boyd, ...me time has been connected ...les force of the Lambert Au-... Co., has become the manager.

...achine to Add—The Gisholt ..., Madison, Wis., one of the ...ufacturers of turret lathes, ..., etc., in the Middle West, ... new steel buildings, a ma-... by 112 ft., and a store-... 112 ft.

... Accessory Co. Changes—... Flemming, San Diego, Cal., ... over the San Diego County ... the complete accessory, tire ... carried by the Weinstock-Nichols Co., one of the largest accessory concerns on the Pacific Coast.

To Make Ford Steering Device—W. J. Laughlin, a Beloit inventor, is establishing a small shop for the manufacture of auxiliary steering devices for Ford and other cars. It will be known as the Steerautomat and is a malleable iron appliance connected to the front axle, holding the wheels in a straight line.

Want to Handle Another Car—Potter & McCormick, Pomona, Cal., Chandler agents, have moved into their new building on South Thomas Street. The firm is now handling the Chandler exclusively but it has been announced that the company is looking for the agency of a car which will not conflict with the Chandler, a car selling for less than $1,000 factory.

Repairs Worn Shoes—The Lockstitch Double Tread Tire Co., 1840 E. 13th street, Cleveland, O., is repairing worn and unserviceable shoes. The process consists of the combining of two used casings into one thoroughly serviceable casing. Blow-outs and puncture holes, also small breaks, are first repaired. One casing is then lockstitched on top of the other by means of a double or triple row of stitching around the entire circumference.

Milwaukee Co. Moves—The Schreiber-Boorse Motor Car Co., National and Chandler agent at Milwaukee, and located at 180 Fifth Street for nearly ten years, will move to the east side, into the heart of the new car and supply district that has been developed in the last 3 or 4 years. A large two-story garage building will be erected on Oneida Street near Jackson Street, at once. It will be of steel and concrete slab construction, 68 by 120 ft. in size.

New Louisville Openings—J. B. Kennedy Co. has opened a garage and repair shop at the corner of Jackson Street and Broadway, Louisville, Ky. Frazier & Miller have opened a tire and car repair shop at 601 E. Broadway. The company also carries a complete line of accessories. The Southern Motors Co., 615 South Third Street, which handles the Dodge, Hudson and Packard pleasure cars and the Detroit electric, has opened its electric garage department. It is equipped to handle fifty cars.

Changes in Arizona Overland—An important change has been made in the Huntsman-Hotchkiss Overland Co., Arizona, distributing agents for all the Willys cars. H. H. Hotchkiss, who has heretofore managed the Tucson office of the company, has assumed charge of the office and salesroom in Phoenix. D. B. Hutchins, former manager here, has become agent for the county of Cochise, which includes the cities of Douglas and Bisbee. Northern Arizona will offer an especially attractive field for the automobile salesman next fall, according to Mr. Hutchins, who has just returned from a 1000-mile trip through that section. Heavy summer rains have fallen and abundant range feed is assured. This means that the cattlemen and sheepmen will have plenty of money. In the course of his northern trip Hutchins appointed sub-agencies as follows: Williams, Davenport & Kirkpatrick; Flagstaff, Flagstaff Overland Company; Winslow, Winslow Overland Co.; Holbrook, Smith Overland Co.

Hercules Sales Co. Moves.—The Hercules Sales Co., Louisville, Ky., which controls the selling rights for the Hercules car, has moved its offices from the Starks Building to the plant of the Kentucky Wagon Manufacturing Co., where the Hercules is now being manufactured. The output at present is ten cars a day. A. B. Challinor has been appointed sales manager of the Hercules Sales Co., Louisville, Ky. For many years he was connected with the General Motors Co., in charge of the sales in the Southern district.

New Arizona and New Mexico Chevrolet Distributor—The Babbitt-Polson Co., Williams, Ariz., has been appointed distributing agent for the Chevrolet car in Arizona and New Mexico. Sub-agencies are being established in all the principal cities and towns of the two States. Carroll Davis is to handle Chevrolets in Prescott and Yavapai counties, Arizona. His partner, Charles Carrow, has left Prescott and gone to Phoenix, where he has associated himself with Louis Garesche for the purpose of introducing the Chevrolet in Maricopa County.

Recent Ford Agency Changes—Davenport, Iowa, has been awarded one of the eighteen factory branches now being established by the Ford Motor Co. H. D. Rue, late of the Chicago branch, will be placed in charge. Two will be allotted to Iowa, Fort Dodge securing the other. The Davenport plant will be in part an assembling plant and will furnish parts and supplies to all agents and patrons in eastern Iowa. A building is now being sought for the Davenport agency. A. H. Cain of Roodhouse, has secured the Ford agency in Greene County, Ill., succeding Morrow Bros. of Athensville. The Bloomington Motor Co., organized a year ago by J. C. Blair of Toledo, Ohio, to handle the Ford car in McLean County, Ill., with Bloomington as the distributing point, has been succeeded by the Lockwood, Mandel & Schwarzman Motor Co., with Oscar Mandel president; A. Schwarzman, vice-president, and J. E. Lockwood, secretary and general manager. The new company will erect a new garage building to cost $25,000. The territory is to be enlarged to include Woodford County. McLean County has the distinction of being the leading distributor of Ford cars in Illinois outside of Chicago.

VOL. XXXIII NEW YORK—THURSDAY, SEPTEMBER 2, 1915—CHICAGO NO. 10

The AUTOMOBILE

Improving the Steering

A Part Often Neglected in Design — Common Failings in General Layout of This Important Part

By A. Ludlow Clayden

IF an ordinary motorist ever has the opportunity of driving a good racing car the thing which impresses him most strongly is commonly the wonderful ease of the steering. The best racing cars can be steered at a good speed literally with two fingers. By contrast, the average automobile needs careful handling at high speed and often the operation of the steering in turning a right-angle corner calls for a distinct effort and a strong grip if one hand is to suffice.

There is no magic about racing car steering, it is not especially costly nor is it of peculiar design, but it is designed as carefully as the motor because *it has to be.* On an ordinary car a steering that is very stiff as compared with racing practice is good enough so the engineer has been prone to leave it alone and it remains no better than it was in the dark ages of automobilism when a driver had to be something of an athlete. Yet a man who once has handled an easy-steering car will never be satisfied with any other, for the difference it makes to the physical condition after a long day on the road is remarkable and has to be experienced to be believed.

Fundamental Imperfections

Practically every automobile has the same type of steering so far as system is concerned, the inventor of the conventional front axle with swivel heads at each end bearing the name Ackerman. With Ackerman steering it is generally assumed that the tie rod arms projecting from the swivels should meet at the middle point of the rear axle if their center lines are produced. Now, when on a curve the two rear wheels run along two circular paths of different radius, and each wheel makes a tangent to its rolling circle, as viewed in plan. The front wheels meanwhile roll on separate circles of their own and the ideal steering gear is such that each of the four wheels should make a tangent to the circle along which it is rolling.

This true rolling can occur at three positions only: One is the straight position when the car is turning neither to right nor left, and the other two are at some definite angle of lock to right and left respectively. The effect for all other positions is that three wheels may roll perfectly but the fourth must do some skidding or perhaps two roll and the other two divide the skid between them.

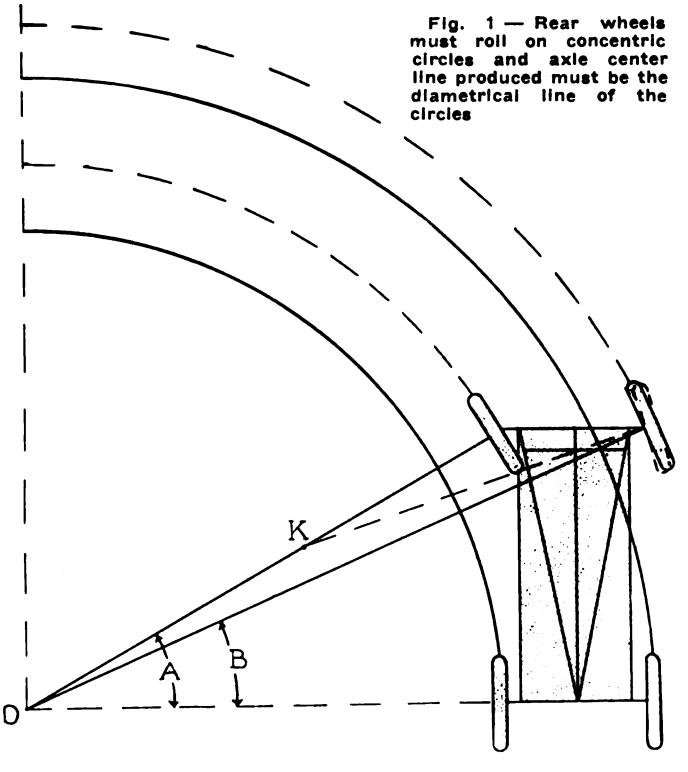

Fig. 1 — Rear wheels must roll on concentric circles and axle center line produced must be the diametrical line of the circles

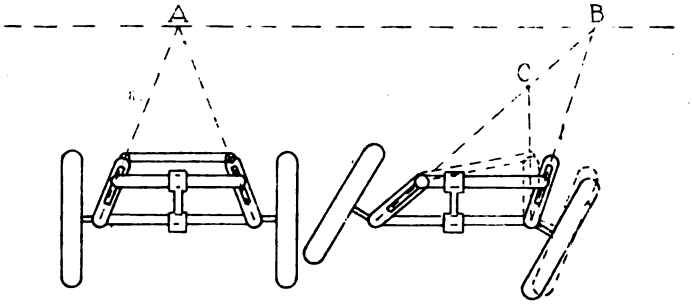
From Fig. 1, it is obvious that the rear wheels must both roll on concentric circles and that the rear axle center line produced must be the diametrical line of the circles. Thus neither one of the rear wheels can skid unless both do. Suppose the point about which the car is turning is *O*, then the center lines of both the front wheel spindles must meet at *O* if every wheel rolls perfectly, without skidding. It is obvious that by turning the steering wheel we can bring one of the front wheels into such a position that the spindle center line passes through *O*, but the second front wheel will then take up a position depending upon the length of the tie rod and the layout of the tie rod arms. If the tie rod slid in guides attached to the front axle and



Left—Fig. 2—Ideal steering design, the tie rods sliding in guides attached to the front axle and the pins at its ends moving in slots cut in the tie rod arms. Right—Fig. 3—Ideal design illustrated in Fig. 2 with the conventional type steering dotted over it. In both views the right arm is supposed to be in the correct position and the left arm is correct as shown in the full line. The dotted lines show the inaccuracy of the conventional system

the pins at its ends moved in slots cut in the tie rod arms as sketched in Fig. 2 there would be no steering error whatever and the second front wheel would always be a tangent to its rolling circle, but such a construction is mechanically impractical. In Fig. 3, the ideal design of Fig. 2 is shown with the steering of the conventional type dotted in over it. In both views the right arm is supposed to be in the correct position and the left arm is correct as shown in full lines. The dotted lines show the inaccuracy of the conventional Ackerman systems.

This is exaggerated a little, but turning back to Fig. 1, assuming that the inner front wheel is at a correct angle, the tie rod may easily draw the outer wheel into a position as indicated in dotted lines. When this happens the rear end of the car is endeavoring to turn on a circle with center at *O* while the front end is trying to turn about *K* Fig. 1. Obviously this is impossible, and so the true turning point will depend upon which of the wheels skid.

Another thing shown by Fig. 1 is that the two front wheels must never be parallel except when in the straight position, as the angles *A* and *B* must always be different. It is possible to calculate the angular movement of the outer wheel spindle to correspond to any given angle of lock of the inner wheel, so that the center lines of the spindles may intersect at *O* and all wheels roll properly, but the equations are cumbersome and there is no need to quote them.

In Fig. 4 is shown the layout of a front axle and steering. The angles shown by full lines on the right circle are the angles which correspond to those on the left circle, if we are to have perfect rolling. For this example the wheelbase of the car is taken as 108 in. and the distance between the steering swivels *OQ* as 50 in. Now assume that we use a length of tie rod arm of 10 in. and choose any angle θ between the tie rod arm and the center line of the chassis. Then, when the left wheel moves to angles 10, 20, 30 and 40 deg. the right wheel ought to move to the positions shown in full lines, but the inaccuracy caused by the tie rod causes the actual positions to be as shown in dotted line. Now, the angle of error *E* is shown by the difference between the full and dotted lines on the right hand side as marked at *E* and the amount of this angle depends upon the length of the tie rod arms *OA*, *OB* and the angle θ which the tie rod arms make with the center line of the car.

It has become a habit to make this angle such that the tie rod arms produced would meet at the center of the rear axle, but this does *not* give the nearest approach to accuracy, by any means necessarily. With the proportions chosen for the diagram of wheelbase 108 in., distance *OQ*, 50 in. and lengths *OA* and *OB*, 10 in., the average of error is much lower when θ is chosen of such a value that the produced tie rod arms would meet much nearer to the middle of the car than to the middle of the rear axle.

Striking the Mean

There is no need to go into the mathematics of the layout, for they are quite simple and individual cases can be worked out by anyone, but a few conclusions are worth comment. It can be shown either graphically or by calculation that:

1—Where the tie rod is in front of the axle the inaccuracy is *in*creased by increasing the length of the tie rod arms.

2—Where the tie rod is behind the axle the inaccuracy is *de*creased by increasing the length of the tie rod arms.

Thus suggesting that there is advantage in the use of long arms as a rule, but there is something else to be considered. In Fig. 4 a front axle and tie rod are shown as they lie when the steering is locked over and it is obvious that we must not allow the angle ϕ, ever to become too large, for the greater it grows the less is the leverage which the tie rod exerts over the wheel.

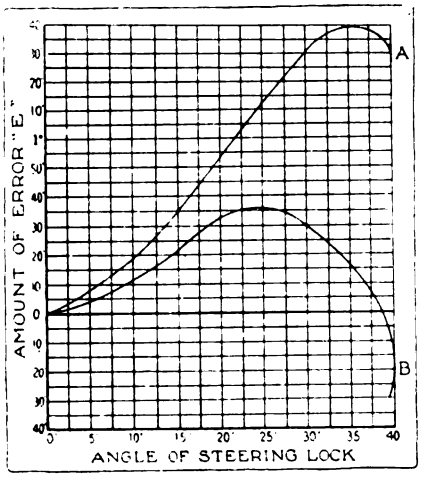
It is easy to see that there is a limiting position when the angle ϕ would become nothing and then the steering could not be moved back again to the straight position. Unfortunately for the engineer this angle varies inversely as the error. That is to say:

1—With the tie rod in front the angle ϕ is increased by *shortening* the arms.

2—With the tie rod behind the angle ϕ is increased by *lengthening* the arms.

Probably with the usual weight of car the angle ϕ ought never to be less than 150 deg., so all we can do is to make the tie rod arms of a length to suit this condition and they will then be as nearly accurate in action as we may hope to get them, if we choose the best value for θ.

The only way in which to determine the best proportions of tie rod layout is to calculate the correct angular proportions and then to try different values of tie rod arm length till the happiest mean is struck. Fig. 5 may be of interest as showing the plotted errors for the proportions of chassis



Left—Fig. 5—Showing the plotted errors for the proportions of tie rod layout in chassis chosen for Fig. 4. In upper curve error E is plotted for a value of θ such that the tie rod arms would meet in the rear axle center. Below—Effect of increasing θ to 15

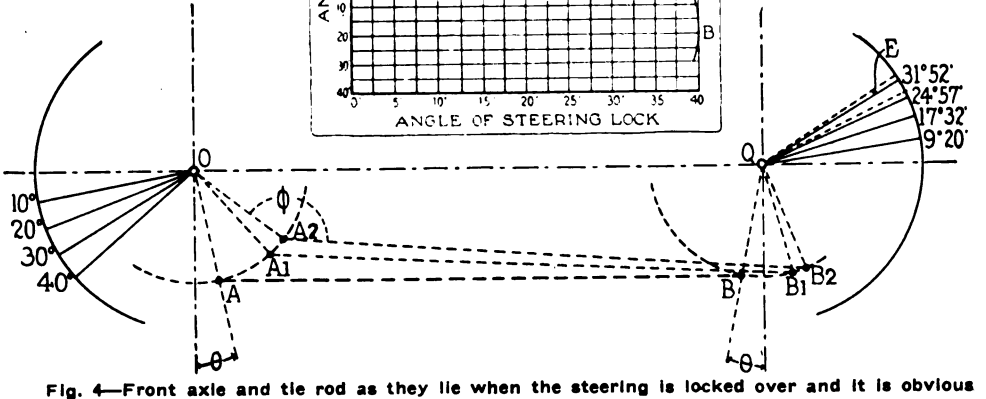


Fig. 4—Front axle and tie rod as they lie when the steering is locked over and it is obvious that the angle Φ must never become too large, for the greater it grows the less is the leverage of the tie rod over the wheel

chosen for Fig. 4. In the upper curve the value of the error E is plotted for a value of θ such that the tie rod arms would meet in the rear axle center. The far better curve below shows the effect of increasing θ to 15.

Another useful point which may be brought out by drawing a series of diagrams for different cases is that an increase in wheelbase increases the accuracy of the steering, but it is not necessary to use space here to show it for it can be easily worked out by anyone.

Errors Cause Large Forces

What then is the effect of manufacturing axles in quantity and using the same axle set for cars of differing wheelbase, as actually happens? The answer is that it is a matter of pure luck whether the steering is fairly good or fairly bad. The reader may think that, as the angular errors are only a degree or two at most, this accuracy is hardly worth troubling about, but there is one way of stating the case which brings home the forces at work.

Suppose that the road is dry and that all four tires hold on well, then in rounding a curve it might be possible for the two front wheels to roll truly without skidding (on center K Fig. 1.) If this happened the two back wheels would be forced to skid together and outwards, in an effort to counteract the steering effect of turning the wheel. In other words the driver is applying a heavy push to the inner end of the rear axle and is forcing the rear wheels to skid sideways by a quite large amount. Even if the distance is small it is obvious that the lead is considerable, and quite sufficient to make the steering heavy or inaccurate in direction. During a turn on a dry road the amount of power wasted in rubbing the tires which take the skidding action may easily exceed a tenth of a horsepower which does not sound a very large amount but is quite sufficient to be worth considering.

An Unconsidered Power Loss

Now comes a still more curios fallacy which is the idea that it is an advantage to cant the front wheels by tilting the spindles relative to the swivel centers, or *vice versa*. In Fig. 6 is shown the normal constructions, of splaying the wheels so that the tires are nearer together on the ground line than they are at the top.

Consider one of the wheels. It leans over sideways, yet the ground may be assumed to be flat. Thus the tire bears more heavily on one side of the tread than upon the other. Produce the axis of the wheel till it cuts the ground and it is at once clear that a little section of the tire has become part of the surface of a cone with its center at O and its side resting on the ground. This makes the wheel with its tire into what is virtually a bevel blank with a very large angle.

Now if we rest a bevel blank on the ground on edge as in Fig. 7, and then push it in the direction of the arrow, it will not run straight forward, but will run in a circle with a center at the natural cone center. So with the wheel and tire in Fig. 6. Its natural tendency, by virtue of the tilting, is to run in a circle also, and we prevent it from doing so, because the opposite wheel is also trying to run in a corresponding, opposing circle and the two pull against each other. The effect is that the tire tread is worn unevenly and the extra amount of power used up in wearing down the outside edge of the tread is pure waste. Again the amount is small and the effect is not great in any way, but little is gained by the splayed wheel and something is lost.

Castor Swivels

It is necessary to say something here about the various so-called castor systems of steering, of which some are good, and some have advantages existing mainly in the imaginations of their originators. To grasp the subject, first consider the forces at work on the wheel, which are the driving force of the car, the weight carried by the wheel and the resistance of any object which the wheel encounters on the road. The driving force and weight together must have a resultant equal and opposite to the resistance.

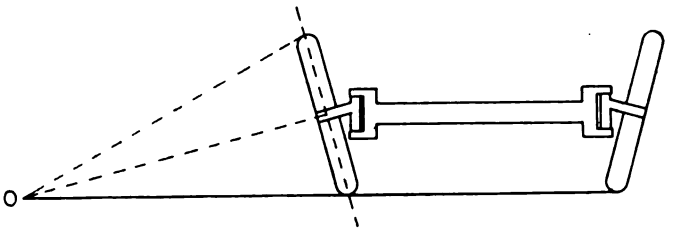

Fig. 6—Normal wheel construction, the wheels being splayed so that the tires are nearer together on the ground line than at the top

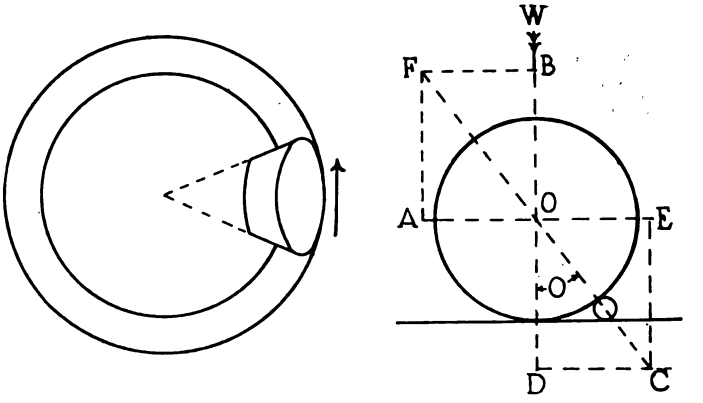
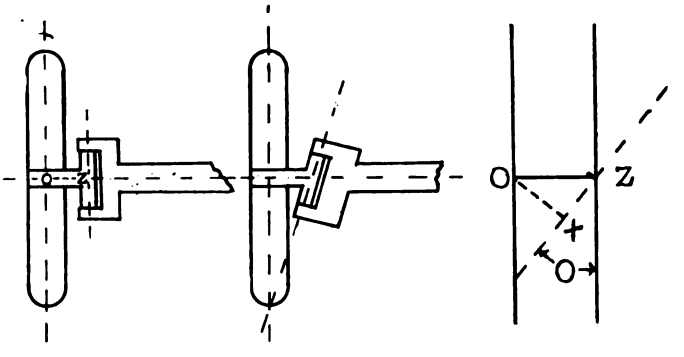


Left—Fig. 7—If a bevel blank is rested on the ground on edge and is pushed in the direction of the arrow it will not run straight forward but in a circle with the center at the natural cone center. Right—Fig. 8—Diagram of forces as the wheel strikes an obstacle. Graphically resolved there are the weight BO and the driving force AO. The resistance of the obstacle on the road must act along the line CO, thus if CO is made equal to the force the resultant FO of AO and BO must be equal and opposite to CO



Left—Fig. 9—If the plane of the wheel is vertical and the distance from the plane to the vertical axle of the steering swivel is OZ then the couple tending to turn the wheel about its swivel pin is OZ.W tan θ. Center—Fig. 10—A design where the swivel is tilted sideways so that its axle produced meets the ground at the same point as the tire. Right—Fig. 11—Another analysis of the forces, showing that the couple tending to turn the swivel is not zero, but merely reduced to OZ . cos Φ .W tan θ

Striking an Obstacle

First to take the case of the ordinary vertical pivot, assume the wheel to be striking an obstacle as shown in Fig. 8. Resolving the forces graphically we have the weight BO and driving force AO. The resistance of the object on the road must act along the line CO. Thus if we make CO equal to the force, the resultant FO of AO and BO must be equal and opposite to CO.

But CO itself can be resolved to match the other diagram of forces, into DO and EO, whence EO equals W tan θ.

Turning now to Fig. 9, if the plane of the wheel is vertical and the distance from the plane to the vertical axis

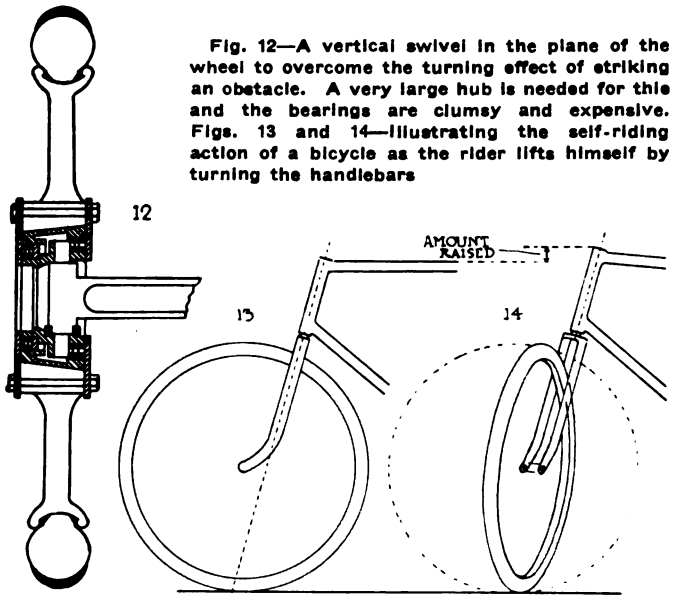


Fig. 12—A vertical swivel in the plane of the wheel to overcome the turning effect of striking an obstacle. A very large hub is needed for this and the bearings are clumsy and expensive. Figs. 13 and 14—Illustrating the self-riding action of a bicycle as the rider lifts himself by turning the handlebars

of the steering swivel is OZ, then the couple tending to turn the wheel about its swivel pin is

$$OZ . W \tan \theta$$

Now, by virtue of our original diagram of forces Fig. 8, it follows that the force $W \tan \theta$ always acts at the center of the wheel in the plane of the wheel. In other words it acts at O, whether the steering swivel be vertical or not.

In Fig. 10 is shown a design where the swivel is so tilted sideways that its axis produced meets the ground at the same point as the tire, the idea being that the resistance to shock is *horizontal* and not at an angle depending on the height of the obstacle, as has been proved to be the case by the analysis of forces in Fig. 8. The notion is that as the point of contact of tire with road is vertically beneath the swivel axis there is no turning moment on the swivel.

But let us analyse the forces once more. In Fig. 11, let OZ be the horizontal distance from the center line of the swivel pin to the central plane of the wheel. Draw OX at right angles to the swivel pin. From Fig. 8 we know that the reactionary force due to the obstacle is $W \tan \theta$. Resolving the diagram of the tilted pivot Fig. 11, it follows that the force $W \tan \theta$ acts on the swivel at a leverage OX instead of a leverage OZ as in the vertical pivot. Now OX equals $OZ \cos \phi$ where ϕ is the angle between the pivot and the vertical, so the couple tending to turn the swivel is not zero, but is merely reduced from OZ, $W \tan \theta$. to $OZ . \cos \phi . W \tan \theta$.

Similarly the converse of the tilted pivot has been suggested, the wheel being dished till the point of contact of tire with road is directly under the swivel as Fig. 6. Here the turning moment on the swivel is lessened slightly more than with the tilted swivel, but it still remains a substantial force.

There is one way only of overcoming the turning effect of striking an obstacle, and that is to use a vertical swivel *in the plane of the wheel.* This system has been used with conspicuous success on some foreign omnibuses and is perfect from a geometrical viewpoint. The system is sketched in Fig. 12, but its drawback is that a very large hub is needed and the bearings become clumsy and expensive.

The true meaning of caster action is that the steering wheels shall return to the straight position when the wheel is released after making a turn, and to get this action we require to utilize part of the weight of the car to provide a restoring force. In other words we must lift some part of the car a trifle when the steering wheel is turned to right or left. The reason that a bicycle has a self-righting action is that the rider lifts himself by turning the handle bars. The wheel is touching the ground at a point behind the point where the produced steering swivel would strike it as shown in Fig. 13. This being the case, turning the front forks around lifts the whole front end, Fig. 14.

Just the same effect can be obtained by inclining the steering swivels of an automobile by a degree or two, so giving them a little rake, and in this connection it may be mentioned that when a car steers badly and has a tendency to wabble at high speed, it is often possible to effect a complete cure by slacking off the front axle clips and driving in tapered wedges of hard wood so as to give the swivels a backward tilt. Such rake is more effective with central swivel steering as Fig. 12, but it is a real advantage with the usual sort of axle.

The Cure for Flapping

Another point that is not fully appreciated is the cause of "flapping." Often it may be noticed that a car running over a rough road has its front wheels in a state of oscillation from side to side, even when the steering wheel is held rigidly central. To understand this Fig. 15 shows a drag link and its connections. If the steering wheel is held rigidly A is a fixed point and if the axle rises and falls relatively to the frame the drag link must swing about A as a center. This means that the front end of the link B, will move along the arc of a circle with radius AB. Let C be the point nearest to the frame which B can reach as the car takes a bump. Then when B is raised to coincide with C it is not only lifted but is drawn back by an amount DC equal to the difference between the circular path of B and the true vertical. Similarly, on the rebound the same sort of action occurs, and running over a bump is the equivalent of giving the steering wheel movement enough to steer the car by pulling the drag link a distance DC.

Obviously the longer the drag link the smaller the effect of this action, as the length of the link is the radius of the circle, also by choosing the most suitable relative positions for A and B when there is no shock to disturb things, we can make the arc BC correspond fairly closely to the vertical line. Usually it is found that the best compromise is obtained by raising the front end of the link a good deal, so that the amount DC is divided fore and aft of the vertical as shown dotted in Fig. 15, for with this layout the deflection caused by the rebound will be opposite in direction to that caused by the compression of the spring.

So much for layout considerations. The forces concerned are small, the inaccuracies slight, but time spent on determining the best compromises is amply repaid by the ability to steer accurately to an inch, which is lacking as a rule. Some cars which steer well do so because the connections were proportioned correctly by accident, but if this happens with one model it does not follow that it will do so again with the next unless the layout of the good car is analysed and the reason for the accuracy discovered.

Quite apart from layout is the question of detail design of steering gear parts, and this is just as important in the pursuit of good acting steering. This phase of the subject the writer intends to take up shortly in THE AUTOMOBILE.

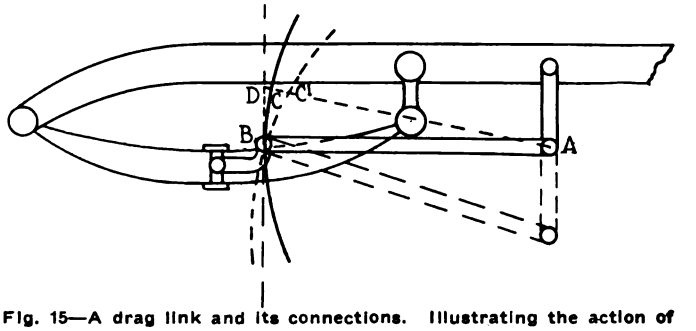

Fig. 15—A drag link and its connections. Illustrating the action of the forces set up in running over a bump

Register Trade Marks in Latin America

Often Unscrupulous Persons Register the Trade Marks of Well Known Foreign Manufacturers and Thus Control All Right To Sell Goods Under Those Marks

By Our United Export Bureau*

UNLESS a manufacturer has protected himself it is possible for any one in Latin America to register his trade mark and stop him selling his products in these republics. In some countries goods become the property of the person or persons controlling the trade mark on them, for this reason merchants in those countries only purchase goods from those controlling the trade mark.

Some unscrupulous people make it their business to register well-known foreign trade marks, thus compelling a manufacturer to either purchase his trade mark or lose the advantage of a well-known brand, which has been developed at a large expenditure of time and money. Hardly a week goes by that a case of this character is not brought to our attention.

The Spanish law on which the Latin American trade mark law is based was created by the Crown of Spain for the protection of tobacco in all its forms, and was drawn up with only this in view, the king taking the attitude that those who did not protect their trade mark were not entitled to any consideration, the party first registering the trade mark having everything in his favor.

Register Your Trade Mark

As the attached table of costs for obtaining the registration of trade marks shows, the operation is not an expensive one when your goods are known and sold on the brand they bear, and we cannot too strongly advise the registration before selling goods in any of these countries.

At the present time there is a movement on foot which only lacks the approval of three nations to make the trade mark law in the western hemisphere a uniform one.

Under present conditions, a manufacturer to obtain his trade mark in these countries, must grant a full power of attorney to the person making the application to represent him in all negotiations to obtain the registration of his trade mark. Also another point of interest is that if you purchase a trade mark and do not record the transfer in the Government office for this purpose within 60 days, the sale becomes null and void and the trade mark remains the property of the person who previously had title.

In some of the countries the enforcing of the trade mark law and its interpretation is controlled by an organization similar to our local chambers of commerce, or commercial clubs and combined with the heads of the offices of patents and trade marks. Another form is seen in Costa Rica, where police authorities enforce the trade mark law, and in some cases have even forced a man to place a trade mark upon his goods.

It is interesting to note the broad view of what constitutes a trade mark—for example, names of manufacturers and business firms, their seals, stamps, engravings, vignettes, monograms, mottoes, legends or any other distinctive sign whatsoever, serving to identify the products of a manufacturer or the articles constituting the trade of commercial houses.

The offense of infringing on a trade mark is a penal one, besides the confiscation of the goods.

Nicaragua has the shortest trade mark law and appears in its penal code in articles 314 and 319, making a total of eight lines, but in this small space they accomplish a great deal. For example, he who forges a seal, stamp or mark of any party whatsoever, private, industrial or commercial, bank or individual, or makes use of forged seals, stamps or marks will be liable to imprisonment for one year and a fine of from $50 to $500. He who causes to be placed on an article of manufacture the name of a manufacturer who is not the maker thereof, or the commercial sign of a factory which is not the real factory, is liable to imprisonment of six months and a fine of from $50 to $500.

Registration Is Easy

There are a number of offices and patent and trade mark attorneys in the United States who are prepared to undertake the registration of trade marks throughout the world.

ARGENTINA.
Life—10 years; renewable.
Fees—$21.25.

BOLIVIA.
Life—Indefinite.
Tax of $1.95 per year.

BRAZIL.
Life—15 years; renewable.
Fees—$1.25 in stamps; renewal same.

CHILE.
Life—10 years; renewable.
Fees—$1.92; certificate $0.16; renewals the same.

COLOMBIA.—
Life—20 years; renewable.
Registration of trade mark $15; renewal $30.

COSTA RICA.
Life—15 years; renewable for periods of 10 years.
Fees—$7.90.

CUBA.
Life—15 years.
Fees—$12.50; renewal the same.

ECUADOR.
Life—20 years; renewable for periods of 15 years.
Fees—$19.19; renewal fees $13.34.

GUATEMALA.
Life—10 years; renewable.
Fees—$26.

HONDURAS.
Life—Indefinite.
Fees—None provided by law. Translation, publication and stamps $35 gold.

MEXICO.
Life—20 years; renewable.
Fees—5 pesos (Mexican currency is depreciating very rapidly).

NICARAGUA.—
Life—10 years; renewable.
Fees—$2.08; certificates $0.08 each.

PANAMA.
Life—10 years; renewable.
Fees—$25; renewal fee $20.

PARAGUAY.
Life—10 years; renewable.
Fees—$19.30; each extra certificate $0.13 with stamp tax $0.07 for first page and $0.15 for each additional page.

PERU.
Life—10 years; renewable.
Fees—$14.70. By applying for registration through the Peruvian Consul General a certain amount is saved in stamp fees.

SALVADOR.
Life—20 years; renewable.
Fees—$3.63; annual tax on foreign trade marks $1.82; extra certificates $1.82; stamped paper from $0.04 to $0.10 per sheet. Ordinary paper may be used with stamps.

SANTO DOMINGO.
Life—10 to 20 years; renewable.
Fees—Registration for 10 years $5; 15 years $10; 20 years $15.

URUGUAY.
Life—10 years; renewable.
Fees—$10.34; renewal $25.85; extra certificates $2.07.

VENEZUELA.
Life—30 years; renewable.
Fees—$8.98.

Bronzes of 59 per cent tin but different alloys: From left to right: 50 hrs. at 390 deg. cent., 100 hrs. at 310 deg. cent., 71 hrs. at 390 deg. and 100 hrs. at 310 deg.

Brass and Bronze—Offsprings of Copper—Part III

Alloying Substances Provide Metals Which Are Useful in Many Industrial Fields and Impart Widely Different Qualifications

By J. Edward Schipper

ALUMINUM is considered a lightening agent and yet when added to bronze in the proportion of 10 per cent to 90 per cent copper the resulting metal has a tensile strength up to 90,000 lb. to the square inch. Above this percentage of aluminum the alloy becomes brittle and no more than 11 per cent can be tolerated. It makes good small and medium castings, is readily worked, may be forged at a red heat and is quite ductile. It takes a fine polish and at one time was suggested as a good metal for U. S. coinage. One use to which it has been put is in the making of kettles for fruit preserving. It can even be made into small springs.

Nickel, in combination with copper, tin, antimony and lead, is much prized in the manufacture of the nickel-babbitts so-called, which are employed frequently for automobile motor bearings. It is a hardener and strengthener and it is put in the bearings to reduce their tendency to wear. The nickel which is added to the babbitt is the commercial grade and is generally about 98 per cent pure. It has about the same specific gravity as copper and hence does not greatly affect the weight of the given metal. Its influence on bronze is quite similar to its influence on steel in that it is a toughener. The impurities in nickel are iron, copper, silicon, sulphur, arsenic and carbon.

The metal known as white copper is a combination of copper and nickel. The United States 5-cent piece is made from a metal which contains 75 per cent copper to 25 per cent nickel. Copper, zinc and nickel go together to from German silver which has been used frequently in small parts for carbureter construction, wire in magnetos, ornaments, etc. The composition of German silver is generally copper 60, zinc 20 and nickel 20. In other words German silver is a brass when it belongs to the copper-zinc branch of the family. It has a tensile strength when cast which varies all the way from 24,000 to 46,000 lb. per sq. in. or higher. The results from thin sheets according to Kent give as high as 87,129 lb. per sq. in. The metal is known for the difficulties it presents to the foundry and rolling mill.

German silver can also be a bronze according to some authorities who give formulas which have a composition of copper, tin and nickel. According to others it is a Kalchoid, having both zinc and tin. The Chinese metal known as pakfong is made of copper, nickel and zinc and the bullet casings now in use in the European war are made from an alloy which is about 80 per cent copper to 20 per cent nickel.

Bismuth Toughens Bronze

Bismuth has a notable effect on bronze and although not used commercially to as great a degree as other alloying substances, it is recognized as a valuable toughener. It has been suggested that bismuth bronze be used for telegraph wires as these have to endure considerable stress, due to the wind. It is one of the component parts of the materials used for aluminum cooking utensils. If not carefully employed, however, and if the proportions are wrong the brittleness of the resulting metal is so great that it cannot be used commercially. When added to copper in a percentage of less 0.5 the alloy is ductile. Above that point the brittleness begins to show. One of the features of this metal is the fact that it reduces the electrical conductivity of the metals to which it is added. It has another peculiar property in that it is intensely diamagnetic, being repelled by a magnet.

Manganese is used in non-ferrous alloys where it is desirable to have castings of strength and toughness. This metal is valuable because of its strong affinity for oxygen with the result that it takes up the oxygen in castings and combines with it preventing it from forming bubbles of danger. It makes a casting homogenous, strong and ductile. Manganese bronze is one of the most useful non-ferrous metals in practical work but strange to say it is not a bronze at all, but a brass since it has as its root a composition of copper and zinc.

In appearance manganese bronze is similar to phosphor-bronze. It was invented by P. M. Parsons and was named by him white bronze. It is prepared by combining ferro-manganese in various proportions to copper and zinc alloys.

The ferro-manganese is first refined with particular care to have all the silicon removed and the iron content carefully regulated. In action the manganese bronze is similar to mild steel, having a tensile strength of about 60,000 to 90,000 lb. per sq. in. and an elongation in 2 in. of 20 per cent. This metal finds its great use in the manufacture of propellers for steam vessels. The great strength permits the blades to be made thin, and therefore efficiency of the propeller is not sacrificed. Besides this they do not corrode and are practically indestructible. While they cost about double the price of a steel propeller, the latter will have to be renewed about every three years, whereas the bronze propeller will be as good at the end of that time as it was at the beginning.

Manganese bronzes, of which there are many different grades are used also for resistance wire bearings, valves, piston rings and gun metal. When used for any purpose under water such as for pumps and for propeller blades it has to be carefully fitted so that galvanic action is not set up.

Silicon Bronze for Telegraph Wire

Silicon has its principal value when considered as an alloying substance in the manufacture of silicon bronze wire for telegraph purposes. It is about as strong as phosphor bronze but whereas phosphor bronze has a conductivity of only 26 per cent that of pure copper, the silicon bronze has a conductivity of 96 per cent that of copper, when specially prepared with a view of obtaining maximum conductivity. In ordinary practice for telephone wires the conductivity of the silicon bronze is about 70 per cent that of copper. The wire has great tenacity and is a resister of corrosion. It is practically as strong as steel which has been used for the purpose and need only be approximately one-half the diameter to carry the same amount of current as the ordinary steel telephone wire of 0.08 in. diameter can be replaced by silicon bronze wires of 0.04-in. diameter. The tensile strength of silicon wire, 3 per cent silicon and 97 per cent copper is about 55,000 lb. per sq. in. cast. With that strength a wire 0.08 in. diameter would be able to sustain its own weight to a length of 13.8 miles. A bar of steel of 90,000 lb. per sq. in. tensile strength having a sectional area of 1 sq. in. can sustain its own weight for a length of approximately ½ mile.

Iron enters into the brass and bronze alloys at times but is of little value as compared to other substances. In fact it is an impurity in most instances. It is found in manganese bronze because the manganese is added in the form of ferro-manganese. It is found in the gear bronzes at times when iron is added up to as high as 4 per cent, to act in the nature of a hardener. In this respect it gives good results and is accepted as standard practice.

While the alloying substances mentioned are those most frequently used in the arts and sciences, there are several others which are used in secret formulas and for special purposes which are not general enough in their nature to be discussed here. The alloying substances themselves are combined quite frequently, the mother metal copper in these cases being omitted.

Many manufacturers of metal have adopted a pet formula which they have kept secret and these metals are generally sold under a trade name. This is true of casting and forging metals for such purposes as propellers, bearing liners and other specific purposes. Indefinite compositions also have been given names which are generally used. Some of these are tobin bronze, bell metal, admiralty metal, Muntz metal, high brass, cartridge brass, German silver, gun metal, art bronze, gold bronze, delta metal, and many others.

Many Family Branches

These are the main branches upon which are hung the offshoots of the non-ferrous family tree. Like a tree with copper as the trunk and two main branches called brass and bronze, there are offshoots from these branches which are quite separate from the trunk as far as physical qualities and uses are concerned. The complexities of the inter-relationship of the different metals which compose the family are so vast that the study of centuries has not yet evolved the situation to one where practice is standard. In fact the newer art of iron and steel alloying has far surpassed the older one of brass and bronze as far as the standardization of practice is concerned.

The reason for this is not far to seek. It lies in the fact that the heat treatment of iron and steel can be depended upon to give a definite result, provided the materials are put into the mixture in the desired proportions. In bronze work for example, there are several well-known instances where the order of placing the materials into the crucible has such an effect upon the resulting metal that the qualities of two metals mixed in different ways are entirely at variance with each other. Heat treatment cannot be called to the help of the mixer of brasses and bronzes to anything like the degree to which it is in steel work. While it is true that heat treatment will never make a good steel out of a poor mixture, it is a fact that a good mixture can be brought to its state of best usefulness by skillful manipulation of the furnace.

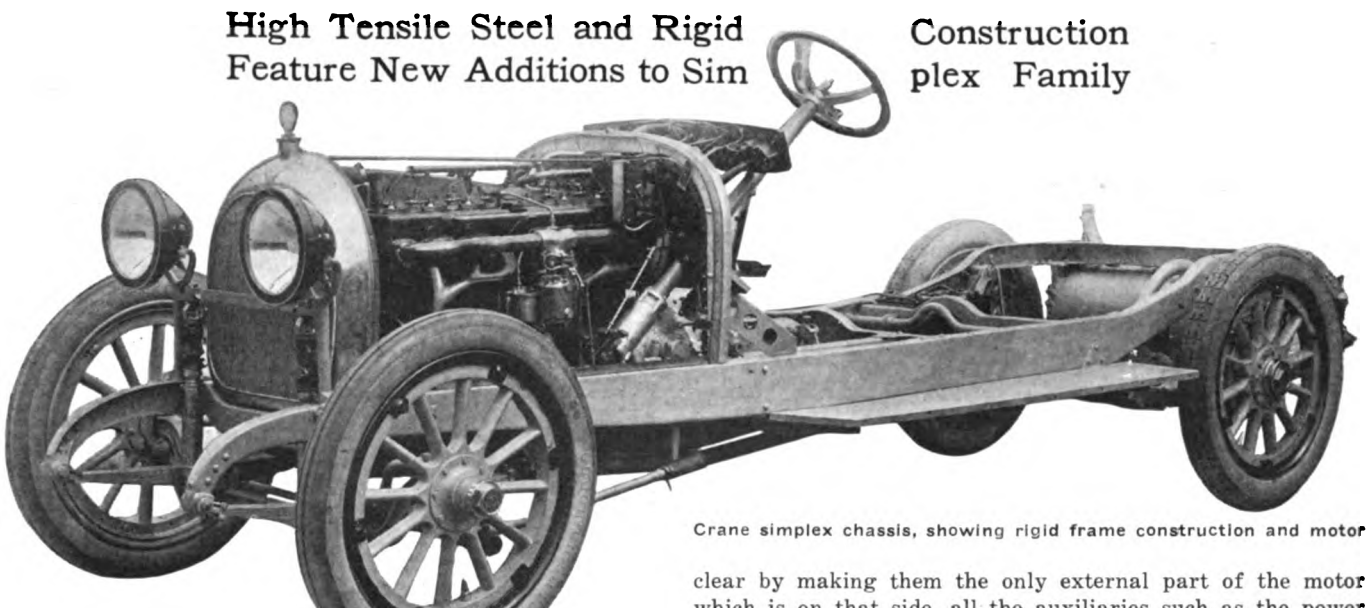
The End.

Some of the Cars of the American Ambulance Corps in France

Lined up before the hospital building which cares for the several hundred wounded brought in every week from the front by the cars. From a photograph contributed by Eliot Norton, Esq., New York City

Crane-Simplex a High Power Design

High Tensile Steel and Rigid Construction Feature New Additions to Simplex Family



Crane simplex chassis, showing rigid frame construction and motor

WHEN Henry M. Crane, former president of the Crane Motor Car Co., of Bayonne, N. J., builders of what has been known as the highest-priced chassis in America joined the ranks of the Simplex company last fall, it was expected that a product of special engineering interest would be evolved, due to the fact that cost has been made a secondary consideration throughout for the best possible in material and design. The Crane model Simplex is now being actively marketed and its chassis price of $5,000 indicates that it is designed to meet the tastes of those who prefer practically custom made cars.

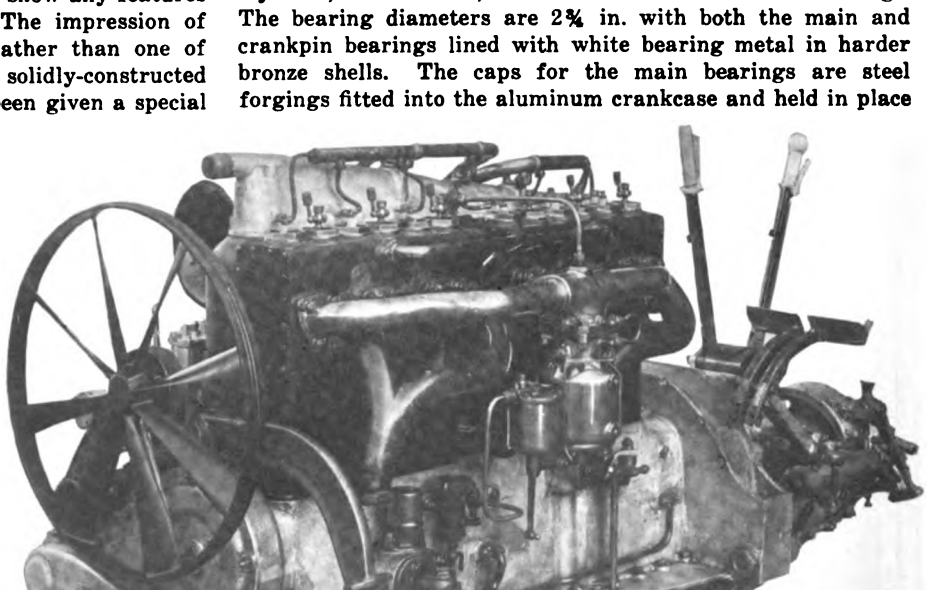
A general survey of the chassis does not show any features of design which can be called radical. The impression of great sturdiness and strength is given rather than one of freakish design. In a word, it is a large, solidly-constructed car, in which the subject of material has been given a special amount of attention and in which the details have been worked out carefully from the viewpoint of long life and accessibility. One of the features of the sales end of the car, is that it is guaranteed for life so long as it remains in the hands of the original purchaser.

The specifications of the standard chassis include a wheelbase of 143½ in. with 36 by 4½ front and 37 by 5 rear tires, and a standard tread of 56½ in. The power plant is a combined unit of six cylinders, disk clutch and four-speed gearset mounted with three-point suspension. The flywheel housing has two of the supports in a unit with it, and a third point is at the center of the cross member at the front of the radiator. The cylinders are cast in two blocks of three, with the head integral and with both the exhaust and intake on the left side. In fact, it has been made a special point to keep the valves free and clear by making them the only external part of the motor which is on that side, all the auxiliaries such as the power tire pump, generator, magneto and starting motor being on the right side. The carbureter is on the left.

100 Hp. at 1800 R.p.m.

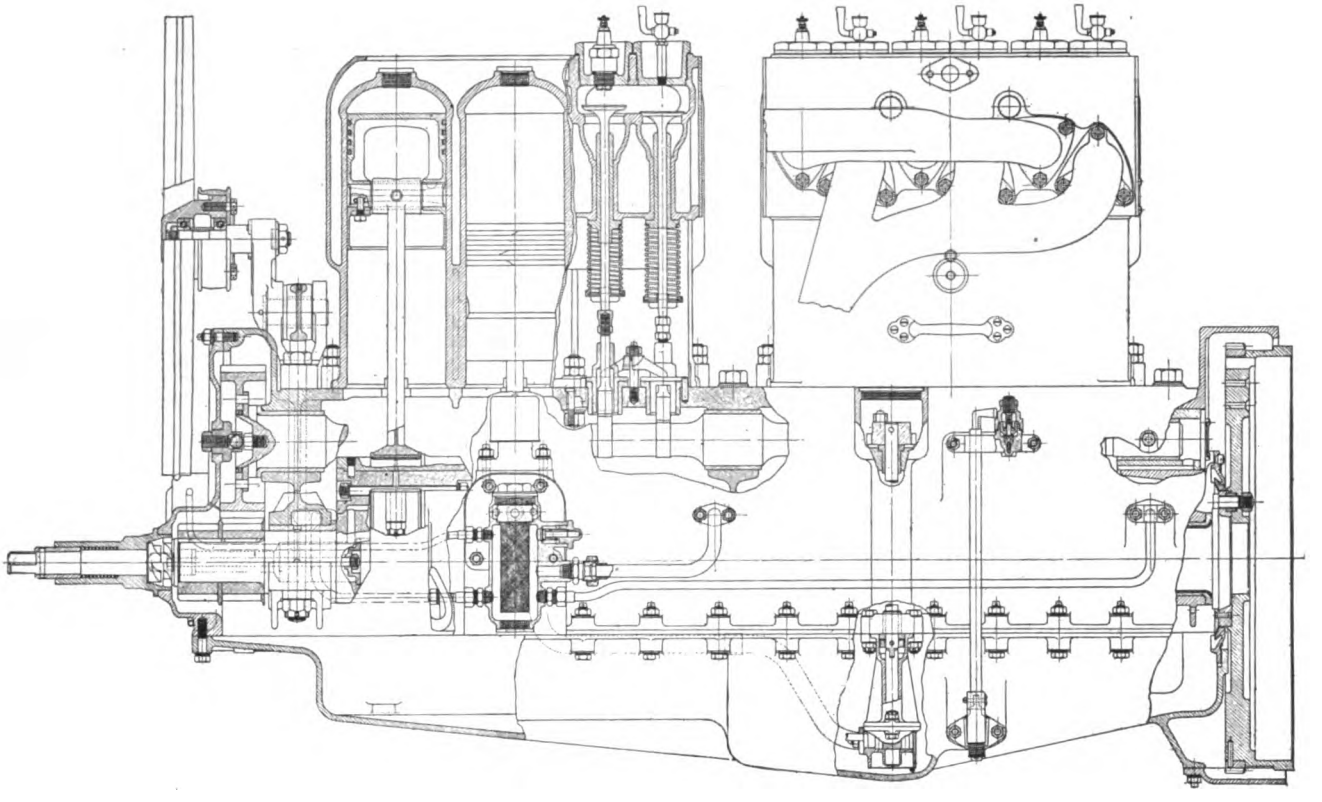
With a bore of 4⅜ and a stroke of 6¼ in. the motor develops in excess of 100 hp. at a speed of from 1800 to 2000 r.p.m. The valves are 1¾ in. diameter, in the clear and the design throughout is not one which would imply an extremely high-speed motor but rather one of medium speeds. The gear reduction at the rear axle on the standard models is 3 to 1 and the motor has been found powerful enough to handle cars weighing in the neighborhood of 5000 lb. on all ordinary grades and in all ordinary country at this ratio.

The crankshaft is very rigid. It is of electric furnace alloy steel, oil hardened, and is carried on three main bearings. The bearing diameters are 2¾ in. with both the main and crankpin bearings lined with white bearing metal in harder bronze shells. The caps for the main bearings are steel forgings fitted into the aluminum crankcase and held in place

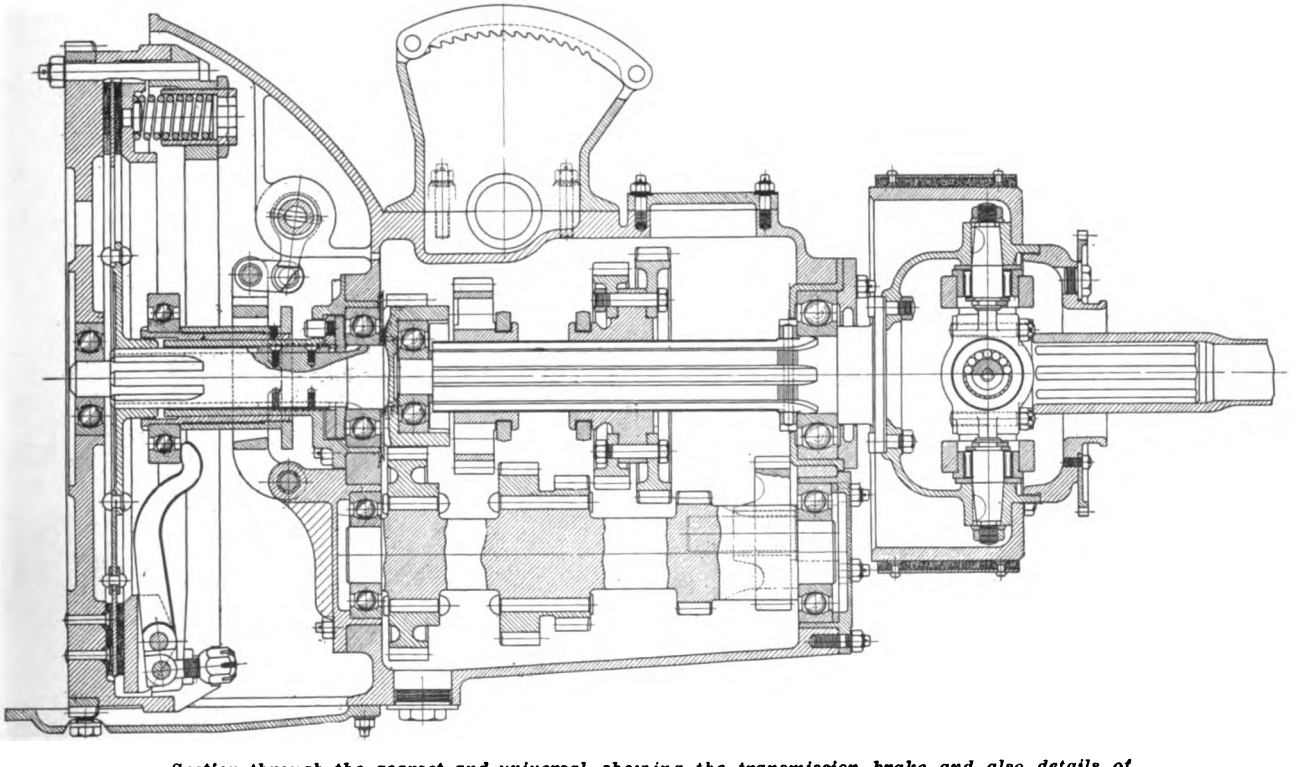


Left side of motor used in Crane-Simplex

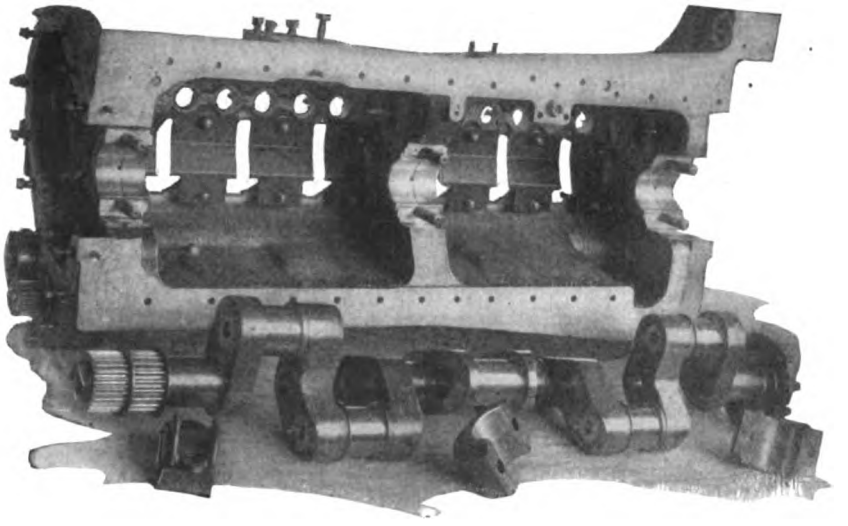
Sections of Crane-Simplex Motor and Gearset



Part section of Crane-Simplex six-cylinder motor, showing details of cylinder, piston and valve construction and bringing out the arrangement of waterjacketing and manifold details



Section through the gearset and universal, showing the transmission brake and also details of the clutch mechanism. As will be noted, the clutch has a single driving disk between two fabric-faced plates. The gearset is full ball bearing mounted and the universal is housed within the brake drum



Crankcase and crankshaft of the Crane-Simplex six-cylinder motor

by heavy bolts which pass entirely through the crankcase. I-beam connecting-rods which are machined on all sides for lightness are employed, the machining not only taking off the excess material but forming an excellent method for detecting poor forgings. The connecting-rods are not only balanced as regards weight, but the centers of gravity of each are determined carefully and precautions taken to have the centers of each set of connecting-rods at an equal distance from the crankpin axis.

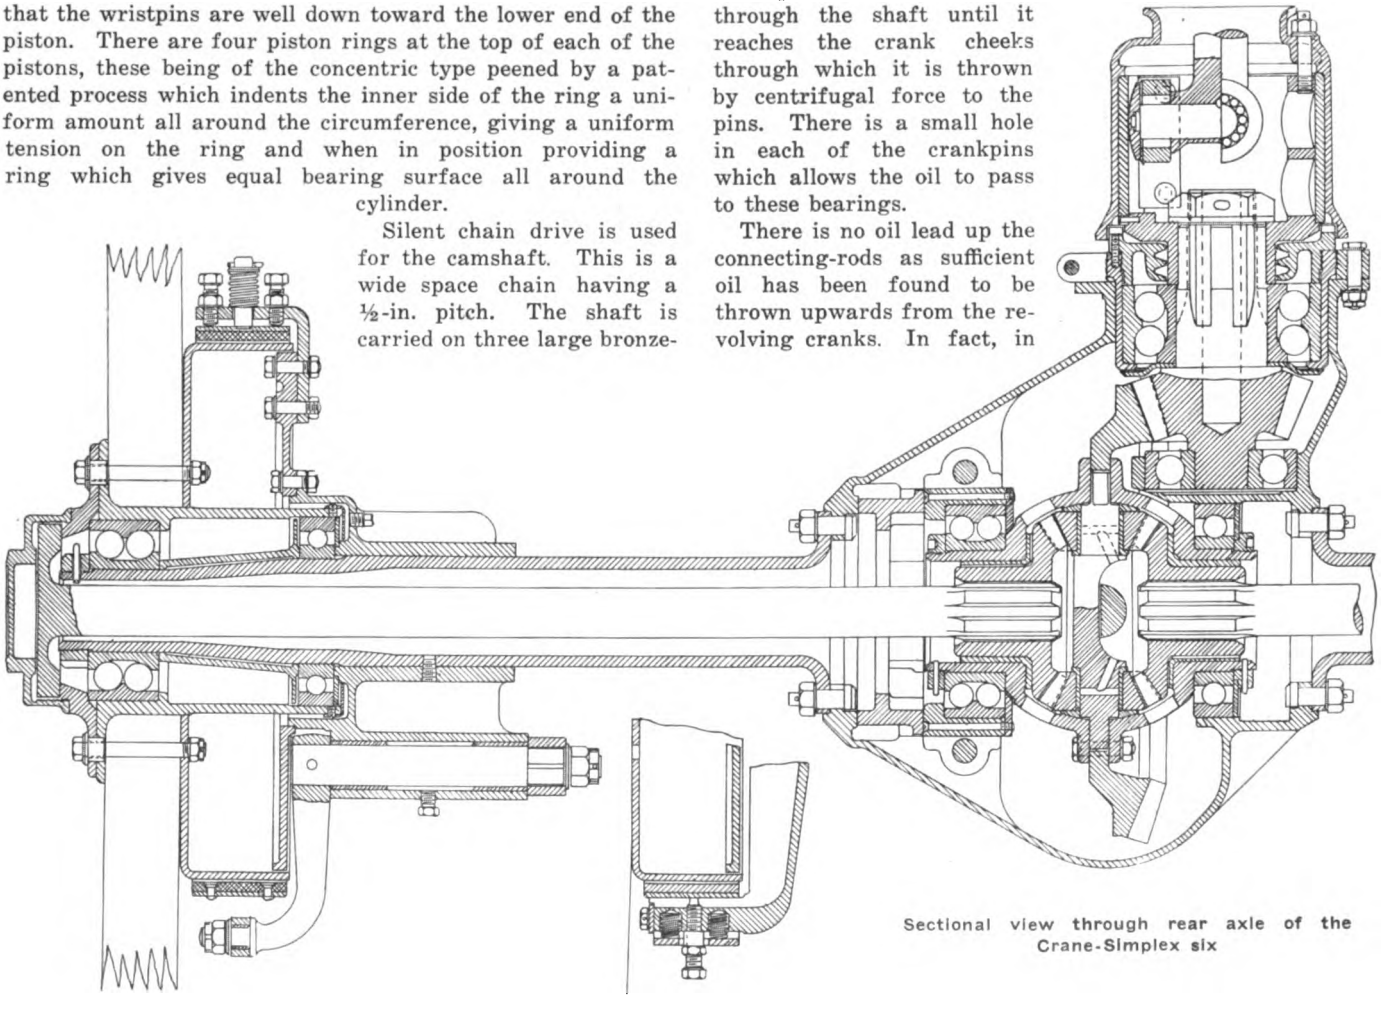
Pistons 6 1/16-In. Long.

A feature of the motor is the length of the pistons. These measure 6 1/16 in. and it will be noted in the motor section that the wristpins are well down toward the lower end of the piston. There are four piston rings at the top of each of the pistons, these being of the concentric type peened by a patented process which indents the inner side of the ring a uniform amount all around the circumference, giving a uniform tension on the ring and when in position providing a ring which gives equal bearing surface all around the cylinder.

Silent chain drive is used for the camshaft. This is a wide space chain having a ½-in. pitch. The shaft is carried on three large bronze-lined bearings which are so arranged as to allow the removal of the camshaft through the front of the case. The cams, which are integral with the shaft, are of the tangent type and work against followers which are of a special design so arranged that they provide the equivalent of a 4-in. roller follower, although they are solid. These lifters combine the advantages of the solid lifter with that of the roller type and allow a steep cam which at the same time is not unduly noisy.

Oiling is by pressure feed and the lubricant is carried positively from a gear pump operated by special drive from the camshaft from the oil reservoir in the lower half of the crankcase to a distributer housing mounted in an accessible position on the left side of the crankcase. This distributer has a large strainer through which the oil first passes, and an overflow valve which acts as a by-pass pressure regulator keeping about 10 lb. pressure on the system at all but low engine speeds. There are three leads from the distributer, each one going to a main bearing and carrying the oil directly to these under pressure. In addition to these three leads there is a smaller one which carries oil to the silent chain camshaft drive. In order that the driver shall be at all times aware of the condition of the oiling system there is an independent lead which passes to the cowl board and operates a pressure gage. From the main bearing, the oil passes through a hollow crankshaft, the oil entering from the main bearing to four large holes drilled into the shaft. The pressure on the oil is ample to overcome the centrifugal force at the exterior of the shaft and from this point the oil passes through the shaft until it reaches the crank cheeks through which it is thrown by centrifugal force to the pins. There is a small hole in each of the crankpins which allows the oil to pass to these bearings.

There is no oil lead up the connecting-rods as sufficient oil has been found to be thrown upwards from the revolving cranks. In fact, in



Sectional view through rear axle of the Crane-Simplex six

order to prevent an excessive supply of oil, baffle plates have been introduced between the cylinders and the crankcase which allow the connecting-rods to work only through comparatively narrow slots. After the oil has been forced through the system, it drains back into the crankcase and thence back to the reservoir of the lower half whence it is again pumped into the system after being drained.

Twin Exhaust System

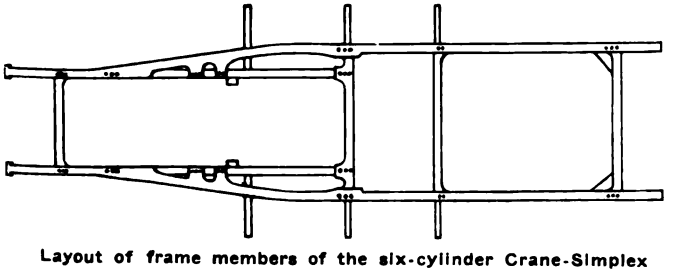
In order to cut down any possibility of back pressure, due to overlapping explosions, a twin exhaust system is used, each block of three cylinders exhausting into a separate manifold. The pipes are carried down at the front end of each block and then curved back and carried straight to the muffler. This gives a compact manifold design which is so arranged as to get the hot gases away from the motor as quickly as possible. The intake is quite compact and both the pipe itself and the carbureter, which is a Newcomb modified slightly to conform with Crane requirements, are waterjacketed. These manifolds and the valves are the only things carried on the left side of the motor. On the right side are the auxiliaries and below the manifolds on the left, are the removable cover plates which permit of easy and accessible valve adjustment.

One saw steel disk is used in the clutch which is built into the flywheel casting. This steel disk is carried on a splined shaft leading to the gearbox and is mounted between two Multi-bestos rings, one of which is riveted to the flywheel and the other to a heavy ring which forms the driven member and which is pressed against the steel disk by means of twelve spiral springs. Since the clutch is continually kept in an oily condition it is necessary, in order to maintain a positive drive without slip, to have unusually strong springs and to accommodate these and at the same time render it easy for the driver to remove the clutch, care is taken to provide a strong leverage in the pedal arrangement.

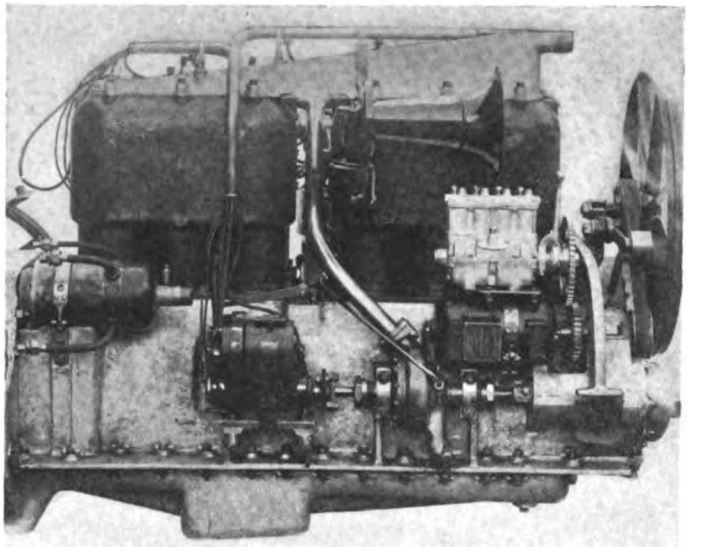
Four-Speed Gearset

Extending back from the rear of the motor is a bell-shaped extension, which forms a housing for the flywheel and clutch and also the forward end of the gearbox. The latter contains a gearset which provides four forward speeds. The countershaft is below the main shaft and both are mounted on annular ball bearings. The reverse idler is fitted with a bronze bushing and runs on a stationary shaft of large diameter. The materials used in the gears and shaft are electric furnace products of great strength and durability. Center control is used and to provide the utmost simplicity the gearshifter gate is mounted directly upon the gearcase, bringing the shifter lever and the emergency brake lever in the center of the car. Heavy oil is used in the gearbox and there is an oilproof housing between the gearset and the clutch to prevent any leakage of oil from the gearset into the clutch.

Hotchkiss final drive is employed in connection with a floating axle in which special attention has been given to securing a wide bearing spread for rigidity while at the same time all the load is borne on the axle tubes. The shafts are high-tensile alloy steel and the tubes are nickel steel bolted to a central cast-steel housing. This has an exceptionally large removable cover which renders accessible the rear axle driving gears which can be removed through this opening. The driving gears are of electric furnace alloy steel of spiral



Layout of frame members of the six-cylinder Crane-Simplex



Right side of motor showing starter, magneto, generator and power tire pump mountings

bevel form and are carried on a double row ball-bearing in front of the pinion and a single row behind. The large gear is mounted on the differential which is a four-pinion design carried on annular ball bearings. The bearing arrangements at the outside ends of the axle tubes are so arranged by turning the hub inward that the axle is considerably shortened, giving a saving of weight and also an increase in rigidity. The wheel is carried on a double row ball-bearing mounted directly on the center line of the hub and a single ball is located at the inner side.

Service Brake on Driveshaft

The service brake is carried on the driveshaft and the hand brake on the rear wheels. The drum diameter of the hand brake is 14 in. and the face width, 2½. Adjustment on these brakes is provided by a nut at each wheel. The service brake which is mounted on the propeller shaft just back of the gearbox is a contracting band design lined with Multibestos having a drum diameter of 10½ in. and a face width of 4 in.

An I-beam section front axle, which is so arranged at the knuckles that the wheels pivot at the point of contact between the tire and the road, is employed. Since the axle and knuckles are of electric furnace alloy steel they can be made of comparatively light section. The knuckle pin is fitted in bronze bushings and the load is carried on hardened washers bearing against the bushings. The hubs are forged steel and are equipped with roller bearings supplied with grease plugs which can be removed by refilling the hub caps. The spring clips are of alloy steel and the steering rod connections are ball and socket type with extra large bearing surface. All the moving parts of this linkage are packed in grease and covered with leather boots.

Narrow Turning Radius

Heat-treated alloy steel is used in the construction of the frame, which is of interest. The frame is but 30 in. wide in front, the width increasing back of the motor to 44 in. This permits of a very narrow turning radius. The great width of the frame under the body allows a light construction, but the arrangement of the subframe in front makes the structure particularly rigid for half the length of the frame. Beyond this point it is braced by double cross members. The depth of the flange of the side members is 6½ in. and the running boards are attached directly to the lower flange of the channel side members. This avoids the use of splash

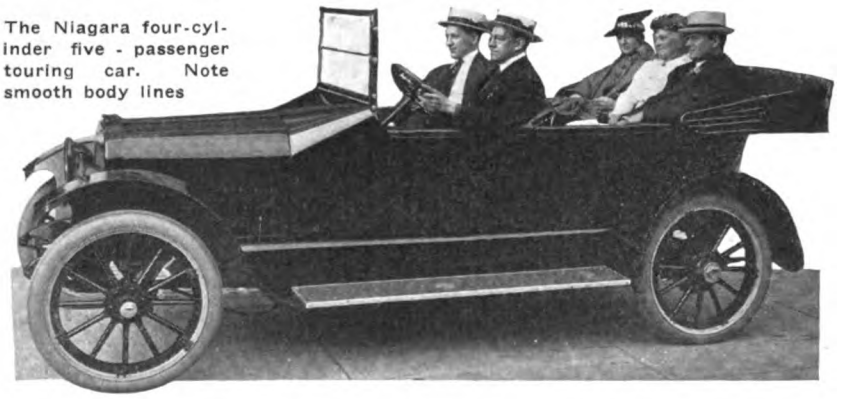
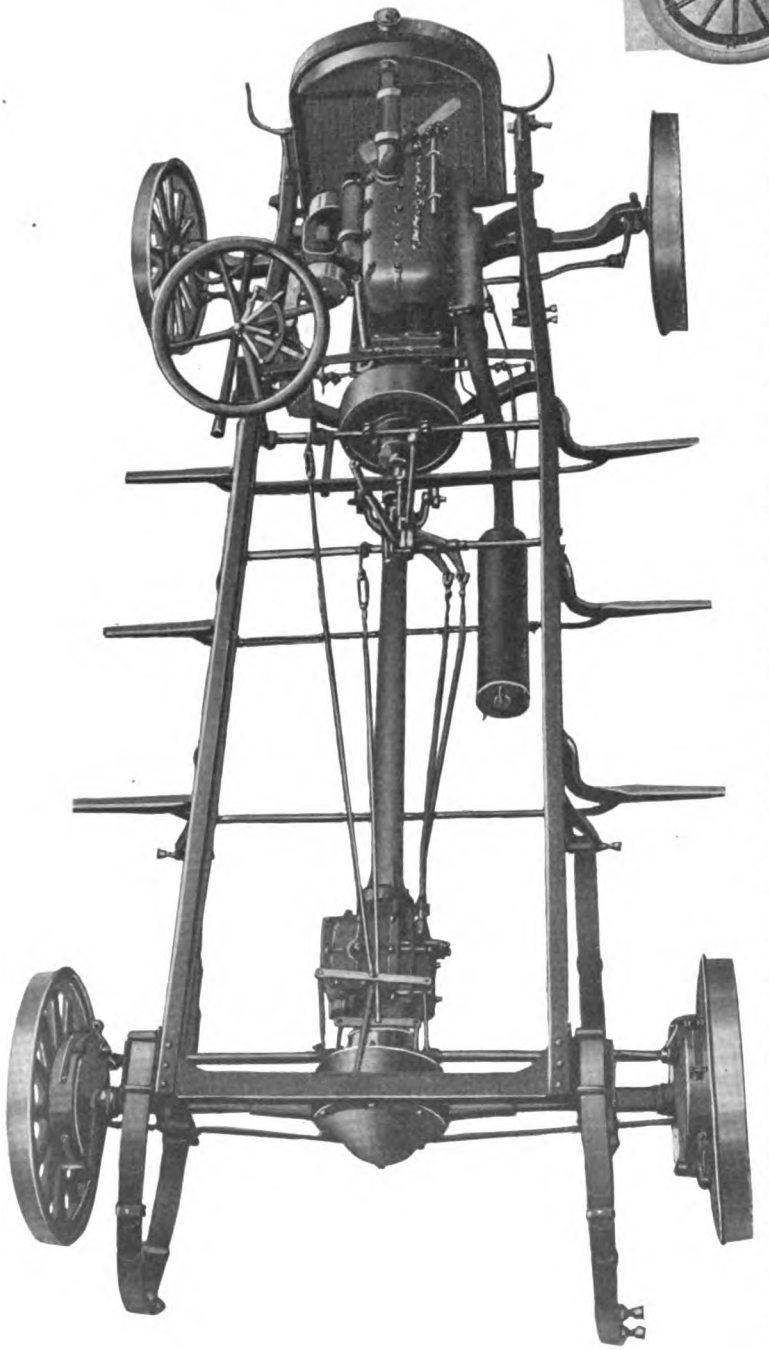
European Touches in Niagara Four

High-Speed 3½ by 5 Block Motor—Detachable Cylinder Head—Ample Bearings and Rigid Assembly—Sells for $740



The Niagara four-cylinder five-passenger touring car. Note smooth body lines



Chassis layout of the Niagara four-cylinder car, showing left drive and center control and mounting of the gearbox at the rear axle

DETAILS of the Niagara Four, which, as was announced in THE AUTOMOBILE for August 26, is to be built by the Niagara Automobile Co., Buffalo, N. Y., bring to light the fact that the design follows European tendencies in a great many respects. The power plant, which has a nominal rating of 36 hp. is of the high-efficiency, high-speed type with the four cylinders cast in a single block. The bore and stroke are 3½ by 5, and in exterior appearance everything has been done to maintain up-to-date cleanness of design. The valve chambers are entirely waterjacketed, and below the jacketing the valves are inclosed.

Detachable Cylinder Head

In accordance with what is rapidly becoming universal practice, the cylinders and heads are cast separately, allowing for good casting work and permitting the manufacturers to use large valves and to assure themselves of good core setting in the casting. The cylinder heads are held in place by heat-treated nickel-steel bolts which give a tight fit to the head and allow the copper-asbestos gasket between the cylinder and head castings to be tightly compressed, thereby preventing any leakage.

Three-ring pistons are employed and care is taken in the piston and connecting-rod assembly to maintain as near perfect as possible reciprocating and rotary balance. The centers of gravity of the individual pieces are carefully located as well as every assembly. In construction the upper end of the connecting-rod is fitted with bronze bushings. The rods themselves are drop-forged and are of the conventional I-beam design.

Three bearings are used for the crankshaft. These bearings are of sufficient length to guard against whipping tendencies, and the flywheel is rigidly bolted directly to the crankshaft by means of a flange on the rear end. The material of the crankshaft is carbon steel, heat-treated for rigidity and with ample diameter, bearing space and physical characteristics makes up a solid unit.

Lubrication is practically self-contained in the aluminum crankcase, the upper half of which forms the engine bed, and the lower half containing the oil pan and lubrication system. The method of circulating the oil is a plunger pump operated from an eccentric on the camshaft. This pump forces the oil through direct leads to the bearing surfaces in the crankcase, and by its action maintains a series of troughs full of oil below the connecting-rods. On the bottoms of the connecting-rods there are oil scoops which complete the circulation system for the lubricant. The excess oil drains back to the oil pan where it is strained and again passes through the system.

Cooling is through a honeycomb oval radiator and carburetion is effected by a Zenith instrument which is supplied with gasoline by a gravity tank located in the cowl.

The Electrical System

From an electrical standpoint the car is fully equipped, having a Disco motor-generator system for lighting and starting, operating through a positive drive silent chain which is completely inclosed. For ignition, there is a Remy distributer system which is operated from the Willard storage battery that is constantly kept charged by the generator. The starter is operated by a push button on the toeboard and is capable of spinning the engine under normal conditions at 125 r.p.m.

A multiple disk clutch is used in conjunction with a three-speed selective gearset integral with the rear axle. All the gears are made from chrome nickel steel and are carried on Hyatt high-duty roller bearings. The rear axle is floating and is contained in a 2¼-in. steel housing. The driveshafts which take only the propulsion torque are 1⅛ chrome nickel steel. The gears are the product of the Brown-Lipe Co., the bevel drive pinion and ring gear being 3½ per cent nickel steel. The axles are supported by a truss rod.

Drop forged I-beams are used for the front axles, the steering knuckles being Elliott type and the bearings cup and cone ball design. Artillery type wheels equipped with 32 by 3½ tires with twelve oval 1½-in. spokes and demountable rims with an extra rim comprise the wheel equipment. The springs are semi-elliptic front and three-quarter elliptic rear, the lower half of the latter being 44 in. in length with the upper or scroll part 20 in. long, measured from the center of the spring shackle to the point of support. The springs transmit the drive and in order to provide sufficient material to take this strain the width of 1¾ in. is used with a rear shackle and a fixed front support.

Brakes Are Double

The brakes are double with contracting service and expanding emergency on rear axle drum. Drum diameter is 11 in. The frame is pressed steel channel section 4 by 1½ by 5/32 in. with three cross members tapered from 32 in. at rear to 28 in. front. The wheelbase is 112 in. and the road clearance 11 in. Standard tread of 56 in. is employed.

In the way of body work, the Niagara provides a yacht-line five-passenger body which is up to date in protective upholstering and coach work. The door hinges are invisible, instruments mounted on the cowl board and the storage battery carried beneath the front seat. The framework of the body is of first grade white ash with all joints mortised, screwed and glued. The steel coverings are of 18 gage polished nickel steel sheeting. Complete equipment is sold with the car, which markets for $740 f.o.b. Buffalo, N. Y.

(*Continued from page* 417)

guards and goes to make up a quiet assembly. For the engine support, there is a sub-frame made up of two deep channel members which are fitted to side members at the front end, and to a cross member at the rear. Suspension is by semi-elliptic springs all around, the rear being 62 in. in length and forming a unit of the Hotchkiss drive, taking both torque and drive. The rear spring support is by ball and socket connection, giving an exceptional flexibility at this point.

Steering is by worm and full gear, both the worm and gear being hardened steel and the wormshaft being fitted with thrust bearings. The gears are inclosed and operate in heavy oil.

In the fitting and equipment of the chassis, everything has been done to promote reliability and long life. Throughout, wherever possible, bushings take the wear to avoid the possibility of having to purchase expensive parts when a bushing replacement will do. Starting and lighting is by the Rushmore system and for ignition a high-tension dual outfit is supplied. The radiator is a cellular patented design carried on a cross member over the front axle. It is cooled by a 21-in. aluminum fan. The lines of the radiator are carried to the hood and cowl and hood clamps which provide against the possibility of rattle ever developing are fitted. Yale locks are supplied on each side of the hood and the cowl board is fastened to the dash and is independent of the body and cowl. The instruments on the cowl board are complete.

The Engineers' Forum

Thinks Aluminum Piston Will Never Prove Success in Truly High-Duty Motor—Weight and Endurance —Believes Aluminum Is Not Stronger Than Cast Iron

By Finley Robertson Porter,
Finley Robertson Porter Co., Inc.

PORT JEFFERSON STATION, L. I., Editor THE AUTOMOBILE:—I have read with a great deal of interest the exceptions taken to my remarks last week in reference to the universal use of aluminum in the automobile by both A. L. Clayden of THE AUTOMOBILE and J. E. Diamond, of the Aluminum Castings Co. Mr. Clayden's remarks in reference to crankcases and gearboxes is absolutely correct, and in my former article I should have mentioned the fact perhaps that these two units are, as Mr. Clayden explained, a case where rigidity is the main object and aluminum is to my mind the most acceptable material to be employed.

Inasmuch as this practice has become so general, it did not occur to me that these points were at issue and I based my remarks on other essential parts, feeling that the question of these two units was never involved.

In view of the discussion becoming as broad as it has I will concede that aluminum is without doubt the best material to be employed in these two cases.

Taking up the matter of pistons, however, I still feel that an aluminum piston will never prove a success in a truly high-duty motor. I mean by this, one that will develop at least a horsepower for every 2 cu. in. of displacement. I feel most certain that the motor of 1917 that will be recognized as a standard in the better class of automobiles, will have to prove sufficient for five- and seven-passenger touring cars, with a displacement not to exceed 200 cu. in. To attain this efficiency it means that a greater percentage of the heat generated will have to be dissipated by energy produced at the driving wheel rather than through a waterjacket or whatever cooling medium is employed.

Heat Conductivity Value

My contention in reference to the aluminum piston is that its great heat conductivity is of no real value because of the fact that the piston clearance and film of oil so thoroughly insulates the transmission of heat to the waterjacket that it becomes only a question of transferring the heat from the head of the piston to the side walls quickly enough to allow it to flow through the wall contact at the best possible rate. I believe it is conceded that cooling by radiation from the inside of the piston is a very negligible quantity since there has been no way as yet devised that permits of introducing air enough at this point to become a factor.

If this theory is correct, we can eliminate the conductivity of aluminum as a factor in its favor and confine ourselves principally to the question of weight and endurance. In view of the conditions mentioned, the temperature of a piston in a motor of this type must necessarily be very high when working under a full load, which we must remember is only a small percentage of the time, but in view of the fact that these extreme conditions do exist, they must be cared for in design with the result that an aluminum piston can be figured at scarcely more than 8000 or 10,000 lb. to the inch, inasmuch as these extreme temperatures may reach as high as 800 to 900 deg., which means that aluminum at that point has very little resistance, while in the case of cast iron we can assume a safe working stress of at least 25,000 lb. to the inch at these temperatures, and in the case of steel this factor can be safely considered as high as 60,000 lb. for cast steel and up to 175,000 lb. when the higher grade of forged steel is employed.

Inasmuch as the future motor will without doubt be confined to bores not to exceed 3 in., the question of section needed to conduct the heat away from the head of the piston comes to a point where steel can easily be employed, based almost entirely on the question of strength.

High Expansion Coefficient

My great difficulty, however, with aluminum pistons has been the high coefficient of expansion. Coming back again to the extreme heat conditions that prevail in a motor at times, it necessitates clearance enough to take care of this, which means that about 80 per cent of the time the motor is working with very loose pistons, which not only produces a piston slap but has a great tendency to break rings and produces a great deal of wear in the ring grooves which in a very short time becomes a source of trouble.

Referring to Mr. Diamond's remarks, I concede that aluminum is not one-third lighter than steel or cast iron but is rather one-third its weight. This is purely an error on my part and I stand corrected.

I do not concede, however, his statement that aluminum is stronger than ordinary cast iron, and I believe his assumption of 20,000 lb., tensile strength for aluminum is very low. It surely is, if it is supposed to surpass cast iron in strength. I have no difficulty in getting cast iron to run as high as 38,000 lb. tensile and have never heard of any aluminum concern claiming more than 32,000 or 33,000 tensile strength for aluminum. At the same time admitting that it is very far from uniform, so that a safe working factor must be accepted far below this figure.

280,000 Tensile for Steel

His statement also in reference to the strength of steel is far below what I would consider correct. The steel that I am using in motors for such parts as crankshafts, camshafts, bolts and nuts we are getting as high as 280,000 tensile.

Mr. Diamond's contention that my granting an improvement in the case of a low-priced automobile should also apply to a high-priced one I believe is a mistake, and in the matter of two designers being given free hand, one confined to aluminum and iron and mild steel and the other to the use of steels, is no doubt occasioned by my omitting to men-

tion that for crankcases and gearcases I felt that aluminum was so generally accepted that it would not be under discussion.

In the matter of the difference of expansion between aluminum, iron and steel as being prohibitive to the employment of inserted sleeves, I still differ with Mr. Diamond, but careful consideration of my view on this point as expressed in your last issue, will disclose the fact that I modified my statement in reference to this type of construction to the extent that I conceded the method possible, but was under the impression that it would require considerable experimenting to determine its feasibility.

All discussion in reference to this subject could be made much more valuable and instructive if we could first determine just what is considered a commercial job.

My impression of the matter is that it simply means the elimination of useless expenditures for material and methods not consistent with the results obtained. I do not believe the question as to whether an automobile costs $1,000 or whether it costs $3,000 should enter into the argument because of the fact that an engineering problem I believe should be based entirely on results obtained and not on any one intermediate condition that might be adopted by the different manufacturers. I believe we should consider the best possible results leaving the question of price out of it.—FINLEY R. PORTER, Finley Robertson Porter, Inc.

Predicts Adoption of Aluminum Pistons as Standard by Majority of Cars—System of Ribbing Strengthens Dome

By Walker M. Levett,
Walker M. Levett Co.

NEW YORK CITY—Editor THE AUTOMOBILE:—I have followed with deep interest your symposium on the use of aluminum alloys in automobile construction. Inasmuch as our company was the first in the aluminum piston field and has been manufacturing aluminum alloy pistons of very many varied types for upward of four years, in the automobile, marine and aeroplane fields, having been concerned with the designing of some and having cast all the magnesium-aluminum alloy pistons used in the well known racing cars of the last three years, in addition to having cast numerous other magnalium and aluminum alloy parts for automobiles, I have been particularly interested in that part of the discussion relating to engine design and piston. In replying to some of the comments that have been made, my attitude is simply that of one offering the benefits of observation accrued through experience as an aid or guide for some of those who have not had the same interesting opportunities that have arisen in what is, so far as I know, the greatest and undoubtedly the most diversified experience in casting aluminum alloy pistons.

A Mistaken Attitude

F. R. Porter's contribution in particular proved interesting to me as he portrayed a situation which we are now meeting almost daily, in view of the rapidly growing interest in aluminum and its alloys for engine requirements. With all due deference to Mr. Porter and his unquestionable attainments, there is not the slightest doubt in my mind that he "rushed into print" on the matter of aluminum alloy pistons, without having given them the thorough work-out which the ultimate benefits derived by those who have done so would warrant. Mr. Porter's attitude unfortunately is one that may be found among a good many clever automobile engineers. That it is a mistaken stand is best proved by the fact that aluminum pistons are being used with a remarkable degree of success for standard production in some of the best known cars for 1916 with the likelihood of their being adopted as standard by a vast majority of cars in the following year.

It is solely with the motive of aiding other engineers who, against their own conviction possibly, realize that the day of the aluminum piston has arrived, and that of the iron piston is on the wane, that I am taking this opportunity of stating a few concrete facts, both as to successes and failures in experimental work with aluminum pistons and aluminum cylinders.

The distinct impression gained after some years' experience along these lines is that each engine offers an individual problem as to clearance and prevention of slap. The engineering rules relating to coefficient of expansion seem to strike a snag when applied to two pistons of the same dimensions used in different type of engines, owing to the differing cooling properties of each type. I could give off-hand a number of rules for clearances that are proving perfectly satisfactory in different types of engines and ranging all the way on the skirt from 0.00125 in. per in. of piston diameter to 0.00275 in. per in. of diameter and without the slightest indications of slap or undue wear in either case. On the other hand, I have known of experimental work where the ordinarily safe rule of doubling the clearance usually allowed for cast iron pistons failed to operate and permitted a very appreciable slap. The manufacturer in whose engine this occurred persisted, however, until he arrived at a satisfactory clearance and has adapted our Magnalite pistons for his standard production.

With regard to the slap which is noticed when the engine is cold and too much clearance has been permitted, there have been numerous methods devised to overcome this usually objectionable feature and with evident satisfaction. Offsetting the wristpin 1/32 in. seems to have satisfactorily solved the slap problem for one manufacturer. Adding ¾ in. to the length of the skirt is a solution by another. A four segment split in the skirt of the piston and machining the skirt to an almost exact fit with the cylinder wall has also prevented any play and consequent slap for another manufacturer. Numerous counter-balancing weight distributien methods also have been employed with success.

Experience with Magnalite Pistons

The matter of the initial slap where objectionable is therefore adequately taken care of by methods that were gained solely through experience. The matter of clearance is one which warrants a little experimental work for each engine in which Magnalite pistons are to be used and the results fully justify the effort. Space limitations prevent my giving full details of numerous interesting experiences with Magnalite pistons that have come with long association with this metal. I will state for Mr. Porter's benefit, however, that we recently shipped abroad pistons on an order from one of the best known concerns, who apparently has been in the fortunate position of being able to disregard costs. This concern formerly had employed pistons which were machined from solid steel billets. Their instructions to us were practically *carte blanche*—to produce a lighter-than-steel piston, which would stand up under the heavy stresses of their high-speed motor.

Sham Warfare Motor Equipment Test

Right—Part of the military instruction camp at Plattsburg pitched in a sheltering wood

Left—Mack 3½-ton truck pulling field gun and limber on way to Plattsburg camp

By J. Edward Schipper

MILITARY Instruction Camp, Plattsburg, N. Y., Aug. 29—What an automobile machine gun corps can do in time of action was clearly demonstrated today in an engagement which took place here between the red and blue armies made up of units from the military instruction camp. The machine gun corps which is attached to the red, or invading army, and is under the command of Captain Smedburg, machine gun expert of the U. S. Army, in connection with the second U. S. Cavalry, succeeded in capturing the entire Thirtieth U. S. Infantry, one of the principal units of the blue defending army and one of the crack organizations of the regular army.

The action centered about the Coopersville, N. Y., bridge over the Big Chazy River. Late Saturday night the blue army scouts captured this bridge. Reinforcements arrived and were ordered to hold the bridge against any attacking force. Captain Root of the Thirtieth U. S. Infantry marched on the bridge early this morning and found it in possession of the blue scouts with its reinforcements. Although the red army scouts reported that other than the force holding the bridge the field was clear, a host of blues was concealed in the brush and shrubs nearby awaiting the order to surprise the crack regiment of reds. Everything had been arranged for a successful ambush of the unsuspecting blues. About a mile to the north of the bridge the machine gun troop, in its armored cars, was waiting on the State road ready to rush to the support of the attacking reds, and when everything was ready the reds hopped up from every side, completely surrounding the regiment of blues, who tried in vain to re-form their line to resist the attack.

Armored Cars in Action

The final stroke was delivered when the whole battery of armored machine gun cars dashed down the State road into the very midst of the trapped blue regiment and the umpires ruled that the entire organization was captured; or rather, that its survivors were. The machine gun troop has shown that it has justified every claim for mobility. Dashing down the road at 30 m.p.h. with machine guns cracking and the gun crews busily engaged in feeding ammunition to the Benet Merciers and Colts it makes a business-like spectacle, and is not incapable of being concealed behind stone walls, etc., in the neighboring fields.

Watch Motor Equipment

MILITARY INSTRUCTION CAMP, PLATTSBURG, N. Y., Aug. 29—Keen eyes are focused on the work in progress at this camp. Alert brains are studying the results here accomplished. The prinicples involved amount to far more than the possible 1200 graduates from the school of military instruction, because the men are not the only features of interest to the military authorities of the country.

The war in Europe has brought out the necessity for an adequate supply of material of all kinds. The work of the motor equipment in Europe has opened the eyes of officials in this country as to what the possibilities of its use are

Autocar machine gun express with its crew

when it comes to problems involving quick mobility. In former years the 25-mile-a-day march was considered sufficient for any need under ordinary circumstances. To-day 100 miles a day is not considered too much when it becomes necessary to transport large bodies of men from one point of operation to another. The use of machine guns in Europe has now reached a scale never dreamed of in former wars. It was at one time sufficient to have three machine guns to a regiment of 1000 men; from twenty-five to thirty guns are now considered necessary. The machine guns and the motor vehicles go hand in hand. They are two prominent landmarks in the military history of the past two years.

Both machine guns and motor vehicles are parts of the plan of quick mobility. For this reason, the presence of a machine gun troop fully equipped with motor vehicles at this camp is attracting the attention of army experts to a notable degree. There are fifteen motor vehicles in the camp and fourteen of these are with the machine gun troop.

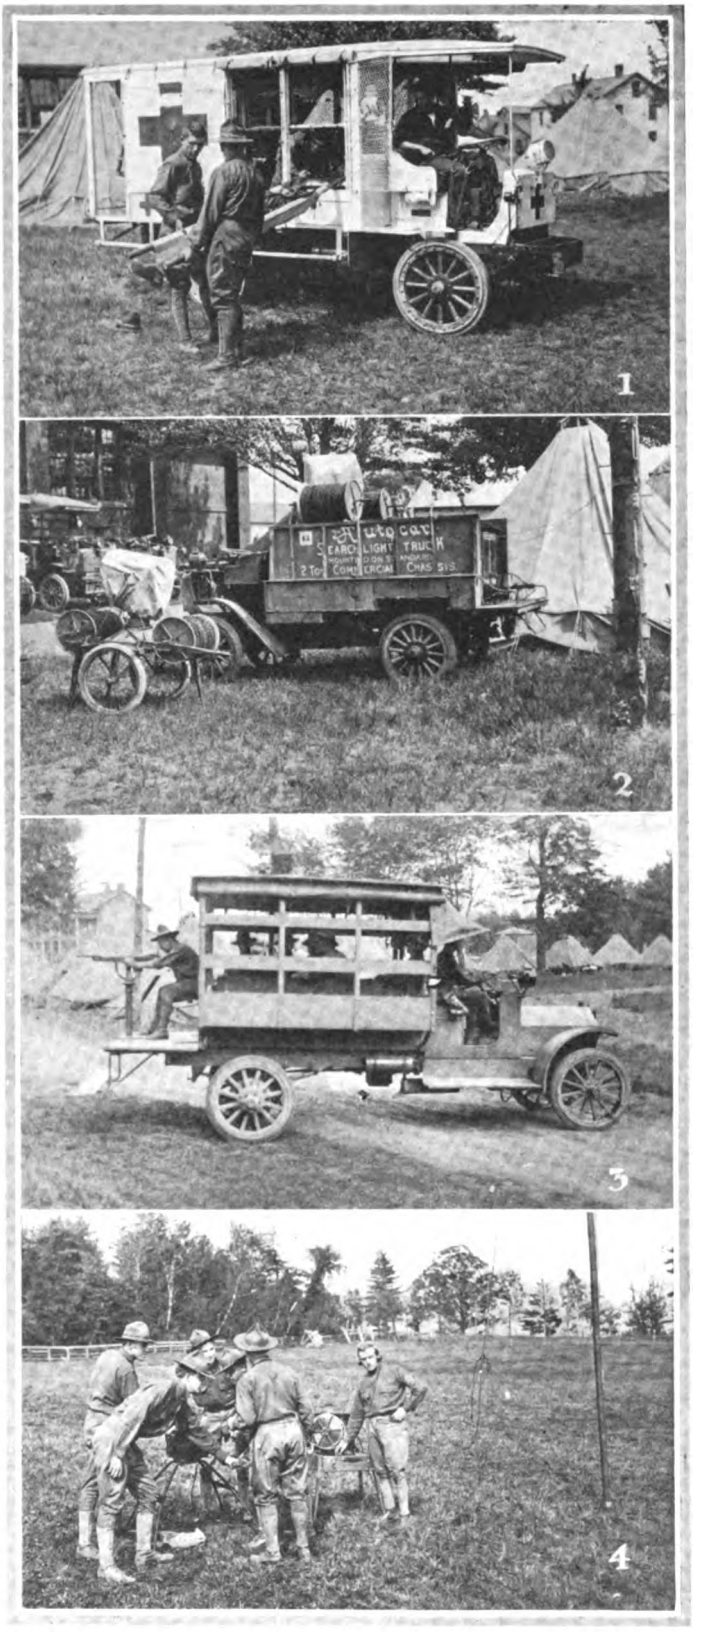
This is the first experiment in motor-transported machine gun units which has ever been conducted by the U. S. Army or the National Guard, because, hitherto, no funds or opportunities for such an experiment have been provided. Private capital has supplied the money for this organization in connection with the military instruction camp and from the experiments here conducted, it is purposed to learn exactly what kinds of cars and trucks are suited for the purpose, how many guns and men can be transported to advantage upon one truck, the speed at which they can be operated, the sort of country they can be used in effectively, and other data which at the present time are merely guess work.

Seventy Men in Machine-Gun Troop

In this troop there are about seventy men, lawyers, bankers, and business men from all over the country. They are graduates from Harvard, Yale, Princeton and other leading universities. With the troop there are twenty machine guns and two 1-pounders. The machine gun expert of the U. S. Army, Captain Wm. Smedberg, is with the troop to instruct the men in the operation of the guns and to keep a watchful eye on the performance of the equipment. Capt. Raynal C. Bolling, general solicitor of the U. S. Steel Corp., who has been instrumental in organizing the troop, is in command. The necessary funds for the experiment have been contributed by Judge Gary, chairman of the board of the U. S. Steel Corp., Geo. W. Perkins, J. P. Morgan, Brown Bros., Potter, Choate & Prentice and White, Weld & Co. In addition, vehicles have been supplied by the Autocar Co., International Motor Co., the Cadillac company, Garford, Simplex, Mitchell, Buick and Hendee Mfg. Co. A privately-owned Ford and a Locomobile are also present. In addition, the Carnegie Steel Co. has supplied armor, the Hay-Buddon Mfg. Co. has provided a field repair shop anvil and the Vought and Williams Co., a forge and vise. The U. S. Tire Co. supplied a number of extra casings for the cars.

With this equipment, there is a sufficient variety for accurate line to be drawn on the possibilities on each type of car. So far, the experiments show that two main factors govern the utility of the vehicle under consideration. They are, the speed and the body. This fact became evident even on the march from New York to Plattsburg, a distance of 400 miles accomplished in four days. Capt. Bolling immediately divided the cars in three classes; slow, medium and high speeds, and laid out the work of each accordingly. Regarding the body, the fact which stands pre-eminent at the present time is that it must be so designed as to be suitable for all around purposes. A special type of body which can only be used occasionally fails to have the general utility necessary in campaign work. This fact will become evident as a detailed study of the equipment at the camp is made.

The Garford truck is of 1½-ton capacity, and on the chassis is mounted an all-around utility body which can

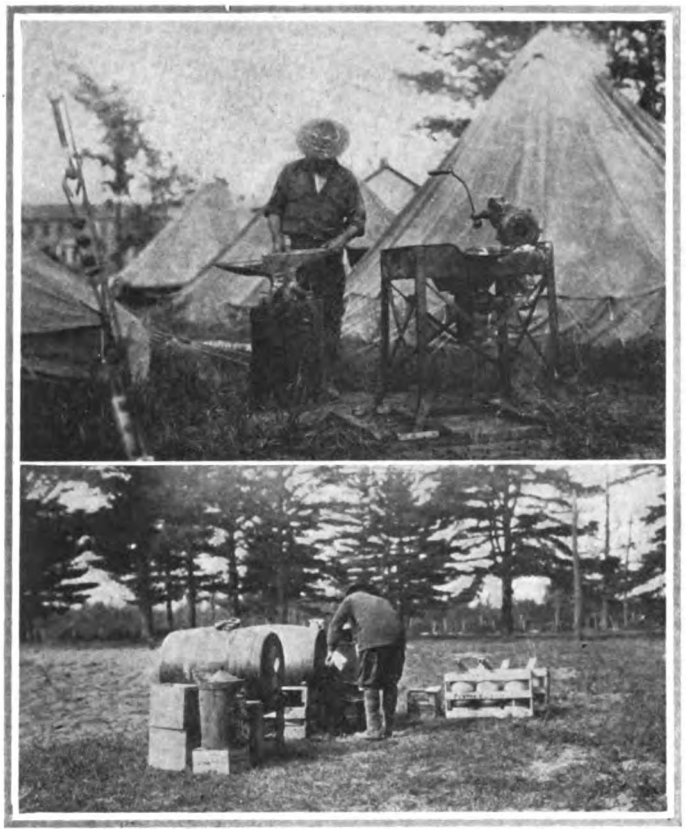


1—Autocar ambulance in action. Wounded man being handled on stretcher carried with car

2—Autocar searchlight truck with detachable searchlight reel, which can be wheeled 1-4 mile from truck, which is the source of power. This apparatus was also employed at Fishkill Landing

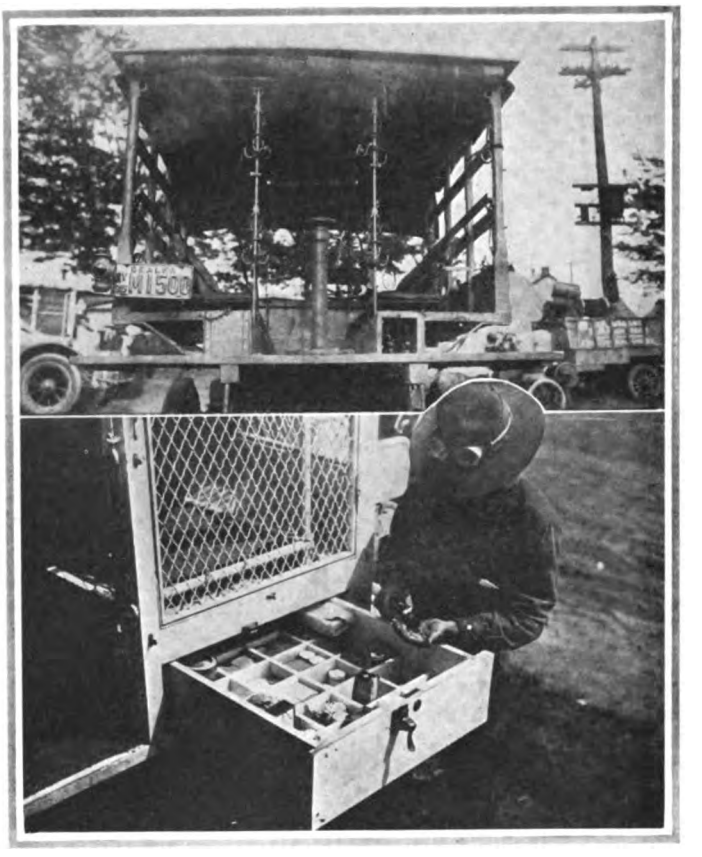
3—Garford 1 1-2-ton truck with machine gun mounting. This is an all-around useful body which can be used for transport and machine gun work, or the machine gun can be dismounted and the body used for ambulance purposes

4—Field wireless crew with apparatus which can be carried on motor vehicles



Field repair equipment carried to the permanent encampments for work on the motor trucks

Field gasoline station used at the Plattsburg camp—here is a feature which could be improved for permanent encampments



Rear view of the body mounted on the 1 1-2-ton Garford truck, which is an example of all-around use

Drawer in the side of the autocar ambulance body containing enough surgical equipment to perform a minor operation

either be used as an ambulance or a transport and machine gun car.

Body as an Ambulance

When used as an ambulance, the machine gun is, of course, removed to bring the car under the protection of the Red Cross. At that time the car can go right to the front and pick up wounded men as far as battle conditions will permit. It has a capacity of six stretchers which can be carried on racks supported within the car on uprights, as will be noted in the illustration on this page. The body, however, is more of a transport and machine-gun outfit than an ambulance. With the machine gun mounted on the rear platform, and with the side seats for the crew, a speed of 35 m.p.h. can be secured. If desired, the seats can be removed and the men crowded together to the utmost capacity of the vehicle. When not near the firing line the machine gun is removed and placed in a bag which is carried in a space provided for it beneath the side seat. The stretchers fold up, the stretcher racks are out of the way and, in a word, all-around utility is the chief asset of this type of body. It can be a field ambulance, a motor transport wagon, an offensive machine gun unit, a rear guard unit, a reconnoitering car, or fulfill any duty of ordinary military usage.

On the Buick chassis, which is of 1500-lb. capacity, there is mounted a type of body which has been found of great use on the battlefields of France when it becomes necessary to transport quickly ten or a dozen men from one part of the scene of operation to another. It is a sort of open express design which can be provided with armor plate if necessary and carries on the rear platform a machine gun mounting for either offensive or defensive work. A car of this class can dash about from one place to another at a speed of from 35 to 40 m.p.h. and with the crew of the machine gun could withstand a considerable attack while the men are performing the work assigned. In other words, a car of this type could be sent on an expedition such as the blowing up of a small bridge, and while the men in the wagon were setting the explosive and arranging the fuse the machine gun could be utilized to hold off the enemy for a sufficient length of time to accomplish the work.

Armored Cadillac in Camp

The Cadillac cars are the military hospital and armored cars which have been described before. They belong to the North Western Military Academy of Highland Park, Ill., and are part of the contingent which recently completed a tour to San Francisco. The armored car can attain a speed of 40 m.p.h. and is equipped with a revolving gun turret. The present car is equipped with pneumatic tires with the spare tire exposed at the side. In time of service these would no doubt be replaced by solid tires. The military field hospital in its present condition has a machine gun mounting on the rear which of course would have to be removed if the car were used for ambulance work. One of the points of this car's equipment are the roller stretchers. These take up so much room that they could not be used to advantage were there wounded men in any quantity.

Submitted for test by the International Motor Co. are two Macks, a 1-ton and a 3½-ton. One of the surprises of the camp has been the performance of the 3½-tonner. This is equipped with demountable armor plated sides and has mounted on its body two machine guns and a 1-lb. rapid fire gun. It acts almost as a land gun boat. On the march to the camp, 400 miles from New York, this truck with its equipment which weighed up to 8 or 9 tons was speeded to 35 m.p.h. In addition to its own load consisting of more than thirty men, the three guns, 15,000 rounds of machine gun ammunition, 12,000 rounds of 1-lb. shells, 800 rounds of 3-in. shrapnel for the field piece, two independent searchlight

systems, one of gas and the other of electric, two independent gasoline systems, and the armor plating, this truck towed a limber and a 3-in. field piece of the latest design capable of firing 9000 yd. or over 3½ miles with accuracy.

The other Mack, of 1-ton capacity, is equipped with pneumatic front and solid rear tires and a platform body upon which are removable sides and tail piece covered with Harveyized steel armor. This is capable of resisting rifle fire at 500 yd. Just for an experiment, the plates were removed and the men opened fire with the machine guns at 200 yd. The hail of bullets failed to penetrate the plate, simply splashing off, but the plates themselves rapidly became crystallized under the vibration set up by being struck blows equivalent to the falling of several ton weights at the rate of over 300 per minute. The result was they soon cracked and fell apart, although at no time did a bullet penetrate through the steel. The steel is guaranteed against rifle fire, however, at 500 yd. with the latest steel bullets. The truck is equipped to carry a Maxim rapid fire gun and a Colt machine gun with full crews for each of these and 15,000 rounds of ammunition. Both the armor plate and guns can be removed on short notice to be set up in a field position. The bodies on both these Macks have been designed by Alfred F. Masury, chief engineer of the International Motor Co., who spent 3 months making a study of European military motor equipment in Europe. A feature is the tubular centrifugal radiator behind the motor in a steel bullet-proof frame.

Simplex Machine Gun Express

On the Simplex 100 hp. is a body which may be called a machine gun express. This body carries a driver for the car and has just sufficient room for a machine gun and crew. It is capable of speeds in excess of 60 m.p.h. and can be used to dash into the enemy's line, operate the machine gun for a short time and then before it can be reached by artillery, make a hasty retreat. It is such vehicles as this that have been of great use on the other side for making quick reconnoissances.

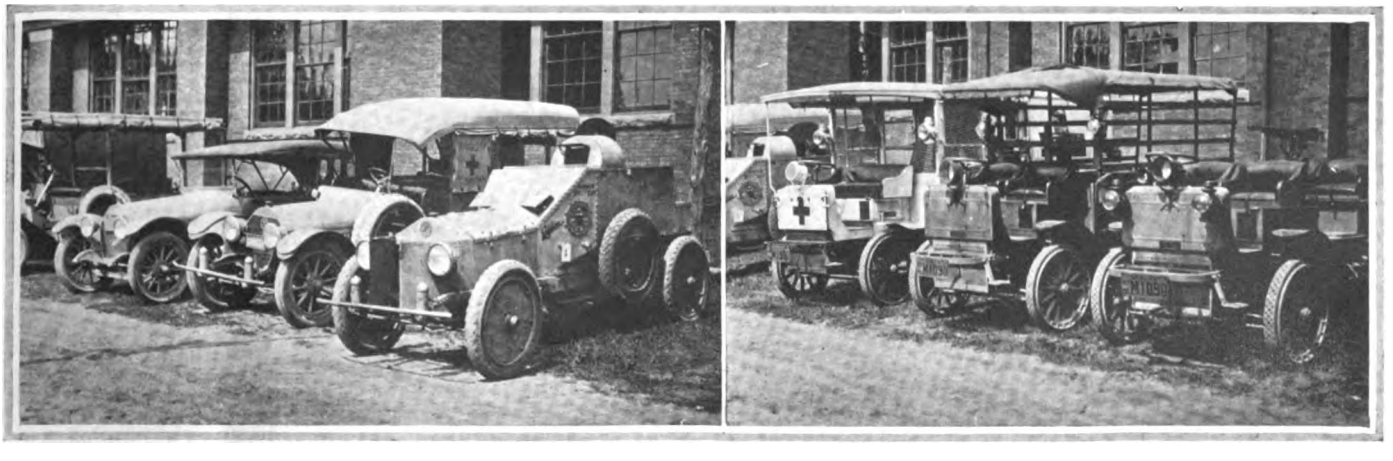
The four Autocars have all special bodies which are similar to those now in actual use on the European battlefields. These are all on the standard Autocar 2-ton chassis. The officers' reconnoissance car can carry a group of officers on a tour of inspection of the lines or for any service at all where it is necessary to take three or four men quickly along the lines. It fills the place of the officers' horses, doing the work much more rapidly wherever it is possible to remain on the road. The searchlight car is the same as that recently concerned in the manoeuvers at Fishkill Landing, N. Y. The searchlight wagon attached to the car can be wheeled a quarter mile away from the truck which contains the generator for the electric current. In this way the searchlight can be taken to the brow of the hill while the power plant remains concealed in the valley below. The motor ambulance is the same as that attached to the Canadian contingent now fighting in Flanders and the military transport is a body intended to convey men to and from headquarters or about different parts of the line. Any of these wagons can be used for transport wagons, the ambulance having carried twenty-eight at Fishkill Plains, besides having had some actual ambulance experience in working over two drowning men who were caught in a stream which was thought to be fordable. This ambulance has traveled up to 40 m.p.h. It has a water tank underneath with a tap on the rear with room for six prone and eight sitting-up besides the crew and on the side of the body there is a drawer containing enough surgical apparatus to perform a minor field operation.

Mitchell Touring Car for Officers

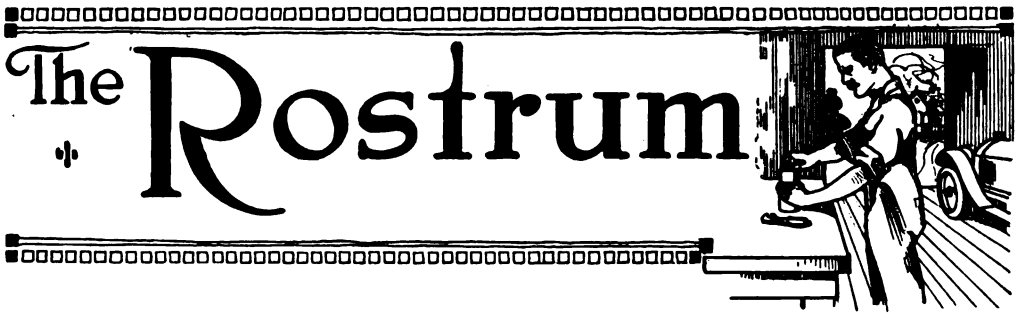
For an officers' utility car there is a Mitchell 6-16, which has a speed of 60 m.p.h. It is a standard seven-passenger touring model. There is also a Locomobile touring chassis and a Ford chassis, each capable of acting as machine gun express cars. The remaining piece of motor apparatus with the machine gun and artillery corps is a Gallaudet tractor bi-plane with a 100-hp. Gnome engine for scout work.

One other piece of motor apparatus is at the camp; this is a wireless truck mounted on a White 1½-ton chassis equipped with a special body to take care of this work. This apparatus can be set up for action in 12 min. and it can send messages 800 miles. The vehicle carries an entire crew and has a generator and complete outfit for sending and receiving wireless messages on the truck. It has a mast for the wireless antennae which are of the umbrella type. The mast is in nine sections and is 85 ft. high. This apparatus belongs to the United States regular army signal corps and has been in use for a little over a year.

Out of the preliminary chaos, however, certain definite facts regarding the uses and requirement of military equipment are beginning to stand forth. The best all-around weight capacity is not above 1½ tons except under special circumstances. Military transport cars must not be merely converted furniture vans or milk wagons, but on the other hand must have special bodies which render them of actual use other than mere vehicles upon which a body of men can pile themselves in traveling across country. With machine gun mounting, many of these vehicles can be made to serve as valuable offensive units. Trucks can be used for towing artillery; with adequate motor-driven apparatus, 100 miles per day is not too much of a journey. The machine gun squad of Plattsburg traveled 100 miles per day for 4 successive days with twenty machine guns, a 3-in. gun and caisson with limbers for each full equipment for the men, cooking outfit, provisions, and all the paraphernalia necessary. Special body design on sturdy, fast chassis will answer the requirements of all-around service far better than miscellaneous trucks picked up here and there.



Views of the motor vehicles kept ready for action at the military instruction camp in Plattsburg



Has Trouble with Gasoline Feed

EDITOR THE AUTOMOBILE:—I have a Winton six-cylinder car. The gasoline tank is on the rear end of the car and the gasoline is forced up to an auxiliary tank on the dash. It then flows down to the carbureter. I also have a four-cylinder Rambler and the gasoline tank is under the front seat and the gasoline flows from there to the carbureter. When running very slowly for 20 min. in hot weather, the gasoline will stop flowing to the carbureter and the car stops. If I wait 5 min. the gasoline will begin to flow again and everything will work properly. Both cars work exactly alike in this respect. Can you give me some advice as to the cause of this?

Riverton, N. J. H. C.

—The fact that two cars act the same renders this a very mysterious state of affairs but there are two explanations which may fit the case. The first explanation is that there are air locks in the piping. It very often happens that in installing the gasoline line, large vertical bends are allowed to occur in the piping. When this happens, there are certain times when the gasoline will be drawn away and what corresponds to a large bubble in the pipe will form in the bend. The result is that the gasoline is choked and cannot flow until this bubble is broken, which occurs due to the weight of the gasoline after a few moments' wait. When the gasoline is again drawn through the piping, another bubble is apt to form and the same occurrence happens again.

The second explanation for your trouble is that, instead of the gasoline ceasing to flow, the condition of running on a rich mixture for 20 min. results in flooded engine which will not again operate until sufficient gasoline has evaporated to bring the mixture down to the range of explosiveness. Above and below this range, a mixture of air and gasoline will not explode. With the ordinary carbureter, the auxiliary air valve will remain closed at very low speeds with the result that practically all of the suction of the motor falls upon the jet and nothing but raw gasoline is drawn into the manifold. After running a short time in this condition, with more gasoline being drawn into the manifold than is being used, the motor is choked and stops. When you wait for 5 min. as you state, the accumulated gasoline evaporates with that result that an explosive mixture is again formed and the car will run properly until the same condition is again set up.

The remedy for the trouble is either to make a lighter adjustment on the air valve, or to install some device admitting extra air to the manifold. A number of these are on the market and can be attached by simply tapping into the intake manifold and by installing a control system, such as a Bowden wire, to the steering column or some convenient position in the car. Whenever the mixture becomes super-rich, so that it is necessary to dilute it with an extra supply of air this can be done from the driver's seat. Such an installation not only guards against the trouble which you mentioned, but also permits a reduction in your gasoline bills by making a leaner mixture for higher speeds at which the car is practically continuously run during a tour through the country.

It would be well for you before making any such installation, however, to go over the piping to see if your trouble is not due to the readily cured air locks due to vertical bends. Referring to the illustration, Fig. 1, the difference between the bent piping which is apt to have air locks and the straight piping in which they are avoided, is shown.

A Metal Lighter Than Aluminum

Editor THE AUTOMOBILE:—I have been very much interested in the articles appearing in THE AUTOMOBILE on the possibility of using aluminum in gasoline engine construction, and am appending a clipping which will speak for itself.

Both the pistons and the cylinders are made of this metal and the writer had the chance to examine the engine lately and found both the piston and cylinders in splendid shape. The length of the cylinders covered by the ring travel, seemed to have even a higher polish than cast iron, and there were no scars on either member and no wear which could be noticed, although it is said that the engine has seen considerable service.

It is possible that Krause has made a discovery which will become very valuable to engine designers.

St. Louis, Mo. C. E. B.

—The clipping inclosed by C. E. B. states in part: "To take a piece of fire clay out of the earth and from it make a metal lighter than aluminum and as tensile as steel, and then take this metal and make of it a 75-hp. motor weighing 175 lb. you are capable of driving a polyplane aircraft 2 m.p.m. is an achievement that bids fair to place its achiever among the great inventors of the world. This is what G. A. Krause claims to have done. It is said that the U. S.

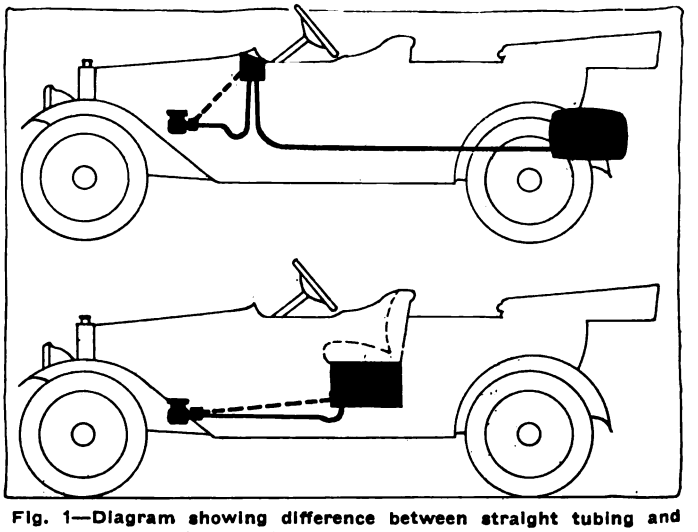


Fig. 1—Diagram showing difference between straight tubing and curved tubing which causes air locks in gasoline line

Government is figuring on a contract calling for 2500 of Krause's motors at $1,600 each or $4,000,000 gross. Naval officers have been in St. Louis a week testing the metal and motor. Speaking of his metal, Krause said, "It is a fire clay product with a specific gravity of from 1.76 to 2.16 and a tensile strength ranging from 21,000 to 35,000 lb. per square inch."

In all probabilities the alloy referred to is a mixture of aluminum and magnesium, although the specific gravity of the well-known aluminum magnesium alloys is generally a little higher than the figure given in the quotation. Magnalium for instance, has a specific gravity of about 2.5. Its tensile strength cast is from 18,000 to 21,300 lb. per square inch, and in annealed plates, runs as high as 42,200 lb. per square inch which is higher than that given above. The reason that the magnesium alloys are lower in specific gravity, is that magnesium itself is very low in specific gravity, this figure varying from 1.69 to 1.75, while the specific gravity of aluminum is 2.6 to 2.7.

With careful working, magnesium-aluminum alloys can be so made that a tensile strength of approximately 53,000 lb. per square inch with a 3.7 per cent reduction in area can be readily secured.

Weakened Magnets Need Recharging

Editor THE AUTOMOBILE:—I have a Velie racer which is equipped with a Mea Magneto from which the machine is started by hand crank and it will not fire at low speed when turned by hand. I suppose the magnets are weak.

This is a foreign magneto and will be glad if you can advise me who handles this apparatus in this country.

Saltville, Va. P. S.

—The reason you give for your magneto failing at low speeds is probably the correct one. This magneto has magnets which are differently shaped, as compared with those manufactured in this country, which as a rule have the standard horseshoe type.

The shape of these magnets is brought out in the illustration, Fig. 2. The magneto is handled by Marburg Bros., 1790 Broadway, New York City.

Grease Will Not Retard Layshaft

Editor THE AUTOMOBILE:—In THE AUTOMOBILE for Aug. 5, page 224, under the heading, Has Difficulty in Changing Gears, would state that I have recently seen in the instruction for another car the request to use heavy cylinder oil in the gearbox. This makes me think that it is quite possible that too stiff a grease might noticeably retard the layshaft. Is not this true?

Boston, Mass. W. G. R.

—It is hardly possible that heavy grease would continuously slow up the shaft although it might do so, for a considerable time after it was introduced into the gearbox. After a short time, however, the rotation of the shaft and gears would cut a path through the grease and the resistance for turning would become so small that there would not be sufficient retardation of the shaft to make gear changing difficult. The slowing of the shaft must be due to something which binds and hence will probably be found in the bearings.

Carrying Capacities and Tire Pressures

Editor THE AUTOMOBILE:—According to statistics recently compiled by THE AUTOMOBILE, the number of automobiles in this country has now passed the 2,000,000 mark. This indicates a tire output of 12,000,000 for this year. An estimate of $16 per tire, which is conservative, will give a valuation of $192,000,000 which will represent this year's output. It has been shown that 30 per cent. of this enormous sum is being wasted by ill-advised loading of tires. In other words, $57,600,000 will be wasted this year through failure to observe proper loading precautions.

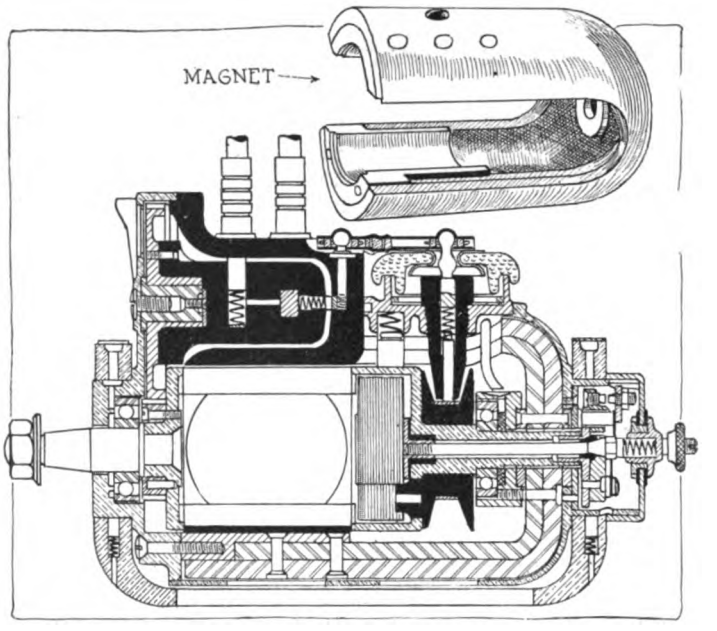

Fig. 2—Section of Mea magneto and sketch of Mea magnet

The load properly assigned to a tire should be the actual load on the tire with the car fully loaded. The actual load on each tire can be ascertained by weighing first the front of the fully loaded car, then the rear, dividing each figure by two to get the load per tire. It can then be inflated to the proper pressure for that particular weight as indicated by the scale of carrying capacities and inflation pressures. A certain tolerance in pressure should be allowed for leakage but before the pressure drops 20 per cent the tire should be pumped up again.

Realizing, of course, that every consumer has a right to his own ideas as to what constitutes good service, and that no practical inflation schedule will cover all possible conditions of service, the following schedule is offered and recommended by the Goodyear Tire & Rubber Co., as a guide under normal conditions:

Gross Carrying Capacity, Pounds Per Tire, Including Passengers and Complete Equipment

	Tire Section Diameter						
Inf. Press.	3-in.	3½-in.	4-in.	4½-in.	5-in.	5½-in.	6-in.
30	250						
35	290	360					
40	335	410	500				
45	375	460	560	675			
50	415	515	625	750	875	1000	1140
55	460	565	690	825	960	1100	1255
60	500	615	750	900	1050	1200	1370
65		670	815	975	1135	1300	1480
70		720	875	1050	1225	1400	1595
75			940	1125	1310	1500	1710
80			1000	1200	1400	1600	1925
85				1275	1485	1700	1940
90				1350	1570	1800	2050
95					1660	1900	2165
100						2000	2280

Akron, Ohio. H. S. QUINE.

Why Speed Increases Fuel Consumption

Editor THE AUTOMOBILE:—Would there be any difference in the amount of gasoline consumed in a car going 40 miles, at the rate of 40 m.p.h. and the same car on the same trip going 10 m.p.h.?

New Westminster, B. C. L. W.

—There would be a difference in the gasoline consumed going at these two different rates of speed and the probabilities are that there would be less consumed for traveling the distance at 10 m.p.h. than there would at 40 m.p.h. The reason for this is in the wind resistance. In traveling at 10 m.p.h. the wind resistance for each square foot of projected area against a vertical transverse plane would be .492 lb. At 40 m.p.h. this resistance has increased to 7.873 lb. There-

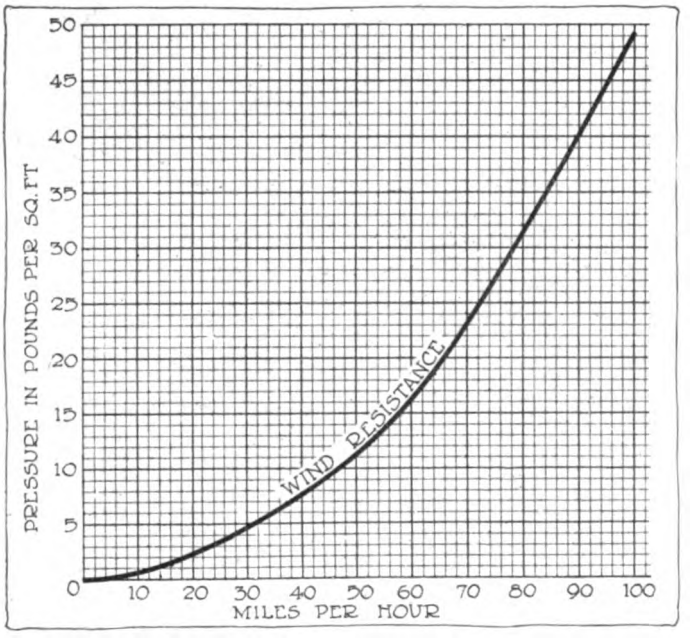

Fig. 3—Curve of wind resistance at different speeds

fore, if the projected area is 25 sq. ft. this pressure amounts to a considerable quantity at a rate of 40 m.p.h. The power required to overcome wind resistance can be figured approximately by a formula which is given as follows:

$$H.\ P. = .96\ P\ A\ M$$

In this formula *H. P.* is the horsepower required to overcome the wind resistance, *P* the pressure of the wind in pounds per square foot and *M* is the speed of the car in m.p.h., thus, assuming a car with a front area of 10 sq. ft. and a speed of 60 m.p.h. the power required to overcome the wind resistance alone, will be 20.8. A curve of wind resistances for different speeds is given in Fig. 3.

Wants Conventional Piston Defined

Editor THE AUTOMOBILE:—Do you know of any books, in either English, French or German which take up the design of motor vehicles from an engineering standpoint? If so, give price and tell whether you can furnish them.

2—How can I secure a copy of the S. A. E. handbook?

3—How can one secure junior or student membership in the S. A. E.?

4—Can you furnish indexes to articles published in past issues of THE AUTOMOBILE and if so, do you furnish back numbers of the magazine?

5—Do you know of any list of allowable unit working stresses used for the different materials entering into the make-up of an automobile?

6—What is the conventional piston design? Is there a similar design for the other parts of an engine and if so, where can I find them?

Chillicothe, Ohio. N. S. A.

—There are a large number of books covering this subject published in all three languages and it would be impossible in the space available here to give a full list of these together with their authors and publishers. It is suggested that you communicate directly with different publishing houses for their list of books covering the subject you outline, in the different languages.

2—Copies of the Society of Automobile Engineers' handbook can be purchased from the offices of the Society at 29 West Thirty-ninth Street, New York City. The book is sold in loose-leaf form with leather binder. It is in two volumes.

3—A junior or student membership in the Society of Automobile Engineers can be secured by filling out the form of application blank provided by the Society whose address is given above. It is only necessary to address the secretary of the Society who will be glad to furnish you with application blank on the back of which are printed the requirements for membership in any grade. The Council of the Society, when acting upon the application blanks, determines the grade of membership to which an applicant is most suited.

4—Indexes to the back issues of THE AUTOMOBILE are published semi-annually in the last issue in December and in June. Back numbers of the periodical are furnished whenever they are had in stock.

5—So far as THE AUTOMOBILE has any record, there is no published list of allowable unit working stresses used for the different materials entering into the make-up of an automobile.

6—There is no definite conventional piston design as a piston might be made in several different ways as regards the number, position and kind of rings and yet still be conventional. The only parts of an automobile which may be said to be strictly conventional in every way are those which follow the standards laid down by the Standards Committee of the S. A. E. Such things as I-beam connecting-rods, I-beam front axles, channel frame members, horizontally split crankcases and a large number of other details found in every car are what might be called conventional although no two are exactly alike.

Tire Size Affects Speedometer Reading

Editor THE AUTOMOBILE:—The speedometer on my car is made for a 36 by 4½ tire, and by using a 37 by 5 tire, what is the difference in per cent on the mileage?

If the speedometer registers 20 m.p.h. how fast is the car really going and how is it figured up?

Montreal, Ont. W. O. G.

—The fact that you have changed your tire size to 37 in. diameter and kept the 36-in. gear for your speedometer drive will make the speedometer register a lower speed than you are really going. The reading on the speedometer for a definite sized gear will vary inversely as the diameter of the tire. Therefore, the speed shown on the speedometer will only be 36/37 of your actual rate of travel or, in other words, only 97.3 per cent of your actual speed. To secure the proper speed reading, you will have to take the speed shown on your meter and multiply it by 1.027. The accompanying illustration, Fig. 64 shows the problem diagrammatically since the speedometer really measures to the speed of which the wheel is revolving. It will take a larger wheel a less number of revolutions to go the same distance than a small wheel, because the circumference of the larger diameter wheel is greater.

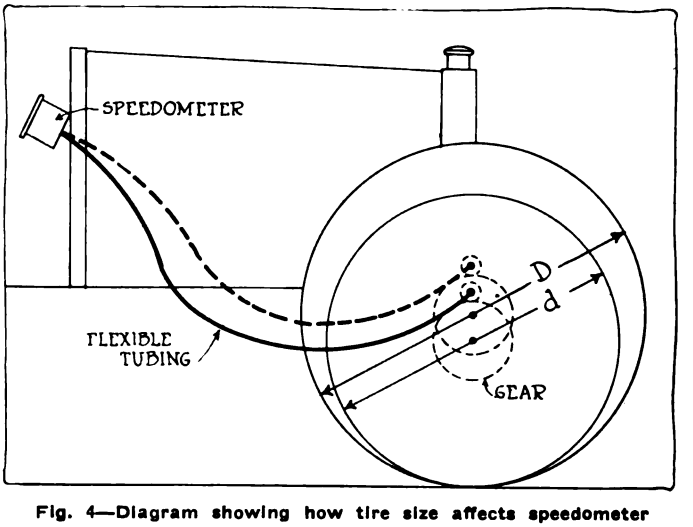

Fig. 4—Diagram showing how tire size affects speedometer reduction

The Car That Stays Young

By M. C. K.

When prices are forced down by competition and values drop more than the prices the first cause is always the public's inability to distinguish between genuine and imitation values. Nobody really prefers what is shoddy or prefers to make it. This being the case, what could be more logical than to cultivate insight in values? The following article, in connection with the responses it may call forth and continued work with details, is an experiment in this direction. It may fall short of its aim, but the classification it introduces cannot help proving useful in some degree.

COMPLETE competence to form and explain a first-hand conception of The Car That Stays Young is divided among hundreds of persons and therefore does not practically exist. Little bits of special technical knowledge relating to paints and rust, leather and imitations of leather, upholstery materials and trimmings, seat springs and brass tacks, colors and dyes, surface qualities and ductility of skelp, rigidity and elasticity of rods and wires etc., must be combined with a large and discriminating driving experience as well as with engineering insight and good sense for the fitness of things, in order to round off a detailed mental image of The Car That Stays Young with a minimum of maintenance and in which nevertheless a smart and creditable appearance is not sacrificed from the start to offset in advance the inroads of wear and tear.

All have piecemeal ideas on this subject, as the ambition to produce or own The Car That Stays Young is universal. Only a few nowadays measure their satisfaction by the amount of painstaking care needed to keep their vehicle trim and resplendent; this particular form of vanity from the horse-and-carriage days having almost disappeared even where most of the labor involved falls to the lot of a hired chauffeur. But the universal desire for a car that will continue to look fit, robust and up-to-date when past middle age usually finds a negative expression. The "cheap" car which nobody wants but which multitudes buy unknowingly is the opposite and the negative of The Car That Stays Young; it may be high-priced or medium-priced or low-priced, but if it gets the reputation of being "cheap"—with some other popular adjectives in reserve for emphasis, if needed—it is mainly because it turns out that it always ages prematurely, in efficiency, in looks, in sounds, in style. Rarely does the word refer only to an inharmonious crudity in lines and proportions; for of this shortcoming many an owner can remain happily unconscious, while to others, though they did not notice it at first, it gradually becomes a more and more aggravating source of mortification; it "gets on their nerves" and prompts them to get rid of the car.

Hundreds of errors can be committed in the design and production of an automobile, and it takes only three or four serious ones to place upon it the stigma of cheapness. There is no end to the combinations of mistakes which will result in this lapse from grace, and no single conception of the "cheap" car can therefore be set up. The word, implying only a denunciation and negation, suggests no useful arrangement of the ideas which it conceals. Yet the general avoidance of all the faults for which this commonly employed word may stand would mean a remarkable sort of progress of great economical and esthetic or educational value —with the usual commercial rewards for those accomplishing it in marked degree or in the most judicious manner. At this point the conception of The Car That Stays Young, being positive and comprehensive, suggests itself as one that can be cultivated and built up till it stands almost as clearly before the constructive mind as the actual Panhard-Levassor car did in 1895 or the Mercedes in 1901. The Car That Stays Young also represents a group of facts and ideas which can be followed up independently of routine work at factories and independently of other descriptive or test-recording work in the press. The conception is in itself a classification of important facts relating to the future value and usefulness of a car; facts which are usually snubbed in comparison with the careful attention given to all factors of the present day and hour, which always automatically assert their importance. Such a classification developed into a living and growing thing, to whose completeness automobile owners, repairmen and members of allied industries may contribute greatly from their experience, might eventually become a standard and highly specialized work of reference on Durability, which is the property on which data are most difficult to secure.

In view of so many chances for contributing a mite to progress by starting inquiries and the collection of data under a new and promising caption, the writer will try to give an outline of the leading ideas and questions which arise when one attempts to draw a mental picture of The Car That Stays Young. Having no special competence to answer the majority of the questions, he must leave them open, supplying only a framework to be covered and dressed gradually with the assistance of those who possess exact knowledge on the point involved in each instance.

Some very general considerations on design and style present themselves first.

Fancies Seldom Durable

The Car That Stays Young is meant to be used for a number of years. It can have no conspicuous design feature which is liable to be generally abandoned in later cars. A powerful conservative factor hides in this self-evident rule. It acted strongly against the introduction of 6-cylinder cars with long motor hoods, as the guarantee of the permanence of the type was vague; much less strongly against the V-eight and the twin-six which are shorter, and most of all in favor of the simple four which is standard. It forbids excessive rake of steering post and very low seats, huge fenders, bath-tub and boat bodies, fancy curves and garish colors. Any new style feature for which no substantial utilitarian reason can be advanced comes under the ban, but also the most promising engineering innovations are excluded so long as they remain subjects for discussion. Very knotty questions, can of course, come up in choosing between motors of thoroughly established durability on one side and 40-speed (2,400 r.p.m.) or 50-speed (3,000 r.p.m.) motors of more advanced design or Knight motors, on the other side; in choosing between silent or roller chain gears and spur or miter gears, between ignition by magneto or by some of the devices which have followed the wide adoption of electric lighting and starting. Among starter systems the choice is as yet difficult. Even a highly sagacious judgment coupled with the greatest care in examining the product, to see whether innovation has been undertaken lightly or with thorough revision of all the construction features which it may affect, can scarcely give the full assurance that comes with Time and Reputation—speaking of time and reputation relating specifically to the design feature under debate in each case and not merely to the manufacturer's methods and standing in general; all make mistakes at one time or another.

The ambition to assist in testing out new principles in motor engineering by investing in the "last cry" and the desire for acquiring The Car That Stays Young are not fully or safely compatible. But on the other hand one who buys The Car That Stays Young has a long time to wait until he can do so again. Progress has time to mature fully before he needs to go into the market once more. Science becomes safely industrialized while he is slowly wearing out his first purchase. To display a fine dash in selecting a car in which the most advanced ideas are embodied must always be a luxury and a risk, since scarcely any important idea reaches practical maturity till it has been on trial for 3 years with the manufacturer and for 3 years more with the public. "Art is long and life is short" holds good for the art of building cars and for the lives of the users. If the object is to crowd sensations and technical automobile experience into the short span of years during which motoring for the sake of motoring remains interesting to any one individual, the Car That Stays Young is not in all respects the ideal, but among the general public probably not more than one in a hundred will deliberately buy experience if he knows how to buy satisfaction. If style and lasting utility with few troubles can be combined, he will prefer such a combination to a flash of pride in a car that is marvelous today and doubtful next year.

Large Progress Matures Slowly

The number of years required for the thorough *mise au point* of important engineering ideas can be realized from examples. The ups and downs of alloy steels have not come to rest yet. Riveting is not yet a perfected process for frames, but frequently gives way in trucks where loads are heavy and vibration is pronounced, yet no form of welding takes its place entirely. Patience forsook nearly all who tried to subdue the promising air-cooled motors, but it survives in a single important instance among automobiles as well as for one class of aeroplane motors and now bids fair to come to new life in twin fours, sixes and nines. The gradual increase of stroke length and piston speed, with the accompanying lightening of parts, is still seeking its best limits in European cars and corresponding but different limitations suitable for American conditions and fuel prices. No spring system departing from the standard has yet been accepted as finally superior. The two-cycle motor is still stubbornly advocated and represented in Europe, though little used. The motor bus is still in its infancy in the matter of general design and weight. Every step toward the best has its pitfalls and stumbling blocks and is contested by the fairly good whose shortcomings are known but endurable.

Where the influence of these more fundamental features in motor vehicle construction are concerned the question of cost of production is in the background for determining whether the vehicle will be one that Stays Young or otherwise, while technical ability, experience, system and capital of the concern undertaking an innovation of this order must be accepted as factors greatly reducing the risk for the purchaser. For example, if a firm known to have all facilities for conducting tests and a large reputation at stake announces that electric castings have replaced drop forgings in its new car, it is fair to assume that it has found a reliable technical advantage in the change—say one depending on a stronger alloy and simpler heat treatment—but if a firm with fewer safeguards against error were to switch from forgings to stampings the change could not be accepted with the same assurance, and were it to adopt castings there would be room for a suspicion that they were chosen for being cheaper in small quantities. Though the industrial history teems with examples of technical slips committed by large firms and resulting in reducing the durability and reliability of its cars for a season or two, it abounds in far greater degree in examples of minor concerns which have gone to the wall for daring to take a technical lead prematurely.

If The Car That Stays Young is to have advanced technical features at all comprehensive or vital in character, it is therefore necessary to conclude—as most purchasers indeed do conclude—that it should at least be the production of a concern having much to lose by an error. There is scarcely any room for patronage of the admirable strugglers in the industry unless they stick closely to the established data in all important engineering features and surpass their big competitors in attention to the taste and durability of details and appearances.

Where Judgment Presides

With regard to these details and appearances the requirements for The Car That Stays Young fluctuate of course somewhat in conformity with the progress that is accomplished from year to year or from day to day, but the sins which are committed to meet the price question or for lack of knowledge of the "unmechanical" materials are usually definite and avoidable; somebody knows how the most favorable proportion between cost and value could have been maintained, while in the case of one of the larger technical questions nobody knows the final equation for sure or has means for proving his knowledge. The simplest observations in the streets, roads and repair shop disclose a number of details which make a car old in looks or action or both, and many which suggest inquiries.

Vulnerable Fenders

Crumpled, buckled and rusty mud fenders are common and very disfiguring. The means for obviating this trouble are found not only in careful driving, but in the use of crowned shapes which are much stronger than the flat ones against all impacts and resume their shape after a slight buckling, and in avoiding to have the edges of the fenders extending so far in any direction that they will be sure to receive accidental bruises in the traffic or the careless entering of a garage. The manufacturer is not always supposed to have anything to do with the careful driving which protects fenders, but it is readily realized that in reality the responsiveness of clutch, carbureter, steering gear and brakes and even the change-gear ratio, the shapes and locations of levers, pedals and throttle-control have great influence to facilitate just those minor swerves in emergencies by which the caroming with other vehicles is avoided. From this point of view the protection of the fenders becomes a deeply technical problem. The use of crowned shapes is simpler and, while the best of these, which have no flat portions, cost more than flat ones, they can be narrower than the latter with the same clearance for spring action and the same protecting capacity, since they envelop the wheel more closely. They are therefor naturally less exposed as well as stronger and prettier. No doubt, there are some advantages to be gained for the ordinary flat fender by studying the material, the shapes and the points of attachment of the brackets which support it. Elastic yielding may be encouraged, perhaps. Data may be in existence on these particulars, but an obviously safe precaution lies in having some more robust part project farther than the edge of the fender. The value of a prominent hub cap and of a running-board a little broader than the fenders with which it connects, is probably well worth looking into. An outward flare is an old expedient, which may afford some protection by allowing the fender to yield elastically to an impact which would injure it if received squarely edgewise. A close study of the smallest possible dimensions of the fenders consistent with their purpose leads to the crowned type eventually, but would reduce many flat fenders to safer proportions where price is important. The flat but edged fender is the compromise solution. The front fender which turns with the wheel may be susceptible of improvement, but here barely requires mention, as it represents no established practice. With regard to a finish

for fenders other than paint or baked enamel and materials other than sheet iron and aluminum, every practical possibility is as yet to be classed among innovations and therefore not yet of interest for building up a conception of The Car That Stays Young.

Other points, each of which also branches into a network of questions, are such as the following:

Radiators, to keep them from leaking or having cooling fins crumpled.

Rusty mufflers and exhaust pipes.

Dented motor hoods; rusty streaks at joints with radiator and dash.

Running-boards; with or without an apron.

Foot-board finish; pedals and pedal slots.

Motor finish and noises; mounting of motor and drip pan.

Wire and wood wheels; demountable wheels; demountable rims.

Steering linkage; joints, buffer springs, noises, finish.

Front seats and their upholstering.

Doors and hinges.

Paint and varnish, composition and colors.

Leather and its substitutes; cloths; seat springs.

Lines of wear on bodies; exposed portions in general.

After commenting upon each of these points in the next instalment, an effort will be made to sound specialists in the automobile industry or its allied industries for definite data on the features with which they are most familiar.

(To Be Continued)

Eisemann Device Starts Heavy Motor When Cranked Slowly by Hand

WHAT is termed an impulse starter has been developed by the Eisemann Magneto Co., Brooklyn, N. Y.; it is a device which causes a standard magneto to produce a hot spark, regardless of how slowly the motor is cranked. It is intended especially for heavy motors used on trucks, tractors, etc., though it may be employed on passenger cars as well.

The production of a hot spark regardless of cranking speed is produced by automatically compressing and releasing two springs which are part of the driving mechanism and which give the armature a sharp twist and thus cause the spark to occur at the proper moment. At speeds above 120 r.p.m. the device is automatically drawn out of action. The device can be attached to any model Eisemann magneto.

Fig. 1 shows the device when the motor is running, when it merely acts as a coupling between the drive shaft and the armature.. Fig. 2 shows it just before the trigger lets go and the armature is snapped forward, producing the spark.

The member *A* is driven from the timing gear; *B* is the part that drives the armature; *C* is a trigger which transmits the drive from *A* to *B* when the motor is running, and drops in the notch in the cross bar by the action of gravity when the crank is slowly turned.

The impulse springs are placed between the two blocks *D* which are fastened to the driven member *B* and the

Eisemann impulse starter and coupling mounted on magneto

pins *E* which are part of the driving member *A*. Turning *A* in the direction of the arrow compresses the springs.

When the crank is turned the trigger is moved around so that it drops into the notch in the cross bar by gravity, and thus holds the driven member *B* temporarily against rotation. Further movement of the crank handle compresses the springs, and when the compression is complete the cam on the trigger comes into contact with the driving member *A* and pulls the trigger away from the notch in the cross bar thus releasing the driven member and allowing it to fly in a clockwise direction; rotating the armature and producing the spark.

The trigger is heavily weighted on its upper half, and as soon as it is rotated it tends to move inward still further so that when the driven member snaps in a clockwise direction the trigger drops into the notch *F* in the driving member, Fig. 1. This feature allows the drive to be positively transmitted and removes the load from the springs. This connection is maintained until the speed drops below the minimum operating speed of the motor, at which time gravity becomes stronger than centrifugal force and allows the trigger point to come into contact with the notch again.

All parts are fully inclosed and operate in grease. The device also incorporates, on its driving side, a standard Eisemann coupling which not only gives flexibility, but also allows the magneto to be removed by lifting directly upward.

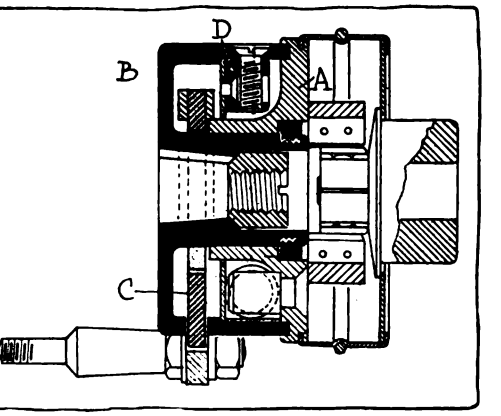

Fig. 3—Section through starter and coupling. Trigger is shown at C

ACCESSORIES

Pagel Oil Indicator

AN oil feed indicator which will stop the motor instantly should the lubricating oil become exhausted in the crankcase, the strainer clogged or the pipes leaky, has been brought out under the name of the Pagel oil feed indicator. This indicator also checks excessive speeds of the motor. It is mounted on the cowl board in the customary manner. The oil register fits in a 2-in. hole and has a ⅛-in. standard pipe thread connection either internal or external. The automatic motor stop is made either for the pressure or non-pressure feed system and is so arranged that by attaching the ground wire from the magneto it will stop the motor automatically should the oiling system fail. It is a plunger device, as shown in the accompanying illustration, being so arranged that when the oil ceases passing through the feed, the plunger is seated and grounds the magneto.

The oil enters the opening of the oil feed indicator at the left and on its way forces its piston backward. This piston operates in a tapered cylinder. The oil flows past the piston and out again through the opening at the right. The movement of the piston causes the hand control to rotate, the dial being insulated, and when the oil ceases to pass through, the indicator rests on the motor stop pin, thereby short-circuiting the magneto and stopping the car. The speed pin can be set at any desired rate and when the motor speed is sufficient to carry the indicator to the pin, it short-circuits. This does not stop the motor but prevents it from going faster. The oil feed indicator sells for $2.25 f.o.b. Sycamore, Ill. The Pagel oil register may be obtained for $1, as may be the Pagel automatic motor stop.—Turner Brass Works, Sycamore, Ill.

Goodrich Gasoline Hose

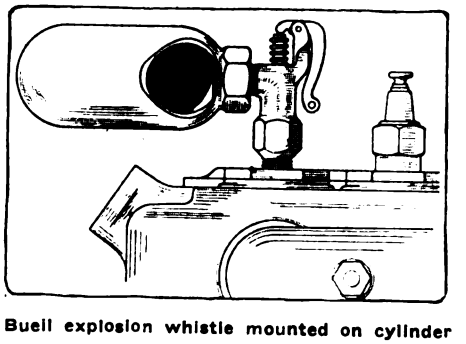
The inside rubber tube of the Goodrich gasoline hose is protected from the action of the gasoline by a fine fabric especially treated which is held in place by a steel wire. Thus, no matter how much disintegration takes place no particles of rubber, no matter how small can possibly get into the gasoline and thus cause trouble in the carbureter or motor. The wire is a flat steel spiral covering approximately two-fifths of the fabric surface and it prevents the hose from kinking. The hose is made in two styles, the Commander and the Goodrich. The latter has a smooth surface and the protecting wire in its interior is wider than that of the Commander variety which has a corrugated surface.—B. F. Goodrich Co., Akron, Ohio.

Buell Explosion Whistle

A novel idea in warning signals has been brought out under the name of the Buell explosion whistle. It comprises a whistle type of signaling device mounted in the valve cap of one cylinder where a portion of exploded gas which attains a pressure of from 250 to 300 lb. is used to blow it. The mounting usually employed with the whistle is shown in the accompanying diagram, the device screwing into a special plug by means of a standard spark plug thread.

The device is quite simple, consisting of a small poppet valve and a high pressure whistle controlled by a 1/16-in. cable located on the steering column. The valve is very sensitive so that a slight touch is all that is necessary to blow the whistle, and one of the great advantages of the signal is that the gas is clean, therefore not choking up the whistle with carbon and soot after it has been in use for a short time. The whistles come in two models, a single tone and a chime, both being 2 in. in diameter, and are of compact design. The chime is produced by three different tones, one of which is quite low and designed to give a pleasing tone to the whistle. With this arrangement, an easy musical signal is given when time is not pressing, but in case of emergency, an abrupt and powerful warning can be produced.

The special plug is useful on Ford cars and other cars where it is not possible to mount the whistle in a valve cap. The price of the three-tone chimes supplied in any spark plug thread size is $6, and a single-tone whistle with valve, $4.25. The special spark plugs for Ford cars, etc., are $1.25.—U. L. Mfg. Co., Chicago, Ill.



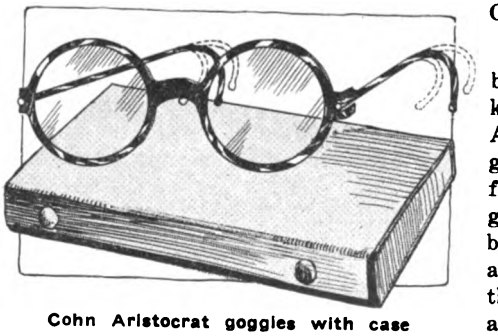
Buell explosion whistle mounted on cylinder

J-M Narco Tire-Cut Filler

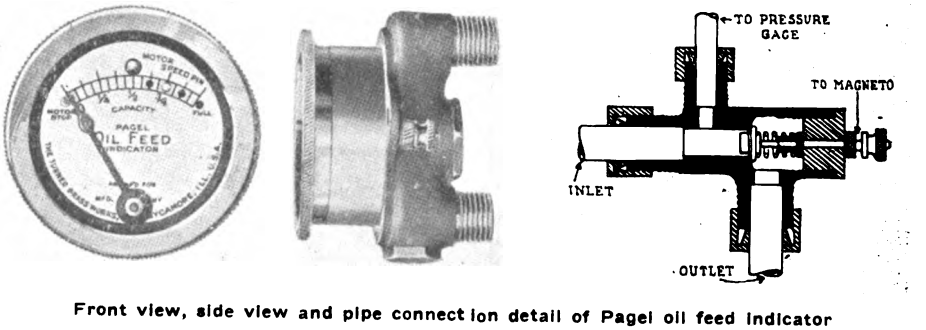
This tire-cut filler is designed for sealing up little cuts and scratches in the casings of tires which would otherwise be enlarged by sand and stone particles and it is claimed to greatly prolong the life of casings treated in this manner. The filler welds itself to the walls of the cut and the loosened tread and solidifies quickly, becoming an integral part of the tire without in any way impairing its resiliency. The filler comes in small tubes at 50 cents and in larger ones at $1.00. Tapering spouts on the tubes permit of quick and easy application.—H. W. Johns-Mansville Co., New York City.

Cohn Motor Goggles

A complete line of goggles for automobile use is incorporated in the five brands known as the Turtle, Peerless, Tourist, Aristocrat and Elite. The Turtle is the goggle with round eyepieces and patent frames and temples. The feature of the glass is the fact that the temples can be bent to any desired size or shape, as they are unbreakable. Folding side sheets of the same material, known as Zylonite, are supplied if desired. Peerless is a



Cohn Aristocrat goggles with case



Front view, side view and pipe connection detail of Pagel oil feed indicator

slightly different shape goggle and also has the Zylonite frames and unbreakable adjustable temples. Side guards can also be furnished with these. The Tourist is a flat, straight frame goggle with horizontal bridge so designed that it can be worn over the regular eyeglass. Like all the other goggles in the line, it has the unbreakable adjustable temple. The Aristocrat is a curved bridge goggle with a round eye, 2¼ in. in diameter. The Elite goggle is designed to fold and has collapsible temples which are also composed of the non-breakable Zylonite. These are wide, rectangular lenses with a hinged frame, the eyepieces being 3 in. long by 1⅞ in. high. Prices vary with the designs and the lens sizes.—Max G. Cohn & Co., Inc., New York City.

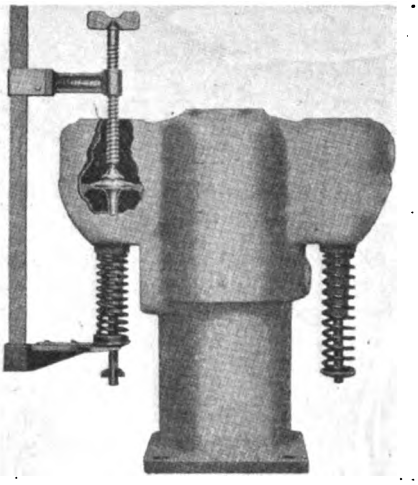
Mertz Valve Spring Release

A valve spring release for the purpose of taking out the spring seat retainer and otherwise working with a valve against the valve spring, has been brought out under the name of the Mertz valve spring release. It consists of a vertical bar at the lower end of which there is a projection fitting beneath the valve spring seat and at the upper end has a clamp which can be screwed down directly on the valve itself. In order to have the correct height for the arm containing the clamp which screws down upon the valve, there is a sliding arm which locks in any position on the vertical bar.

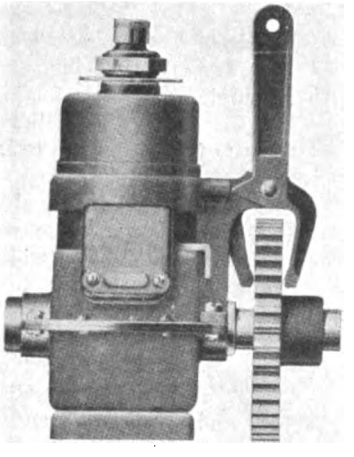
The correct length of the instrument is given on removing the first valve. At the bottom there is also an adjustable gage to fit the valve spring washer and the correct height of the instrument is fixed by locking the clamp holder in the correct position. The operation of the instrument can be readily grasped from the accompanying illustration. The pitch of the screw thread on the clamp is such that the strongest valve spring in use can be compressed by merely tightening on the thumb screw with the thumb and forefinger. The price of the release is $2.—H. B. Mertz Co., Pittsburgh. Pa.

Advance-Toledo Power Tire Pump

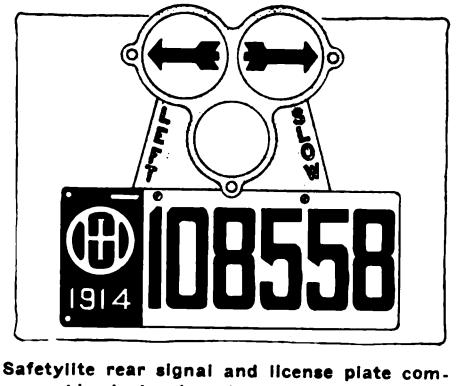
This is a pressed steel tire pump which can be fitted to used cars as well as to new. The cylinder and upper half of crankcase is a steel stamping, and the cylinder itself is reamed and burnished. The lower half of the crankcase is also a steel stamping, giving a two-piece body, both steel stampings, and giving the advantages of strength and lightness expected from this construction. The piston is of cast iron with soft steel rings. The pump crankshaft is a drop forging, and the bearings are nickel-babbitt die cast in the body. The pump is provided with a gear shift so designed that the sliding gear on the pump crankshaft is assembled with the hub on the outside.



Mertz valve spring release



Advance-Toledo power tire pump



Safetylite rear signal and license plate combined showing direction arrows

Warren motor restaurant for five

The advantage is that when the gears are put into engagement with the drive the stresses are all close to the pump bearings.

The intake port is covered with a protector which prevents dirt or sand from entering the pump, and the hose connection at the pump end is a special design, giving a large opening into the hose and a large substantial thread at the hose end. The pump sells for $15 with all fittings.—Advance Machinery Co., Toledo, Ohio.

Premo Accessories for Ford

Under the name of Premo two new accessories have recently been put on the market, one a constant tension fan belt adjustment for Ford cars and the other a gas and spark control for Fords. The constant tension fan belt adjustment consists of a coil spring attachment which clips to the fan belt pulley shaft holder and holds the belt perpetually under the proper degree of tension.

The gas and spark control is supposed to take the place of that originally on the car by slipping the polished brass collars over the teeth of the old quadrant and clamping the friction device to the levers. The makers claim a gain in appearance and durability. The price of the fan belt adjustment is 50 cents and of the spark and throttle control $1.—New York Motor Device Co., New York City.

Safetylite Rear Signal

The Safetylite is the name of a rear signal recently put on the market which indicates the direction in which a car is going to turn as shown in the accompanying illustration by means of arrows. The device consists of an aluminum casing containing electric bulbs controlled from the dash or steering wheel. The light from the bulbs brightens either the right or the left arrow so as to render it clearly visible to a driver in the rear. The signal is fitted with a standard license-plate bracket and sells for $15.—Automatic Signal Appliance Co., Cleveland, Ohio.

Warren Motor Restaurants

The Warren line of motor restaurants is comprehensive, embracing every style and size, but the one which appears most popular is naturally the five-person type illustrated herewith. It is made in style like a suit case, a wood box being covered with black enameled duck and lined with black and white striped enameled cloth. The case contains two nickel-plated food cases, each 8¾ by 5¾ by 4¼ in., knives, forks, spoons, cups and plates for five persons, two glass jars and a place for a vacuum quart bottle—which is not included. The case is 19½ in. long, 14 in. wide and 6 in. deep. The set sells for $17.—Warren Leather Goods Co., Worcester, Mass.

America's First Concrete Speedway

Twin City Oval Ready for 500-Mile Derby

THE Twin City concrete speedway on which the first annual World's 500-mile Derby is to be run on Saturday, Sept. 4, is America's only concrete speedway, and is regarded by F. H. Wheeler, of Indianapolis, Ind., its chief promoter, as the greatest in the world. It is a 2-mile track, laid inside a high wooden fence over 3 miles long. It is just south of the Minneapolis city limits and is only a short distance across the Mississippi and Minnesota rivers from St. Paul. It is decidedly a Twin City affair. To date the investment has been $870,000, which will be raised to near $1,000,000 when the grounds are landscaped next Spring.

The track is 80 ft. wide for 1577 ft. in front of the judge's stand, and on the turns and backstretch is 60 ft. The straightaway is 285 ft. long, practically flat, with an angle of only 1 ft.

From the ends of the two stretches are easement curves of 800 ft. entering into the high circle or leaving it, at 8 ft. height. These four easements allow the drivers to rise gradually into the total angle of 14.98 ft., or extreme height at the outside from the ground at each end of the oval, and to drop down again into the stretches. The change from the end of the easements into the high curve is a 1 per cent grade.

40-Ft. Safety Zone

The safety zone in front of the stands is 40 feet and inside the parking boxes are set back a similar distance. The retaining wall on both sides of the track is of concrete, 2 ft. 6 in., or 2 ft. above ground. This wall is 12 in. at the bottom and 9 in. across the top. The tire protection in front of the stands is 10 ft. netting strung on iron posts set in the retaining wall. The radius of the cement circles from the two end major axes is 1350 ft. The height of the outside of the track on the curves is 14.98 ft.

The track, which is expected to develop above 100 m.p.h., was built as follows: A sand water-settled base was slushed in, ranging from 18 in. to 8 ft. thick. This was rolled in layers of a foot by a 12-ton roller. Above this was laid a concrete base reinforced with flat expanded metal 6 in. thick, a 1-2-4 mixture of cement, sand and stone. This was covered with an inch of 1 to 1 trowel finish of cement and sand.

The forty pits are each 8 by 15 ft. abutting the 30-in. track retaining wall, separated by 2 by 4 wood partition with wood backs, equipped only with a bench seat at the rear and sand floor.

71,616 Is Seating Capacity

Total seating capacity provided is 71,616. Four grandstands are in front of the pits on the front stretch; a fifth is at the end of the backstretch and another at the second curve top. Bleachers are on the backstretch. The total frontage of the grandstands is 3672 ft. and of the bleachers 912 ft. In all there are 1840 boxes seating 11,016 persons. The grandstands seat 48,796 and the bleachers more than 10,000. The stands are frame, covered, set on wood towers of 8 by 8 timbers and 2 by 6-in. crossbeams, fully braced in both directions with a carrying capacity of live load of 150 lb. to the square foot.

The boxes are 6 by 8 ft. with rise of 8 in. in each case and 24 in. for the last tier. Between the tiers are 6 ft. walks. In each box are six armchairs. The grandstand seats have iron hand rails and small opera backs. Thirty-six official garages are in a frame building, each 12 by 16 ft. with folding front door, back of the main grandstand.

Automobiles gain entrance to the grounds at six points and to the oval by three subways. Back of the main grandstand is free parking space for 15,000 cars, in the oval are 2000 reserved parking spaces, and reserved room for 20,000 more. The subways are reinforced concrete, 60 ft. long and 60 ft. wide with 12, 14, and 16 ft. headway, respectively, decreasing to 9 ft. under the track. For pedestrians from the street railway lines at the backstretch is an additional subway 12 ft. wide.

Exact cost of the track and equipment cannot be known until an audit is made, but President F. H. Wheeler gives estimates as follows: Land, about 342½ acres, $175,000; grading, $100,000; track, $250,000; stands, $150,000; fences, $100,000; tunnels, $70,000; buildings, $25,000.

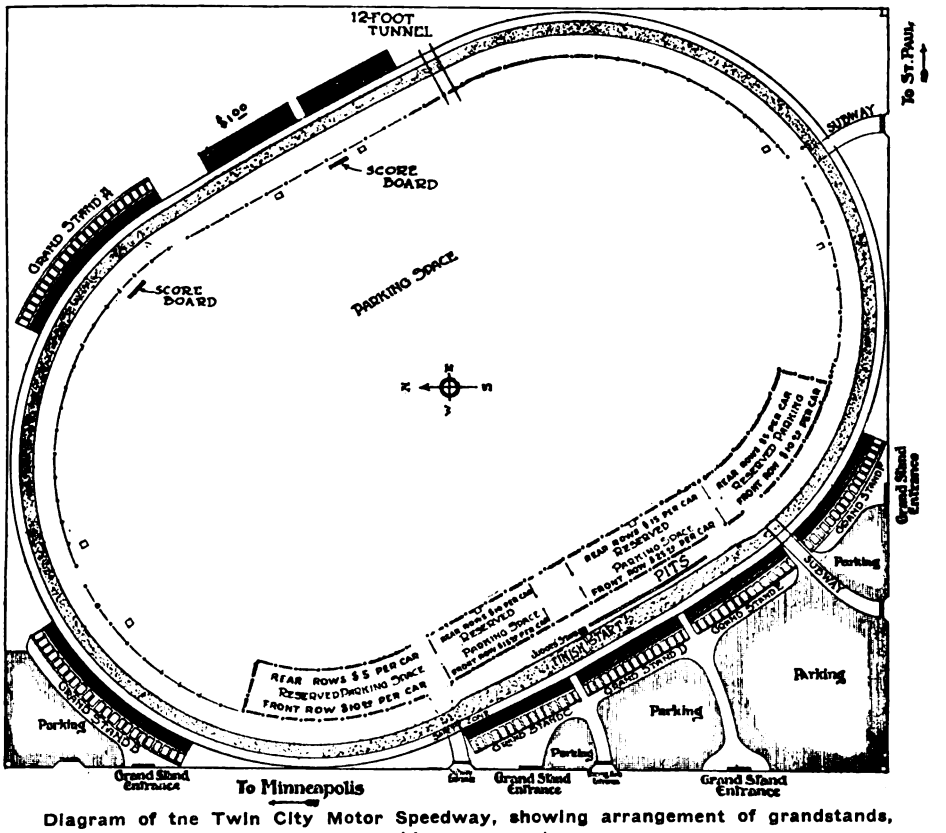


Diagram of tne Twin City Motor Speedway, showing arrangement of grandstands, parking spaces, etc.

Making Meetings Pay

THE Society of Automobile Engineers is to be congratulated that it has so active an offspring of the main body as the Detroit Section, which has just formally announced its occupancy of permanent quarters with a paid secretary.

One year ago this section was struggling along as best it could with a more or less apathetic interest shown. To those who had the society's doings at heart it seemed deplorable that a section so advantageously situated as the Detroit branch was, in the very center of the industry, should not be commanding of greater interest and enthusiasm. The regulars put their heads together and thought over the matter. They realized that the bait must be better papers and more of them by some of the foremost engineers, a goodly number of them residing in Detroit. So they set about righting matters.

A prominent engineer was asked to give a paper on a pertinent subject. There was a surprising jump in attendance and interest. Engineers began to watch for the meetings, and to enter into the discussions. It was the beginning of a new era for the Detroit Section.

Since then the movement for a home of its own was started and successfully carried to a conclusion, thanks to the aid of some of the representative manufacturers in the industry. This but serves as a lesson for other branches of the Society.

Progress in Radiators

A CHANGE in automobile construction that has passed with little comment is the coming of the pressed-steel shell, now used on very many cars. Whether a radiator is of the honeycomb type or of the more common tubular pattern, it is equally a delicate, cellular structure containing a large number of joints and not possessed of any great mechanical strength. In fact the thinner and lighter its construction, the better will it operate as a radiator of superfluous heat.

With the pressed-steel shell this delicate bit of apparatus is suspended inside a stiff casing which protects it from weaving strains, and can be struck or pushed without injury to the radiator proper. In the old pattern, where the external portion also contained water and was made of thin sheet metal, accidental injury was easy, and the task of supporting the cooler so that frame weave could not affect it has taxed the ingenuity of most automobile engineers.

The new idea appears to be both better and cheaper, a rare combination of qualities; and thus the new style radiator ought to be written down as one of the conspicuous mechanical advances of the year.

Saving Costly Parts

WHAT is a problem of considerable importance in medium and low-priced cars is vital in vehicles selling for amounts which place them in the class of high-priced design. It might not be a matter of great importance to renew parts which are made from mild structural steels that are produced in great quantities and of uniform specifications, but when it becomes necessary to replace a part made from some high-grade electric furnace steel or some material which has cost hours of labor and taken the combined skill of metallurgists and shop workers it becomes necessary to use some means of lessening the cost to the owner of repair parts.

The ideal car would doubtless be one in which all the high-priced parts were guarded against wear by intermediate buffers of lower price and lower grade materials which were sufficiently soft to absorb the wear while the higher-priced and harder materials went unscathed. It is a fact that in spite of the average price of cars falling year by year the life of the more important and expensive parts is increasing, due to these safeguards.

Battery Exchange

THE great delay in getting the battery charged has always been one of the inconveniences which the electric car owner has been desirous of removing. With the necessity of waiting several hours while a battery is being charged under the old system, it seems hardly possible that the new idea of battery exchange, which is in reality but putting into practice what has long been foreseen. has come to pass.

S. A. E. Adopts Reports of 7 Divisions

Final Count on Letter Ballot for Standards Shows Every Suggestion Adopted

NEW YORK CITY, Sept. 1—Final count on the letter ballot for standards recommendations of the Society of Automobile Engineers has now been completed and the results show that all the suggestions as to new and revised standards which were approved at the last meeting of the Society in June were adopted by a large majority in the letter ballot. The balloting was closed on Aug. 16.

Voting members of the Society were urged to vote on all questions on which they felt technically qualified to express an opinion. Prior to adoption by letter ballot all of the recommendations in question had been approved by the respective divisions of the Standards Committee having the work in hand, by the Standards Committee as a whole, by the Council and by the entire Society at the June meeting. The vote showed that the total number of ballots cast was 154. Of these fifteen were defective for various reasons. The full report as to the detailed vote on each of the standards follows and shows that an overwhelming majority was in favor of every suggestion. The highest number of negative votes polled against any recommendation is noted as against the elimination of the gray iron casting specification. The votes counted against this numbered only seven with eighty-seven in favor of the elimination. The detail report follows:

SIXTH REPORT OF CARBURETER FITTINGS DIVISION

	Yes	No
Flanges for ½ in. and ⅝ in. carbureters	87	0
Flanges for 2½ in., 3 in. and 3½ in. carbureters	83	2
Carbureter air heater	78	8

SEVENTH REPORT OF ELECTRICAL EQUIPMENT DIVISION

	Yes	No
Bulb bases, sockets and connector plugs	85	3

SECOND REPORT OF ELECTRIC VEHICLE DIVISION

	Yes	No
Motor voltage	55	5
Motor name-plates	60	2
Number of cells in standard battery equipment	56	4

SEVENTH REPORT OF IRON AND STEEL DIVISION

	Yes	No
Revised vanadium steel specifiations	90	2
Specification 3330—nickel chromium steel (new)	91	1
Revised steel castings specification	88	2
Elimination of gray iron casting specification	87	7
Revised notes and instructions on steels, etc	92	1

SIXTH REPORT OF MISCELLANEOUS DIVISION

	Yes	No
Flat fan belt and pulley widths	95	1
Cotter pin sizes	101	1
Brake lining sizes	85	5

FOURTH REPORT OF SPRINGS DIVISION

	Yes	No
Nomenclature of cantilever springs	89	3
Tests for parallelism of eyes and master leaf	88	2
Eye bushing and bolt tolerances	86	2
Wrapped eyes	87	1
Width of spring ends	87	3
Frame brackets	84	4
Offset of center-bolts	86	1
Nuts for spring clips	85	4
Center-bolts	84	1
Center-bolt nuts	83	2
Spring widths	82	4

REPORT ON BELL HOUSINGS

	Yes	No
Number of bolts	73	4
Flange widths	75	2
Bolt hole circle	73	2

October Standards Committee Meeting at Chicago Athletic Club

NEW YORK CITY, Sept. 1—Meeting dates and places for the October Standards Committee meeting and the meeting of the entire organization for the 1916 winter session are announced by the Society of Automobile Engineers. The headquarters of the Standards Committee meeting to be held in Chicago on Oct. 14 will be the Chicago Automobile Club. In all probability there will be an afternoon as well as a morning session, the opening being at 9 a. m. Reports will be made by several divisions of the Society and the meeting will probably be attended by many members.

The divisions which will in all probability have progress reports to make are those dealing with electric vehicles, the miscellaneous division, truck standards and foreign co-operation.

The electric vehicle division will, in all likelihood, report again on speed and mileage ratings and on specifications involved in the assembly and operation of battery-propelled cars.

The miscellaneous division has still to report upon a number of subjects, including universal license plates, position of motor numbers, expression of car weight, air pump bases, water hose and hose clamp dimensions.

The truck standards division and the foreign co-operation division which was formerly known as the International Standards Division will, according to the present schedule, submit some important matter with regard to solid tire equipment in this country and abroad. These divisions will hold a joint meeting at the office of the Society in New York on Sept. 7 for the purpose of considering data relating to industrial truck standards, smaller than 36-in. diameter tire, branding of millimeter equivalent dimensions on solid tires, universal standards for truck tires and wheels, actual deviation from nominal tire tread diameter, carrying capacity table, ½-in. felloe band thickness for 6-in. dual tires and trailer hitch.

Small Waverly Truck Coming

INDIANAPOLIS, IND., Aug. 27—It is stated on good authority here that the Waverley Co. of this city will in the future announce a new electric commercial model of light capacity at a lower price than heretofore Waverley vehicles have been offered.

S. T. Davis, Locomobile Head, Dies

Connected with Industry Since 1899—Had Been Locomobile President Since 1902

BRIDGEPORT, CONN., Sept. 1—S. T. Davis, Jr., president of the Locomobile Co. of America, died here at 2 o'clock last night from hemorrhage of the brain. Mr. Davis was taken ill on Saturday with what appeared to be acute indigestion but a hemorrhage occurred on Monday and his condition became rapidly worse.

Mr. Davis, who had been connected with the automobile industry since June 13, 1899, the date on which he used his first car, was born in Washington, D. C., Feb. 8, 1873. He entered Columbia College preparatory school and took the degree of civil engineer from the Rensselaer Polytechnic Institute, Troy, N. Y.

In 1900 he started as treasurer of the Locomobile Co. of America, under A. L. Barber, a position which he held for 2 years, after which he became president, an office which he held up to his death. Mr. Davis was one of the organizers of the National Association of Automobile Manufacturers in 1900 and was its first president. Since that time he was on the directorate of this organization and its successors, the National Automobile Board of Trade and the National Automobile Chamber of Commerce, Inc.

Mr. Davis had a number of interests outside the automobile industry, being a director in several companies and being interested in real estate and banking to a considerable extent.

He was a member of the following clubs: New York Yacht; Automobile Club of America; Ardsley Club; Brooklawn Country Club; Automobile Club of Bridgeport; Algonquin; Seaside; Bridgeport Yacht Club; the University Club in Bridgeport, and the University Club in New York.

New Olds Model at $1,162.50 for Southern States

LANSING, MICH., Aug. 30—The Olds Motor Works are now supplying dealers in the Southern States and in other parts of the country with a special model wide tread four-cylinder Oldsmobile 43, the price of which is $1,162.50 for either the roadster or touring car. This model is fitted with specially constructed wire wheels finished in red light enamel and by the use of an extra wide tread on the wheels it is not necessary to lengthen the axle shafts.

Heinze Co. Enters Starter Field

To Open Plant in Springfield, O.—Begins Work in 60 Days

SPRINGFIELD, OHIO, Aug. 30—The John O. Heinze Co., recently formed to make electric self-starters in this city at the Shuey factories' building, is preparing to employ a force of 300 men, it is reported. Associated with Mr. Heinze is William Pflum, who was formerly vice-president and general manager of the National Cash Register Co.

Mr. Heinze is vice-president and chief engineer of the company. Before coming to Springfield, Mr. Heinze was chief engineer of the Northway Motor Co., Detroit.

The company has taken out patents on an electric starter, for lighting and ignition apparatus. The company will manufacture these apparatuses in large quantities. The company expects to begin the manufacture of its products within sixty days.

The company has brought a number of men from Detroit and other cities. Among these are: Paul Arthur, former assistant engineer of the Continental Motor Co., Detroit; Gordon Reid, formerly assistant to chief engineer Dunham of the Chalmers Motor Co., and John Boone, electrical engineer of Detroit. Mr. Arthur is head of the designing department and Mr. Reid is in the efficiency department. Mr. Boone is electrical engineer and chief of the laboratory. William Pflum is president and general manager.

—

S. A. E. Sections Active in September

NEW YORK CITY, Sept. 1—The month of September starts the activities of the Society of Automobile Engineers. The Detroit, Indiana and Metropolitan sections have all announced their meeting topics and the dates and places have also been decided. Another section activity which may soon take place in connection with the meeting of the Standards Committee at Chicago in October is the inauguration of a Chicago section.

The Metropolitan Section will hold its meeting at the Automobile Club of America, New York City, on Sept. 16. Leon Goldmerstein, a member of the Aeronautical Society and associate editor of the Journal of the American Society of Mechanical Engineers, will present a paper on the aeroplane. In addition H. G. McComb, chairman of the Research Committee of the section on governors will submit the final report of this body for discussion.

On the same night as the Metropolitan Section meeting the Detroit section will open its program at the Ponchartrain Hotel with a paper by J. G. Vincent entitled "A Discussion of the Twin Six Motor." The entire technical section will be devoted to the reading and discussion of this paper.

On Sept. 24 the Indiana section will also hear a paper by Mr. Vincent and in addition James E. Diamond will talk on aluminum pistons. The meeting will be held in the rooms of the Hoosier Motor Club at the Claypool Hotel.

Winter Meeting in Show Time

The 1916 winter meeting of the Society of Automobile Engineers will be held in New York in the first week of next year, during the automobile show. It is the intention of the Meetings Committee and the Council that the coming national sessions shall be fewer in number than heretofore and be the occasion of the presentation and discussion of papers of marked interest and value to automobile engineers. Features of the technical program, which will include consideration of reports of various Divisions of the Standards Committee, are now being arranged. The members are requested to express their views as soon as possible as to what subjects it is desirable to have treated at the coming meeting. It is requested that in sending suggestions rather full outlines of the proposed papers be given, including the naming of preferred authors.

—

To Make Four-Wheel-Drive Automobile Chassis

ST. PAUL, MINN., Aug. 30—The Twin City Four-Wheel Drive Co., recently incorporated with a capital of $500,000, to manufacture four-wheel drive trucks, will also make a chassis for automobiles on the four-wheel-drive principle. The company has opened temporary offices at 2334 University Avenue, S. E., Minneapolis. Announcement of the formation of the company and its factory plans was made in THE AUTOMOBILE for Aug. 26.

—

Maxwell Ships 250 Cars Daily

DETROIT, MICH., Aug. 31—The Maxwell Motor Co., Inc., is shipping daily from its Detroit plants 250 cars of the 1916 model, a marked increase over previous production records.

"Reports from our dealers throughout the country," said sales manager C. E. Stebbins of the Maxwell company, "indicate that our estimates as to our 1916 output is already about 10,000 cars under what it should be. In other words, to date our dealers have asked for nearly 10,000 more cars than their contracts call for."

New Madison Six Is on Market

Has Rutenber Motor—Seven-Passenger at $1,085—Five, $985

ANDERSON, IND., Sept. 1—*Special Telegram*—A new six-cylinder model has been brought out by the Madison Motors Co., this city. It uses a Rutenber six-cylinder block motor, 3 x 5 in., with Remy starting and ignition system, the ignition being the Remy magneto type distributer. Motor and gearsets are unit with the flywheel entirely inclosed with 120-in. wheelbase and 34 by 4-in. tires. The car sells as a seven-passenger touring car at $1,685 and either a five-passenger touring car or two-passenger roadster at $985. Axles are made by the American Gear & Mfg. Co. and clutch and gearset by Detroit Gear & Mfg. Co. Steering is by Warner reversible and full gear. Stewart vacuum gasoline system is used and equipment is complete.

—

Daniels to Build Eight

READING, PA., Sept. 1—*Special Telegram*—A new eight-cylinder car will shortly be brought out under the name of the Daniels eight from a factory in this city by Geo. E. Daniels, formerly vice-president and general manager of the Oakland Motor Co., Pontiac, Mich. It is expected that the new car will use a Herschell-Spillman motor, and will be virtually a custom-made job, the streamline body being made in five- and seven-passenger models and in the touring design with center cowl as well as inclosed types. The wheelbase is given as 127 in., and the price will be in the neighborhood of $2,350.

—

Polhamus Resigns from Bowser

SOUTH BEND, IND., Aug. 28.—A. Z. Polhamus, chairman of the executive board of the S. F. Bowser Oil Tank & Pump Co., Fort Wayne, has resigned from that position after serving the company in various capacities for 25 years. He started with the firm in 1890 as superintendent of salesmen, later becoming assistant manger. He was a stockholder, a director and secretary-treasurer of the firm when it was incorporated in 1898. In 1904 he was chosen general manager and held that position until 1914, when he was made chairman of the executive board. His health during the past few years has demanded open-air activities and he became interested in horticulture. As the affairs of the concern are in good condition at the present time, he has decided to retire. He will retain his financial interest in the company.

Trade Review of the Week

—

Detroit Factories Struggle to Keep Up with Demand—Dealers Optimistic

DETROIT, MICH., Aug. 31—Last week the Detroit automobile industry still continued to exert every influence that would aid in the production of the maximum number of cars. Everywhere the demand has remained as stiff as ever, and in some instances it is claimed that dealers could take more cars than they have contracted for. It is evident that many estimates of certain dealers' allotments of cars should have been larger to take care of the trade, but it is almost impossible for the majority to increase the number contracted for, since the factories' schedules have been based upon dealer contracts, and with a place for every machine it looks now like a forlorn hope for any of them to expect to get more vehicles than their contracts stipulate.

Healthy Production Conditions

As an indication of how things are going with some of the big factories, Dodge Bros. is now in about as healthy a production condition as it has been so far since beginning the making of a car under the Dodge name. The daily output is between 235 and 250 cars. Last week Packard announced that it is carrying the largest payroll in its history—about 8200 men. The factory is practically ready for the quantity production of the new car, and motors and various parts are now coming through rapidly. Customers' cars will start to come along in about two weeks. Maxwell reports unprecedented demand from dealers and is making 250 cars a day.

Another Cable Order

The Scripps-Booth Co. last week received another cable order from England, this for 500 more cars, it is said. As the concern has already shipped some 400 to this dealer, the foreign business is assuming large proportions.

Chalmers is also breaking records, the Six-40 model receiving a good reception, especially through the East. Last week two trainloads of Chalmers cars were shipped to the New York branch, as an indication of the quantity trend of the business.

Foreign Trade Grows

There can be no doubt that foreign business is outstripping all expectations of a few months ago. Those concerns who already have good foreign representation are doing their utmost to deliver cars to these agents, principally in England, and others are contracting for this invasion of the hitherto small market abroad. Many of the well-known London dealers have come over to make the best connections they can. One of the most prominent of the Detroit makers, who up to this time has had no English sale, has closed with a prominent Britisher for a considerable number of vehicles.

—

Aug. Sales for N. Y. Break All Records

NEW YORK CITY, Aug. 31—The month of August has closed with record sales for the local automobile dealers. Never before in the history of the dealers has the automobile-buying public been so urgent in its demand for cars. August has in former years been considered a slack month, and the dealers had to wait usually until the middle of September or the beginning of October before trade picked up. This year, however, August sales have been on a par with those of March, April, and May.

Business for September and October is expected to break records. Just at present the dealers are beginning to catch up on their deliveries and in a majority of cases, especially in the small car field, shipments are coming in regularly. The buying public consists of farmers from Long Island and New Jersey, and hundreds of people who already own cars, but who either want small or large cars for their separate uses.

Last week the dealers were busy getting in their closed cars and to anticipate inquiries for these cars, the majority of them had new catalogs on their tables describing the new models in winter cars. A large sale is already reported in closed bodies.

The small cars in August made very good sales. The Maxwell company sold ninety-one cars during the month. The Saxon company reports one of the best retail months, having sold sixty cars retail. Many inquiries are being made on its coupes and sedans. The agency expects a rush business until December.

The Hupp agency is just beginning to make deliveries. Sales in August amounted to twenty-eight. It is 123 cars behind in orders. It expects a 100-per cent increase in business in September.

Demand for Closed Cars

The Chandler company reports the largest month it ever had, having sold 109 cars to date, which is about 70 per cent better than last year's sales for that month. The agency expects a big demand for closed cars and at present, in anticipation of this demand, has several special closed bodies on its floor.

Cadillac sales were much above normal, almost doubling last year's mark. Sales during August were equal to the best months since January. The company is doing a large business in closed cars.

Shipments are coming in regularly for the Franklin agency, which is now getting two carloads a week. Sales last month were between thirty and forty.

Sales in the National and Jeffery cars were about 200 per cent better than those in the same month last year. The agency reports the same complaint of a number of the other dealers, a scarcity of cars.

The Ford service station in Long Island City delivered 1200 cars last month. Shipments, however, were small and as a consequence the station was approximately 1600 cars behind in deliveries.

—

Rains Hurt St. Louis Sales—Repairmen Reap Harvest

ST. LOUIS, MO., Aug. 28—The solid week of record-breaking rain and the resultant floods from which St. Louis in particular and the greater parts of western Illinois and eastern Missouri in general are just recovering had a strong but diverse effect upon the automobile industry in this district—it hurt the automobile dealer and benefited the repair and accessory man. In fact, for the time being, it almost ruined the business of the former and yet it boosted almost beyond estimation the prosperity of the latter.

The situation from the dealer's standpoint was well summarized by George Weber, president of the Weber Implement & Automobile Co., who happened to be touring the stricken district when the storm came.

He said: "There are no roads left at all in some districts. The washing away of bridges has completed the demoralization of vehicle traffic and many days will pass before conditions are normal. Where the torrent has not obliterated roads it has washed out the surface and this will necessitate extensive repairs.

"We could bear all these troubles with equanimity, however, if the crops were not seriously affected by the rains and floods, but early reports indicate heavy damage has been done. In many cases, wheat, which had been cut and was lying in the field awaiting threshing, was washed away."

The repair and garagemen, on the other hand, have been busy day and night ever since the water began to recede in pulling mired and submerged machines to town and overhauling them. The accessory men have been working day and night selling new parts to car owners whose machines were caught in the deluge.

Lansing Factories to Double Output

Reo and Olds Cos.' Schedule 40,000 Cars—Export Trade Grows

LANSING, MICH., Aug. 28—The two big local automobile manufacturing plants, the Reo Motor Car Co. and the Olds Motor Works, are scheduling an output of about 40,000 passenger cars for the season 1916. This is double the 1915 output.

During the business season just ended, the Reo Motor Car Co. sold 17,500 cars. For 1916 the production schedule calls for at least 25,000 cars. According to assistant sales manager Harry Lee, dealers have thus far contracted for more Reo cars that the total number sold the past season.

The Olds Motor Works are planning to make from 12,000 to 14,000 cars for the next season. During the 1915 season between 4000 and 5000 Oldsmobiles were sold, according to assistant sales manager N. W. Barton.

The export business of the Olds works is expected to become an important part of the general business from now on. During the past few days orders have been received from Australia, South Africa and England. The order from the latter country is for 600 passenger cars.

Refined Walker Electrics $615 Lower in Price

CHICAGO, ILL., Aug. 27—In its line of 1916 electrics the Walker Vehicle Co., this city, is listing four models, three of which sell for $1,985, as compared with $2,600, a reduction of $615 over a year ago. These models embrace a wide choice of body and are all built on 96-in. wheelbase chassis. The fourth model is on a 104-in. chassis and lists at $2,150 as compared with $2,800, a reduction of $650. This is a five-passenger limousine which is roomy in dimensions.

Refinements have been made in the body work on all models, principally in the use of more aluminum in the weather-exposed parts, sashless windows, mechanical window raisers of the lever type and a number of detail improvements in fittings and equipment.

Baker Wheels and Rims Succeed in R. A. C. Tests

LONDON, ENGLAND, Aug. 19—Certificates have just been issued by the Royal Automobile Club, concerning tests which have been made on the Rebak rims manufactured by the Baker Rim Co., Stourbridge. The tests were first on the road and then in the shop to determine the solidity of the rim of the wheel and the time required for removing and replacing it. A distance of 1000 miles on the road was covered and the average speed 20 m.p.h. The car weight was 4095 lb. with a load of 1.674 lb. on the front axle and 2421 on the rear.

The size of the tires was 820 by 120 mm. (32 by 4.7 in.) and the inflation was about 60 lb. to the square inch. No security bolts were used. On examination at the conclusion of the trial, according to the report, the rims were found to be firmly fixed upon the wheels and there was no sign of movement having taken place. The rims with the tire in place were then removed and replaced upon the wheels, with the time taken for the operation. These times are given as follows:

Wheel	Removal	Replacement
Left rear	10 sec.	11 sec.
Right rear	12½ sec.	13½ sec.
Left front	10 sec.	11 sec.
Right front	15 sec.	9¾ sec.

Subsequently the tire was removed from the rim which had been upon the left rear wheel and the time was 11½ sec. Four new tires were then placed upon the rim and the time for fitting and removal was as follows:

Make of Tire	Fitting	Removal
Dunlop	1 min. 20 sec.	14 sec.
Michelin	0 min. 58 sec.	7½ sec.
Palmer	2 min. 28 sec.	15 sec.
Clincher	1 min. 35 sec.	10 sec.

After the trials the rims were found to be in good condition and had not rusted and the water had not entered beneath the beads. There was no sign of creeping either of the tire upon the rims nor of the rims upon the wheels.

The Rebak detachable wheel also made by the Baker Rim Co. was made the subject of R. A. C. tests the route covered being 1000 miles with a Ford car. This car on the scales showed a weight of 1688 lb. with the average running weight throughout the trials of 1860 lb. During the last 31 miles of the trial the retaining nuts and lock nuts were intentionally loosened on all four wheels and tightened with the fingers. At the conclusion the retaining nut was tight with the lock nut loose on the left rear, both nuts tight with wheel loose on the right rear, retaining nut type lock nut loose on left front, both nuts tight but wheel loose on right front.

Duplex Power Car Co. Elects

CHARLOTTE, MICH., Aug. 27—At a meeting of the stockholders of the Duplex Power Car Co. the following board of directors was elected: James H. Brown, W. H. Cooley, Horton H. Bryan, M. J. Lamson, A. M. White, Frank T. Town, Frank L. King. Executive officers will be elected Sept. 8. It was announced that an order for 200 trucks from Denmark had been received but had to be declined as the orders on hand would not permit this order being completed within four weeks as specified.

Drummond to Make 4 and 6

Omaha Co. Will Assemble Cars in Its Present Plant—Ollier Promoted

OMAHA, NEB., Sept. 1—*Special Telegram*—The Drummond Motor Car Co. has been organized in this city to manufacture the Drummond four- and six-cylinder car. The Drummond Co. has been in existence for twenty years, and will assemble cars in its present plant.

Ollier a Studebaker Vice-President and Director

NEW YORK CITY, Sept. 1—At a special meeting of the Studebaker Corp., held last Friday, L. J. Ollier was elected a vice-president and director. His present promotion takes him from the position of sales manager to a vice-presidency that carries the duties of sales director.

H. R. Benson has resigned as vice-president and a director of the corporation to become distributor of Studebaker cars for the State of Maine and a part of New Hampshire. He will make his headquarters in Portland, Me.

Watson Is Haynes Sales Manager

KOKOMO, IND., Aug. 6—D. L. Watson has been appointed general sales manager of the Haynes Automobile Co. to succeed R. Crawford, who has resigned. Mr. Watson was formerly assistant sales manager and has been associated with the company for 14 years.

Coghlan Leaves Klaxon for Moon

NEW YORK CITY, Aug. 30—R. G. Coghlan, eastern sales manager of the Lovell-McConnell, Mfg. Co., has resigned his position to become associated with the Moon Motor Car Co. of New York, in the capacity of district manager.

Pennsylvania Tire Prices Reduced

NEW YORK CITY, Sept. 1—The Pennsylvania Rubber Co. has reduced the prices of its smaller sized vacuum cup tires, effective to-day. The following list gives a few of the new prices: 28 x 3, $12.65; 28 x 3½, $15.40; 30 x 3½, $16.20; 30 x 4, $19.55, and 31 x 3½, $16.90.

Pullman Opens New York Branch

NEW YORK CITY, Aug. 31—The Pullman Motor Car Co., York, Pa., has opened a factory branch at 1892 Broadway, this city. A full line of the latest models will always be on exhibition as well as a complete stock of repair parts for all models. Henry Drouet, formerly with the Pullman Sales Co., this city, will be in charge of the branch.

Sell Electrics Without Batteries

Walker Co. To Deduct $270 When Batteries Are Omitted —Movement Grows

CHICAGO, ILL., Aug. 31—*Special Telegram*—The Walker Vehicle Co. will sell its 1916 Chicago electric passenger cars with or without batteries, deducting $270 when sold minus the batteries. Arrangements are being made to rent batteries in this city at $20 per month the first year and $16 per month the following years. The concern renting batteries agrees to keep them in repair and if the battery capacity falls below 80 per cent, it will renew the parts free.

A National Movement

NEW YORK CITY, Aug. 31—That the electric vehicle business in this country, both as regards passenger and commercial cars, is on the threshold of a change, is the opinion of many in the industry. What changes are expected to take place are directly traceable to the practice which is rapidly coming into vogue of renting battery service. This, in turn, has made it possible for dealers to sell electric cars without battery equipment and naturally enables them to quote prices all the way from $200 to $900 less per vehicle, depending on the style and size. What the reduction in price will enable the electric car dealer to accomplish and what the battery rental service will do in the way of making electric cars more desirable both for pleasure and commercial use are at the present time sources of considerable speculation among those engaged in this business throughout the country.

Demand Growing

It has been the experience with practically all dealers in electric cars that lately there has been a growing demand for cars without the batteries. This has been especially true in certain New England centers and in the Middle West, although in New York no appreciable demand for cars without this equipment has made itself felt. In Hartford, Conn., about 3 years ago, the practice of renting battery service was inaugurated by several of the charging stations and has proven itself to be a success.

Opens Manufacturers' Eyes

The idea worked out by the General Vehicle Co. and Electric Storage Battery Co. in and around Boston, whereby electric truck users may purchase vehicles without batteries and buy battery service at a fixed charge through the interchangeable battery scheme has opened the eyes of manufacturers to at least some of the possibilities of reciprocal arrangements. This interchangeable idea has also been carried out in San Francisco, Spokane, Baltimore, Worcester and other centers and seemed in all cases to work out excellently. The result has been that the fever has spread throughout the field and many have gone so far as to predict that the battery proposition will work itself out on the same basis practically as the Prest-O-Lite tank arrangement, whereby the owner of one of these tanks is able to secure renewals at a nominal cost. The only difference between the two ideas seems to be that the battery will not have to be purchased, but rather a fixed charge made for the service.

Universal Renting System

While as yet it is impossible to indicate a concrete and fixed idea on how the interchangeable battery renting scheme is going to work out on vehicles which are so difficult to standardize, there are many in the industry who, although they do not desire to be directly quoted, are extremely optimistic as to the eventual outcome. It is said that a Chicago man who has taken out a series of patents on different methods of effecting the battery exchange system has secured the co-operation of several New York agents who have gathered together and worked out what may turn out to be a feasible universal battery renting system. This system and its working plans, it is stated, will be all ready for public announcement within 2 or 3 weeks. The most optimistic of those who have studied the plan state that they would not be surprised if some of the gasoline car manufacturers, especially in the truck business, would go into the business of building electric chassis for commercial use with standard battery mountings.

Mileage and Price Limitations

According to the views of the believers in the battery rental system, the only factors working against the development of the electric vehicle industry are the mileage limitation and price. With the battery rental system giving all the mileage desired and the practice of selling the car without the battery giving the reduction in price the idea is that these two factors will be largely overcome. One of the other advantages claimed is that a car in commercial service or even in touring use need only carry a battery of sufficient size for its desired trip mileage, thus a car on a 100-mile trip will take a 100-mile battery while on a 25-mile trip. When asked regarding the demand for cars minus battery in New York City the representatives of the electric car interests here all stated that while there has been no appreciable demand here, in other parts of the territory there is an indication that the practice of battery rental is growing.

Glide to Concentrate on Six

Five-Passenger Design with 3 by 5 Block Motor Has Modern Equipment

PEORIA, ILL., Aug. 30—One of the concerns to join the ranks of six-cylinder builders for the 1916 season is the Bartholomew Co., maker of the Glide car. This concern has dropped the Glide 30 of 1915 and will concentrate on the 1916 Six-40. The new car is a five-passenger design selling for $1,095, and is an assembled design, having a Rutenber 3 by 5 motor with the cylinders cast in a block. Other specifications of the car include positive water circulation by centrifugal pump, Westinghouse electric lighting, starting and ignition, disk clutch, three-speed gearset and Hotchkiss drive. The rear axle is floating with a pressed steel housing and the driving gears are carried in a cast steel carrier. Both brakes are on the rear wheels with 14 by 2 in. drums. Steering is by screw and nut with an 18-in. wheel.

Up-to-date equipment is used throughout. The gasoline feed is by the Stewart-Warner vacuum system, the wheels are provided with Goodyear demountable rims and 34 by 4 in. tires, the top is a one-person design with Jiffy curtains and the instrument board is fully equipped, including a Stewart-Warner magnetic speedometer driven from the propeller shaft, an ammeter and a dash lamp.

There is a detachable sedan top, which gives an all-year-round equipment if so desired. The Glide sedan top is constructed with a frame of hard wood, ironed and braced against squeaks and rattles. It is upholstered in Bedford cord and has double strength glass in the doors and windows. There is an electric dome light in the top. This body can be removed or attached by two men in an hour. The touring body to which this may be fitted is a full streamline design with the modern yacht-like sweep from the headlights to the rear of the body. The upholstery is enamel leather over curled hair and oil-tempered springs. The wheebase is 119 in.

—

Proposed Denver Special-Tax Ordinances Favor Garages

DENVER, COL., Aug. 28—Two special-tax ordinances affecting the automobile business in Denver have been introduced in the City Council this week, and both are expected to pass when they come up for final action at the next meeting of the Council.

One provides for a $25 yearly license fee for all public garages, and the other

requires an annual license fee of $25 additional for each curb pump.

Through the efforts of the Automobile Trades Association of Colorado, the license fee for garages was reduced from $50, which the original bill provided. This organization was also instrumental in securing the introduction of the bill permitting curb pumps within specified districts. These curb pumps will be allowed throughout the residence portion of the city, but will be barred from the main part of the business district on account of congested traffic conditions.

There are now approximately sixty-five regular garages in Denver coming under the license requirements.

—

Injunction Against Splitdorf Denied

TRENTON, N. J., Aug. 27—The injunction sought by Sidney S. Meyers, a stockholder of the Splitdorf Electrical Co., Newark, against that company to restrain it from paying $1,000,000 for a patent on a high-tension magneto to the Sumter Electrical Co., Sumter, S. C., has been denied by Vice-Chancellor Backes in the Chancery Court, to-day. Mr. Meyers, who thought the payment too large, will make an appeal. In connection with the purchase of the Sumter company's patent the Splitdorf company planned to acquire the Southern concern.

—

Dimming Ordinance in Kansas City

KANSAS CITY, MO., Aug. 28—The council has passed a new dimming ordinance, providing that the main shaft of light shall be confined to a minimum spread and that the uppermost rays shall not be more than 6 ft. above the surface at a point of 100 ft. ahead, and the shaft shall be directly ahead of the vehicle. The penalty is $1 to $100 fine, or five to sixty days in jail, or both. Thirty arrests were made under a previous dimming ordinance, but the persons were released and not tried because of defects in the ordinance.

—

N. Y. Taxicab Co. Upheld

NEW YORK CITY, Aug. 6—An injunction has been granted by Justice Callaghan in favor of the Haverty Taxicab, Inc., which will restrain the police from arresting the chauffeurs employed by the company who operate their machines without meters.

The justice held that until the question is finally passed on by the higher courts the company should be allowed to use machines, with or without meters, as it sees fit, without interference on the part of the police. The company operates taxicabs without meters upon call from private garages, and holds that its cars do not have to be licensed under the public hack ordinance as in the case of motor vehicles soliciting patronage on the street.

Michelin French Plant Rushed

Produces 6000 Tires a Day—Other Activities—Trouble with Solids in Field

CHICAGO, ILL., Aug. 28.—American automobile business men returning from Europe give many interesting sidelights on the situation so far as automobiles in the war are concerned. F. V. Springer, head of the export department of the Republic Rubber Co., states that at the Michelin tire factory in France 6000 pneumatic tires are being produced daily, this company not manufacturing any solids. In the valve plant of the factory 500 high explosive shells are being produced daily, and 8000 fuses. In addition, the company is producing artillery wheels and is taking up the manufacture of aeroplanes.

Last year the Michelin company made a check extending over a period of 2 months on all of the cars operating in France and Italy, the result of which shows that 80 per cent of all the cars in France last year were fitted with Michelin tires and 70 per cent of those in Italy also. Fully 80 per cent of the tires used in France have steel-studded treads, the French car owner not yet being convinced of the merits of the different types of anti-skid rubber treads used by Americans.

In northern France considerable difficulty has been experienced in the solid tire field by tires on military trucks separating between the tire and the base. This is largely due to the heavy loads carried and the high speeds, it being quite common for trucks overloaded to be driven 140 to 150 miles a day. This means higher speeds than heretofore necessary in truck use, and has proved disastrous to tires. Tire makers at the present time are trying to cope with the situation. In Italy factories are exceptionally busy, Fiat devoting the majority of its time to the production of motor trucks, which is at the rate of 40 per day at present.

—

Traffic Mgrs. to Consider Extra Demurrage

NEW YORK CITY, Aug. 31—At the meeting of factory traffic managers and members' representatives to be held in Detroit, Sept. 14, at the Detroit Board of Commerce, as announced in THE AUTOMOBILE of Aug. 29, such matters as extra demurrage, or storage charges on automobiles held in freight cars at destination, will be considered. Another important point that will be brought before the meeting will be whether batteries can reasonably be considered a component part of engine starters and subject to the same rates; also, damage to automobiles by sparks and cinders entering cracks around doors of freight cars. The effect on automobile shipments of the ruling by express companies that carload rates do not include wagon service and that such shipments are subject to extra switching charges will be considered. Advertising matter on freight cars, and recommendations to be made to the Uniform Classification Committee regarding the classification of various items will also be looked into.

—

Pennsylvania Has $138,406,000 in Cars

HARRISBURG, PA., Aug. 30—At the rate of $1,000 per car, there is $138,406,000 invested in motor vehicles in Pennsylvania. The registration to date is 138,406, and the number of trucks is 7453. The registration of cars thus far this year runs as follows: Under 20 hp., 14,543, against 11,107 last year; between 20 and 35 hp., 112,703, against 75,709; between 35 and 50 hp., 10,655 against 9759; cars over 50 hp., 639 compared with 585 last year.

—

Detroit Body Pays $111,000

DETROIT, MICH., Aug. 28—The Security Trust Co., trustee for the Detroit Body Co., has been allowed to pay secured claims totaling about $111,000. Of this amount a mortgage of $75,000 will be paid to the First and Old Detroit National Bank and a mortgage of $36,000 to the Detroit Trust Co.

—

No Glare for Washington

WASHINGTON, D. C., Aug. 28—The district commissioners have adopted an amendment to the police regulations granting permission to use electric or acetylene headlights or sidelights on automobiles and motorcycles. The lights are to be allowed, however, only on condition that they are equipped with anti-dazzling devices approved by the chief of police.

—

Indianapolis Co. to Make Carbureter

INDIANAPOLIS, IND., Aug. 27—Papers of incorporation have been filed by the VanBriggle Motor Device Co. with $150,000 capital to manufacture a new carbureter invented by L. H. VanBriggle. The incorporators are: L. H. VanBriggle, H. S. Rominger, Z. F. Harshbarger, U. Z. Wiley, Frank Bivens, R. E. Hosea and E. O. Null.

—

Flaum Shock Absorber Assigns

NEW YORK CITY, Aug. 30—The Flaum Shock Absorber Corp., manufacturer of shock absorbers, at 1876 Broadway, has made an assignment to H. I. Barnett. The company was incorporated on Jan. 8, 1915, with a capital of $20,000. S. M. Halper is president, and C. A. Most treasurer.

United Kingdom Continues to Lead in Car Imports from United States

Takes 2246 Cars Worth $4,413,387 in June as Compared with Only 240 Cars Worth $239,274 in June, 1914— France Takes 969, or 826 More Than Last Year

WASHINGTON, D. C., Aug. 28—The tremendous gains made in our export trade in automobiles, cars and parts during the last fiscal year are vividly shown in detailed figures issued this week by the Department of Commerce. The gross figures were published exclusively in THE AUTOMOBILE for Aug. 12.

The United Kingdom holds first rank in the volume of its imports of cars from this country. During June last the number shipped to that country was 2246, valued at $4,413,387, while in June a year ago the number was only 240 and the value $239,274. During the twelve months ended June, the number of cars exported to the United Kingdom increased from 7222, valued at $5,853,127, in 1914, to 13,934 cars, valued at $21,149,552.

The shipments to France in June last amounted to 969 cars valued at $2,634,338, as against 143 cars, valued at $88,874, exported in June, 1914. During the fiscal year these exports rose from 1429 cars, valued at $924,130, in 1914, to 5441 cars, valued at $13,776,752, in 1915.

Italy's Imports Decrease

Italy's imports of cars from this country show a sharp decline from seventeen cars, valued at $13,801, in June a year ago, to four, valued at $2,893 in June last. Even more marked was the decrease during the fiscal year, 343 cars, valued at $242,695, being shipped there in 1914, while in 1915 the number was 115 and the value $78,265.

There were no shipments of cars from this country to Germany in June last, while in June a year ago forty-four cars, valued at $56,249, were exported. During the fiscal year the number of cars exported there decreased from 1435, valued at $1,059,249, in 1914, to twenty, valued at $20,164, in 1915.

Under the heading "other Europe" large increases are to be noted. In June last the number exported to European countries not already mentioned was 1432, valued at $2,952,440, while in June, 1914, the number was 242 and the value $203,816. During the twelve months' period the number increased from 2928, valued at $2,337,733, in 1914, to 4249, valued at $10,720,541, in 1915.

Eight hundred and twenty-seven cars were shipped to Canada in June last, the value being $631,609, while in June a year ago the number was 513 and the value $642,024. During the fiscal year the number shipped there decreased from 4624 cars, valued at $5,919,776, in 1914, to 4433 cars, valued at $4,428,338, in 1915.

Mexican Trade Poor

Our export trade in automobiles with war-ridden Mexico is not very flourish-

ing. In June last eleven cars, valued at $13,255, were shipped there, as against three cars, valued at $4,577, exported in June a year ago. During the twelve months' period the exports fell from 167 cars, valued at $256,675, in 1914, to seventy-eight cars, valued at $81,322, in 1915.

310 Cars to West Indies

The West Indies and Bermuda took 310 cars from this country in June last, the value being $165,199, while in June, 1914, the number was sixty-five and the value $44,657. During the fiscal year the exports increased from 556 cars, valued at $513,124, in 1914, to 1693 cars, valued at $993,188, in 1915.

Decrease to South America

Our exports of cars to South America increased from seventy-six, valued at $50,683, in June, 1914, to 193 cars, valued at $119,044 in June last, but during the fiscal year decreased from 1985 cars, valued at $1,939,212, in 1914, to 1264 cars, valued at $702,163, in 1915.

British Oceania imported 459 cars from this country in June last, the value being $399,134, while in June, 1914, the number imported was 425 and the value $369,693. During the twelve months' period these exports declined from 4244 cars, valued at $3,695,595, in 1914, to 3186 cars, valued at $2,670,483, in 1915.

Exports to Asia Gain

Our export trade in cars with Asia and other Oceania increased from 147 cars, valued at $149,121, in June a year ago to 735 cars, valued at $1,849,630, in June last, and from 2140 cars, valued at $2,076,278, in the fiscal year 1914 to 2316 cars, valued at $4,557,634, in 1915.

Under the heading "other countries" the exports amounted to 157 cars, valued at $128,370, in June, 1914, increasing to 222 cars, valued at $183,871 in June last, while during the twelve months' period the shipments declined from 2017 cars, valued at $1,756,980, in 1914, to 1147 cars, valued at $1,076,233, in 1915.

The detailed schedule of exports and imports appears on the opposite page.

—

Gasoline for Export Up

NEW YORK CITY, Aug. 30—The Standard Oil Co. of New York has announced an advance of 1 cent a gallon all around in the price of gasoline for export. This brings the quotation for deliveries in 110-gal. drums f.o.b. seaboard to 18 cents a gallon. This is the first price advance in more than a year, during which time the quotation has held firmly at 17 cents a gallon. The New York company's quotations on export business are regarded as the standard, and any changes in the local company's prices are followed by the other companies doing an export trade.

$49,000,000 for Rural Delivery

—

Motor Vehicles To Be Extensively Used—$2,000,000 Saving Effected

WASHINGTON, D. C., Aug. 28.—Motor car manufacturers and dealers throughout the country will find much to interest them in a statement issued by the Post Office Dept. to the effect that Postmaster General Burleson will ask Congress next December for an appropriation of about $49,000,000 to provide rural delivery during the fiscal year beginning July 1, 1916. The appropriation for the current year is $53,000,000.

$1,000,000 for New Routes

Of the $49,000,000, it is estimated that $48,000,000 will operate all the rural routes now authorized. The additional $1,000,000 will pay for new service to be established before or during the 12 months to be covered by the appropriation. The Post Office Dept., in a statement, says that the appropriation for rural delivery for the fiscal year 1913 was $47,000,000. The Postmaster General now proposes to provide a modernized and a much larger service during the fiscal year 1917 for just $2,000,000 more than the cost of the old service 4 years ago. One of the reasons why this is possible is because of the economies resulting from the introduction of the automobile in this field of postal transportation.

Automobile Service Success

The department's statement says the success of the automobile service has been fully demonstrated during the last 2 months. With one or two unimportant exceptions, in connection with which postponements of the change were asked and allowed for special reasons, the motor car has been substituted for wagon delivery, wherever ordered, smoothly and on the scheduled time. The motor service is steadily gaining in efficiency and popularity.

Many Applications

Applicants for examination for permanent places as automobile carriers average twenty to each position. In some cases as many as forty men have sought the positions, offering to supply a car, do the 50 to 60 miles a day required for 6 days a week, at the compensation offered—from $1,500 to $1,800 a year. Inasmuch as the majority of the motor car routes radiate from small communities, in which relatively few machines are available for business purposes, this showing is regarded as conclusive proof of the desirability, as well as the feasibility, where road conditions are good, of using the motor car as a carrier of rural mails. It is to be remembered, according to the department's statement, that the adoption of the motor car for this service will give a powerful stimulus to the cause of good roads and improve the facilities available to the farming population for utilizing the parcel post system.

U. S. Rubber Imports Grow

WASHINGTON, D. C., Aug. 27—Crude rubber shipments from the principal South-American ports have shown an increase of 2,143,076 lb. for the year ending June, 1915, over the year previous, most of which surplus was imported by the United States, according to the report of George H. Pickerell, consul for the United States at Para, Brazil, to the Department of Commerce. The total rubber shipped from the three chief rubber ports of the Amazon Valley was 5,192,260 for the year ending June, 1915, as against 3,049,184 for the year previous. Of this total the United States took 3,088,114, and Europe 2,104,147. The year previous the United States took 1,035,396, and Europe 2,013,788; so that while the United States has increased its imports nearly threefold, Europe has stood practically stationary. The three ports included in these figures are Para, Manaos, and Itacaotiara. Para shipped more than two and one-half times more to the United States than to Europe; Manaos shipped the greater part of its output to Europe, and Itacaotiara shipped all of its rubber to Europe. Para ships nearly three times the amount of rubber that the other two combined do.

S. O. Advances Gasoline Up 1 Cent in New Jersey

BAYONNE, N. J., Aug. 27—The price of gasoline in this city, where much of the supply is made by the Standard Oil Co., was raised 1 cent a gallon to the dealers yesterday and they in turn increased the price to customers. The price is now 14 cents a gallon, an increase of 3 cents within a month. It was said yesterday that there may be an increase in the prices of other oil products. Local dealers are selling Gulf gasoline at 13 cents.

Further advances have recently been announced in some of the southern States. In Alabama the price has been advanced 1 cent a gallon and in North Carolina 1 cent a gallon to 16 cents. At most Georgia points the price has been raised 1 cent a gallon to 16 cents, but in Atlanta the quotation has been advanced 1½ cents to 14 cents. In Virginia an increase of 1 cent, to 13 cents a gallon, is announced.

Packard Buys More Real Estate

Pays $75,000 for 12.8 Acres—Business Growth Necessitates Further Expansion

DETROIT, MICH., Aug. 30—Through the purchase of 12.8 acres of ground from different parties, the Packard Motor Car Co. now owns over 100 acres of real estate. The purchase price of the land was about $75,000. To what use this property will be made has not yet been definitely decided, although it may be assumed that new buildings or additions to the plant will be started ere long.

Notwithstanding the fact that the Packard company has now under construction half a dozen additions and new buildings which when completed and equipped with their machinery will represent a total expenditure of $1,500,000, the concern's business is now growing so fast that the officials found that it will be necessary to further expand in order to cope with the future.

Through this new acquisition of land the Packard company now has a strip about 1000 ft. wide and extending over one mile along the belt line railroad.

—

National Adds to Plant

INDIANAPOLIS, IND., Aug. 30—The National Motor Vehicle Co., Indianapolis, is building a large addition to its Twenty-second Street plant, and the improvements include remodelling of the present offices. Pending completion of same, the general offices of the company have been removed to 426 North Capital Avenue, at which address is located its local branch.

—

Pope Buyer Issues Stock

WESTFIELD, MASS., Aug. 29—The Westfield Mfg. Co., which recently bought the plant and business of the Pope Mfg. Co., in this city, has issued the following securities in payment therefor: $400,000 6 per cent serial debenture bonds; $400,000 7 per cent convertible preferred stock, and $800,000 common stock.

The company will continue the manufacture of cars and bicycles and will be under the direct management of W. C. Walker of Hartford. C. H. Tenney of Springfield, Mass., will be chairman of the board, and the other directors will be Joseph Shattuck of Springfield, O. J. Thomen of Redmond & Co., and S. C. Millett of Millett, Roe & Hagen.

Redmond & Co. underwrote the preferred stock and Millett, Roe & Hagen took the bonds, all of which have been placed with investors.

—

Tin Prices Active

NEW YORK CITY, Aug. 31—The last week proved no exception to the recent tendency to establish low records in the New York market. Tuesday tin prices became active and remained so during the whole week and at the end of the week it was 45 cents above Monday's price. This was due entirely to the settlement of the Arabic incident. The copper markets were unsettled yesterday due to a sharp break in London standard warrants. Copper agencies say good sales of copper are being made on a basis of 18 cents a pound. While spot copper declined in London, there was no change in electrolytic. Lead was firm, quite a number of sales being made at $4.90 by the leading interest, while outside interests are asking an advance over the official price set by the American Smelting & Refining Co. The leading situation appears to be in full control of the producers and further advance in the price is looked for this week. The munition makers are reported to be seeking to cover up to the end of the year, but sellers are not as yet prepared to sell this far ahead. The price which was established yesterday was $4.90 per 100 lb. There being a net gain of 45 cents at the end of the week.

A slight change took place in the aluminum market with a gain of 1 cent while antimony declined 2½ cents. The rest of the metal markets made no changes. The oil and lubricants markets were weak with but one change. This change took place on Friday when gasoline rose 1 cent. The rest of the markets made no changes.

—

Hurlburt Leases Mott Iron Works

NEW YORK CITY, Aug. 28—The Hurlburt Motor Truck Co. has leased the old plant of the Jordan L. Mott Iron Works, on Harlem River and Mott Haven Canal, between Third Avenue and 133d Street, this city.

The company has orders for over 1000 trucks to be used as Red Cross ambulances in the European war, and will treble its force of workmen to operate a full twenty-four hours in shifts of eight hours, employing over 300 men.

—

Detroit Steel Products Adds Again

DETROIT, MICH., Aug. 30—For the third time this year the automobile springs department of the Detroit Steel Products Co. is being enlarged. The present addition will be a one-story structure which will add 15,000 sq. ft. of floor space to the department.

"Business thus far this year is fully 50 per cent ahead of 1914," said an official of the company. "August will show to have been the best month we ever had. We have 800 men on the payroll and we are working to full capacity, with three shifts."

—

Velie Makes Factory Changes

MOLINE, ILL., Aug. 27—Increased production will be the result of the changes being made at the plant of the Velie Motor Vehicle Co., this city. The six-story building heretofore used for storage purposes will hold the final assembly departments and shipping rooms. With this new arrangement rough material is received at the west end of the main plant, and finds its way through the machine shop, first assembly and test, hence to the final assembly, where the bodies await installation, after which the completed cars are shipped.

—

Lenox Plant Moved to Lawrence

LAWRENCE, MASS., Aug. 30—The Lenox Motor Car Co., Boston, Mass., will build a reinforced concrete factory to cost $100,000 in this city. It is stated that the company will enter the commercial vehicle field.

—

St. Louis Body to Lease Plant

ST. LOUIS, MO., Aug. 27—The Commercial Auto Body Co. has closed a lease for the building at the southeast corner of Sixteenth and Pine Streets, this city, to be used as a plant for building commercial bodies. The offices and showrooms at 3003 Locust Street will be

retained by the company for the present.

The new factory has four floors and a basement. About 30,000 sq. ft. of floorspace will be available. The bodies will not be assembled, but will be built from the raw material in the plant. The basement will be used for a mill room, the second floor for assembling, the third floor for trimming, and the fourth for painting and finishing.

Heretofore the company has built bodies for Ford chassis only. In the new plant custom work for all makes of chassis will be done.

—

Crane Plant Sold

BAYONNE, N. J., Aug. 30—The entire plant in this city of the Crane Motor Car Co., has been purchased by the Car Lighting & Power Co. The plant will be used by the Clothel Co., the subsidiary of the Car Lighting & Power Co., which manufactures apparatus for refrigeration.

—

Scripps-Booth Adds to Plant

DETROIT, MICH., Aug. 30—Its present plant being inadequate to meet its increasing business, the Scripps-Booth Co. is now having erected a three-story plant on Bellevue Avenue, across from its present location. When this plant is completed a production of 100 cars a day will be possible, and the present working force will probably be doubled.

—

Dividends Declared

Packard Motor Car Co., Detroit; quarterly of 1¾ per cent on preferred; payable Sept. 15.

General Motors Makes High Record After the Arabic Settlement

NEW YORK CITY, Aug. 30—Assuming frankness and sincerity in the latest German assurances, financial interests in New York regard last week's developments in connection with the destruction of the Arabic as of paramount importance to the financial situation. With better understanding between Washington and Berlin the markets once again show up strong. For the most part, stocks showed increase in tone on Saturday, when the majority of issues recorded net advances. One of the important advances was that of General Motors common which rose seventeen points, while that of the preferred rose three points. There were many other notable changes such as Willys-Overland common which rose thirteen points and Studebaker common with a rise of twelve and one-half points. Among the tire issues the largest change took place on Saturday, Kelly-Springfield common rising ten points. Firestone common rose seven points.

Few Declines

There were a few declines this week which ranged from one to five points. The heaviest decline was that of Vacuum Oil which dropped five points, while that of Goodrich preferred and Goodyear common both declined one point. In a general way closing prices were under the best. Trading was on a heavy scale, with very many shares changing hands.

The Detroit issues also picked up with the settlement of the Arabic incident, there being but three declines. The rest of the stocks showed good gains. The gains ranged from one to five points. Continental common, Packard common, and General Motors common rose five points. The bond markets were quiet with no trading.

Business Tour Reaches 2,850,000

Wisconsin Run Covers Territory Containing 20 Per Cent of State's Population

MILWAUKEE, WIS., Aug. 28.—Approximately 20 per cent of the population of Wisconsin—2,850,000—were placed directly in touch with the 1916 models of the leading automobile manufacturers of America; about 50 per cent were informed of the greatest State fair ever held in Wisconsin, and 65 to 70 per cent were made acquainted in one way or another with all that has to do with good roads, motor vehicles, travel, speed, roadability, scenery and natural resources of the Badger commonwealth, by the booster tour undertaken by the Milwaukee Automobile Dealers, Inc., from Aug. 23 to 27 inclusive, over a route of more than 650 miles, covering the richest and most productive territory of Wisconsin.

The first day the tour covered 109 miles, from Milwaukee to Janesville, Wis., by way of Racine, Burlington, Delavan and Beloit. On the second day 153 miles were covered, and at noon the tourists were within 17 miles of Milwaukee. Wednesday the route measured only 101 miles, being from Madison, the State capital, to Oshkosh. The fourth day took the tour from Oshkosh to Green Bay, 114 miles, by way of the Fox River valley, one of the most fertile agricultural and manufacturing districts in the Middle West. On Friday, 131 miles were covered in the run home from Green Bay along the west shore of Lake Michigan.

Close observation of the cars participating in the tour shows that not one experienced mechanical trouble of any kind, necessitating any delay on the road, and if the tour had been run under grade 3 rules of the A. A. A., each entrant would have come back with a perfect road score.

—

Used Car Pocket Edition Revised

CHICAGO, ILL., Aug. 30—The Chicago Automobile Trade Assn., has issued a revised edition of the pocket edition of its National Used Car Market Report which, like the first edition, is supplemental to the large book, but covers only Zone 7 which centers in Chicago. The book is exactly the same size as its predecessor, but despite the fact that it contains information on 154 makes of cars as against 131 listed in the first edition, it has but eighty-six pages instead of ninety-seven.

A great improvement has been made in the method of listing the data and the operation of ascertaining information on a particular car has been considerably simplified. In the first edition, information concerning the model, year, type and list price was given in "run in" form and was not as easy of access as in the new form. In the new edition complete information on each model is given on a single line reading across one page, the "run in" paragraph at the end having been eliminated.

The book contains the following concrete information compiled from the data in the main edition on Zone 7: "U. S. Average"; "As Is Sales"; "As Is Appraised"; the latter being derived from the appraisements made by the committees in Zones 1, 7 and 9.

—

25 Exhibitors to Date for Michigan State Fair

DETROIT, MICH., Aug. 30—The annual Michigan State Fair opens next Monday, Sept. 7, and as in past years the automobile show will be one of the big attractions.

From the list of exhibitors given herewith it will be noticed that most of the local automobile dealers have secured space.

In addition to passenger cars and commercial vehicles there will be several motor tractors and among them, it is said, will be a Ford tractor which will give daily demonstrations.

The list of exhibitors up to to-day is as follows:

Buick Motor Car Co., Buick; Cadillac Motor Car Co., Cadillac; Cunningham Auto Co., Maxwell; Chevrolet Motor Car Co., Chevrolet and Monroe; Chalmers Motor Co., Chalmers; Dodge Bros., Dodge; Denby Motor Truck Co., Denby; Ford Motor Co., Ford; Grasser Motor Co., Hupmobile; Jackson Automobile Co., Jackson; McKenney-Devlin Co., Grant and Haynes, also Vim truck; M. A. Young, Mitchell and Reo; Hudson Motor Car Co., Hudson; Oldsmobile Co., Oldsmobile; Oakland Motor Car Co., Oakland; Overland Detroit Co., Overland; Ross Automobile Co., Ross; Thompson Auto Co., Federal and Commerce trucks; Standard Auto Co., Oakland and G. M. C.; Studebaker Corp., Studebaker; Signal Motor Truck Co., Signal; Standard Motor Truck Co., Standard truck; Kalamazoo Motor Vehicle Co., Kalamazoo truck; Gornor Oil Co., and Kleis & Clouse, Ford starters.

—

Dixie Magneto on National Twelve

NEW YORK CITY, Aug. 30—In the description of the twelve-cylinder National appearing in THE AUTOMOBILE for Aug. 19 it was stated that the magneto used is a special Splitdorf. This magneto is the Dixie model for twelve-cylinder motors manufactured by the Splitdorf Electrical Co., Newark, N. J.

90 M. P. H. To Be Twin City Limit

Wavy Surface of Concrete Track Expected to Keep Winner's Speed Down

MINNEAPOLIS, MINN., Aug. 31—*Special Telegram*—The wavy concrete surface of the 2-mile Twin City Motor Speedway track is expected to hold the average speed of the winner of Saturday's 500-mile World's Derby below 90 m.p.h. Elimination trials which were to have begun Monday were postponed until Wednesday, owing to weather and track conditions. In an unofficial trial Monday, Gilbert Anderson, in his Stutz, made a lap of the track in 1:12 4/5, an average of 99 m.p.h.

Only one of the two Peugeots reported recently shipped from France, to be driven by Wilcox and Aitken, has arrived, and it will not be possible for it to reach the track in time for Saturday's race. Wilcox and Aitken are to be Stutz relief drivers. The Peugeot will be ready for the Sheepshead Bay race Oct. 2, and will probably be driven by Johnny Aitken.

H. J. Tremain of Minneapolis has bought the Duesenberg entered in the Twin City race with Henderson as driver, but has elected Ralph Mulford to pilot it on Saturday.

The track is in fine condition and good weather is promised so that the attendance should be 100,000.

—

Automobile Racing for Japan

TOKIO, JAPAN, Aug. 27—Automobile racing will be inaugurated in this city when a series of track races will be held in commemoration of the anniversary of the coronation of the Emperor. American cars will be entered, among them being two Mercers, recently sold by G. R. Bentel, the Pacific Coast Mercer distributor, to F. J. Fujioka, the two cars to be driven by W. T. Watanabe and H. Sakamoto.

—

De Palma Wins at Kalamazoo

KALAMAZOO, MICH., Aug. 28—Driving a most consistent race and without having the slightest hitch, Ralph De Palma, in his Stutz racer, won the 100 miles race at Recreation Park this afternoon He covered the century in 1:33; 31:40, averaging 65.32 m.p.h. Incidentally De Palma is now richer by $1,000. Bob Burman will receive $700, having finished second in the race in his Peugeot. Third money went to Billy Chandler, who drove a Deusenberg. The fourth prize went to G. F. Patrick, who was at the wheel of a Mercer, while the fifth and last prize

was won by Thomas Ball, driving a Buick.

Ideal weather prevailed and a crowd of from 12,000 to 15,000 people was present when the race started. A thousand automobiles or more were around the course.

Of the race itself there is not much to be said because it was practically a one-man race. De Palma could probably have made better time, but he drove carefully and took no chances. He did not stop once during the entire race.

—

Motometers on Elgin Racers

NEW YORK CITY, Aug. 27—Boyce Motometers were on all cars in the races for the Chicago Automobile Club cup and the Elgin national trophy held at Elgin, Ill., Friday and Saturday, Aug. 20 and 21.

—

Hyatt Service in San Francisco

DETROIT, MICH., Aug. 30—The Hyatt Roller Bearing Co. will open a new service branch in San Francisco. It will be located at 366 Golden Gate Avenue. This will be the ninth Hyatt service branch now in the country, the others being located in Atlanta, Boston, Detroit, Los Angeles, Minneapolis, Chicago and New York.

The local service branch of the Hyatt company has moved into larger quarters at 751 Woodward Avenue. About Nov. 1 this branch will be moved into the new office building now in course of construction.

—

Iowa Dealers in Convention

DES MOINES, IOWA, Aug. 31—The first semi-annual convention of the Iowa Automobile Dealers' Association opened a two-day session here to-day. This is the first convention of its kind to be held in the United States. There are seventeen associations in all. President of the Garage Owners Association of Illinois, W. B. Taylor, and Secretary E. J. McGuirk will address the 600 Iowa dealers. Among those present will be Mayor Hanna of Des Moines, who will give the welcome address. This will be followed with an address by J. Friedman of Dyersville, vice-president of the Iowa Association. Secretary N. L. Seeman will give a report on the Iowa association, which was organized March 10 of this year.

—

Grossman Holds Annual Salesmen's Convention

NEW YORK CITY, Aug. 30—The annual salesmen's convention of the Emil Grossman Mfg. Co., Inc., Brooklyn, N. Y., was held in the offices of the company, Bush Terminal, Aug. 27 and 28. Emil Grossman, president of the company, presided.

Since January, 1915, the company has added over 500 new customers. The company's increase in business for this year, over that of 1914, was over 50 per cent.

The following salesmen and other members of the company's staff attended the 2-day sessions of the convention: Emil Grossman, president; J. N. Lowe, vice-president; L. M. Schwartz, secretary; E. C. Delgado, assistant treasurer; A. A. Greene, in charge of sales to manufacturers; N. T. Gutelius, advertising manager; P. L. McIlvaine, export; S. S. Waldman, purchasing agent; M. S. Rosen, engineer; Harry G. Wedler, W. M. Farans, A. E. Rosenberg, R. R. Rosenquist, A. F. White, representative in India and the Far East; J. E. Vidal, representative in Cuba, Porto Rico, South and Central America; E. E. Gamon, factory manager; R. W. Johnson, assistant factory manager; L. G. Hartdorn, assistant factory manager; Carl Postal, assistant factory manager spark-plug department.

Friday evening the members of the convention were entertained by the company at dinner and at the theater. Saturday evening there was a banquet.

—

Washington Jitneys Common Carriers

WASHINGTON, D. C., Aug. 28.—Within the next few days orders declaring jitneys common carriers, subject to rules and regulations governing this class of public utilities, will be issued by the Public Utilities Commission. The commission has decided to take this action upon the advice of Corporation Counsel Syme, who recently made an investigation of the jitney situation.

The first step of the commission will be the preparation of rules and regulations governing the jitney service. The companies, as well as individual owners, will be required to file immediate reports of all accidents. Annual reports, which will include a complete statement of their financial operations, together with a general description of their rolling stock, etc., will also be made. The question of an interchange of transfers will be decided later.

—

Bosch on Austin and Mercer

NEW YORK CITY, Aug. 31—The Bosch Magneto Co. has closed contracts with the Austin Automobile Co., Grand Rapids, Mich., and the Mercer Automobile Co., Trenton, N. J., to use Bosch magnetos for the coming season.

The Engineers' Forum—Aluminum Pistons

(*Continued from page* 421)

By a system of ribbing, which we have developed ourselves and which gives the dual advantage of quickened thermal conductivity as well as adding rigidity to the dome of the piston, we were able to turn out a piston that weighed less than 12 oz. and under the directions we sent for machining, they have met every requirement, for our pistons have now been adopted for their standard production, which fact speaks for itself.

System of Ribbing

The system of ribbing under the dome which we employ adds greatly to the radiating surface and at the same time strengthens that part of the piston on which the greatest stress occurs, without adding more than a fraction to the weight. Two of the ribs are extended to reinforce the wristpin bosses, offering a solid dome construction from the stress point above the wristpin to the center of the piston head.

The advantages following a correct installation of aluminum alloy pistons are sufficiently well known among your engineering readers so that this feature of the discussion is scarcely worth mentioning here. The principal idea is to offer the foregoing suggestions gained through experience and for the guidance of those who would gain the benefits of Magnalite pistons.

As to aluminum alloy cylinders, it is only fair to state that their present development is somewhat embryonic, although we have successfully cast quantities of them for aeroplane work and unquestionably they will have a broad future in the automobile trade. Just as the problems of aluminum alloy pistons have been solved, so in time will come the full development of the aluminum cylinders, and it is my prediction that sooner than is now expected, an alloy metal will be produced, having all the advantages of light weight and with a bearing surface which will not require the use of a reinforcing iron cylinder sleeve.

Copper and iron have been known and used for fifty centuries but aluminum has been commercially known for but thirty years and the industrial possibilities yet to be developed from the manipulation of aluminum are just beginning to appear.—WALKER M. LEVETT, Walker M. Levett Co.

United Truck Extends — The United Motor Truck Co., Grand Rapids, Mich., is building additions to its plant.

Thermoid Rubber Adds — The Thermoid Rubber Co., Trenton, N. J., will build a two-story, 71 by 190 ft. addition to its plant.

Garford Truck Adds—The Garford Motor Truck Co., Lima, Ohio, is building an addition to its plant at an estimated cost of $20,000.

Pathfinder to Build—The Pathfinder Co., Indianapolis, Ind., has had plans prepared for the construction of a 60 by 400 ft. addition to its plant.

Maine Co. to Make Automobiles—The E. E. Wentworth Corp., Springvale, Me., will construct a plant for the manufacture of automobiles at a cost of $50,000.

American Steel Installs Furnace.—The American Steel Foundries, Chicago, Ill., has installed a 6-ton electric furnace of the Heroult design at its Indiana Harbor, Ind., plant for the production of automobile and other castings.

Sheldon to Treble Output.—The Sheldon Axle Co., Wilkes-Barre, Pa., is increasing its output of worm-drive truck axles by the installation of new machinery and special equipment. After the additions are completed, it expects to treble its output.

Chevrolet Buys Toronto Plant — The Chevrolet Motor Co. of Canada, Ltd., Toronto, Ont., will on Oct. 1 take possession of the plant of the Dominion Carriage Co., Ltd., West Toronto, which it has purchased. It hopes to have cars ready for delivery in three months.

Scripps-Booth New Factory — Ground has been purchased and work is now going forward as rapidly as possible on a new three-story fireproof factory which will be the home of the Scripps-Booth Co., Detroit. The new factory will have a capacity of 100 cars a day.

New Automobile Co. in Mich —The Francisco-Martin Motor Co., Newport, Mich., has been incorporated with $30,000 capital stock to manufacture automobiles. The incorporators are G. W. Francisco, L. J. Martin and F. B. Scholl. It is stated that the company will erect a factory at Newport.

Internal Gear Drive News Issued.—The Internal Gear Drive Assn., Detroit, Mich., has published the first issue of the Internal Gear Drive News, which is to cover the growth of the internal gear drive idea, as applied to motor trucks throughout the world. It will also tell of the service these axles are giving.

Sterling Wheel Erecting Plant — The Sterling Wheel Co., 245 Oregon Street, Milwaukee, manufacturer of ball-bearing resilient wheels for automobiles and motor trucks, which was recently reorganized and the name changed from T. S. Wheel & Mfg. Co., with W. M. Swift Miller, Milwaukee, as president and general manager, is building a plant at Eighth and Oklahoma Avenues.

Timken Forge Plant Progressing.—Work on the new drop forge plant of the Timken-Detroit Axle Co. is progressing. The new upright boilers are in place and the steel frame work is now being erected. The new worm-drive axle assembly plant recently finished is now in operation with a full new equipment of machinery. This plant gives the worm-drive axle plant about 100,000 additional square feet of floor space.

Crown Fender Plant in Ypsilanti—The Common Council of Ypsilanti, Mich., has made it possible for a new industry to locate there with the prospect of employing from 500 to 2500 men when fully running. This is the newly organized Michigan Crown Fender Co., which will manufacture fenders for automobiles and other metal stampings. The city purchased a site and will erect a building 400 by 80 ft. for the concern, which later expects to purchase the property. It is stated that the Ford company will use a large part of the output.

Haynes Additions to Cost $250,000.—Additions to the plant of the Haynes Automobile Co., Kokomo, Ind., will cost $250,000. A large office building is now being completed and will stand outside the old plant, the offices of which will be made a part of the space given over to the manufacture. In addition there will be erected at once three new steel and concrete structures alongside of the present factory. There will be new painting, testing, power plants and also a new building for the storage of rough and finished materials and cars.

The Week in the Industry

Bamford Detroiter Production Manager—W. R. Bamford has been appointed production manager of the Detroiter Motor Car Co., Detroit.

Thorpe Truck-Tire Manager — G. L. Thorpe has been appointed manager of the truck-tire department of the Hood Tire Co., St. Louis, Mo.

Shaw Heads Dallas Co.—The Dallas Qualityre Co., Dallas, Tex., has been organized in Dallas with Lamonte Daniels president and L. L. Shaw vice-president. Mr. Shaw is in charge.

Conrad Sphinx Sales Manager—H. W. Conrad, formerly sales manager of the Pullman Motor Car Co., York, Pa., has been appointed sales manager of the Sphinx Motor Car Co., York.

Hitchcock Truck Dept. Head.—A. S. Hitchcock has been appointed truck department manager of the Cadillac Auto Co. of R. I., Providence. This concern handles the General Motors trucks.

Dealer

New Supply House for Ala.—The Auto Supply Co., J. R. Jones, manager, has been formed in Dothan, Ala., to handle a general line of accessories, etc.

Swan Carbureter Agency—The Los Angeles Ignition Works, which recently moved into a new building at 1007-1011 Main Street, Los Angeles, Cal., have secured the agency for the Swan carbureter for Orange and Los Angeles counties. The Swan carbureter is a San Francisco product which is working into great favor on the Pacific Coast.

Packard at Manchester.—Alvan T. Fuller, who has the agency for the Packard line at Boston, Mass., Portland, Me., and Providence, R. I., has added Manchester, N. H., to his list, having opened an agency there last week on Merrimac Street. F. B. Freeman has been placed in charge of the Manchester agency. He had the Stutz agency in Boston until a few weeks ago.

Cleveland Agencies Moving—The H. F. Neighbors Co., Cleveland agent for the Dodge, has secured a site at the corner of Chester Avenue and Twenty-second Street, upon which two structures will be erected. One has been started and the other will be started soon. The structure under way will have 18,000 sq. ft. of floor space and the other structure will contain 22,000 sq. ft. The Buick agency will be moved off of Euclid Avenue next year.

Motor Men in New Roles

Nachtrib Goes to Dallas.—E. R. Nachtrib, formerly factory representative of the Willys Overland Co., Toledo, Ohio, has been appointed assistant to Manager Taxis of the Dallas, Tex., branch.

Smith Edison's Detroit Office Mgr.—Bertram Smith, well known in the storage battery business for the past fifteen years, has been appointed manager of the Detroit office of the Edison Storage Battery Co.

Bryant Standard Welding Factory Manager—R. S. Bryant, for many years consulting engineer of the Standard Welding Co., Cleveland, Ohio, has been appointed factory manager in charge of all manufacturing.

Jones Sun Branch Mgr.—S. A. Jones has been appointed western branch manager for the Sun Motor Co. and is expected in Dallas next week to close arrangements for the opening of a branch house in this city.

Has Entire State Agency.—J. W. Gogarn, who was recently given the agency for the Mitchell line at New Haven, Conn., has been made agent for the entire State as a distributor for the Carl H. Page Motors Co. of New York.

Parrish Denby Sales Manager — The Denby Missouri Truck Co., 405 North Twenty-second Street, St. Louis, Mo., has been appointed distributer of the Denby truck in the St. Louis district. G. Y. Parrish will be sales manager of the new concern.

Gaston Cadillac Rep.—George Gaston, formerly salesman for the Munger Automobile Co., the Dallas Cadillac agency, is now district representative for the Cadillac Motor Car Co. His territory embraces Texas, Missouri, Kansas, Oklahoma, Arkansas and Louisiana.

Thackston Dallas Hupp Mgr.—E. O. Thackston will be general manager of the Dallas Hupmobile Co., Dallas, Tex., with F. N. Abbott as territorial manager. Hupmobiles will be handled exclusively in sixty-five counties of North, East and West Texas. This organization will be in the way of a factory branch. A new building at 2210-2212 Commerce Street is being erected for the company and this will be the salesrooms and parts department.

Recent King Changes.—B. R. Hayden has joined the King Motor Co. of Chicago as sales manager. G. W. Franklin has resigned from the Wetmore-Quinn Co. to join the A. A. Crumley Co., Michigan State distributor for the King car, as sales manager. Mr. Franklin was formerly sales manager for the Regal Motor Car Co. Bert Collins, late of the Studebaker Corp., has joined the King Motor Car Company as a special factory salesman. His position is a new one created for the purpose of making jumps to certain points where co-operation with dealers, old or prospective, is needed. He will have no particular territory. A. J. Smith has returned to the automobile business and is now sales manager for the Reliance Automobile Co., northern California, distributor for the King eight.

Dealer

To Distribute Danver Oiler—The Danver Sales Co., 17 Custom House Street, Providence, R. I., will distribute the Danver auxiliary oiler for Ford cars.

Pasadena Savage Tire Moves — The Savage Tire Co.'s Pasadena branch, under the managership of Frank Verbeck, former racing driver, is located in its new quarters, 43-45 East Union Street.

Recent N. Y. Trade Changes.—The Akron Tire Co. has leased a store at 1789 Broadway, New York City, and the Lyons-Atlas Co. service station at 1876 Broadway has been leased to the Lexington Motor Car Co.

Moves to New Quarters.—The Henshaw Motor Car Co. of Boston, agent for Dodge Bros. cars, has leased the building 915-921 Boylston Street that was built especially for the E. R. Thomas Co. when it opened a branch at Boston with Mr. Henshaw in charge. It was later occupied by the Garford agents, but for some months has been idle. Mr. Henshaw will utilize the entire building, but he will also continue his service station at the Motor Mart.

Indianapolis Republic Tire Distributor—The Varney Electric Supply Co. Indianapolis, Ind., has been appointed distributor for the Republic tire. The territory controlled by the Varney company includes all of Indiana (with the exception of a few counties in the northeastern part of the State), southern Illinois and the western portions of Kentucky and Tennessee. S. C. Walker, secretary and treasurer, has complete charge of tire sales and has eight district men under his jurisdiction.

The Automobile

Die Casting vs. Machining

For Unstressed Parts Process Offers Economical Avoidance of Costly Shop Work in Car Manufacture

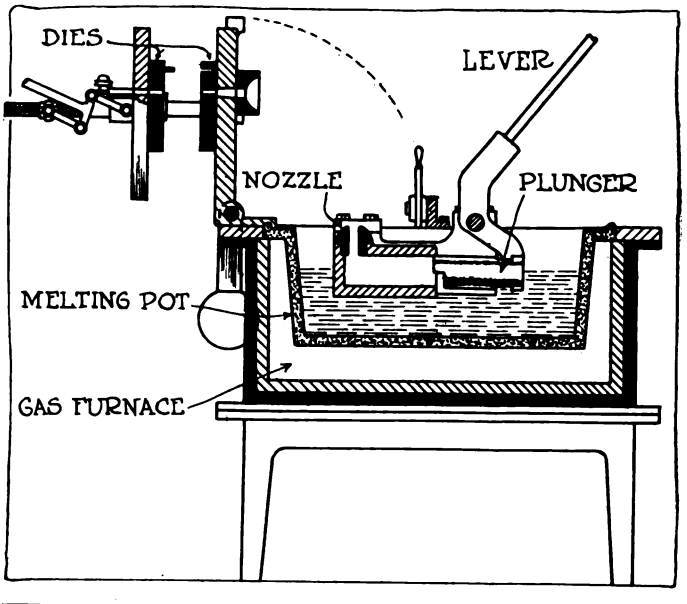
By J. Edward Schipper

PERHAPS some day the gears in the transmission system, the differential gears and a thousand and one other parts that are now the product of laborious drop forging and machine work will be die cast. It is certain that were this ever possible the cost of manufacturing automobiles would drop so far as compared to present-day practice that even the big price cuts of the last year or two would look small to the possibilities which would then be reached. To-day we cannot go this far or even nearly so great a distance in the direction of simplicity in manufacture, and what to-morrow will bring forth in the field it is only possible to conjecture; but with the improvements in materials and with the discovery of material which would act as dies for molten steels this condition may at some time be reached.

While the dream of die-cast steel may be far removed and vague, the die-cast part itself is becoming more and more an important factor in the construction of the up-to-date car. According to present-day practice, die castings are limited to parts which need not have material of more than 18,000 lb. per sq. in. in tensile strength, except where aluminum can be used. This bein a fact, the uses about the car to which this class of manufactured part may be put, are limited to those which do not carry the heavier stresses, either static or dynamic. Thus it is found that for housings and simple parts which have but little actual work to do but which, at the same time, were it not for the process, would require an amount of machine work, die castings are often the most economical to use.

Limits of Strength

With the limitations of strength and the limitations of material which, at the present time, can be used for this method of casting in permanent molds under pressure it is a matter of course that one other limitation should follow; this is the restriction on the uses to which the die-cast product can be put. These restrictions are clearly brought out in considering the parts which have been successfully made from die castings and those which, on the other hand, have failed. In other words, there is a well-defined field in which die castings can be used to advantage in the present



The above is a diagrammatic illustration of the die casting machine patented by H. H. Doehler in 1907. As will be noted there is a cast-iron pot which holds approximately 500 lb. of lead. This melting pot is fitted into the gas furnace and the pump cylinder is contained within the melting pot, being completely immersed by the molten alloy. Into this cylinder there operates a plunger controlled by a lever. This plunger which is attached to the controlling arm is withdrawn by raising the lever to its utmost height and this allows the molten liquid to flow into the cylinder. The downward movement of the lever forces the piston into the cylinder cutting off the flow of the molten metal into it and forcing the molten metal through the nozzle. The die which is divided into two parts fits firmly over the nozzle and can be swung backward on its frame, through an angle of 90 deg. There is a shut-off for the metal operated by a lever and as soon as the main lever completes a downward stroke, the cutter is operated preventing the molten metal from running backward into the pot.

minum die castings have proven satisfac-
the leading automobile manufacturers

h consisted of tin, antimony and copper, or
was a straight bronze, there are many of the
itt metals which are of admirable use for bear-
come to be practice with a great many concerns
omobile business to die cast the babbitt, or nickel-
some have named it, into a backing of bronze.
worked out so well that many are predicting uni-
doption for the die-cast babbitt-lined bronze bearing
tomobile use. Others still favor the solid babbitt bear-

he Doehler Die Casting Co., in casting the babbitt metals
o bronze shells for bearing use, states that the use of the
hinnest possible lining of babbitt produces the most durable
bearing because the softer metal is then more solidly backed with the result that it seems to endure the tendency toward wear to a much better degree than were the babbitt so thick that it would be practically in the same condition as regards the bearing surface as if the entire bearing were of solid babbitt. In manufacture this concern paints the backs of the bearings with graphite paint so that the tinning does not take hold of the coated surface, but is confined only to the part which it is desired to line. The result is that when the lining is cast in place it is only found on the interior surface of the bearing housing and can be readily cleaned off without any loss of time.

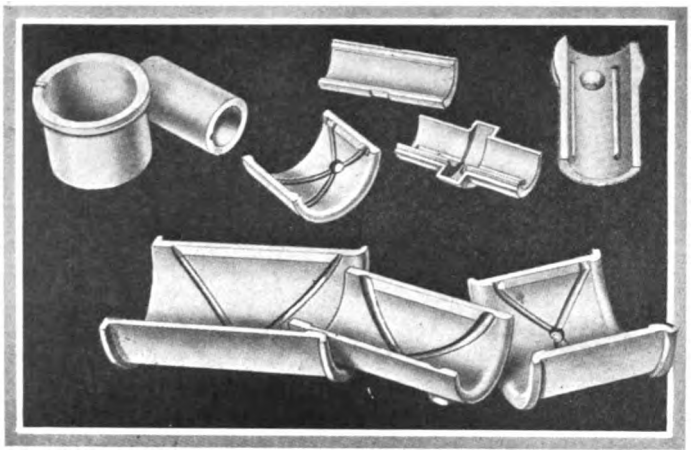
The same alloys that are used for die-cast bearings are sometimes used for parts which are amenable to the die-casting process, but which at the same time must be immune from corrosion. Such parts, where high tensile strength is not required, can be very satisfactorily made from the tin-base alloys, and, as stated previously, there are many motor manufacturers and also die-casting manufacturers who believe that for water-pump housings and similar uses the tin base would perhaps be more satisfactory.

Alloys with a lead base are die cast in such a wide variety of fields that it is impossible in the space available here to more than scratch the surface. All lead alloys can be die cast successfully. The alloys contain from 60 per cent to almost 90 per cent lead and are alloyed with tin, antimony, etc. The so-called type metals fall under this class, and a good example of a die casting for this kind of metal is in the common linotype machine. Here, when the line is complete and the mold is in position a plunger pump forces the molten metal into the mold and casts the line of type under pressure.

One of the greatest strides in the art of die casting has been in the successful handling of aluminum for this class of work. At the present time the methods of carrying on this work as far as their intimate details are concerned are the subject of much secrecy on the part of those who own the patents. Some of the illustrations, however, on these pages show parts which are now familiar to all those in touch with this phase of engineering in the automobile industry. Here are parts which are now die cast commercially from aluminum which a year or so ago were thought to be impossible as far as actual commercial practice is concerned. Practically every day improvements are being made with this process of manufacture, but it is in aluminum that the biggest stride has been made both in this country and abroad during the last few years. As a material for such parts as spark and throttle levers and the little spark and throttle control sectors at the bottom of the control rods which must have teeth cut in them if otherwise made, and numerous other parts of similar complication as far as machine work is concerned aluminum has been used with great success. Owing to the cost of the alloy, however, and the fact that the high melting point of the material makes it very hard on dies, there is considerable competition to be met, and those in the field have had to demonstrate very clearly that the aluminum die casting has resulted in a saving to the manufacturer for certain parts.

Materials Must Be Right

It must be remembered that with die castings a choic
material is most important. A good example of this is
in connection with the suggestion to use the tin-base a
place of the zinc. During the past two years the p



Die cast bearings of various types made by the H. H. Franklin Mfg. Co.

state of the art, and in this range of possibilities it would pay the manufacturer to investigate and determine if many of the small parts which now not only occupy the time of his employees in machine work, but which also occupy floor space for machinery which could be with better economy turned toward other uses. It is necessary to determine whether a die casting would or would not be better than another part made perhaps by forging or stamping and then finished by an amount of machine work determined by the number and directions of holes to be drilled, for instance, or the milling, grinding and other machine work necessary.

Good examples of where die castings have been employed to advantage for automobile use will give an idea of what engineers in general have come to believe is the proper field of work for this type of part. Electrical apparatus, which is necessarily not under great demands as regards strength, but which on the other hand must have parts made within limitations of perhaps 0.001 in. is an instance. We find it quite common in this field for the magneto housings, switch locks, switch handles, base and cover plates to be made of die castings. With the starting units and generators it is the same. In pumps for housings and bodies, ball-bearing cages, speedometers, ring nuts, spark and throttle levers and steering-wheel gears, the die casting has been believed by many to be far better economically than any other class of part. On the other hand, die castings which have been used in parts which have failed through either direct stress or corrosion have shown that for uses wherein either of these destructive agents may exert its influence, they may be bad practice.

Automobile Industry Demands Castings

That the demand for the die casting in the automobile industry is a strong one, and that in spite of the fact that the die casting is limited at the present time as regards its strength, there is a well-defined field for it, is clearly brought out by the fact that one of the largest companies in the die-casting business, the Doehler Die Casting Co. of Brooklyn, N. Y., is at the present time casting 1,000,000 lb. per month, probably 95 per cent of which goes to different automobile manufacturers.

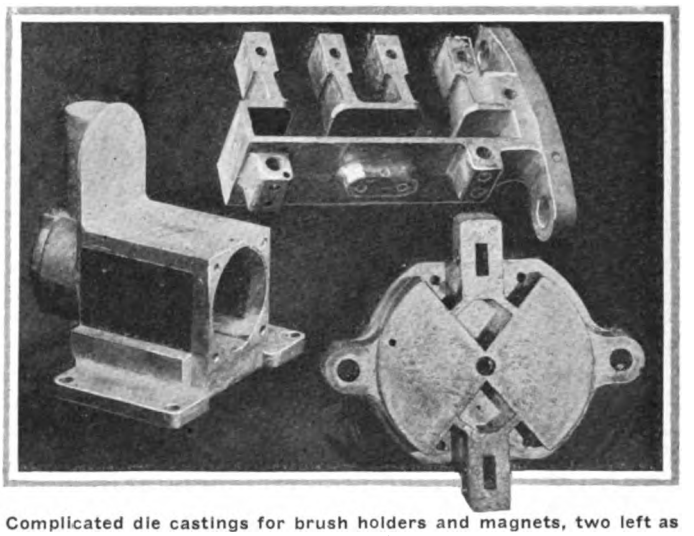
In the automobile industry at the present time four classes of die castings, each with a well-defined field, are in use. They may be classified according to their basis, or, in other words, according to the metal which forms the major part of the alloy. These bases are zinc, tin, lead and aluminum.

With these four classes in mind and with the field for each pointed out, some of the features to be considered in the selection of a proper metal for a die casting will be brought out. It may be said at the start that although probably 85 per cent of the die castings made in the world are with a zinc base, it is in this very class that some of the failures which have been noted in the automobile industry have been reported. A good example of this is in pump-jacket practice.

It is a fact zinc base castings are corroded by aqueous liquids. That this is not alone confined to liquids which have water as a base is shown by the fact that even gasoline which theoretically should not have the slightest influence on metal will cause a certain amount of corrosion due to the impurities—mainly sulphuric acid—which it contains in its commercial state. These castings are often plated with nickel, copper and brass, and in such a case will resist a much longer time the inroads of moisture. It may be buffed to take a beautiful polish, but this does not endure for any appreciable time due to the moisture which is contained in the atmosphere. If a permanent polish is desired it must be electro-plated with nickel or some other alloy.

Zinc Base Alloys Corrode

In spite of the fact that these zinc base alloys corrode they have been used for pump jackets on account of their cheapness and the fact that they can be made accurately in that way. The result is that while the pump housing may last four or five years, sooner or later it is bound to give way and fail. There are those who condemn this practice, stating that the material should not be used for this purpose, but on the other hand a tin base alloy hardened with copper and antimony would be proper. On account of the high price of tin and the other ingredients this metal has been in many cases of prohibitive cost and the zinc base alloy substituted. It is but fair to state, however, that the zinc base alloy can be made of such thickness and can be so thoroughly bushed with brass at vital points that it will last over a period of many years despite the positive corrosion. At the end of this time the cost of renewal of the parts is so small that aside from the temporary inconvenience it can be practically neglected. However, there is no reason why a zinc alloy die-cast pump body should not last the life of a car, if properly designed.



Complicated die castings for brush holders and magnets, two left as made by Doehler company and right by Veeder Mfg. Co.

Where the zinc die casting comes into its field is in such parts as magneto housings, etc., where they are not only not in contact with moisture but are even guarded against the inroads of air by a coating of black copper sulphide.

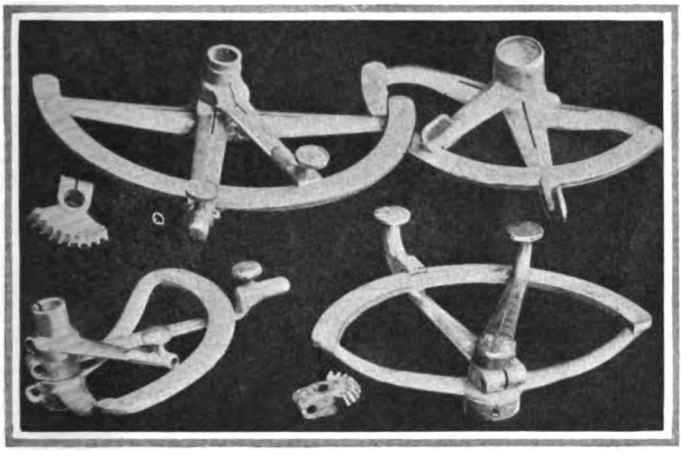
It must be remembered in assembling parts made of die castings that they should fit and not be drawn together by force, thereby exposing parts of these materials to greater strains than they are able to endure. The die casting is not as strong as the yellow brasses and bronzes, and great care has to be used and very often special designing becomes necessary, such as reinforcing and general strengthening to equalize the natural inferior strength of the zinc-base die-

cast alloy. In other words it is not possible for the engineering department of an automobile concern to take the drawings for a part which has been made of brass or bronze and have that same part made in a die casting in such instances where the brass or bronze parts were stressed up to some point near the ultimate.

Strength Equal to Cast Iron

The content of the zinc base alloy generally runs from 70 to 90 per cent zinc, 0 to 20 per cent tin with varying contents of copper, aluminum, antimony and lead. A typical example of an alloy for a zinc-base die casting would be about 85 per cent zinc, 9 of tin, 5 of copper and 2 aluminum. When an alloy of this kind is die cast to a proper design, in the expression of one concern in the business, "It cannot be broken except with a sledge and when cast properly of suitable alloy is about the strength of cast iron." It requires more time and more expensive alloy to make die castings as they should be made than it does to turn them out rapidly from cheap alloy.

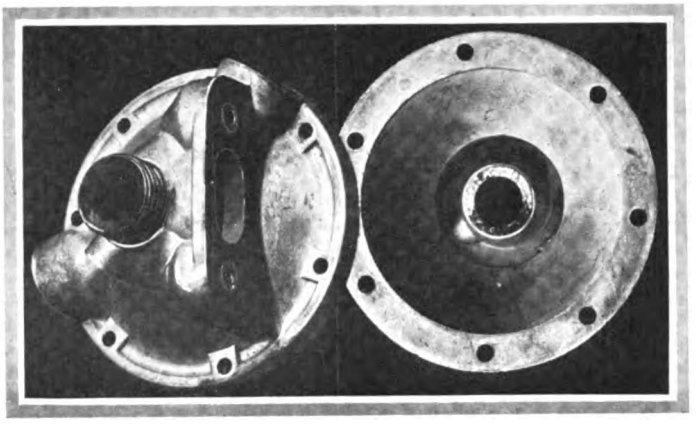
Turning to the second class of die castings, those which have tin as a base and which are alloyed with varying proportions of lead, copper, antimony and zinc, it is found that this includes some of the most useful of the bearing metals. While the term babbitt no longer means the one definite alloy which in definite proportions was laid out by Isaac



Control quadrants of aluminum die castings have proven satisfactory to many of the leading automobile manufacturers

Babbitt and which consisted of tin, antimony and copper, or in other words, was a straight bronze, there are many of the so-called babbitt metals which are of admirable use for bearings. It has come to be practice with a great many concerns in the automobile business to die cast the babbitt, or nickel-babbitt as some have named it, into a backing of bronze. This has worked out so well that many are predicting universal adoption for the die-cast babbitt-lined bronze bearing for automobile use. Others still favor the solid babbitt bearing.

The Doehler Die Casting Co., in casting the babbitt metals into bronze shells for bearing use, states that the use of the thinnest possible lining of babbitt produces the most durable bearing because the softer metal is then more solidly backed with the result that it seems to endure the tendency toward wear to a much better degree than were the babbitt so thick that it would be practically in the same condition as regards the bearing surface as if the entire bearing were of solid babbitt. In manufacture this concern paints the backs of the bearings with graphite paint so that the tinning does not take hold of the coated surface, but is confined only to the part which it is desired to line. The result is that when the lining is cast in place it is only found on the interior surface of the bearing housing and can be readily cleaned off without any loss of time.



There is no reason why zinc alloy die cast pump bodies should not last the life of a car if properly designed

The same alloys that are used for die-cast bearings are sometimes used for parts which are amenable to the die-casting process, but which at the same time must be immune from corrosion. Such parts, where high tensile strength is not required, can be very satisfactorily made from the tin-base alloys, and, as stated previously, there are many motor manufacturers and also die-casting manufacturers who believe that for water-pump housings and similar uses the tin base would perhaps be more satisfactory.

Alloys with a lead base are die cast in such a wide variety of fields that it is impossible in the space available here to more than scratch the surface. All lead alloys can be die cast successfully. The alloys contain from 60 per cent to almost 90 per cent lead and are alloyed with tin, antimony, etc. The so-called type metals fall under this class, and a good example of a die casting for this kind of metal is in the common linotype machine. Here, when the line is complete and the mold is in position a plunger pump forces the molten metal into the mold and casts the line of type under pressure.

One of the greatest strides in the art of die casting has been in the successful handling of aluminum for this class of work. At the present time the methods of carrying on this work as far as their intimate details are concerned are the subject of much secrecy on the part of those who own the patents. Some of the illustrations, however, on these pages show parts which are now familiar to all those in touch with this phase of engineering in the automobile industry. Here are parts which are now die cast commercially from aluminum which a year or so ago were thought to be impossible as far as actual commercial practice is concerned. Practically every day improvements are being made with this process of manufacture, but it is in aluminum that the biggest stride has been made both in this country and abroad during the last few years. As a material for such parts as spark and throttle levers and the little spark and throttle control sectors at the bottom of the control rods which must have teeth cut in them if otherwise made, and numerous other parts of similar complication as far as machine work is concerned aluminum has been used with great success. Owing to the cost of the alloy, however, and the fact that the high melting point of the material makes it very hard on dies, there is considerable competition to be met, and those in the field have had to demonstrate very clearly that the aluminum die casting has resulted in a saving to the manufacturer for certain parts.

Materials Must Be Right

It must be remembered that with die castings a choice of material is most important. A good example of this is given in connection with the suggestion to use the tin-base alloy in place of the zinc. During the past two years the price of

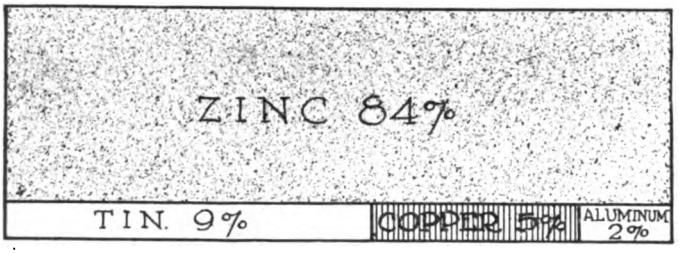


Diagram showing the composition of a zinc alloy frequently used for die casting work. Castings of this material have approximately the strength of cast iron

tin has fluctuated between 0.30 and 0.50 cent, with the price during the past 2 years something over 0.40. It can easily be seen that with this wide variation in price several thousand castings weighing from 1½ to 3½ lb. for each half such as happens in water-pump casings would make a big difference in operating expenses to a large plant.

One of the classes of metals which metallurgists have been trying to die cast for many years is the softer brasses, but so far the high temperature has defied the efforts of the die-casting industry. Brass sand castings are so cheap as compared to the present-day permanent mold castings that most parts are cheaper cast by the old method than the new. Other points given against brass casting are the great shrinkage, destruction of the molds, quick-heat conductivity of the die and slowness of manufacture.

A word should be said regarding one of the characteristics of die-cast metals which renders them of greater strength and uniformity than the plain sand-cast products. This is the closer grain of the material due to the pressure under which the metal is cast. Micro-photographs of die castings as compared to straight sand castings bring out the fact that the grain of the die-cast material is much finer in structure than the coarse grain sand casting. There have been brasses and bronzes, and are still in the bearing field, which have been successfully cast in sand in which the microstructure is a fibrous one rather than granular. These special bronzes, however, are probably the last in the list of these metals which it is aimed to die cast as the temperature of fusion is so high that the molds would be able to stand only a small quantity of castings before they cracked and had to be replaced.

It must be remembered that the cost of a die casting bears a definite relationship to the number of castings which can be made from one die. The dies are made of high speed chrome-tungsten steel. It requires the highest class of labor to make them, working carefully with microscopic accuracy, hence between the cost of the material, the cost of the die-cutting tools and the cost of high-priced labor, large numbers of castings must be made from one die to keep the unit cost a minimum.

Renault Aviation Twelve Possibly for Cars

PARIS, Aug. 28—Renault has produced a twelve-cylinder water-cooled aviation motor which, after being thoroughly tested at the national aviation motor laboratory, has been fitted to big capacity aeroplanes. The new motors are being produced in large quantities and supplement the eight-cylinder air-cooled motors in which Renault has specialized for a number of years. Renault's motor, which has a bore and stroke of practically 4 by 6, has its cylinders cast in pairs and mounted on an aluminum crankchamber. A certain amount of inspiration appears to have been obtained from the Mercedes six-cylinder aviation motor, particularly as regards the valve arrangement. There are two valves per cylinder inclined in the head, and operated by a fully inclosed camshaft running down the head of each line of cylinders. The ends of the rockers project through the housing as in the case of the Mercedes. The drive for the camshafts is obtained from the front end of the motor by means of bevel gearing and shaft, the entire mechanism being contained in a neat aluminum housing. The oil pump is placed crosswise at the foot of the two shafts giving camshaft drive.

Two Carbureters Used

Two special Zenith carbureters are used, each one being outside the cylinder group and close up to the crankchamber. In each case the intake valves are on the outside and the piping is reduced to a minimum. Magneto and water pump are carried across the front of the motor. No flywheel is used. Compared with the engines used on aeroplanes up to the present, the Renault production is remarkably clean-cut and accessible. Many modern car engines are not superior in this respect. The only visible moving parts are the valve stems and the ends of the rocker arms.

Although the motor has been specially designed for aeroplane service, an external examination gives the impression that the designer has been more anxious to get the neat, clean-cut appearance demanded by automobile users than to save weight. There has been no attempt at weight paring by the use of copper jackets or even plates for the water-jackets. Many of the fitments are Renault stock design, and although the design is a decided departure from anything produced in this French factory, the origin of the motor is obvious without the name plate.

Break from Rotary Design

The production of this motor is of more than ordinary importance by reason of it being on the part of the French the first important break from the rotary air-cooled aviation motor. This design is fully applicable to automobile service, and there is every reason to believe that the end of the war will see the adaption to automobiles of the Renault twelve-cylinder aviation motor built to smaller dimensions. It is significant too, that in the last army aeroplane contracts no rotary aeroplane motors were ordered and one water-cooled radiating cylinder motor was struck off the lists. Renault and Sunbeam twelve-cylinder water-cooled engines predominated in these contracts.

French to Relax Automobile Restrictions

PARIS, Aug. 28—With the month of September the state of siege will cease to exist in what is known as the interior of France. At the same time the regulations governing the use of automobiles outside the army zone will be considerably simplified. Instead of it being necessary to make application for a separate pass for each journey undertaken, this pass carrying the photograph and signature of every person in the car, it is now possible to obtain a monthly pass available for the whole of the interior of France and for any number of journeys. This pass is issued to either the owner or driver of the car, and must bear that person's portrait and signature. Any persons can be taken as passengers, providing they are provided with official papers proving their identity.

The new regulations do not affect Paris and neighborhood, where it is still necessary to secure a fortnightly pass available only for the Seine and Seine and Oise districts, and stating the number of passengers carried. There is no change either as regards the war district and the big stretch of territory behind the battle line considered to be of military importance.

Stutz Wins First and Second Places at Twin Cities

Double Victory by Cooper and Anderson on New 2-Mile Cement Speedway—Old Rivals Vanquished —Pace 86.35 M.P.H.—Track Rough in Spots

Twin City Speedway Results

Car	Driver	M.P.H.
Stutz	Cooper	86.35
Stutz	Anderson	86.35
Duesenberg	O'Donnell	78.86
Ogren	Alley	77.94
Sebring	Haibe	75.33
Duesenberg	Haupt	74.02
Duesenberg	Chandler	Flagged at sunset
Delage	Oldfield	Flagged "

FORT SNELLING, MINN., Sept. 4—The great Northwest, that territory served by the twin cities, Minneapolis and St. Paul, had its first taste of a home speedway to-day when the new 2-mile cement speedway located midway between the two cities, was opened this afternoon, the christening performance being a 500-mile race for a purse of $50,000, measuring up with the classical Indianapolis event in both distance and prize money.

Under a cloudless sky and with all that the weather-man could provide, 40,000 spectators watched the Stutz team, made up of Earl Cooper and Gilbert Anderson, win the most signal honors that it has been the lot of any entrant to carry off in a speedway event. Not content with taking first place, the Stutz team to-day won positions one and two, thereby carrying off $30,000 of the total prize money.

Relentless Warfare

From the drop of the flag in the flying start the two Stutz cars began a relentless warfare against De Palma and Resta, who had vanquished them at two other 500-mile events, Indianapolis and Chicago. But Peugeot steel and Mercedes design were not equal to Stutz stamina to-day, and the veterans Cooper and Anderson wore down every rival in the first 100 miles and then made a most interesting team race for the remaining 400 miles and finished in one of the closest finishes ever seen on a speedway, Cooper leading by less than ¼ sec. and little more than half the length of the car.

The pace was 86.35 m.p.h., slower than the pace of 89.84 which De Palma set at Indianapolis last May and considerably under the pace of 97.58 set by Resta when he carried off first honors at the Chicago 500-mile event on the new board track in June. To-day's pace would have been considerably faster if the Stutz twins had had any cars to push them. During the first 100 miles the pace was over 90 m.p.h., but that immediately wore out Resta's Peugeot and the Stutz team dropped nearly 3 m.p.h. in the average from that point.

Cement Track Rough

The new cement track was rough. It had been built too hurriedly. The pouring of cement was started July 9. Constant rains held the work back and later rains delayed it. The fillings had not time enough to settle before the cement surface was laid. There could be only one result, undulations in the surface and high spots where the expansion strips are placed between the blocks of cement. For days before the start of the race stone chippers with chisels in hand were squatted around the track busily engaged in chipping off the high spots that threw all four wheels of the cars into the air. Time was lacking and when the race was staged many high spots remained and the cars suffered severely.

Downs Erstwhile Victors

The Stutz alone seemed able to withstand the vibration of the track and yet maintain high speeds. But it was Stutz day. Stutz was seeking revenge for past failures to win the coveted honor of a 500-mile classic since three years ago when the Stutz made its debut as a car on the Hoosier speedway and immortalized itself in racing fame by carrying off fourth place as a newcomer. Nineteen hundred and thirteen saw Stutz win third; in 1914 it was fourth, leading all other American cars; this year it was third and fourth again, being beaten only by foreign machines; at the Chicago speedway it finished fourth and sixth; but to-day it was not only first but first and second, and the vanquished were the cars that defeated it in 1913, 1914 and 1915. Peugeot, Mercedes and Delage are names that have been nightmares to American builders of racing cars for the last three years, but their reputations were tarnished to-day and for the first time an American car has won a 500-mile classic since the National victory of 1912.

Resta had the inside position in the first row at the start and he set out to get the lead and hold it. He took it in the first lap and held it in the second and third when Burman in another Peugeot headed him out, with the Stutz team trailing a few lengths back and with De Palma's Mercedes in the group. Burman took the lead in the fourth lap and led for 30 miles until he went out with a broken connecting-rod. He was setting a metal-breaking pace, hotly pursued by Resta, De Palma and the two white Stutz machines, lying back 100 to 200 yd. These four were ½ mile ahead of the others in a couple of laps. At 10 miles Burman started drawing away from the field; at 15 miles he was the length of the homestretch ahead of Resta and the others; lap by lap he continued to gain and by 20 miles he had a gain of nearly a mile. So it continued to 30 miles, then came the end. On the thirty-second mile he limped in, stopped at the pits and withdrew.

In the meantime matters had been changing back of Burman. For 10 miles Resta pursued the fleeing Burman in another Peugeot but at 16 miles Cooper had pushed the Stutz up and had Resta two lengths back of him with Anderson in the other Stutz scarcely four lengths back. De Palma had already stopped to change a plug and was nearly two laps or 4 miles back. Here started the grinding process on Resta. From 20 miles to 60 miles he was held between the two, no jockeying, but Cooper leading a fast clip of over 90 m.p.h. Resta was never over 50 ft. back of him and little further back came Anderson.

Peugeot Takes Lead

At 60 miles Resta crept up and took the lead, the two passing the tape side by side. But Resta's honors were short. He held leadership but a lap before Cooper had wrested it

from him. A lap later and Resta again led by a length. For four circles of the oval he held the lead, all three so close together that a blanket would almost cover them. It was at 74 miles that Anderson showed in front to the cheers of the grandstands and in a lap he was over 150 yd. ahead of Resta with Cooper trailing about 50 yd. back of the Peugeot. Two laps more and Resta was again in front. He held the lead for nearly 10 miles but troubles overtook him, the pace had told on his Peugeot. Trouble symptoms showed up at 94 miles when he lost premiership to the two Stutz cars. Resta slowed up on the backstretch and stopped at the pits. He continued a lap or so more and was out. Just at this crisis Cooper's pace had told on tires and he pulled in to change a left front leaving Anderson away in the lead when he finished the first century in 67:09, a pace of 90.91 m.p.h.

The Duel Ends

Thus ended the race that promised to be the grandest duel of the year between Stutz and Peugeot and Stutz and Mercedes. At this point De Palma was nearly three laps or 6 miles back. He had lost 1.45 in changing a plug and was losing in the pace the leaders had set.

Up to this time the first group of cars had been the magnet of all grandstands, but here the attention turned to the second group of cars led by Mulford in a Duesenberg, who was second at the 100 miles, due to Cooper's tire change. He was only 43 sec. back of Anderson. Close back of him was O'Donnell, his team-mate who was leading De Palma by the narrow margin of 2 sec. The Ogren, driven by Alley, was ½ min. back of O'Donnell. The last group, containing Sebring, Chandler's Duesenberg and Haupt's Duesenberg, were from 15 to 25 min. back of the leaders.

From 100 miles the Stutz team gradually drew away from the field. At 140 miles they were minutes up on O'Donnell who was solid in third place; at 200 miles the lead was 4 min.; at 240 it was 6 min.; at 300 it was 10 min.; at 360 it was 11 min.; at 400 it had jumped to 13; at 440 it was 26 min.; and at 500 miles it was nearly 33 min. It was a steady gain made possible by speed ability.

Back of Alley there were interesting brushes at times for positions. Haupt's Duesenberg and Oldfield's Delage were rivals at times but the constant tire troubles of Oldfield made it impossible to maintain a position that would insure his finishing before sundown, the limit set by the referee in which the race had to be finished. Barney had twenty stops chalked up against him, nine alone being for tire repairs, three for changing spark plugs and the others for fuel, water, changing driver or mechanic and sundry other troubles. He broke a steering knuckle coming into the homestretch and borrowed a steering arm from Burman, making the improvised repair and continuing. It was the only case of a broken steering knuckle in speedway racing for some time.

Mulford, who was a strong contender for third honors from the start, was eliminated at 120 miles when in fifth place due to a broken side member in the frame.

Our First Cement Track

To-day's race was the first one ever run on a cement speedway in this country, although the classical Brooklands in England is a cement speedway that has been in existence for many years. The speedway here is scarcely banked enough for the highest speeds and within a year the track will unquestionably be improved. The banking is not straight as in the Chicago board speedway but a cross section is a parabola, the same as used on the new board speedway being built in New York. Yesterday and during practice it looked as if the new cement course would be too dusty for safety. Sweeping it off each day and washing, as the management did, failed to lay the dust. The final solution was a coating of light oil, 39 gravity, which was readily absorbed into the cement and dried in less than an hour.

Instead of starting the race at 10 o'clock, the proverbial hour for starting 500-mile events, it was delayed until noon, in order to let the business men attend. This caused several entrants to ask if it would be called off at sunset, not a few entrants realizing that it meant fast pace to finish all cars by 6.44, the official sundown. A compromise was effected in which those cars still running at sundown were given additional mileage on a pro rata basis, according to the speed they had averaged and in this way two cars, Chandler's and Oldfield's running at the finish, were given seventh and eighth position. Twelve cash prizes were awarded but only eight of these captured, the remaining four going back to the speedway treasury.

Early Eliminations

To-day's race is the only one of the now classical 500-mile events in which every car that was eliminated fell out before the race was one-half over. Fourteen cars started the race, six finished the 500 miles, two were running when it was called off and six had withdrawn. They went out at 30, 70, 100, 120 and 180 miles. Never before have cars gone out so early in a contest; generally several drop out early, but invariably some hold out until near the end. To-day's race was really only a 100-mile event so far as the contest element was concerned.

Little Tire Trouble at Twin Cities

Right Rear Tire Main Sufferer, Due to Outside of Track Being Rougher —Unusual Mechanical Troubles Show Effect of Rough Track

FORT SNELLING, MINN., Sept. 4—There was not so much tire wear on the 500-mile race on the speedway here to-day as was anticipated, a fact largely explained by the relatively slow speed of 86.35 m.p.h., a lower pace than set on the Indianapolis brick track, and 11 m.p.h. slower than the Chicago board speedway. The day was hot and more tire troubles were expected. As at other speedways it was the outside right rear tire that suffered most, due in this case to the outer part of the track being rougher than the central strip on which the majority of the cars drove and also due to the fact that much of the car weight is thrown on this wheel.

Of the fourteen cars to start to-day six finished the 500 miles; two were running but flagged off at sunset; and six had dropped out due to mechanical troubles. Of the six cars that finished the race eighteen tires were changed, an average of three per car, or an average tire life of over 170 miles. Silvertown cords were used on the winning Stutzes.

Tire destruction wore out seven on the right rear wheels; five on the left rears; five on the right fronts; and only one on the left front. A few treads were thrown.

Cooper changed six on his Stutz, two right rears, a left rear, two right fronts and a left front; whereas Anderson, his running mate, changed but three, two right rears and a right front. As these two cars ran practically neck and neck for 500 miles it is difficult to explain just why one should have double the tire trouble of the other. Little differences in car balance, in driving and in many other matters could easily make such a difference.

Mechanical Troubles

Mechanical troubles were more or less unusual, demonstrating that rough tracks are still able to do very material damage to cars when traveling at high speeds, and in this respect the percentage of mechanical troubles was greater than at the Indianapolis or Chicago 500-mile races. Several of these troubles were due primarily to the track, whereas others were not. Mulford's Duesenberg broke a side member of a frame at 120 miles, the channel section breaking nearly in two. More serious was the breaking of a steering knuckle on Barney Oldfield's Delage when coming down the homestretch. Fortunately the car was controlled, a new steering part was borrowed from Burman's Peugeot and the race completed. Still another break apparently due to the track was on O'Donnell's Duesenberg which broke one of its diagonal radius rods when the race was three-quarters over. The mechanic held the rod from trailing on the ground for the last 100 miles. All of these eliminations were more or less directly due to vibration.

Crystallization Appears

Several other cars had mechanical troubles that came perhaps from parts crystallizing or other causes. Burman's Peugeot was the first out at 32 miles, a connecting-rod breaking. Such parts are generally made as light as possible and fatigue due to excessively high speeds is sure to show itself sooner or later. The case was perhaps similar to the part of De Palma's Mercedes that gave way in the last lap of the Indianapolis race this year. Reciprocating parts are being designed with the minimum weight for high-speed work and the breaks indicate that renewals are needed at reasonably frequent intervals.

Resta had a simple trouble, a screw cap coming off the base of the pump case of the Peugeot, making it impossible for him to pump oil. It may or may not have been due to the excessive vibration.

De Palma's troubles began 10 min. after the start when he changed a spark plug; later he made some carbureter adjustments, changed another plug and finally withdrew, due to oil getting into the magneto through the shaft coupling. The oil reached the distributer box and at high speeds missing occurred, but at low speeds the mechanism worked satisfactorily. He withdrew at 190 miles.

In addition to breaking a steering knuckle Oldfield stopped three times to change spark plugs and finished the race with all of the shock absorbers out of commission.

Good Pit Work

Particularly good pit work was done by the leading cars and had Resta and Burman with their Peugeots continued in the race to the finish there would unquestionably have been some quick pit work among the leaders. Cooper made but five stops, a total of 3.5 min. for his six tire changes and three fillings of gasoline. His first right rear was changed after 2 hr. of racing and the second right rear after 2 hr. more of running. The pace was faster the first 2 hr., being slightly over 90 m.p.h. for the first century until Resta was disposed of, Burman was out and De Palma had ceased to be a factor.

What was true of tire wear with Cooper was also true of Anderson on the right rear where he changed one after 70 min. running, another on the same wheel after 65 min. more of speed, but no more to the finish.

O'Donnell made but two tire changes, both after the race had been on for 2 hr., changing both rears as a precaution. From that until the finish he had no more changes.

De Palma changed both rears after 1.5 hr. of racing. Comparing the tire changes of all leading speed cars it is seen that about 2 hr. of fast driving was the life of the right rear tires at the middle of the day when the track was hottest and the pace fastest. After this time the pace dropped, the track cooled slightly and the drivers had fewer cars on the oval to overtake, and were better able to drive a straight course.

The total length of time spent by each car at the pits follows:

DRIVER	CAR	NO. STOPS	MIN.
Cooper	Stutz	five	3.5
Anderson	Stutz	four	4.5
O'Donnell	Duesenberg	three	4.5
Halbe	Sebring	four	4.5
Alley	Ogren	seven	15
Haupt	Duesenberg	seven	16
Chandler	Duesenberg	fourteen	25
Oldfield	Delage	twenty	72
De Palma	Mercedes	seven	24

Burman did not make a stop before he went out; the same applies to Resta and Mulford.

Nothing more could have been desired in the performance of the two Stutz cars. They ran the 500 miles without the hoods being raised, the only stops being for fuel and tire changes. The cars were both alike, being the sixteen-valve design used first at the Indianapolis race this year and later at the Chicago speedway and more recently at Elgin road races where they won first and second positions in both contests.

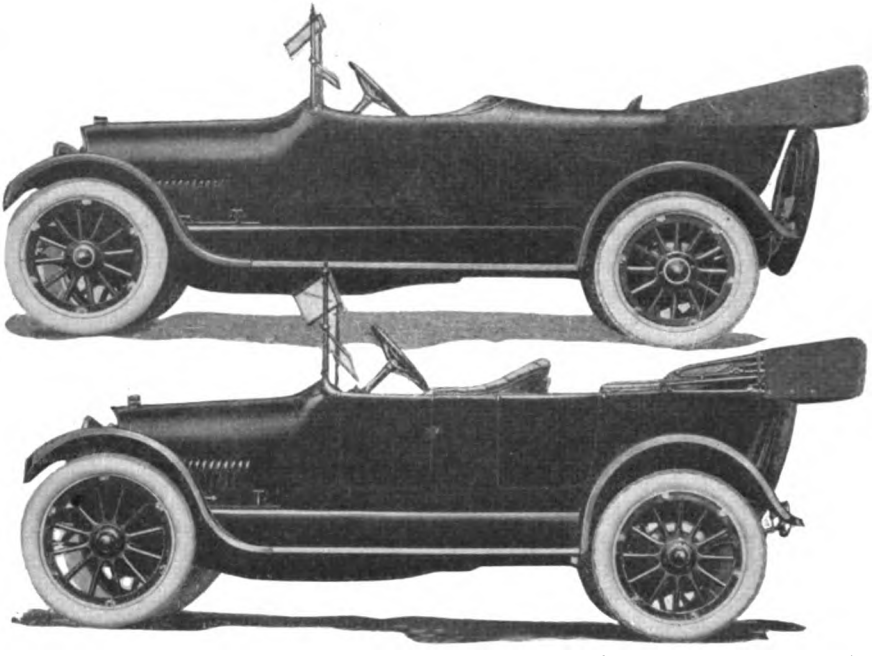
Among other details of equipment, Cooper, Anderson and O'Donnell used Oilzum for lubrication. All cars in the race used Motometers.

Many Unique Points in Reo Design

Accessibility a Marked Feature—Reo Four and Six Show Few Chassis Changes But Have Improved Bodies for 1916—Prices Substantially Lower

FOR 1916 the Reo Motor Car Co., Lansing, Mich., will produce two models, a four and a six, the general design being much the same for the two chassis. Naturally the six, being the more expensive car, has some refinements which the four does not possess, so it is proposed to describe the six-cylinder in detail and to call attention is passing to the differences between the six and the four.

There have been no great changes in the chassis, but the bodies have been improved in line and in comfort, especially that of the six-cylinder which now has divided front seats and a thoroughly handsome outline. Prices have been lowered considerably, the four now costing $875 as against $1,050 last year, and the six $1,250 as against $1,385, with five and seven-passenger touring bodies respectively.

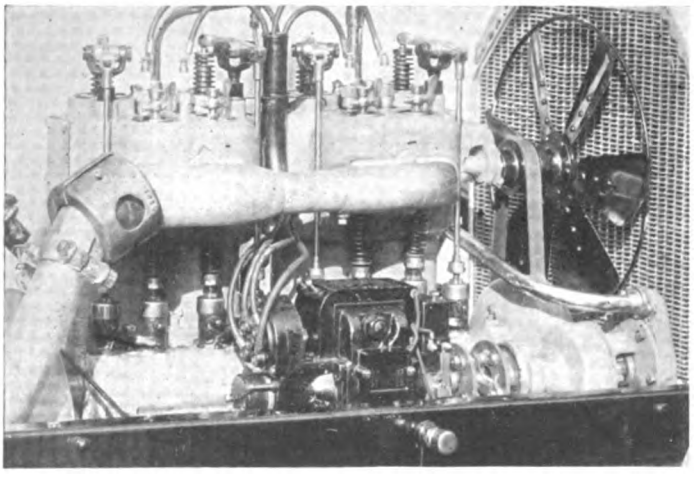


The new Reo body styles. Above—Observe the rolled top edge to the panel on the six which gives a particularly smart appearance. Below—The new four

Starter Is Simplified

In mechanical detail the most striking alteration is in the arrangement of the starter drive, and this may therefore be dealt with first of all. The Reo company is an upholder of the separate gearbox with amidship location, and this gives ample room between the engine and the gear. Advantage is taken of the space thus provided to mount the starting motor clear of either engine or gearset, cranking through the clutch shaft instead of by means of the flywheel, and there is a highly ingenious ratchet arrangement whereby every portion of the drive is released as soon as the gasoline motor has commenced to run; there is no free wheel clutch, no part whatever in motion outside of those which would be moving without any starting equipment.

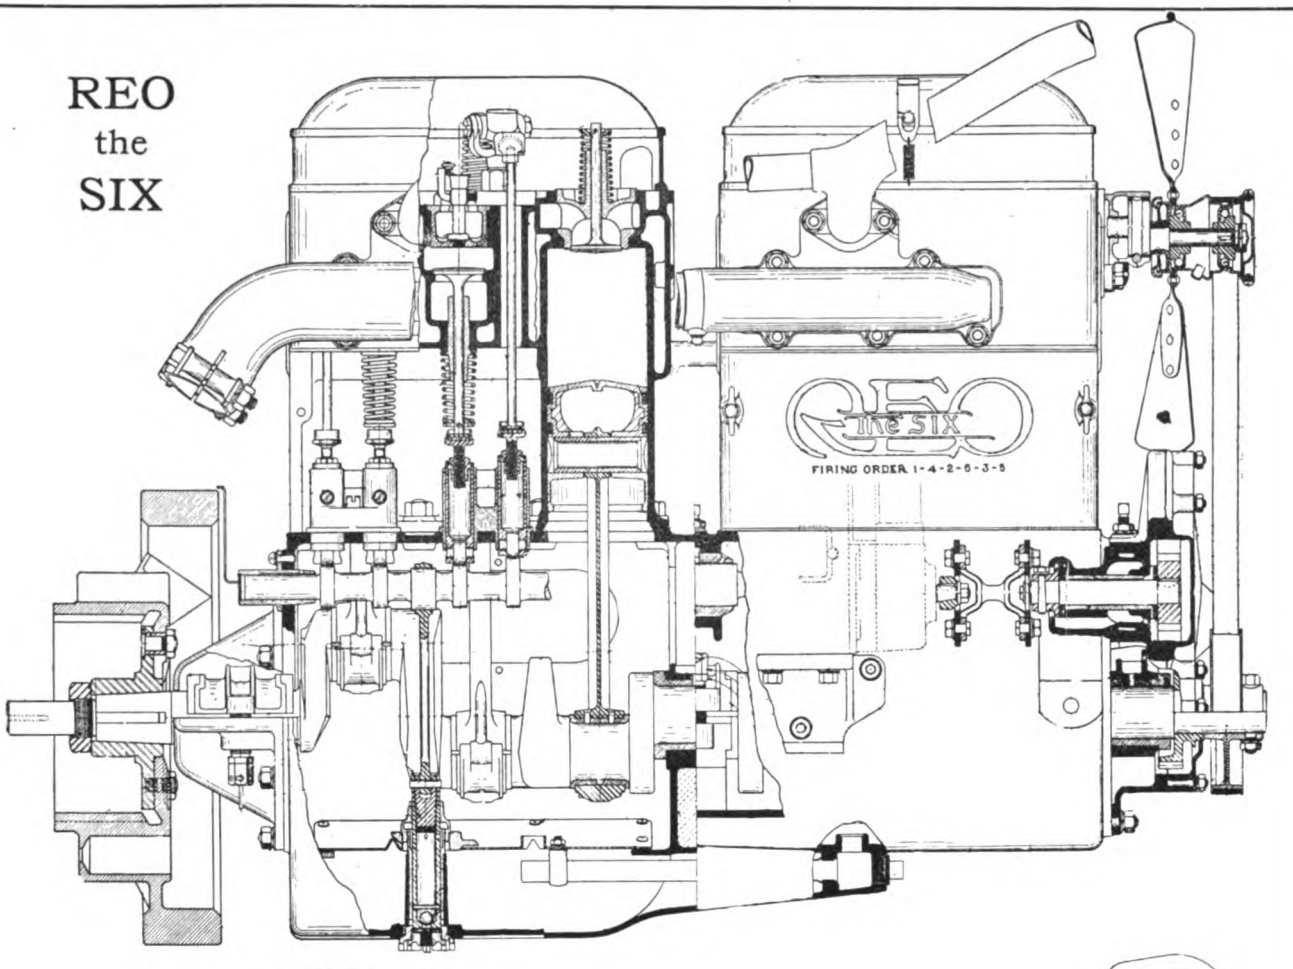
In the 1915 design the same location was used for the starting motor, but the clutch-shaft carried a worm wheel, and the cranking motor had a worm which was in permanent engagement with the worm wheel. This worm wheel was not keyed to the clutch-shaft, but could be locked to it by a ratchet pawl operating in the same way as the ratchet used on the 1916 car, but the worm and worm wheel have now been replaced by a roller chain. This simpler form of drive has a dual advantage; it is cheaper in first cost, and it needs less attention from the driver, for an occasional smear of grease suffices for lubrication, whereas the worm needed inclosure and a bath of oil. The illustration of the gearset shows the ratchet mechanism, the pawl being on the large chain sprocket which turns on a bearing on the front end of the gear case. Actually keyed to the clutchshaft is the ratchet gear, but the pawl is normally held by a spring so that it is clear of its wheel. Normally rotating with the sprocket is a sheave carrying a trip pin, and if this sheave is held stationary for an instant while the starting motor is running it trips the ratchet pawl which then takes hold of the ratchet wheel and allows the engine to be cranked. To hold the sheave for the necessary fraction of a second there is a cord hanging loosely around it, and depressing the starting switch tightens the cord just enough to trip the ratchet pawl. Immediately the starting pedal is released the pawl comes out of mesh and everything stops. The device is very simple and effective, and it is quieter in action than the flywheel gear; probably it is also a little cheaper as the total number of teeth to be cut is fairly small.

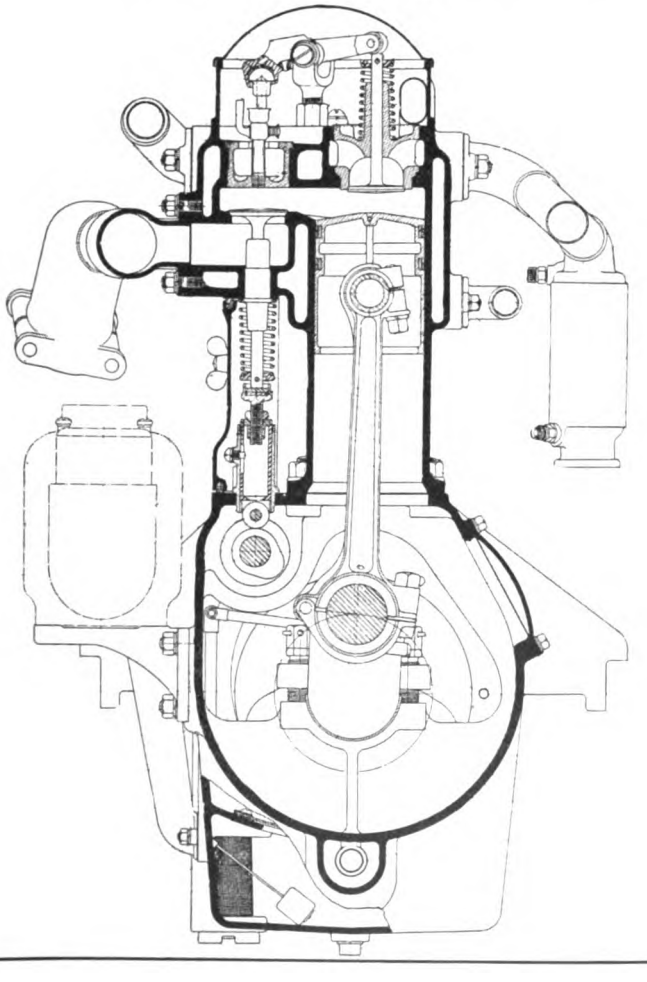


Right side of four-cylinder Reo motor, showing mounting of generator and ignition unit

Having begun with the starting arrangement it will be best to mention the rest of the electrical outfit, as this is common to both four and six. Generation and ignition are

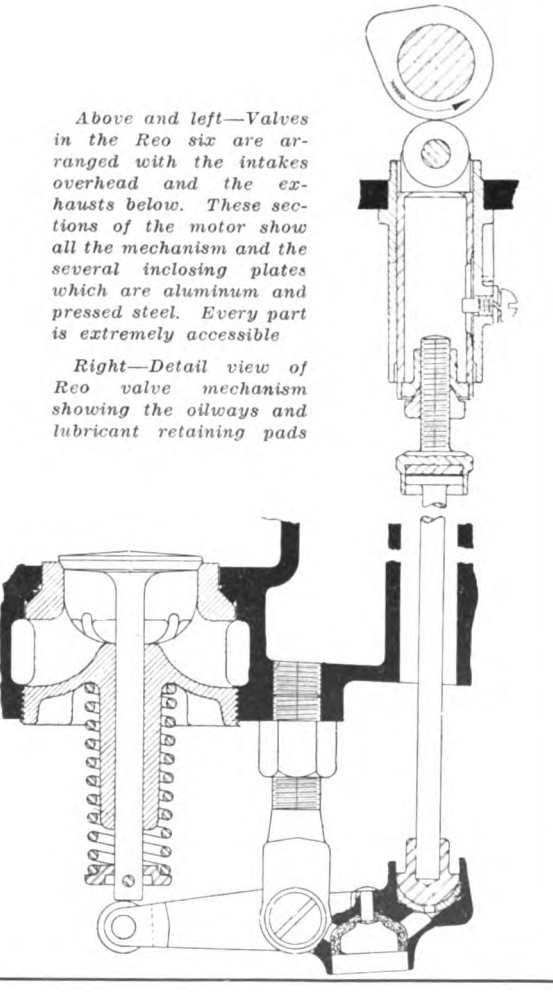
REO the SIX

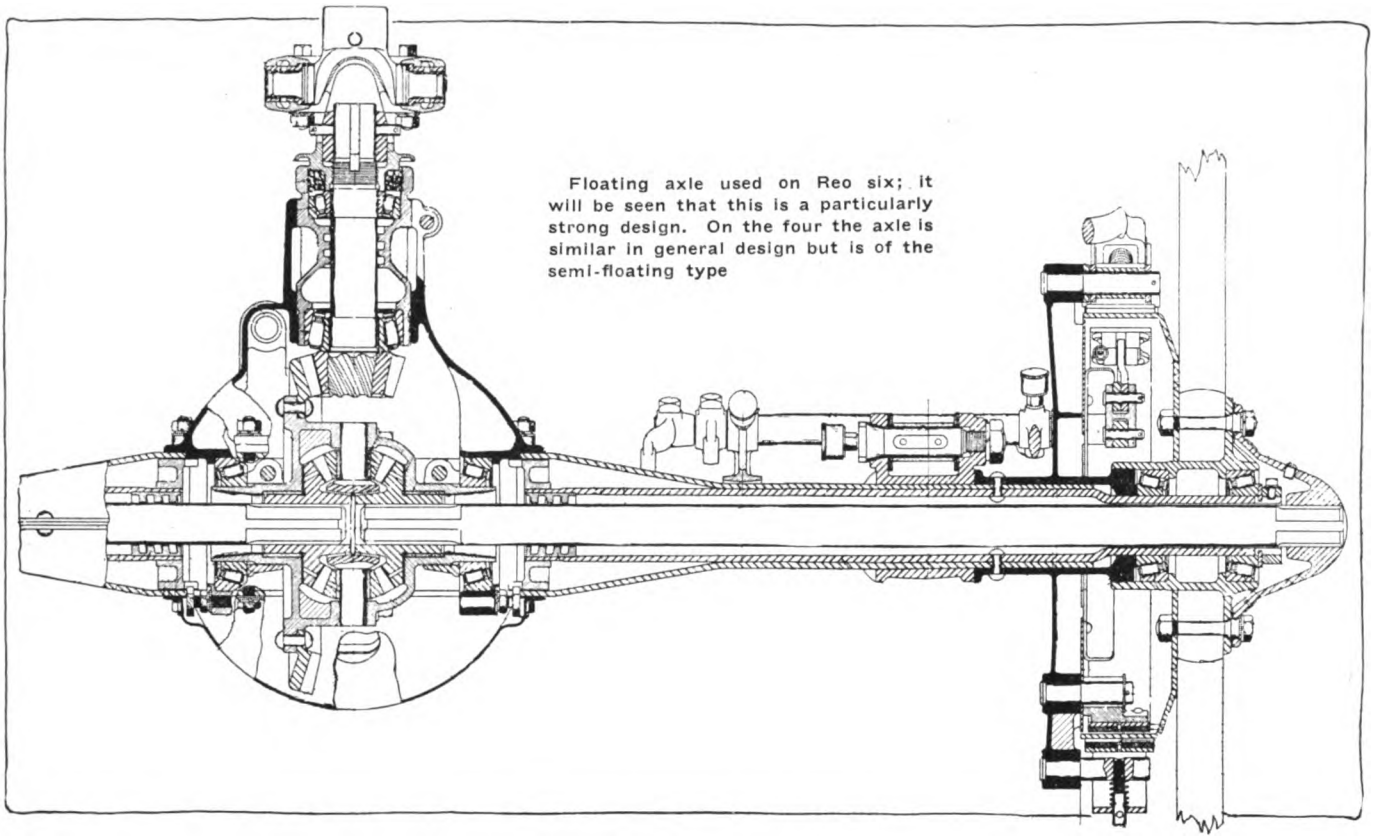




Above and left—Valves in the Reo six are arranged with the intakes overhead and the exhausts below. These sections of the motor show all the mechanism and the several inclosing plates which are aluminum and pressed steel. Every part is extremely accessible

Right—Detail view of Reo valve mechanism showing the oilways and lubricant retaining pads





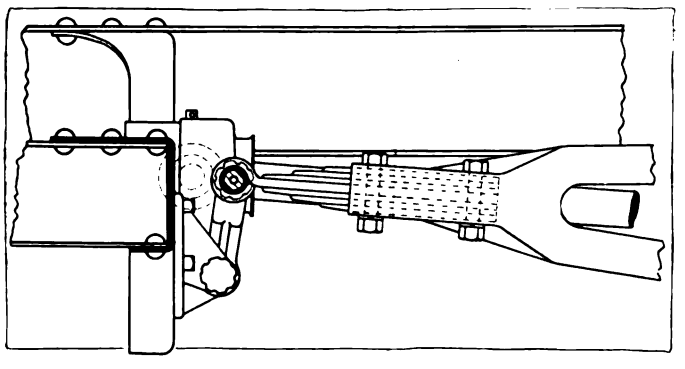
Floating axle used on Reo six; it will be seen that this is a particularly strong design. On the four the axle is similar in general design but is of the semi-floating type

both cared for by a Remy unit, mounted on the right side of the engine, and driven through a simple leather coupling from a special pinion in the timing gear case. There is nothing else on this side except the exhaust valves and the push rods for the overhead inlets, these being inclosed, and the generator is low enough to allow easy access to the valve tappets.

Motors Are Similar Design

On the opposite side of the motor is the water pump, pairing with the generator as to position, and the distribution gearing is composed of helical tooth spur gears. The generator-shaft pinion is driven from the camshaft gear, and to make connection with the water pump a large intermediate pinion is used, the pump speed being the same as that of the crankshaft.

Having thus inverted the usual order by describing detail first, we may now come back to the main dimensions and general scheme of the two motors. The four is 4⅛ in. by 4½ in. bore and stroke, 240.5 cu. in., or 27.2 hp. The six has a longer stroke proportionally, being 3 9/16 by 5⅛ in., 306.5 cu. in. or 30.5 hp. For both four and six two blocks of cylinders are used, and both have the valve arrangement which it is suggested should be called F-head. That is to say there is an overhead intake valve and an exhaust valve in the usual position. This construction has the advantage that it allows plenty of room for the valve pockets and for cooling water around the valves. Cages are used for the intake valves which are set directly over the pistons in the cylinder heads, and it is possible to scrape out carbon effectively by removing the intake valve and the compression cock plug over the exhaust valve. The spark plugs are also set upright in the cylinder head area, which is supposed to be the best place for efficiency. In the four the valve rockers are not incased, but aluminum covers are used on the six, the object being to protect the mechanism and to shut in the few small sounds that may be caused by the valves, though the operation is designed with a view to eliminating noise right at its source.



Spring front end of Reo torque rod to give flexibility with absence of rattle

Valve Operation Designed for Silence

The important points in making an overhead valve motor are to keep the weight of the push rods and rockers as low as possible and to prevent the occurrence of backlash at any joint in the mechanism. Turning to the drawing of the valve gear on page 459, it will be seen that the tappet is a light, hollow structure and the top of the adjusting screw contains a pad of soft material bearing against a mushroom foot on the long push rod. This gives sufficient area to prevent rapid wear of the cushioning substance. Coming now to the rocker, this has a large oil cup made integral with it, a felt lining being used to absorb lubricant—preferably soft grease—and to conduct it to both the pin fulcrum of the rocker and the hemispherical head of the push rod, the latter also bearing against a fiber surface. So far every point seems well cared for, but perhaps the most ingenious idea of all is the use of a fiber roller to join the valve stem and the operating extremity of the rocker. A fiber pad at this point would soon wear away because of the slight sliding action between rocker and valve during opening and closing, but the roller is offset just a sufficient fraction of an inch to cause it to turn instead of being dragged across the top of the valve stem. Actually the roller center and the center line of the valve just about coincide when the valve is fully open. This dodge provides an ever-changing surface of fiber and distributes such little wear as does take place over

the whole circumference of the roller. Finally it is noteworthy that none of the valve gear is expensive, all the small parts being very simple both to make and to assemble.

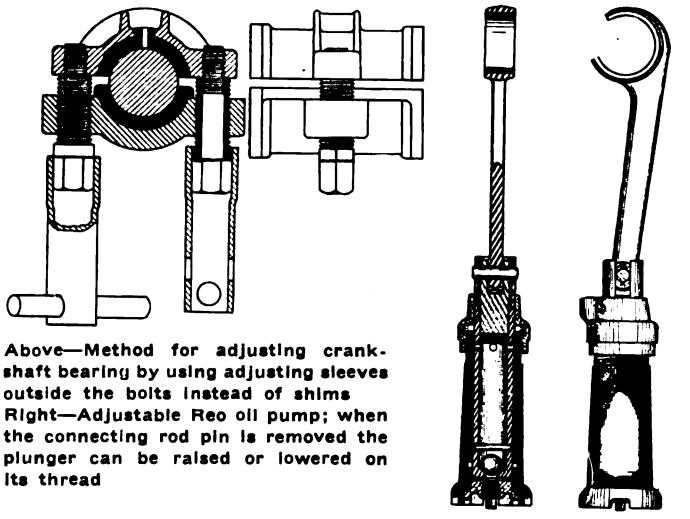
Oil Feed Is Adjustable

Lubrication is a combined pressure and splash system, the three main bearings of the crankshaft being supplied directly from the pump which also feeds the timing gears and dip troughs for the connecting-rods. The system is identical for both motors and its feature of peculiarity lies in the oil pump, which is an especially substantial job. This is a plunger type driven from the camshaft, but unlike the majority of such pumps, it is driven by an eccentric with a full strap connection to the pump plunger and no spring is used for the suction stroke. Reference to the drawing herewith shows that the oil is sucked in at the bottom of the pump cylinder as the plunger rises and is transferred to the interior of the plunger as the latter descends. Thence it passes out through holes at the top of the hollow plunger and so goes to the supply pipes.

Now, the ball valve at the bottom of the plunger will only open after the intake holes near the bottom of the cylinder are closed by the descending plunger, so the effective stroke is very short. Adjustment of the amount of the oil supply is rendered possible by this construction, because the plunger can be raised or lowered to vary the clearance between the foot of the plunger when at the bottom of its stroke, and the head of the cylinder. There is a screwed connection between the plunger and the connecting-rod which permits the adjustment to be made easily.

Unique Bearing Adjustment

An advantage of this form of pump is that it sucks in too much oil at each stroke and discharges the surplus, the effect being to alternate the direction of flow through the meshes of the screen, so tending to maintain the latter free from dirt. Another engine feature that is unique on Reo cars is the method adopted for adjusting the bearings of the crankshaft. In the detail drawing of one of the bearings, appearing on this page, it will be seen that the cap is not packed apart from the upper half by shims, but the width of the gap between the two is set by means of threaded

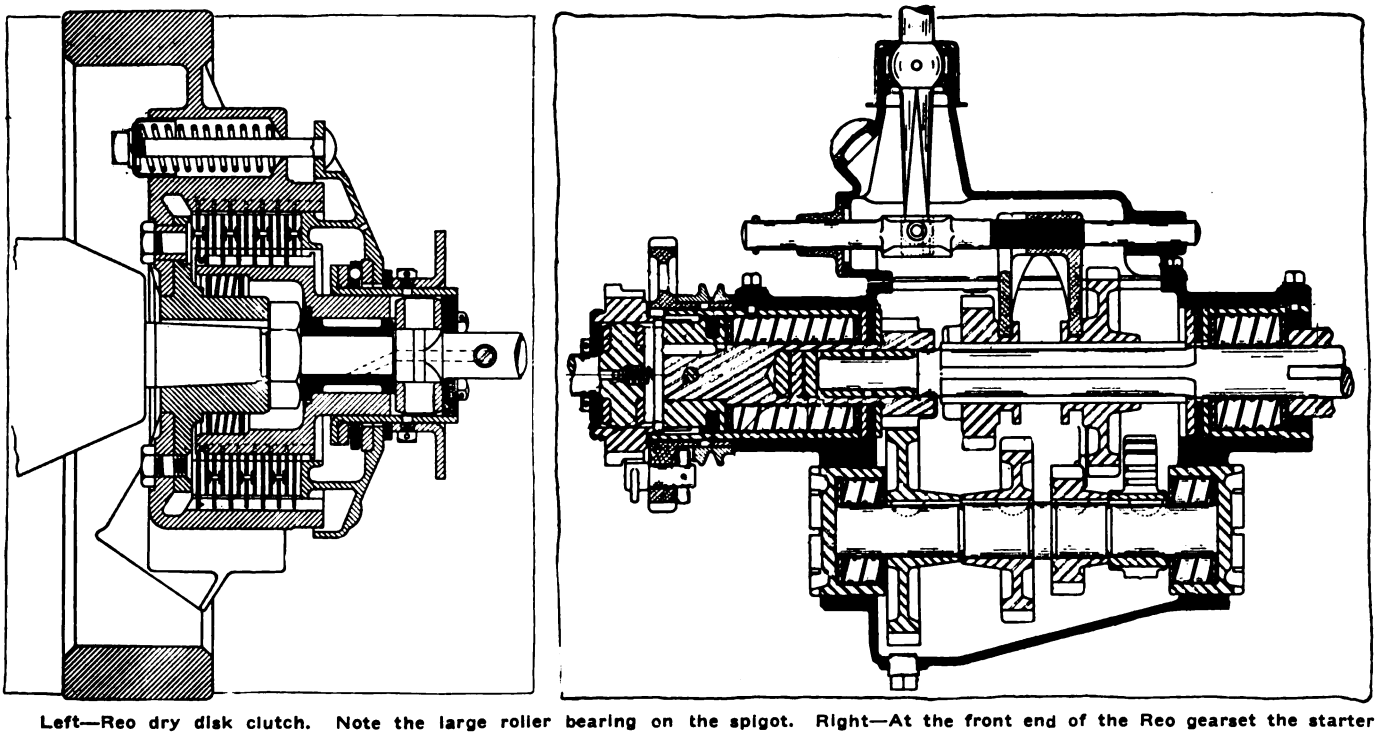


Above—Method for adjusting crankshaft bearing by using adjusting sleeves outside the bolts instead of shims
Right—Adjustable Reo oil pump; when the connecting rod pin is removed the plunger can be raised or lowered on its thread

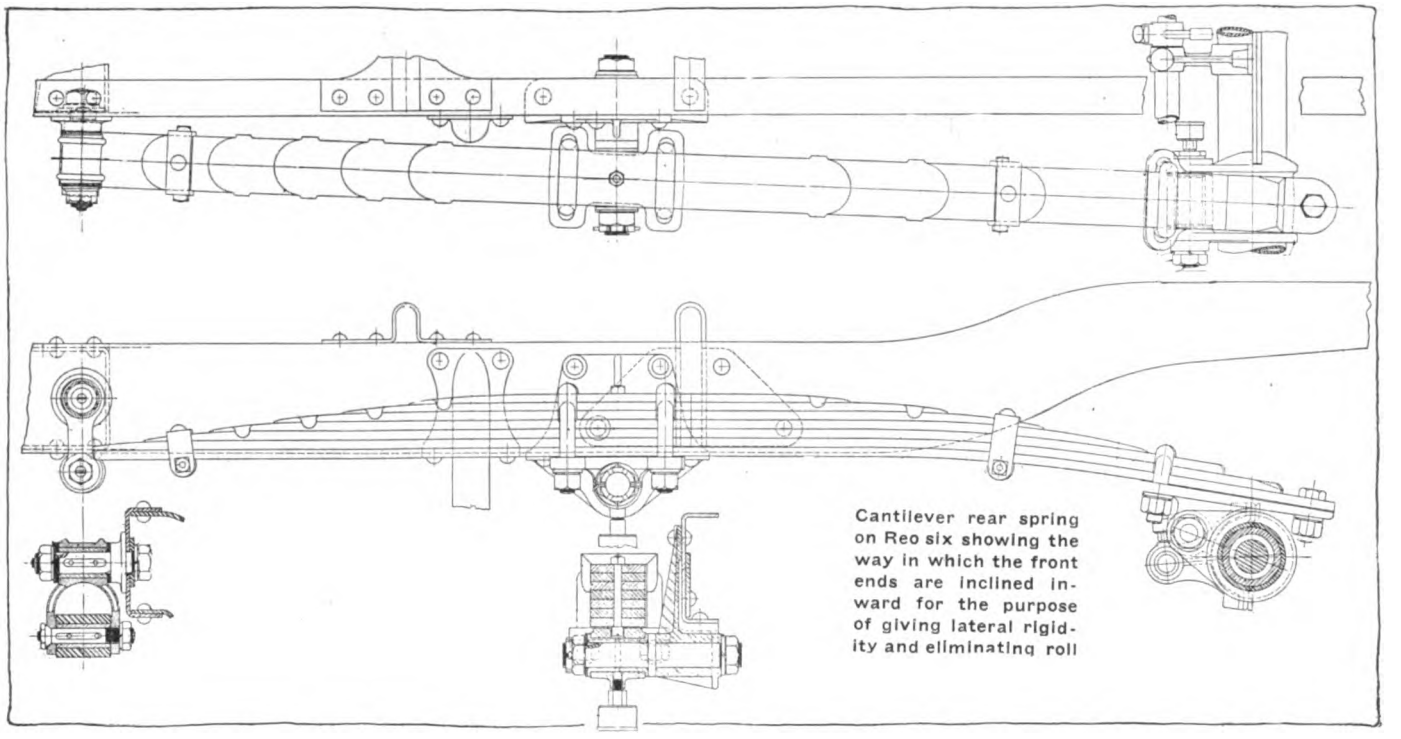
sleeves through which the actual locking bolts pass. Both sleeve and locking bolt have the same sized head and a special tube spanner is supplied which can turn either the bolt alone or both bolt and sleeve together. To adjust the bearing the spanner is first put over the bolt head only and the bolt is slacked. Then the spanner is pushed home and the sleeve unscrewed a little so as to decrease the gap, and finally the bolt is tightened again. Locking wires of an easily detachable sort serve to secure the locking bolts against turning. The bearings at the front and rear ends can be adjusted from beneath the car without dropping the oil pan, as the bolt heads are brought through the latter, and the center bearing is inverted so that the middle bearing can be set up through the hand holes in the side of the crankcase.

For the connecting-rods a hinged cap is used, and shims or liners for adjustment, but it is possible to take up a connecting-rod end through the crankcase hand holes. For the wristpin the bearing is in the piston and is, of course, non-adjustable.

The carbureter is a Johnson, which is a simple instrument with a metering pin adjustment for the nozzle. It is a type that is easy to set and easy to clean, should the necessity



Left—Reo dry disk clutch. Note the large roller bearing on the spigot. Right—At the front end of the Reo gearset the starter sprocket is shown. The grooved pulley just behind is the trip gear for the starter pawl, which can be seen in the illustration at the bottom of the sprocket



Cantilever rear spring on Reo six showing the way in which the front ends are inclined inward for the purpose of giving lateral rigidity and eliminating roll

arise. A simple Y-pipe leads the gas to the two cylinder blocks, and the vertical part of this is inclosed by a water jacket. In connection with the fuel feed the four has a gravity feed from a tank under the front seat, and the six a vacuum tank feed from a rear located container, but the four has a hand pressure pump on the cowl board that can be used when ascending exceptionally steep grades, there being a non-return valve in the filler cap that permits the tank to operate either as a gravity or pressure supply.

Clutch Frees Easily

The clutch used for both six and four is a dry plate, the faced disks being the flywheel members and the plain steel disks the inner ones. There are three springs carried on a spider after the manner that is becoming so popular with cone clutches, but in this case the spider is to the rear and the spring adjusting nuts are in front of the flywheel. The inner member revolves on a spigot which is part of the crankshaft, and it has also a large diameter roller-bearing surrounding the flywheel boss, so the inner member is given an exceptionally true support. The effect of this is to cause disengagement with very small pedal movement and, the inner part being so light, gear shifting is facilitated. Between clutch and gearbox is a short shaft with a telescopic universal joint at each end to allow for any slight disalignment and also to facilitate assembly as it allows either the clutch or the gearset to be taken down without disturbing the other. The gearset itself is mainly noteworthy by reason of the positive lock which holds rigidly whichever shifting fork is not in use. The shift lever is ball mounted on the lid of the gearbox and normally rests in the mid position. Located on either side of the gearbox lid are tubular cases containing spring-backed plungers which enter the slots in the shifting rods, so that with the gear lever in neutral neither shifting fork can move. Pressing the lever to one side or the other forces one plunger out of the slot in the shift rod and so allows the lever to move it, but meanwhile the other plunger holds the second shift rod against any accidental displacement. It is impossible to move both shift forks at once with the gear lever.

Another feature of the gearset is the large size of the Hyatt roller bearings used, especially that at the front end which carries the constant mesh pinion.

At the front end of the drive shaft is a telescopic universal and a pin pattern at the rear. In both cars the drive is through the springs but a torsion member is used, this having another Reo feature in the method of its attachment to the frame. It is sometimes raised as an objection to a torque stay that it is liable to set up a chatter or rattle when the clutch is let in, and to overcome this the Reo rod has a short leaf spring through which the actual attachment to the frame is made. This spring provides a cushioned torsional resistance and can give a little when starting or when applying the brakes. The drawing shows the details so clearly that no more description is needed. The rear axles differ slightly in design, that on the four being semi-floating and that of the six a full floating construction. Almost the same bevel pinion housing is used for both, and Timken bearings are employed for mounting both pinion and differential.

In the larger axle the road wheels run also on Timken bearings and the drive shafts are withdrawable by removing the hub caps, whereupon the whole differential can be removed. Since the wheels are carried on the drive shafts in the axle of the four the last-mentioned feature is peculiar to the six.

One other difference is that the four has a straight tooth bevel gear and the six a bevel of spiral type, the gear ratios being 4 to 1 high, 7.2 to 1 sec. and 14.8 to 1 first speed both for the four and the six.

Anti-Roll Cantilever Spring

The rear springs are again different as the four has three-quarter elliptic suspension and the six a cantilever system. The latter is especially interesting because the two springs are closer together at their front ends than at the rear extremities, and this is said to eliminate much of the roll that is sometimes a trouble with a cantilever system. The drawing shows the details of the spring layout, and it may be observed that the attachment to the axle is performed by a short plate bolted to the end of the longest leaf of the spring. The little clip which steadies the front end of the short plate is not screwed up tight enough to prevent free movement of the spring leaves. There is a full equipment, including all the usual articles and the tires are of good size, the four having 34 by 4 in., and the six 34 by 4½ in. front and rear.

The Engineers' Forum

Must Convince Production Department of Aluminum Construction Advantages—Cars Not Yet Standardized—The Heating Question

By W. B. Stout
Chief Engineer, Scripps-Booth Co.

DETROIT, MICH.—Editor THE AUTOMOBILE:—Engineers are agreed that the attainment of minimum weight in automobile construction is the next great step. This line of development is favored by engineers, production, buying and sales.

In connection with light-weight construction, the use of the newer methods of aluminum casting has been given serious publicity within the last few weeks. This construction is undoubtedly attractive to the engineer who feels that what difficulties there are easily can be overcome by systematic development, and that these are fairly few.

The Production End

The production end of the factory questions the advisability of aluminum for block cylinders, for instance, as production has never handled a proposition of this kind before, and is a department which usually contains more of the Missouri strain than any other department of the factory.

If production can be shown the advantage of block-cast aluminum engines and success in this department, much will be done toward the establishment of the new construction.

The buying end of the firm is, at the outset, opposed to the aluminum construction on account of extra cost. This item of cost in the engine itself looms up large, and is questioned. This resolves itself into a mass of figuring to determine whether the decreased weight of the engine eliminates enough cost in the rest of the chassis to pay for the change from the standpoint of the buying department.

On the Fence

The salesman and dealer is still on the fence regarding aluminum motor construction if he knows anything about it at all. The country salesman will probably oppose it on the start. If only one manufacturer takes it up, then it will be criticized by other dealer's and sales effort will be required to sell the construction irrespective of its merit, as has been the case, for instance, in air cooling. If a number of manufacturers adopt the idea, as seems very probable, then aluminum engines will have plain sailing, for there is no doubt but that the problems involved can be easily solved by the engineering department. Aluminum cylinders are being tried in aviation. Aluminum engines with aluminum pistons have been used successfully without cast iron liners in the cylinders. It is probable that cylinders will be lined however with cast iron or steel or some lining material, and that aluminum pistons will be used, but there is little doubt but that this type of engine is coming.

The first types will be sand cast. Eventually a die casting method may be developed for more accurate work which may cut the cost and better the production.

One problem is prominent in connection with aluminum cylinders for the multiple cylinder constructions. These are generally of small bore and hence have a greater amount of cooling surface per cubic inch of volume than the usual type. This means that in order to run at equally efficient temperature, more heat units per minute must be sent through the cylinder than in larger constructions, providing the cooling effort be the same. This factor has been noted in multiple cylinder motors enough so that thermo-regulation of the cooling water flow has been found advisable.

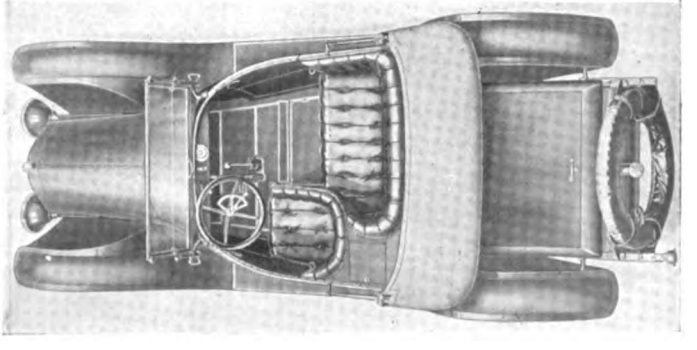
Heat Conduction Increases

With the adoption of the aluminum for cylinders, heat conduction is enormously increased so that the cooling is even greater per cubic inch of wall surface than before. This may necessitate more accurate regulation of cooling, and there is even the possibility that it may bring into prominence again the advantage of air cooling for small cylinders.

The Renault firm with cast-iron cylinders has been using blower cooling on aviation motors for years and has about the most reliable aviation motor which Europe has developed. There is a possibility that aluminum constructions may increase the popularity of this type.

Experimentation with aluminum for major castings in the automobile is but further proof that the automobile of to-day is not yet standardized. Engineers, constructors, purchasers, and advertisers must revise and revamp their ideas and methods with each new step of rational development. To date, however, the entire growth seems to focus as a point of agreement on the acquisition of lighter weight, smoother performing cars.—W. B. STOUT, Chief Engineer, Scripps-Booth Co.

Mitchell Adds Three-Passenger Car



Racine, Wis., Sept. 2—A three-passenger roadster has been added by the Mitchell-Lewis Motor Co., Racine, Wis., to its line of 1916 cars. The body is mounted on the same chassis as the Six of 16 touring design which is featured by 125-in. wheelbase, cantilever rear springs, 34 by 4-in. tires and sells for $1,250. In this design there is an individual seat for the driver set well forward of the extra wide two-passenger seat. A wide footrest is provided for the two passengers and directly back of the drivers' seat is a convenient small package receptacle.

Glide Six Replaces Four for 1916

3 by 5 Block Motor Gives 41 Hp. at 2000 R.P.M.—Detachable Sedan Body—Westinghouse Electric System

FOR 1915 the Bartholomew Co., Peoria, Ill., built one model known as the Glide 30. It was a four-cylinder car. For 1916 the one-model policy of this concern has been continued but in place of the four there is a new model known as the 1916 six-40. This concern has therefore entered the ranks of those who build nothing but six-cylinder models. The new car sells for $1,095, and is an assembled design.

Rutenber Power Plant

The power plant is a Rutenber with the six cylinders cast in block. The dimensions are 3 by 5 and a horsepower output of 41 is claimed at 2000 r.p.m. on the dynamometer. At 1000 revolutions the horsepower curve is said to show 22 brake hp., 33 brake hp. at 1500 r.p.m. and 41 at 2000 r.p.m. This motor is therefore of moderately high-speed characteristics and to take advantage of this fact it is designed to run on a direct ratio of 4.64 to 1. This ratio keeps the motor within the range of efficient speeds during ordinary cross-country driving and allows it to reach the peak of its curve on hill work, while at the same time the ratio is not so low as to prevent throttling for low speeds on high gear.

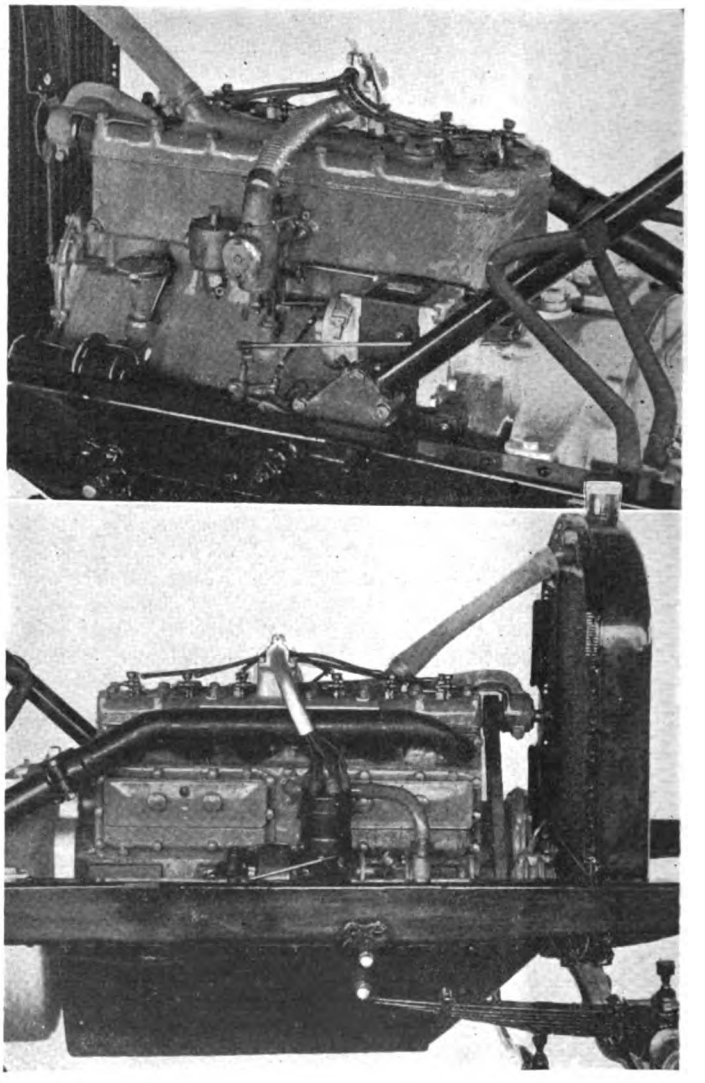
Cooling is accomplished by a centrifugal water pump which forms a positive method of circulation and the radiator is cooled in addition by a two-blade aeroplane type fan which is mounted on a bracket extended from the cylinder head casting.

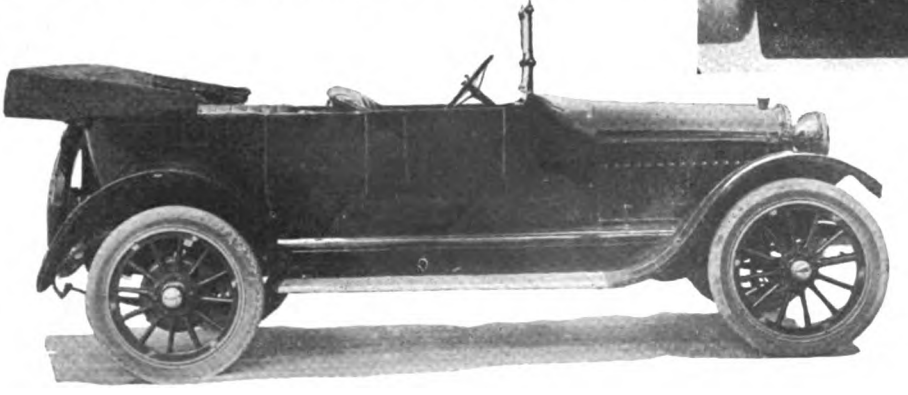
For lubrication there is a vane pump which is driven directly from the front end of the camshaft and which draws oil through a detachable filter in the base and delivers it to troughs under each connecting-rod and to the timing gears. For lubricating the main bearings there are oil ducts cast in the walls of the upper case. A large filler opening is supplied on the left side of the motor at the front end and there is an oil gauge just back of the filler opening for determining the quantity held in the reservoir.

The Electrical System

The electrical equipment is entirely Westinghouse, the starting motor being mounted on the left side of the engine and bolted to a flange which forms an integral part of the flywheel housing. The driving pinion is thrown into mesh by the Bendix gear arrangement, the starting motor being put into operation by pressure on the starting switch button. The generator is on the right side of the motor just back of the centrifugal water pump and is driven by the same shaft which operates this pump although it is separated from the pump drive by a leather coupling which allows a certain amount of flexibility in the connection. A voltage regulator is used in connection with the generator, according to the Westinghouse layout which operates to deliver a tapering charge to the battery. The charging is at a fairly high rate when the battery is exhausted but slower when the battery is practically fully charged.

For ignition the Westinghouse vertical type of the latest design is employed. The timer distributer unit, which includes an entirely independent unit consisting of interrupter,



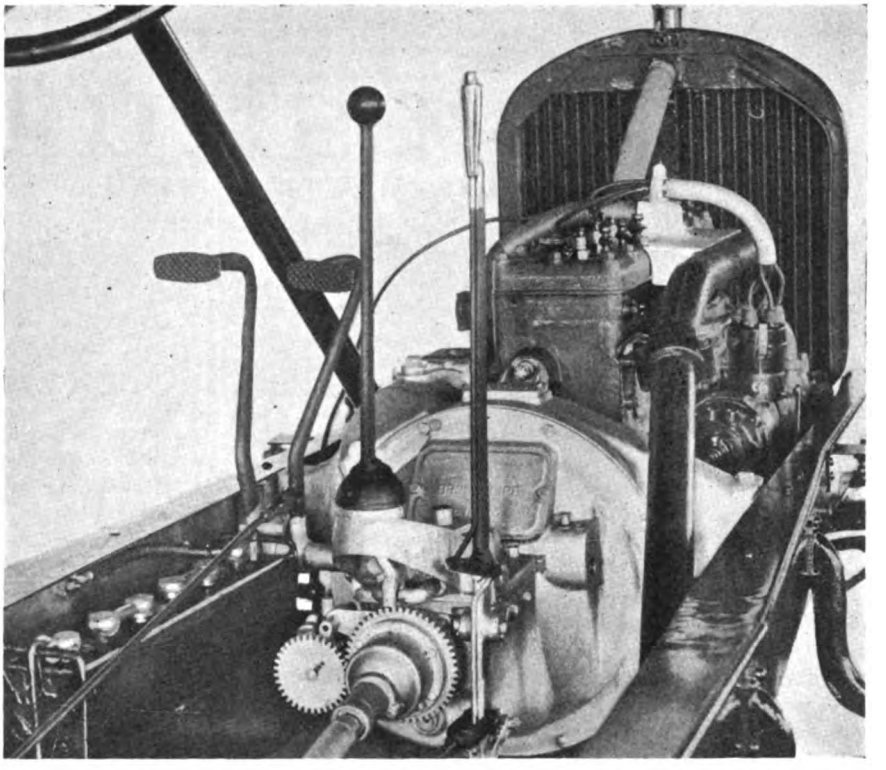


Upper—Left side of Rutenber six-cylinder 3 by 5-in. block motor used in the Glide six for 1916

Lower—Right side, showing Westinghouse ignition unit mounting

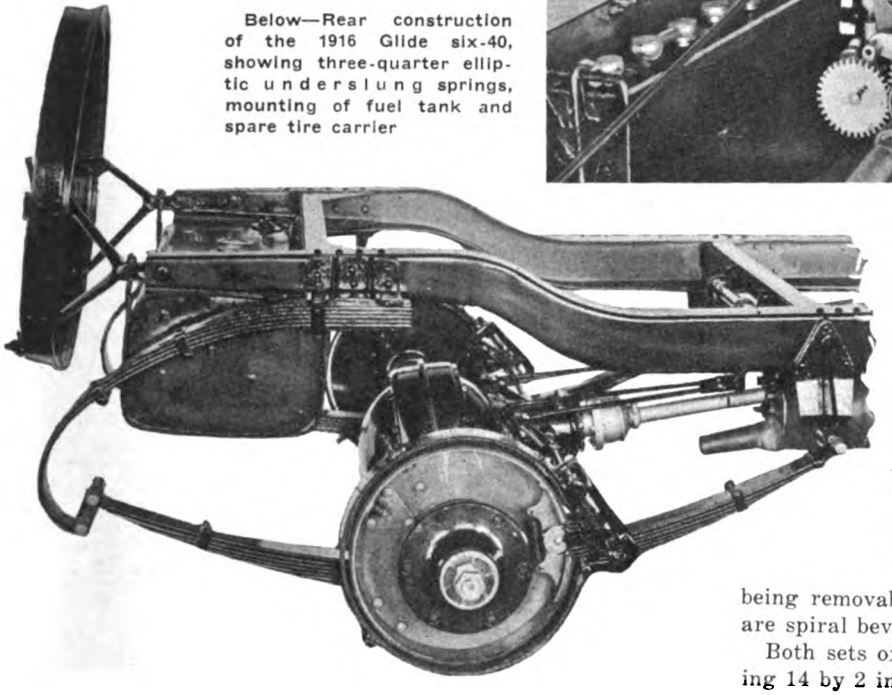
Left—The six-cylinder, five-passenger Glide touring car for 1916 which sells for $1,095

condenser, coil and distributer, is mounted on the front end of the generator and is driven from this shaft by spiral gears running in oil. The wiring system of this arrangement is simple, consisting of leads to the independent plugs and a single wire running to the switch. In order to prevent short-circuiting of the spark-plug wires there is a tube mounted on an insulated block on the cylinder head which keeps these wires free from the dangers of vibration and guards against the possibility of the insulation being burned through by the hot exhaust pipe. The battery used in connection with the electrical equipment is 6 volts and has a capacity of 80 amp.-hr. Located on the instrument board there is an ammeter which gives the car operator a key to the entire system indicating at all times the battery charging rate.



Above—Rear view of the power plant of the Glide six, showing mounting of storage battery inside the frame and the control levers on the gearbox. Note strong frame section

Below—Rear construction of the 1916 Glide six-40, showing three-quarter elliptic underslung springs, mounting of fuel tank and spare tire carrier



Power is transmitted from the motor to the gearset by a multiple dry disk clutch. This is a thirteen-disk design with alternate disks faced with Raybestos. The aim with this clutch has been to keep the surface large and the unit pressure small, thereby reducing wear on the facing. The gearset, which forms part of the unit power plant, is mounted directly in a bell housing back of the flywheel case. The gears are 3½ per cent nickel steel with the limits of backlash kept down for quietness. The drive is taken through a tubular propeller shaft and Spicer universals. The front universal is so arranged as to allow for a slight longitudinal movement of the rear axle and to take care of this there are ten splines on the forward end of the tubular propeller shaft through which the drive is transmitted. The rear universal joint is the same as the front with the exception that it is fastened firmly to the propeller shaft by a solid connection, all the longitudinal play being taken up at the forward end. To guard against dirt and grit the universals are housed to retain oil and exclude foreign matter.

Hotchkiss Drive Employed

As would be judged from the fact that allowance is made in the propeller shaft for end play, the drive is Hotchkiss, both the torque and drive being taken through the rear springs which are underslung. The rear axle is a floating design with pressed steel housing. The driving gears are mounted in a cast steel carrier which is designed to hold the gears in alignment. Accessibility is one of the features of the rear axle, the entire differential being removable through the hand hole. The driving gears are spiral bevel designs with a 4.64 to 1 ratio.

Both sets of brakes are on the rear wheels, the drums being 14 by 2 in. with the foot service brake external contracting and the hand brake internal expanding. This drum is bolted to the rear wheels which are carried on Gurney bearings. The wheels are connected to the rear axle driving shafts through large flanges bolted to the hubs. At the differential ends the axle shafts have six splines. The differential gears are large, having a 5-7 pitch.

Equipment a Feature

Up-to-date equipment is used throughout. The gasoline feed is by the Stewart-Warner vacuum system; the wheels are provided with Goodyear demountable rims and 34 by 4 in. tires; the top is a one-person design with Jiffy curtains; the headlights have a double bulb arrangement for dimming and the instrument board is fully equipped with a Stewart-Warner magnetic speedometer driven from the propeller shaft, an ammeter and a dash lamp.

With a five-passenger body this car sells for $1,095. In addition there is a detachable sedan top which gives an all-year-round equipment if so desired. This body can be removed or attached by two men in an hour. The touring body to which this may be fitted is a full streamline design with the modern yacht-like sweep from the headlights to the rear. Upholstery is enamel leather over curled hair and oil-tempered springs. The wheelbase is 119 in.

Glide Six Replaces Four for 1(

3 by 5 Block Motor Gives 41 Hp. at 2000 R.P.M.—Detachable Sedan Body—Westinghouse Electric System

Rutenber Power Plant

The power plant is a Rutenber with the six cylinders cast in block. The dimensions are 3 by 5 and a horsepower output of 41 is claimed at 2000 r.p.m. on the dynamometer. At 1000 revolutions the horsepower curve is said to show 22 brake hp., 33 brake hp. at 1500 r.p.m. and 41 at 2000 r.p.m. This motor is therefore of moderately high-speed characteristics and to take advantage of this fact it is designed to run on a direct ratio of 4.64 to 1. This ratio keeps the motor within the range of efficient speeds during ordinary cross-country driving and allows it to reach the peak of its curve on hill work, while at the same time the ratio is not so low as to prevent throttling for low speeds on high gear.

Cooling is accomplished by a centrifugal water pump which forms a positive method of circulation and the radiator is cooled in addition by a two-blade aeroplane type fan which is mounted on a bracket extended from the cylinder head casting.

For lubrication there is a vane pump which is driven directly from the front end of the camshaft and which draws oil through a detachable filter in the base and delivers it to troughs under each connecting-rod and to the timing gears. For lubricating the main bearings there are oil ducts cast in the walls of the upper case. A large filler opening is supplied on the left side of the motor at the front end and there is an oil gauge just back of the filler opening for determinin the quantity held in the reservoir.

The Electrical System

The electrical equipment is entirely Westingho starting motor being mounted on the left side of t and bolted to a flange which forms an integral flywheel housing. The driving pinion is thrown the Bendix gear arrangement, the starting m into operation by pressure on the starting The generator is on the right side of the n the centrifugal water pump and is driven which operates this pump although it is pump drive by a leather coupling which al amount of flexibility in the connection. A v is used in connection with the generator. Westinghouse layout which operates to d charge to the battery. The charging is at when the battery is exhausted but slow is practically fully charged.

For ignition the Westinghouse verti design is employed. The timer dist cludes an entirely independent unit c

Remedying a Slipping Clutch

Editor THE AUTOMOBILE:—Recently I have noticed a jump in my car when I open the throttle with a load on the engine. It seems as though the clutch slipped out and in again grabbing suddenly and producing the jump. Can you advise me regarding this?
Eastvale, N. J. A. S. KURTZ.

—The diagnosis which you have made of your own case seems to fit the evidence you have given regarding the action of your car. The clutch does not slip out, however, but remains engaged, when occurrences such as you have noted take place. What actually happens is that the surface of the clutch is in such a condition that the frictional resistance is not sufficient to hold the load. If you have a leather-faced cone clutch, the chances are that the leather has become dry and after allowing the clutch to slip for a length of time in this condition, the face of the leather assumes a hard glaze which prevents it from taking hold as it should. If this trouble has gone too far, the only repair is to replace the leather facing. On the other hand, if it has just started to develop you may save the leather by thoroughly saturating it with neat's-foot or castor oil. This will soften the leather and give it the easy engagement with the firm holding power that is the natural prerogative of cone clutches.

With some cone clutches there is a tendency on account of the thinness of the material or carelessness in placing it on the cone, for the copper heads of the rivets to project through the leather. The result is that the copper bears against the cast iron flywheel and causes a slipping action since the coefficient or friction between copper and iron is not high

Selective Allows Choice of Speeds

EDITOR THE AUTOMOBILE:—I find a great many car owners who believe that with a selective type control it is still necessary to start your car in first speed, then progress to intermediate, and then in a few moments go into high. I have always supposed this method was perfectly proper and have always used it.

Recently in studying a book on automobiles, I find that it says that with a selective type of gearbox "it is not necessary in changing from low to high speed to pass through the intermediate speed." I take this to mean that you may start your car off in any speed you may desire, without injury to your engine and gears, providing you use the proper care in allowing the clutch to slip into engagement. Am I correct in this matter?

Brooklyn, N. Y. F. K. L.

—No doubt what the author meant to make clear is that while it is advisable in shifting gears to go progressively from one to the next it is not necessary to do so. For instance, if a car was in the lowest speed with a selective gearset the step to the highest speed could be made without ever having the intermediate gear in mesh. With the progressive gear, as the name suggests, the gears are moved through the intermediate when going from low gear to high gear. With either type of gearset, however, the acceleration of the car should proceed smoothly from the time of starting until the high gear is in mesh. It is not proper after driving to jump intermediate speeds unless under extraordinary circumstances. One set of conditions wherein it would be perfectly possible and perfectly proper to go from low speed into high is in descending a steep grade. In fact, if desired, on a very steep grade, one can start directly in high gear without violating any of the rules of good riding.

Two-Bearing Crankshaft Satisfactory

Editor THE AUTOMOBILE:—Kindly let me know as to the two-bearing crankshaft on the Regal light four. Are two bearings sufficient and how is it that only two bearings are used?

Delmont, S. D. DELMONT AUTO CO.

—The two-bearing crankshaft for a four-cylinder motor has worked out very well when the motor is block cast and of very short overall length. These bearings are carefully laid out to stand the stresses which they are called upon to endure and stand up quite well under the strain of continuous running. Where the bearings suffer on the two-bearing installation it is generally due to the action of the crankshaft, which instead of rotating throughout a circular path tends to turn in such a manner as to give an oval action to the ends of the crankshaft. This irregular motion which is due to the whipping of the shaft tends to force the bearings out of alignment more and more, and finally when the bearings fail it is due to this irregular action.

In general, where the design has been carefully worked out and the bearing size calculated as it should be, two bearings can be made to form the duties in a light four-cylinder block motor to perfect satisfaction. Where the bearings are going to be stressed to their ultimate capacities, however, for long periods a higher factor of safety is gained by using a larger number of bearings, and the whipping action of the shaft is furthermore broken up into two or more lengths.

Nearly All Have House Organs

Editor THE AUTOMOBILE:—Will you kindly furnish me with the following information:

1—What tire manufacturers issue house organs like Goodyear? Give all those who issue organs like Ford *Times* and Timken.

2—What is the S. A. E. rating in hp. of the model 80 Overland?

3—Why is the long-stroke motor better?

4—Where can I get a directory for Ford cars?

Bouton, Iowa. C. F. M.

—Practically every tire company and every automobile company in the country issues house organs of either simple or elaborate natures in accordance with the plans of the concern. In fact it would be far more simple to give a list of concerns which did not publish house organs than one which contains the names of those who do. In many of the concerns the house organs do not come out regularly, but merely from time to time, while others have regular editions which appear promptly at the schedule period.

2—The S. A. E. rating of the model 80 Overland is 27.25.

3—The long-stroke motor is generally claimed to be superior, due to the higher thermal efficiency. Another argument which is frequently advanced in favor of the long stroke motor is that for a given displacement per minute the piston speed is less. Since the piston displacement per minute is a criterion of the horsepower, the number of reversals of reciprocating motion per unit of power are less with the long-stroke motor, with the result that in general a better running machine is produced with the long-stroke design. The life of the long-stroke motor is claimed to be greater, and it is generally conceded to hold to the last ounce of power at slow speeds, such as under load in hill work, better than the short stroke snappy motor.

4—We presume by this that you mean a directory of Ford owners. THE AUTOMOBILE has no record of any such directory being published, although in most States where there is State registration it is possible to secure a directory of car owners, together with the names of the cars owned.

Mathematics of Motor Flywheel Explained

Editor THE AUTOMOBILE:—I am building an experimental single-cylinder gasoline engine 3¾ by 5¾, with valves positively balanced against cylinder pressure. The valve area is 2.75 in. clear for both inlet and outlet. Crankshaft is balanced and the reciprocating parts are light. What weight of flywheel will be best to use?

2—What should be the volume of the compression space

to give 60, 75 and 90 lb. compression? The valves will open to full area with 20 deg. movement of crank.

Port Henry, N. Y. F. E. B.

—The weight of the flywheel cannot be determined offhand in this manner. In the first place, the manner in which the weight of the flywheel is concentrated is highly important and also the weight of the crankshaft itself has a great deal to do with the necessary weight of the flywheel.

It must be remembered in designing a flywheel that the first function is to enable the gas engine to complete its cycle and the second is to keep the variation of angular velocity within well-defined limits. Any flywheel of even light weight will accomplish the first aim but to do the second, in the most efficient manner requires careful working out either by experimentation or calculation. For purposes of calculation, the mass of the flywheel is generally considered as being concentrated in the rim, and it is possible by this means to calculate exactly the weight necessary to limit the variation in angular velocity to any amount. It is a pure mathematical problem. Let V_1 be the maximum velocity in feet per second of the rim, V_2 be the minimum and V the mean. If M is the mass of the rim it will be equal the weight divided by the acceleration due to gravity 32.2, or $M = \frac{W}{32.2}$

In addition to the above values let v_1 be the maximum angular velocity of the rim in radians per second; v_2 the minimum and v the mean. Let E be the difference between the greatest amount of energy received by the flywheel rim and the mean energy in the rim. I is the moment of inertia of the flywheel rim.

Remembering the general energy formula, $\frac{WV^2}{2g}$

$$E = \frac{WV_1^2}{2g} - \frac{WV_2^2}{2g} \quad ; \text{ or, } \frac{W}{2g}(V_1^2 - V_2^2)$$

This latter expression factors to $\frac{W}{2g}(V_1 + V_2) \quad (V_1 - V_2)$

Examining this expression we see that $(V_1 + V_2)$ is equal to twice the average velocity or $2V$. And, furthermore, $V_1 - V_2$ is equal to greatest range in velocity of the rim. If we divide this by the mean velocity of the rim V, we get a co-efficient which may be called C, which represents a function of the speed variation.

Substituting the suggested values in the last equation, we have

$$E = \frac{W}{2g}(2V) \quad (CV) \quad \text{or} \frac{WV^2C}{g}.$$

Therefore, the weight of the rim necessary for a velocity change of CV ft. per second with the intermittently applied energy E is therefore:

$$W = \frac{Eg}{V^2C} \text{ lb.}$$

With this mathematical value, you can determine the weight of rim necessary for your flywheel. In general for motor of the size you mention, this will probably work out to somewhere around 60 to 75 lb.

2—With a motor having the displacement you mention, 97.5 cu. in., the compression volume necessary to give you 60, 75 and 90 lb. compression would be respectively 40, 35 and 29 per cent of this displacement or 38, 34.125 or 28.275 cu. in.

Different Types of Rear Axles

Editor THE AUTOMOBILE:—Please explain through the Rostrum what a semi-floating, three-quarter floating, and full-floating rear axle is and show cuts of same if possible. It seems that so many automobile mechanics and salesmen are unable to tell one from the other, especially three-quarter and full-floating. I think this will answer many questions along this line.

Minneapolis, Minn. R. M. B.

—In answer to this and several corresponding requests, THE AUTOMOBILE is publishing in this issue on pages 472 to 475 an article explaining the different types of rear axles.

Clutch Brake Prevents Difficult Shifting

Editor THE AUTOMOBILE:—Herewith is a drawing, Fig. 1, showing a clutch brake I have fitted to my car. It is merely a small block of wood or fiber, 1 in. square and 1 in. thick bolted through the upper left hand wing bolt hole of the clutch housing cover. The clutch when released presses against this either lightly or tightly according to foot pressure on the pedal, slowing the spinning of the clutch and making shifting of gears very simple.

New Rochelle, N. Y. W. J. G.

Remedying a Slipping Clutch

Editor THE AUTOMOBILE:—Recently I have noticed a jump in my car when I open the throttle with a load on the engine. It seems as though the clutch slipped out and in again grabbing suddenly and producing the jump. Can you advise me regarding this?

Eastvale, N. J. A. S. KURTZ.

—The diagnosis which you have made of your own case seems to fit the evidence you have given regarding the action of your car. The clutch does not slip out, however, but remains engaged, when occurrences such as you have noted take place. What actually happens is that the surface of the clutch is in such a condition that the frictional resistance is not sufficient to hold the load. If you have a leather-faced cone clutch, the chances are that the leather has become dry and after allowing the clutch to slip for a length of time in this condition, the face of the leather assumes a hard glaze which prevents it from taking hold as it should. If this trouble has gone too far, the only repair is to replace the leather facing. On the other hand, if it has just started to develop you may save the leather by thoroughly saturating it with neat's-foot or castor oil. This will soften the leather and give it the easy engagement with the firm holding power that is the natural prerogative of cone clutches.

With some cone clutches there is a tendency on account of the thinness of the material or carelessness in placing it on the cone, for the copper heads of the rivets to project through the leather. The result is that the copper bears against the cast iron flywheel and causes a slipping action since the co-efficient or friction between copper and iron is not high

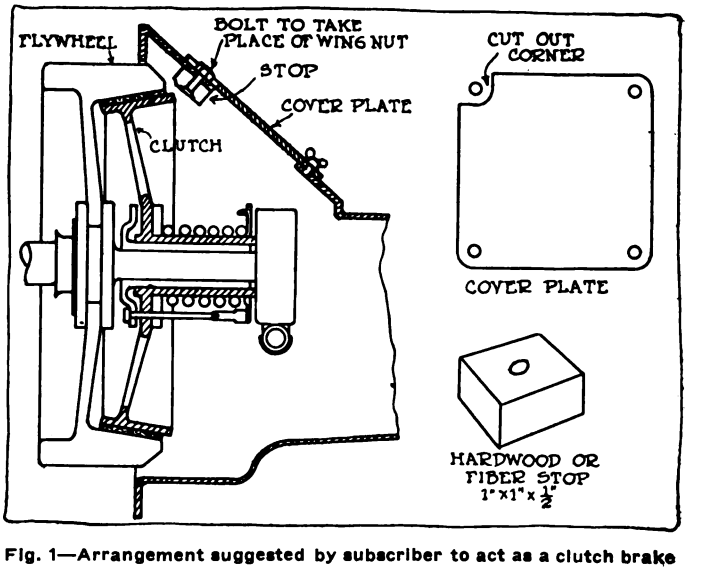

Fig. 1—Arrangement suggested by subscriber to act as a clutch brake

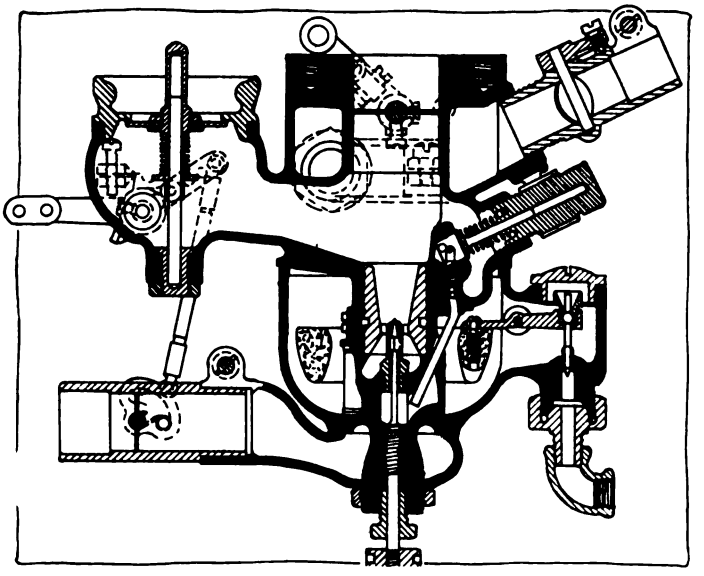

Fig. 2—Sectional view of the Schebler model O carbureter

enough to withstand the load of propulsion with only the pressure of the clutch spring to hold it engaged.

Therefore, should your clutch be a cone, it would be well to examine the surface of the leather to see first if the rivets are properly counter-sunk; secondly, to see if the surface of the leather is not glazed and dry, and third, to see that the leather is not worn out. If the latter is the case, the only remedy is to replace it.

In case the clutch is a disk design, intended to run in oil, the slipping may be due to the accumulation of grease between the plates. Even with the best of care, grease will sometimes accumulate between the clutch plates, with the result that slipping occurs. The remedy for this is naturally to employ some solvent, or something which will cut the grease from between the plates. Kerosene is the agent generally employed for this purpose. The method of applying the kerosene will depend upon how the clutch is assembled and housed. If there is an accessible cover plate, the kerosene can generally be poured down through this and the motor run a while with the gears in neutral. This will cause the grease to be washed out. When this has been done thoroughly, the kerosene is drained and the lubricant renewed.

A mistake very often made by owners of cars which have a disk clutch housed with the gearbox is in placing heavy grease in the gears, forgetting that this will work its way between the plates of the clutch. When this is done the clutch very soon begins to slip.

Adjusting Schebler O Carbureter

Editor THE AUTOMOBILE:—What is the gear ratio of the model 31 Buick?

2—What speed can be had with this type of motor?

3—Is it a high or low-speed motor?

4—Give me a diagram of how to adjust the model O Schebler carbureter for high speed.

5—What is the gear ratio of Reo the Fifth? What speed can be had from this motor?

Schleisingerville, Wis. J. SILL.

—This car is geared 3.5 to 1 on direct.

2—This car can travel up to 60 m.p.h.

3—It may be called a medium high-speed motor.

4—A diagram showing the section of the model O carbureter is given in Fig. 2. To adjust the Schebler model O carbureter, referring to Fig. 3, first see that auxiliary air valve is seating lightly; close needle valve *E* and knurl *I* by screwing to right until they have seated. Do not use any pressure on adjusting screw after it meets with resistance. Then turn needle valve *E* to the left three turns, open throttle about one-third and start motor. After the motor is warmed up, turn needle valve *E* to right slowly until motor runs smoothly with throttle nearly closed. Open throttle slowly about one-third, and if motor backfires, screw down on air-adjusting screw 25 until motor runs smoothly. Open throttle wide and if motor backfires at speed, turn knurl *I* to left until it overcomes backfiring. The second jet *I* should not come into operation until the car has attained a speed of from 18 to 25 m.p.h. or an approximate engine speed of from 700 to 1000 r.p.m.

The second jet *I* adjustment is not a delicate adjustment, and when adjusted for high engine speed will expose from one to four threads of the adjusting knurl. The volume of heat entering carbureter jacket can be governed by position of lever *X*, which can be placed open, half open and wide open. We recommend half open during summer and wide open during winter.

5—The Reo Fifth is geared 4 to 1 on direct. It can attain a speed of 50 m.p.h.

Burning or Scraping Carbon Satisfactory

Editor THE AUTOMOBILE:—I have a 1914 car which has not been overhauled in 6 months and it knocks a little on the grades. I think the cause for this is carbon. Would you advise me to have it burned out or scraped?

Chester, N. Y. C. F. J.

—Either burning or scraping the carbon is an efficient way of having it removed. Both methods remove the carbon, and the one which is most convenient to you will be satisfactory to employ.

Graphite and Oil Stop Squeak

Editor THE AUTOMOBILE:—I have a 1915 Cadillac of the seven-passenger type and have been troubled for some time by the squeaking of the service brakes whenever applied. I have tried putting oil on the brake bands which affords only temporary relief. Would graphite help this squeaking, and if not, could you advise what would?

Dexter, Me. F. A. A.

—The brake bands of this car sometimes become too dry and grip the drums suddenly, giving rise to the noise of which you speak. This can be remedied by applying a mixture of graphite and oil. Sometimes it happens that a rivet head will project through the lining.

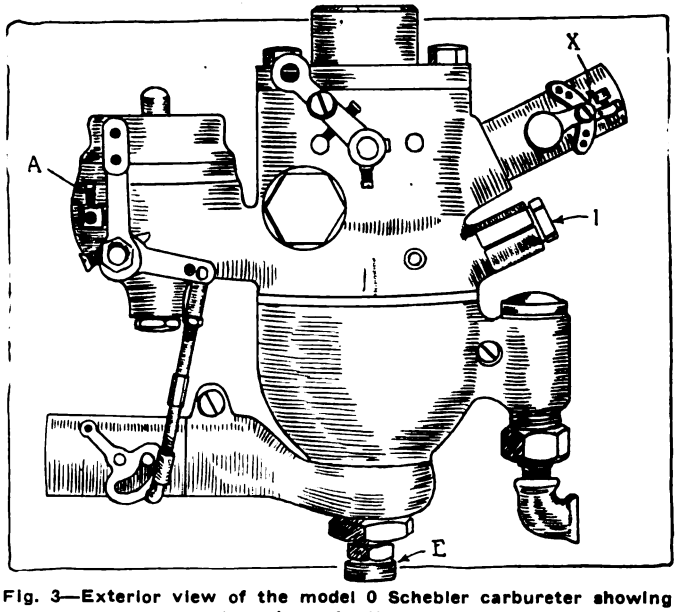

Fig. 3—Exterior view of the model O Schebler carbureter showing the points of adjustment

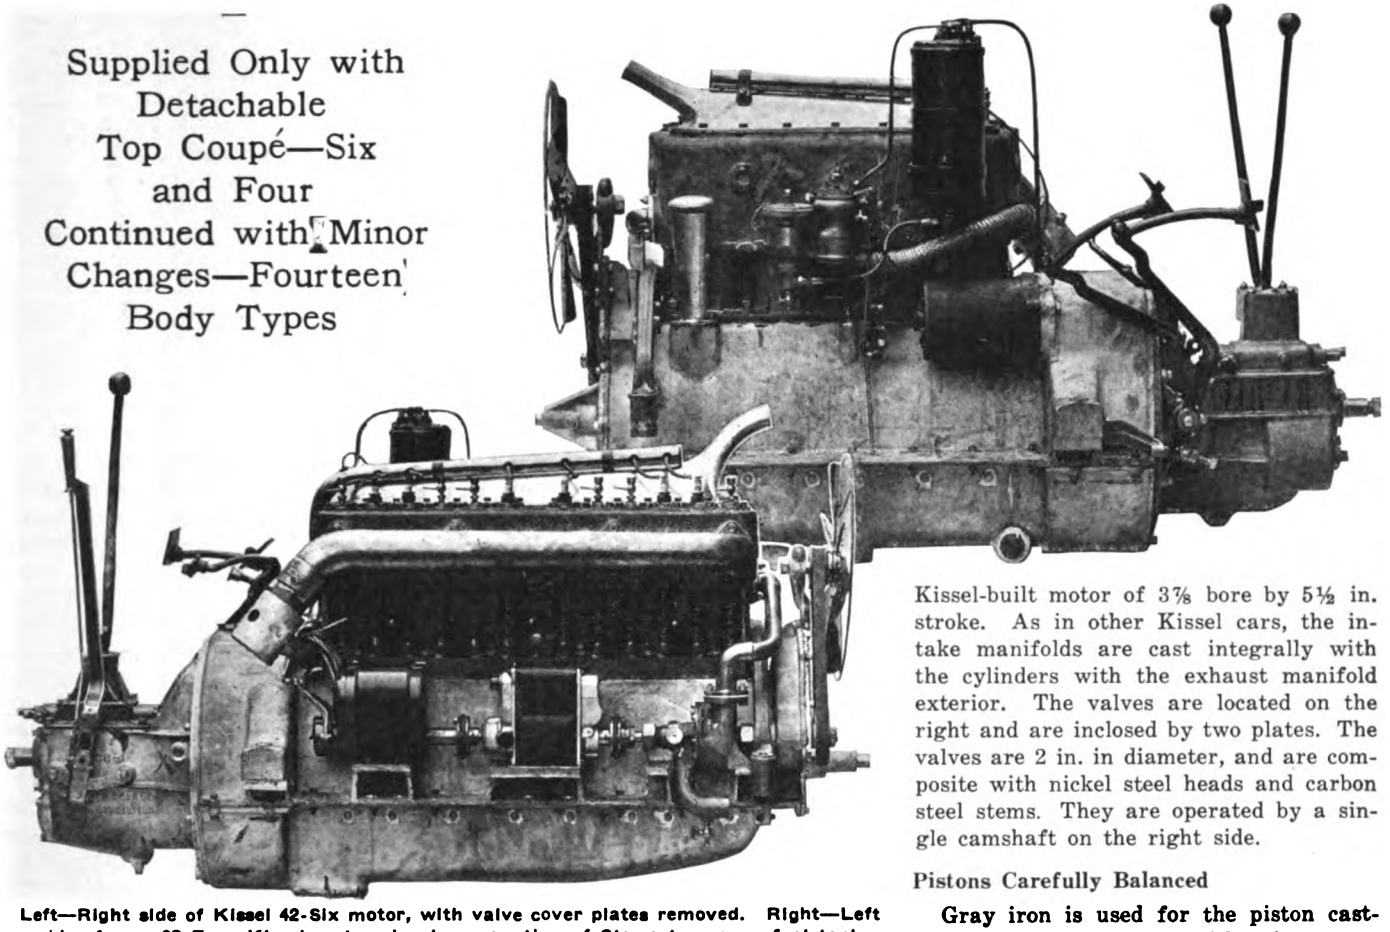
Kissel Adds Four-Cylinder Chassis

Supplied Only with Detachable Top Coupé—Six and Four Continued with Minor Changes—Fourteen Body Types



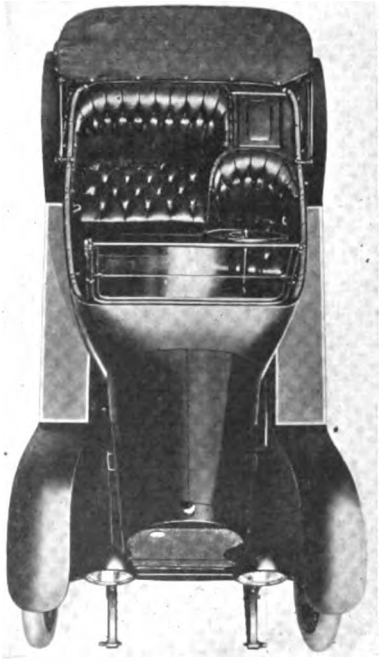
Left—Right side of Kissel 42-Six motor, with valve cover plates removed. Right—Left side of new 32-Four Kissel motor showing mounting of Stewart vacuum fuel tank

PROMINENT features of the line of the Kissel Motor Car Co., Hartford, Wis., for the 1916 season include a reduction in price in the 42-Six and 36-Four models which are continued for this season, and the addition of a new model known as the 32-Four. The all-year car which featured the line for 1915 is continued with refinements, and for 1916 combination touring and sedans or coupés may be had on any of the chassis except the new 32-Four, which is only supplied with the detachable coupé top. The prices are $1,050 for the 32-Four; $1,250 for the 36-Four, and $1,485 for the 42-Six with five-passenger touring bodies on the fours and a seven-passenger touring on the six.

The new four is entirely an added feature this season, while mechanically only slight changes have been made in the 42-Six and 36-Four models. The former has a wheelbase of 126 and a 3⅝ by 5½ motor, while the latter has 121-in. wheelbase and 4¼ by 5½ power plant dimensions.

The New Four

The new 32-Four has a wheelbase of 115 in. It is fitted with a high-speed Kissel-built motor of 3⅞ bore by 5½ in. stroke. As in other Kissel cars, the intake manifolds are cast integrally with the cylinders with the exhaust manifold exterior. The valves are located on the right and are inclosed by two plates. The valves are 2 in. in diameter, and are composite with nickel steel heads and carbon steel stems. They are operated by a single camshaft on the right side.



Kissel four-passenger, the fourth occupying a removable seat on the right. Note storage space behind driver's seat for two suitcases or other baggage or equipment to be carried

Pistons Carefully Balanced

Gray iron is used for the piston castings as for the cylinders. The pistons are required to balance within ½ oz., and the rings, three in number, are of the same grade of iron as the pistons and cylinders, although softer, so as not to wear the walls of the cylinders. The pistons are provided with 1⅛-in. wristpins, which are pressed into the pistons and secured by a set screw and nut. The wristpin bearings are Non-Gran bronze. The connecting-rods are 0.40 carbon-steel, drop forgings, of I-beam section and have their lower bearing caps secured by two 9/16-in. 0.30 carbon steel bolts and castellated nuts. Adjustments can be made at these bearings by removing shims which are placed between the caps and the connecting-rods. The bearing material used at this point is Fahrig metal, 2 in. in diameter and 2⅛ in. long.

Helical Timing Gears

For the crankshaft 0.40 carbon steel is used, the length of the shaft being 30¾ in. The front bearings are 2⅛ by 2½, the center 2⅛ by 2½, and the rear, which takes the side thrust of the starting motor, is 2⅛ by 3¾. The bearings are carried on bridges in the crankcase, which is of aluminum alloy built quite deep for rigidity. The camshaft is made integrally

with the cams finish ground, the shaft being carried on three bronze bearings and driven from a set of helical timing gears of 8¼ normal pitch mounted on a dustproof casing.

Water circulation is positive by means of a centrifugal pump, and the lubrication is carried out by a constant level circulating splash system with the oil reservoir conventionally located in the lower part of the crankcase. The carbureter is a Stromberg and the radiator a cellular Mayo.

Cranking and lighting are by electricity, the starting system being operated by closing the ignition switch and pressing the starting pedal. It is a product of the Kissel engineering force and is so arranged that when the motor is running the lamps are lit directly from the generator. At other times, the current is supplied in the usual way from the storage battery. There are two small lamps for the convenience of the driver, located under the dash, and a dimming switch is provided for the headlights.

A leather-faced cone clutch with adjusting springs under the facing is inclosed in a housing which forms an integral part in the crankcase in the rear of the motor, thus giving a unit power plant, since the gearset is contained within the same housing. The gearset is bolted directly on to the flywheel housing flange in the rear of the crankcase, completing the unit power plant. All parts run submerged in oil and transmit their drive through two Spicer universal joints and shaft to the floating rear axle. This axle is also a product of the Kissel shops. The axle is so constructed that adjustment of the pinion and driving gear can be made without disturbing any other parts. The bearings are Timken and the axle drive shaft of chrome-nickel steel with all the bearing parts running in oil.

The front axles are the same as on the other two Kissel models, being one-piece drop-forgings of I-beam section having 2½ in. depth with special steel spindles heat-treated and ground to 1-in. outside diameter and ½-in. inside diameter fitted with Timken bearings to carry the wheels. Two hardened steel bushings are pressed in each of the spindles and reamed in place to have the bearings fit on the steel knuckle bolt. The spindles are lubricated through holes drilled in the top of the steering knuckle bolts and by a grease cup near the bottom of the steering knuckles.

Both sets of brakes are carried on the rear wheels and are double external. They have 14-in. drums with 1⅞-in. face width using 2-in. lining. The wheels are artillery type with twelve spokes to a wheel. The new 32-Four has 32 by 4 demountable rims, while the larger models have 36 by 4 rims. The chassis frame is pressed steel and in the new model the sections are 4 in. deep, with 1¾ flanges and 5/32 web. The springs are semi-elliptic front and three-quarter elliptic rear.

Steering is by irreversible split-nut and worm. The nut and screw is held in a dustproof case through which grease is introduced. The control levers are mounted in the customary manner on the top of the steering wheel. The gasoline tank is in the rear of the frame, being held in place by two strongly riveted malleable iron brackets. It is of pressed steel and has a capacity of 20 gal. The feed to the carbureter is by the Stewart-Vacuum system.

New Detachable Tops

The new detachable tops are attached by bolting at ten points, at six points to the heavy steel brackets and at four points to the regular top iron of the touring car or roadster. An inverted top iron is used so that when the top is on there is no indication of the parting line between the two halves of the body. The frames of the new all-year tops are built of heavy white ash and elm with mahogany sashes. These frames are covered with sheet steel and aluminum, and the roof is three-ply white wood covered with canvas. The material and construction of the rough are such that warping is rendered practically impossible. In the outfitting these bodies are made quite luxurious, the windows and doors being French plate glass, and there are dome lights, leather trimming, etc. In finishing these bodies they are given seventeen coats and twenty-one finishing operations. The hinges are pressed steel and the lock and window fixtures are of brass.

Fourteen Body Styles

A full line of bodies with complete equipment are supplied by the Kissel company, the inclosed design being the all-year type which provides detachable coupé or sedan top, converting the touring cars to sedans or coupés, as desired. The line of bodies this year is much more complete than for 1915, as with the new model there are now fourteen body styles to choose from, whereas in 1915 nine of these were not built.

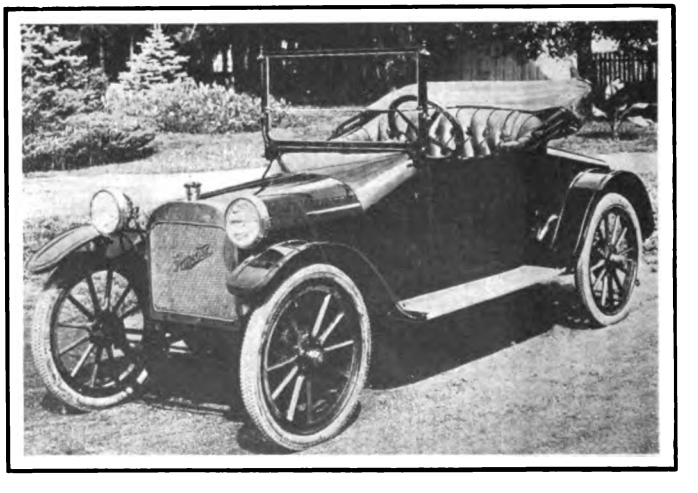
Equipment a Feature of Harvard Roadster

UNDER the name of the Harvard light car, the Pioneer Motor Car Co., Troy, N. Y., is producing the car announced in THE AUTOMOBILE for August 12 and which is illustrated herewith. The car is made with either wood or Spranger wire wheels with demountable rims for standard equipment. The motor is an L-head 2¾ by 4½ in. block with intake and exhaust manifolds cast integrally. The crankcase is aluminum. Inclosed ⅛-in. valves are employed and the carbureter is a Carter fed from a 7-gal. gasoline tank in the cowl. Ignition is by Bosch magneto.

The crankshaft is a one-piece forging carried on two bearings 1½ in. in diameter, the front one being 2 in. long and the rear 2½. The connecting-rod is an I-beam with the lower bearing Babbitt-lined 1½ by 2 in. The piston pin is ¾-in. diameter with a 1 7/16-in. bearing. Lubrication is by the splash system.

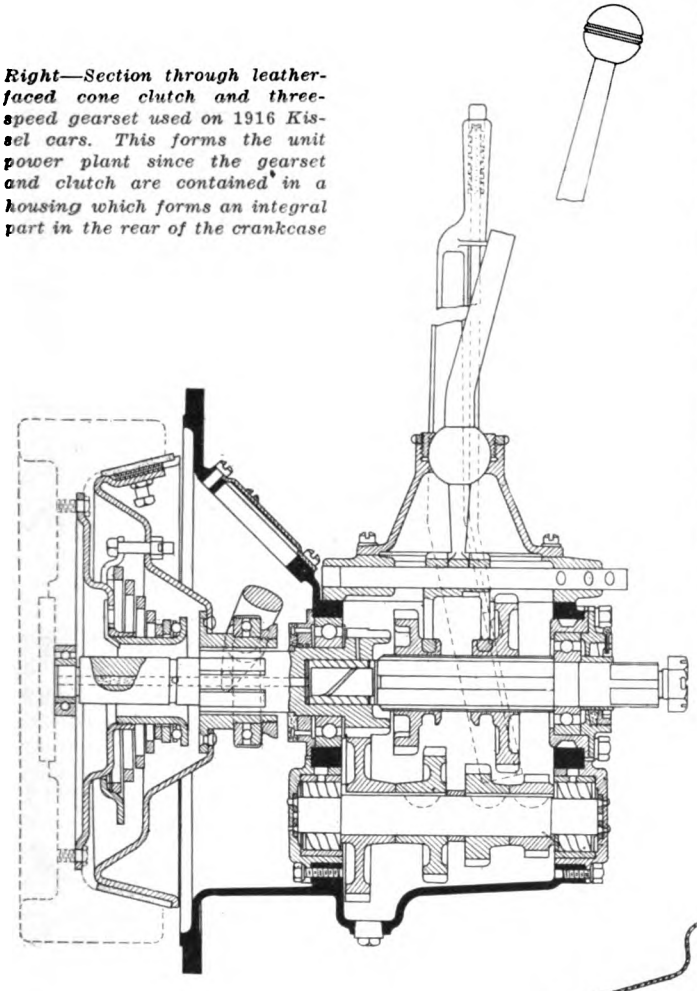
The clutch is a multiple-disk faced with Raybestos and the gearset provides three speeds. It is mounted in a unit power plant housed within the crankcase extension. From the gearset the drive is taken through a Blood Bros. universal and inclosed propeller shaft set to a roller and ball semi-floating rear axle. The springs are quarter elliptic front and rear.

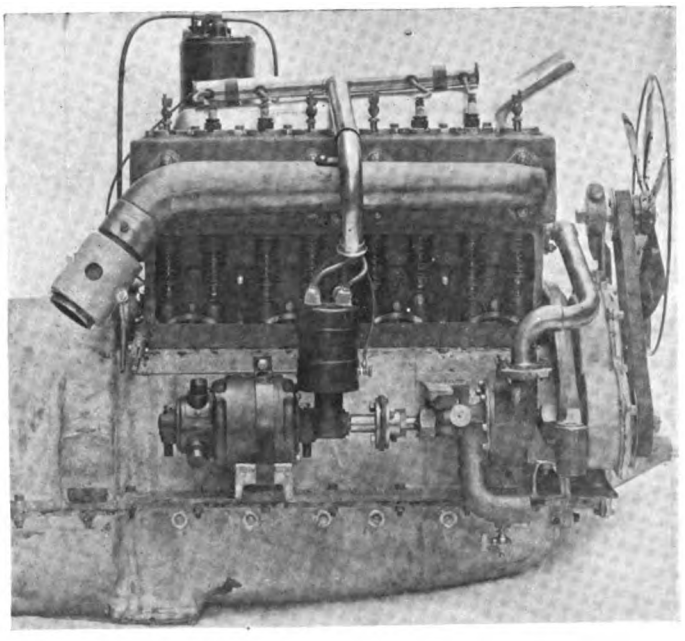
Other specifications of the car include 100-in. wheelbase, 44-in. tread, double set of brakes, sheet steel body, 28 by 3 in. wheels with clincher tires and full equipment providing electric lighting and starting, Pantasote top, Klaxet horn and a complete tool and tire equipment with speedometer, windshield, etc. The speed is given as from 4 to 40 m.p.h. and the price $750.



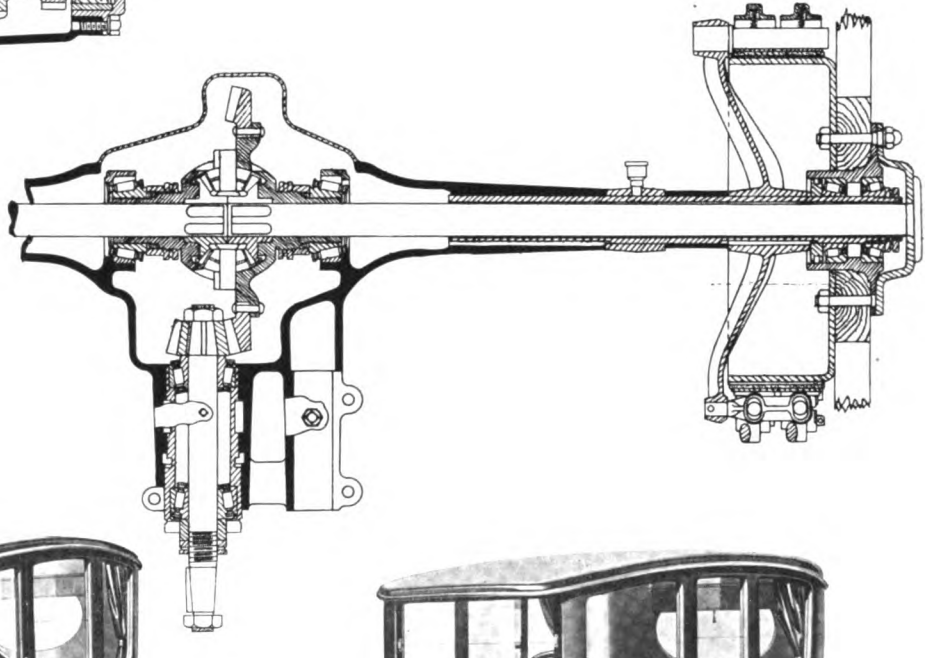
Harvard roadster which sells for $750, fully equipped

Right—Section through leather-faced cone clutch and three-speed gearset used on 1916 Kissel cars. This forms the unit power plant since the gearset and clutch are contained in a housing which forms an integral part in the rear of the crankcase





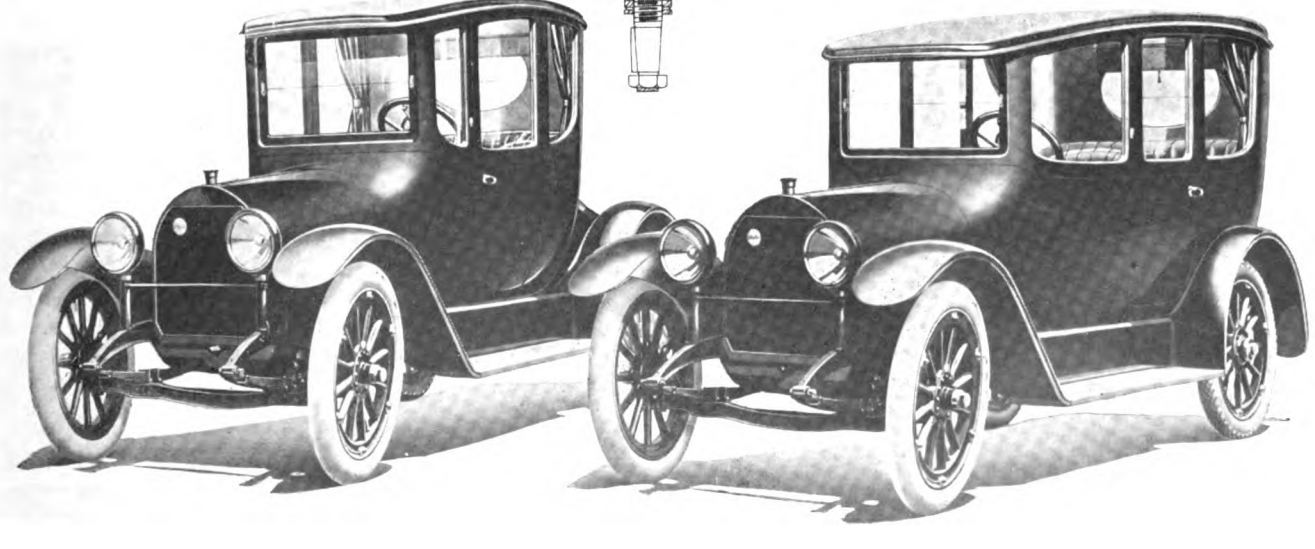
Above—Right side of new Kissel four-cylinder motor, with valve cover plates removed. Note mounting of wiring and Stewart vacuum fuel tank



Right—Section through Kissel floating rear axle. The adjustment of the pinion and driving gear can be made without disturbing any other parts

Below at left—The 36-Four roadster with detachable coupé top detached. It sells for $1,550

Below at right—Detachable top mounted on a Kissel 36-Four chassis, and listing at $1,600



Axle Design for Accessibility and Strength

Requirements of Bending Stresses, Load Carrying and Driving Torque Met by Various Bearing Arrangements —Floating and Semi-Floating the Two Basic Types

(Published in response to numerous requests for information.)

TWO important duties must be fulfilled by the rear axle of the car. First, it must sustain the weight of the rear end and, secondly, it must take the driving stresses which are developed in the propulsion of the car. These two duties are fundamental and have to do with the ability and performance of the car to such a degree that the design of the rear axle becomes of pre-eminent importance in the development of the vehicle.

Three types of axle have come to be practically universally used throughout the field of American cars during the past few years. They are known respectively as the floating, semi-floating and three-quarter floating. These axles each have inherent qualities of their own both in function and design which render them different from one another as regards their performance in the car, yet in spite of frequent explanations as regards the difference between them it is still a source of misunderstanding upon the parts of those who read the specification tables with an idea of learning something about the car which they intend to purchase.

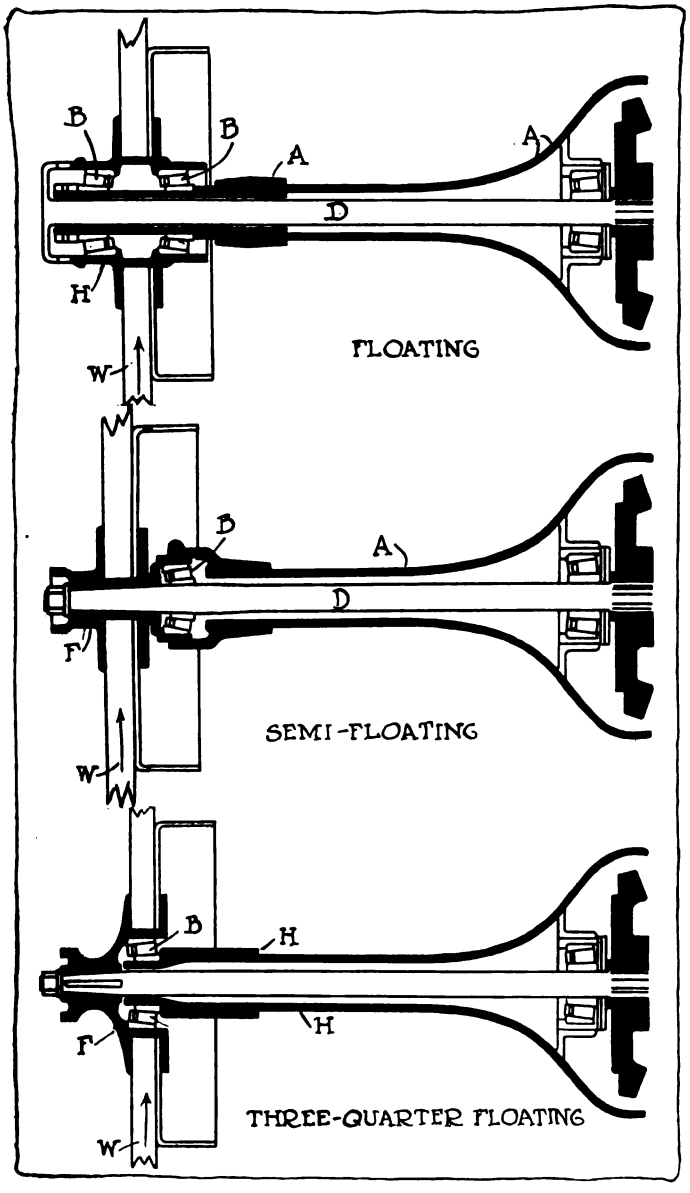


Fig. 1—Diagram showing principles of construction in Timken floating, semi-floating and three-quarter floating design

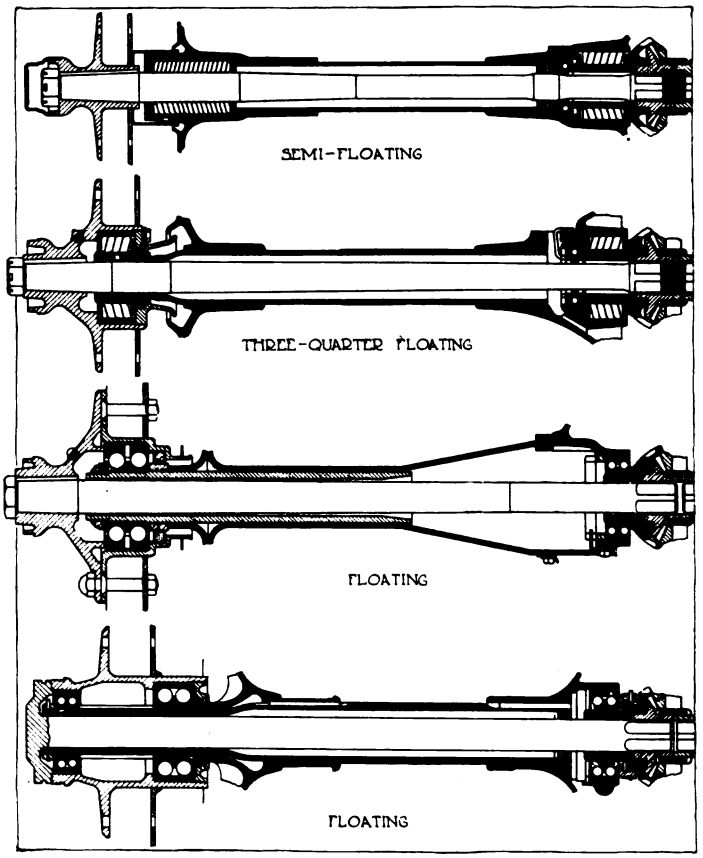

Fig. 2—Four representative types of Weston-Mott rear axles

Fundamentals of Design

In studying the fundamentals of design of the different types of axle it will be noted that the differences have been caused mainly by two desires: First, to separate the weight carrying and propulsion and bending stresses, and secondly, to make the axle accessible. Strength and accessibility have been the two main requirements and an investigation will show how they are met in each type.

The practice of naming the type of axle in the specifications of the car has often caused the non-technical owner to wonder what is really meant and also owners who, technically

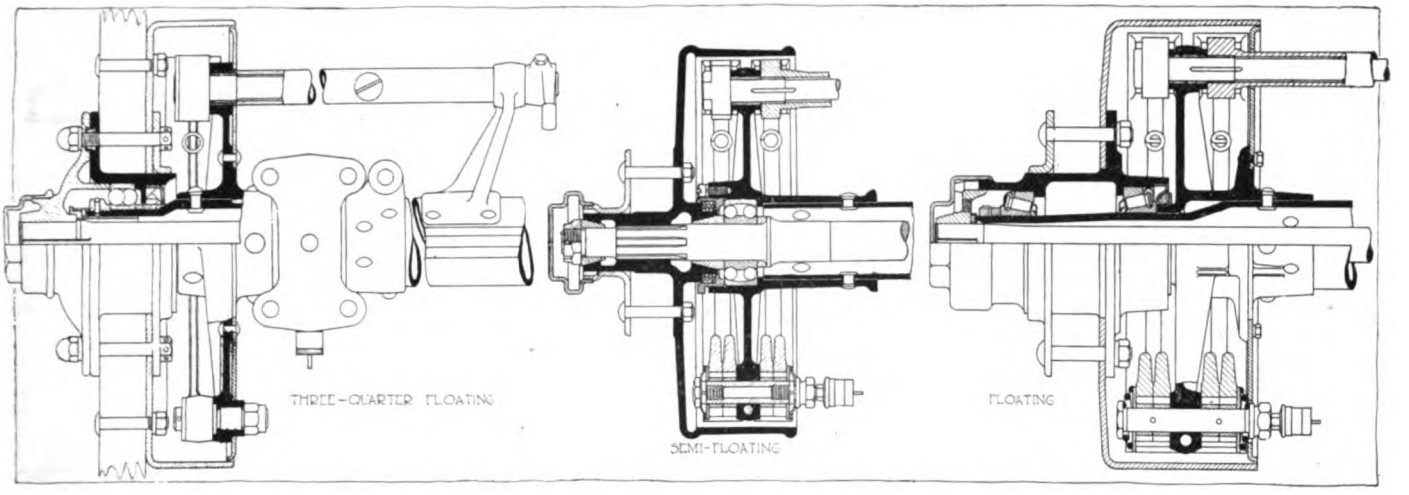

Fig. 3—American Ball Bearing Co.'s three-quarter, semi and floating rear axles showing bearing arrangements at hub

informed on other parts of the car, are not clear as to what the difference in construction really means. The Timken Axle Co. has provided diagrammatically an example of all three types from which it is very easy to see the fundamental differences. These three are shown in Fig. 1. The upper illustration being that of a floating axle or as it is sometimes called, full-floating; the center figure is a semi-floating and the lower figure is three-quarter floating.

Studying these three diagrams the differences of construction are immediately brought out and bearing in mind the statement that the axle has two important duties to perform, the reason for the existence for each may be found. Taking the floating axle first, and studying it from the standpoint of a weight carrier, it will be noted that the force *W* which represents the reaction of the ground upon the wheel in supporting the weight of the car, is transmitted through the wheel to the hub *H* and thence to the axle housing *A* through the bearings *B*. It will be seen that the driveshafts *D* do not carry any of this weight.

Observing this axle from the other standpoint, that of a driving mechanism, it will be seen that the driveshaft *D* has nothing to do but to transmit this torque to the road wheels. From this the axle secures its name floating, as it is free within the housing. When rounding a corner there is an enormous bending stress on the rear wheels and none of this stress falls upon the driveshaft but instead is transmitted through the bearings *B* to the housing *A*. In other words, every stress that the axle is called upon to endure save that of driving the wheels in propelling the car is taken by the axle housing.

The Semi-Floating Type

In the semi-floating axle a different set of conditions prevail. Here it will be noted the rear wheel in carrying the load *W* transmits this load through the flange *F* to the shaft *D* through which the load is transmitted by the bearings *B* to the axle housing *A*. A certain amount of the load carrying stress is borne by the driving shaft in this type of axle, as the portion which extends beyond the bearing *B* is fixed in the hub of the wheel and hence must receive the load. In transmitting the driving stress or torque, the driving shaft turns freely within the housing, the drive being through a connection of the shaft and the hub to which it is fixed. The

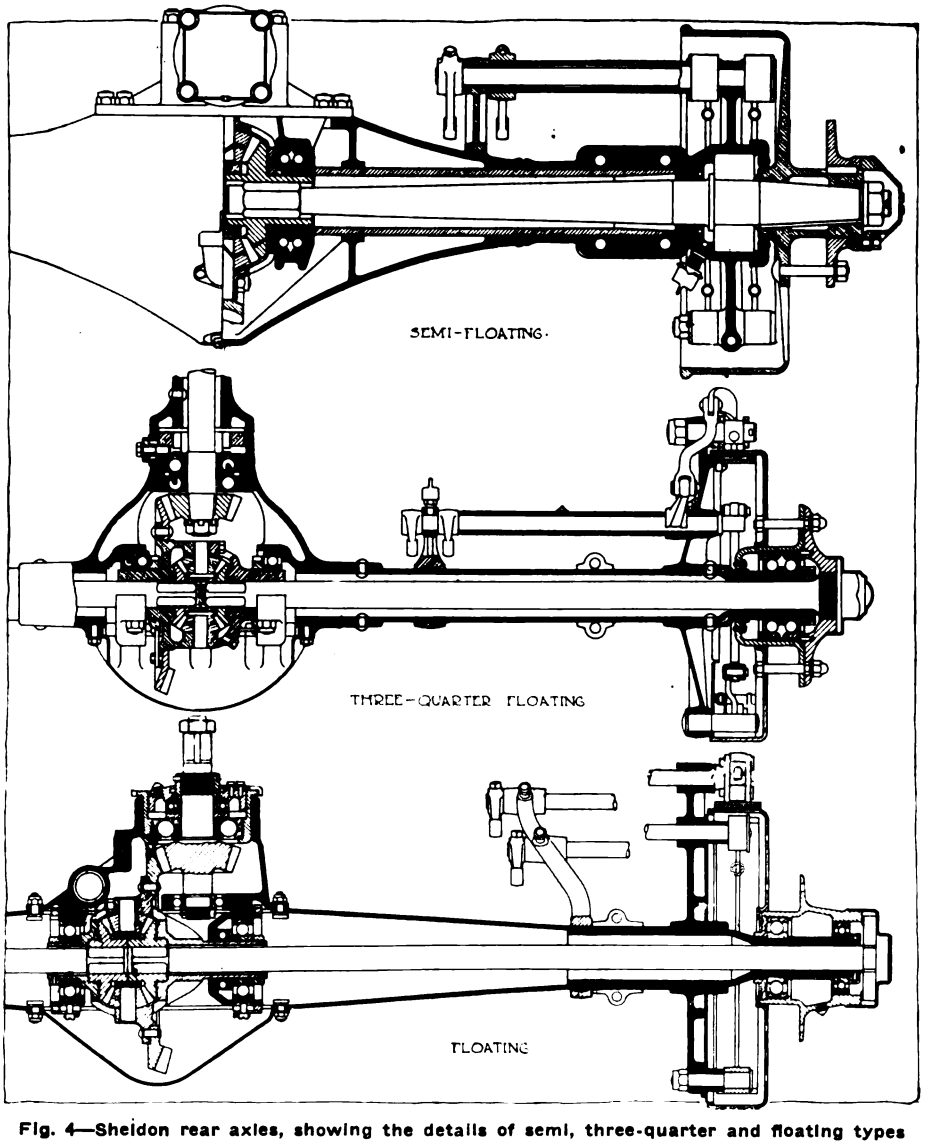

Fig. 4—Sheidon rear axles, showing the details of semi, three-quarter and floating types

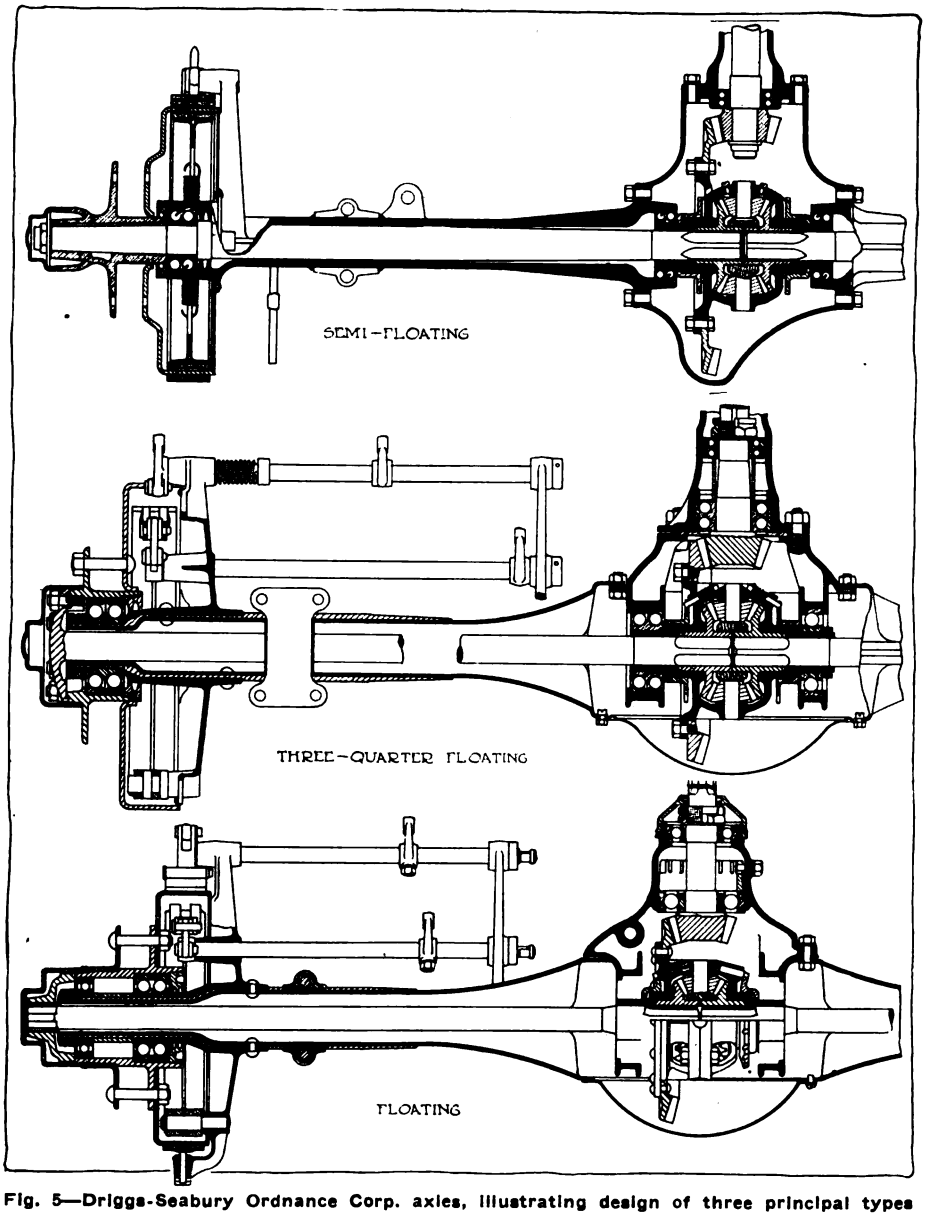

Fig. 5—Driggs-Seabury Ordnance Corp. axles, illustrating design of three principal types

bending strains are also received by the portion of the axle which projects beyond the bearing *B*.

The Three-Quarter Floating

The third type of axle, the three-quarter floating, employs the construction which is in many respects closely similar to the semi-floating. The load stress *W* is transmitted directly through the flange *F* to the bearing *B* and the housing *H*. Practically all the weight, therefore, is transmitted to that portion of the housing which extends into the hub. The bending and driving stresses are taken practically entirely by the drive shaft, some of the bending possibly being absorbed through the housing. Where a single bearing is used under the center of the wheel the disposition of the stresses becomes practically the same as in the semi-floating axle.

Advantages of Each

These are the three methods used to meet the requirements demanded of an axle and from what it has been said, the advantages of each type are quite evident. In the floating design, the shafts can be easily removed for repairs, all it is necessary to do is to withdraw them from the housing by pulling them out. Thus the claim of accessibility is that most frequently mentioned in connection with floating axles.

The claim for the semi-floating and three-quarter floating is that they can be made to accomplish the work readily although having lighter proportions. The reason for this is apparent when the wheel bending or skidding stresses are considered. The bearings which take the stress caused by rapidly rounding a corner in the floating axle are those on either side of the wheel mounted upon the housing. Since these are located in this particular position, they must be fairly close together, requiring good bearing strength to compensate for the large moment which is exerted against them.

In the other type of axle, where the bending stress is taken through the driveshaft, it will be seen that the axle shaft tends to fulcrum about the outer bearing and to rest against the inner bearing in meeting the stresses. In other words, the inner bearing is the power in a lever of the first class which fulcrums about the outer bearing for the purpose of withstanding the bending stresses. Both bearings do the work. The resistance to the load on the outer bearing is taken in the same way as a man lifting a heavy stone by means of a crowbar, resting the bar over a small rock as a pivot and pressing down on the handle. The analogy is complete if the load to be lifted is considered as the bending force on the wheel, the small stone acting as a pivot or fulcrum is the outer bearing, and the force applied on the handle of the crowbar is the same as that applied by the inner bearing on the inner end of the driveshaft.

All Types Manufactured

These are the two schools of axles which broadly cover all three types. They are all satisfactory and do their work in the manner intended, and it is found that most axle factories make all three types to suit the wishes of their customers, which are largely the factories turning out the finished cars.

To give examples of the different kinds of axle and the methods by which prominent manufacturers meet the peculiarities of design necessary with the different types of construction, details of the Weston-Mott, American Ball Bearing Co., Sheldon and Driggs-Seabury axles are illustrated.

Weston-Mott Construction

In Fig. 2 the axles made by the Weston-Mott Co., Flint, Mich., are shown. The upper view illustrates a typical semi-floating design carried on roller bearings. Below that is a three-quarter floating design with the bearing mounted in the hub as described in previous paragraphs. The upper floating design is a single bearing outfit which is similar in many respects to the three-quarter floating, having the bearing in the hub of the wheel. In other words, it forms a sort of compromise between the three-quarter floating axle illustrated above and the floating design shown below. It is claimed that this type of axle has all the advantages of the floating design with the only exception that the axle shafts help to steady the wheels in connection with the hub bearing against bending stresses. The shaft can be removed without jacking up the car.

The construction of the product of the American Ball Bearing Co., Cleveland, Ohio, is shown in Fig. 3. The three-

quarter floating is shown to the left and, as will be noted, a single bearing of the double row self-aligning type is used here. It is mounted on the axle tube which thus carries most of the weight of the car. The semi-floating is in the center and is also provided with a single double-row self-aligning bearing which in this case is mounted directly on the shaft. The floating design has the hub carried on two taper roller bearings mounted on the axle tube as far apart as possible to provide the resistance to bending stresses caused by ruts, curves or curbs.

Sheldon Axle Practice

Referring to Fig. 4, the products of the Sheldon Spring & Axle Co., Wilkes-Barre, Pa., are shown in section. The top drawing is the semi-floating axle. The driveshaft carries the load of the vehicle besides the driving and bending strains and is securely fastened to the hub, thus guarding against the development of looseness at the rear wheel which consequently shows itself in the wobble of the rear wheels. The bearings which support the axle shaft are shown. The outer bearing is not shown in section but may be noted just inside the wheel flange. The inner bearing is shown in section and is just outside the differential. The bearing spread, as will be noted, is practically half the width of the car.

The center drawing in this illustration is the Sheldon three-quarter floating. In this the driving axle not only takes the driving or torsional strains but also maintains the alignment of the wheels. Here it is seen a large bearing and a heavy shaft are used to take care of the conditions which arise with this axle. The bearing must carry all the stresses due to pressure on the rim of the wheels and therefore is of good size.

The lower drawing shows the Sheldon floating design. The outer extremity of the axle tube supports the entire weight of the car through the two annular ball bearings in each hub mounted on the tube. The bearings, as will be noted, are designed to take care of the bending stresses by being heavy although close together as in all axles of this type.

Driggs-Seabury Axles

In Fig. 5 are shown the three types of axle as manufactured by the Driggs-Seabury Ordnance Corp., Sharon, Pa. The upper view showing the semi-floating design illustrates an axle which is typical for this class. This type of axle is used on cars from the cheapest to the most expensive, the axle consisting of a shaft squared or splined at the inner end and the outer extremity mounted in a bearing at the end of the axle tube. While this type of axle is not so accessible as the floating it is easy to remove by first taking off the wheel and then the bearing retaining nut. In other designs for all priced cars as a rule, it is sometimes necessary to remove the entire axle from the car, taking the bolts out of the center housing flange, removing wheel and then disassembling the differential, etc.

According to the Driggs-Seabury Co., this type of axle will rarely give trouble if designed with a factor of safety of 8 to 10. This would provide a large diameter of shaft in the outer bearing tapering toward the inner end where the shaft fits into the differential and reduced again at the outer end to take the taper of the wheel hub.

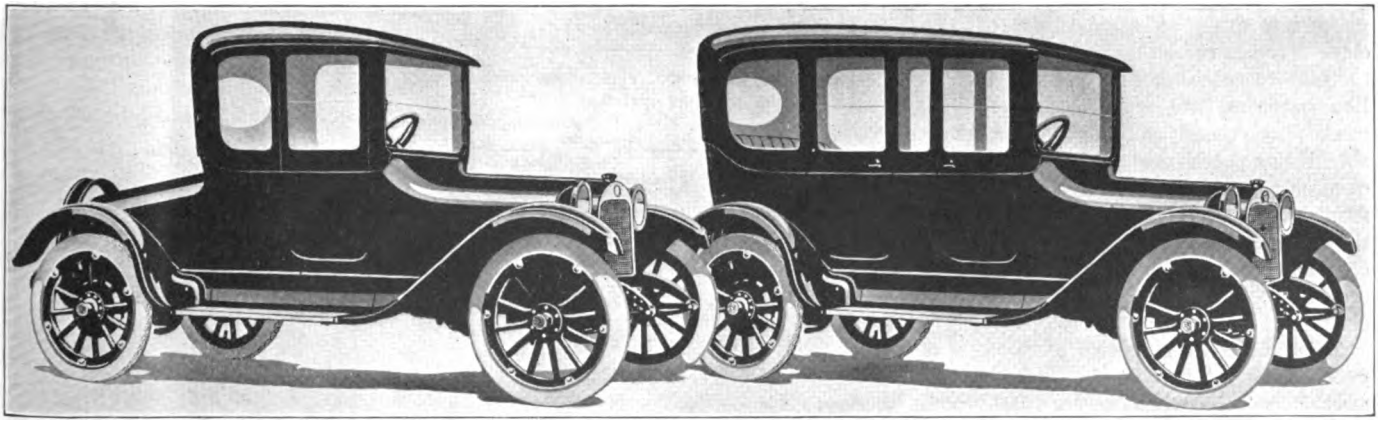
The three-quarter floating is also a typical design of its class, and with this type to remove the axle the bolts are taken from the axle flange and the axle drawn from the housing without jacking the car. The axle flange can be either forged integrally with the axle or be a separate flange, drawn up on key and taper formed on the axle.

The floating axle shown at the bottom of the illustration is mounted in the usual manner on two bearings on the axle tube. It is self-sustaining for both radial and transverse loads, with or without axle shafts in place. Hence the car could be held any distance with the axles removed. The claim of accessibility possessed by this axle is its strong point and, as may be noted, the axle shaft can be drawn directly from the housing.

The entire axle situation is one of interest as it is a part of the car which it is desirable to have as immune from breakdowns as possible, and it is one upon which a great amount of study has been put for this reason. As regards the desirability of the types there is still a difference of opinion with most engineers leaning toward that type in which the bending stresses are taken care of by a wide bearing spread.

An interesting view held by some is that there are no full-floating types of axle on the American market. According to these engineers, the average American's idea of a full-floating axle is one in which the driveshafts can be removed without the necessity of taking off the wheels. This, it is pointed out, is erroneous, as in an axle which has the driveshafts rigidly bolted to the wheels no floating is possible, whether the axle shafts are mounted in the housing or not.

Dodge Bros. Bring Out Demountable Tops for Touring Car and Roadster



DETROIT, MICH., *Sept. 4—For the winter trade Dodge Bros. are now beginning to supply their distributors and dealers with the first of the new winter cars. As far as the chassis, motor and other constructional features are concerned, there is absolutely nothing new from the current Dodge model. The novelty consists in a demountable top which is furnished in addition to the regular roadster or touring body. This top is attached to the car body and does not disturb in any way the windshield. It can be entirely removed in summer and the ordinary mohair top, which is furnished as a part of the regular equipment with the winter car, substituted. A semi-open car can be made out of the winter car by removing the window glasses, side panels, front posts, etc. Either with a roadster or touring body the winter Dodge car will be sold with the usual complete equipment at* $950.

ACCESSORIES

Heco Horn for Fords

A SPECIAL vibrator horn for the Model T Ford car is the Heco. This horn utilizes the power generated by the flywheel magneto of the Ford and the connections are made as shown in the illustration. One wire terminal connects to the magneto and the other is grounded. As no two flywheels generate exactly the same amount of current, it might be supposed that the tone of the horns will vary with the car on which each is installed. To overcome this difficulty, the Heco has been fitted with a special adjustment for equalizing the energy developed from the magnetos, and is said to produce a uniform sound volume, no matter what the current supplied.

Strong claims are made for the extreme simplicity of the horn, which consists essentially of a magnetic vibrator which strikes the sound diaphragm to produce the sound. All vibrating points are made substantially of tempered tool steel against wear.

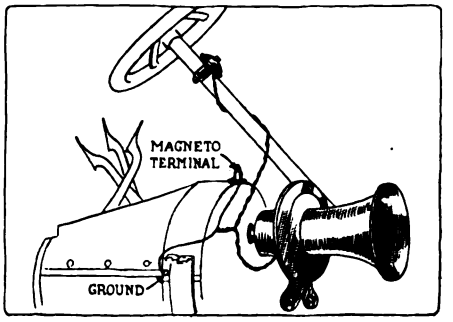
The horn is supplied complete with push button, wiring, screws and directions for attachment. Once the horn is in place it is a simple matter to adjust the tone to the desired pitch. After making the simple connections shown in the sketch, the engine is started running, and the push button held down. While doing this the milled adjusting nut on the rear of the horn is turned until the tone suits the user. The price of this horn is $3.50.—Heinze Electric Co., Lowell, Mass.; sales offices, Detroit, Mich.

Vanguard Windshields for Fords

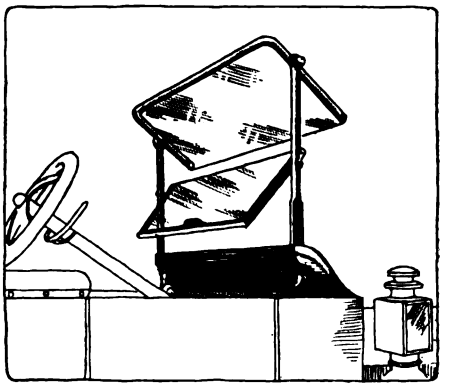
To improve the appearance of the older Ford cars with straight dash and to get away from the abrupt transition between body and hood, the Vanguard rain-vision and ventilating windshield has been designed. With it is combined a cowl shield to fit over the front of the top of the body, thus giving the appearance of a cowl dash. This combination is called the DeLuxe cowl shield for Fords and sells for $15 for either touring car or roadster.

This shield, for which patent was granted Dec. 29, 1914, is made in two sizes, one 42 in. wide for the 1913 Model T Ford, and the other 40 in. wide for the 1914 model as well as all the 1915 Fords that came equipped with the zig-zag shield. Like all rain-vision and ventilating shields, the upper half can be adjusted to any position and locks automatically, while the lower half opens inward as desired. A rubber weather strip, attached to the botom rail of the shield, makes the lower half rain and wind proof.

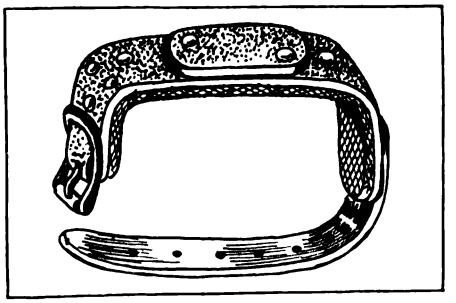
The cowl and metal parts are finished in black enamel and nickel trimmed. The attaching brackets and clips are adjustable. It is claimed that anyone can attach the device in a short time. — Vanguard Mfg. Co., Detroit, Mich.



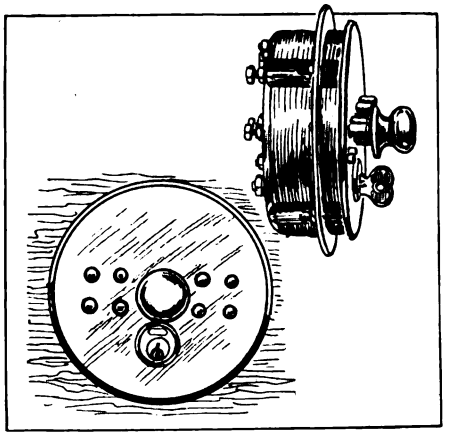
Heco magneto-driven fan for Fords, showing wiring connections



Vanguard windshield and cowl dash for Fords of the older type with straight dash



Leather Tire Goods Co. strap-and-pad oiler for leaf springs



Strap-and-Pad Spring Oiler

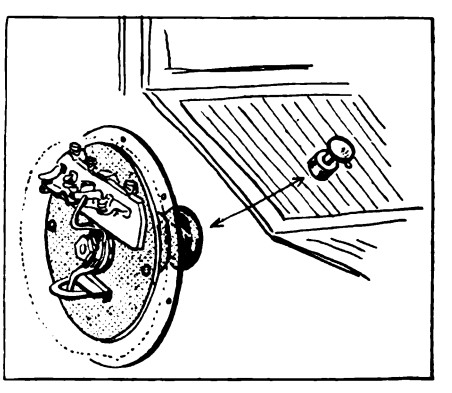
This is a leather strap passing around the leaf spring and held by an ordinary buckle, the strap being lined with a pad of wicking which retains oil and feeds it out to the interstices between the leaves. A hole in the strap is provided for inserting the oil-can spout to recharge the pad; a leather cover excludes dust and though it is stationary, the can spout is easily pushed under it. The leather is treated to prevent oil absorption. Two straps are required for each Ford spring, two for a semi-elliptic and four for a full elliptic spring. Price 25 cents each.—Leather Tire Goods Co., Niagara Falls, N. Y.

H-P-B Dimmer Switch

A dimming switch designed for installation on the dashboard so that it can be operated with the foot, obviating the necessity for taking the hands from the steering wheel is the H-P-B. The lights may be dimmed by throwing them in series or by connecting a resistance in the circuit, the switch being adapted to either arrangement. Installation is a simple matter. Price $2.—H. P. B. Electric Co., Inc., New York City.

Pittsburgh Five Searchlight

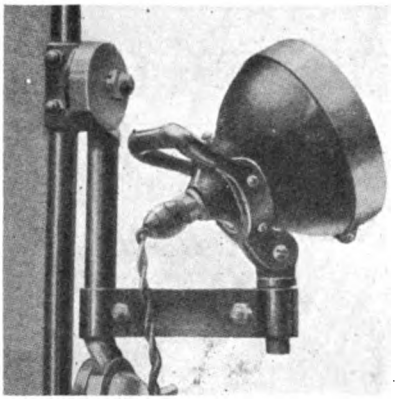
The Pittsburgh Five searchlight is provided with an outside set screw focusing adjustment, which permits the use of any style lamp, either Mazda or nitrogen, regardless of size or voltage, and makes it possible to adjust the lamp instantly for any kind of beam without disturbing it in any way or removing it from its position. Due to this accessible adjustment, the lamp may be transferred from one car to another of different



Above—H-P-B foot-operated dimming switch
Left—Two views of the H-P-B circuit lock

voltage at will. It also enables the user to select a bulb to suit his requirements and in case of accident to use any available bulb as a renewal. Should it become necessary to use the searchlight to take the place of the headlight, the width of the illuminated field can be increased as desired.

Another feature is the double curvature parabolic reflector which though only 5 in. in diameter is said to produce as much beam candlepower as any large headlight, with even distribution of light. The handle serves as a stand for holding the lamp in an upright position when detached for repairing tires, etc.—Pittsburgh Electric Specialties Co., Pittsburgh, Pa.

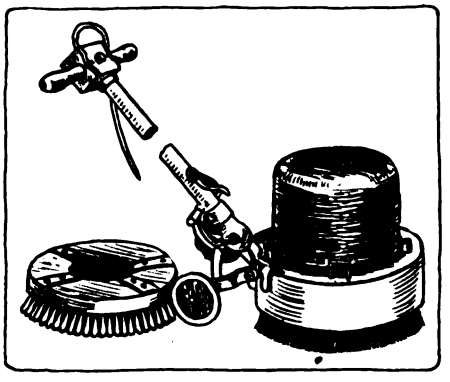


Pittsburgh Five searchlight which is easily adjustable for varying voltages

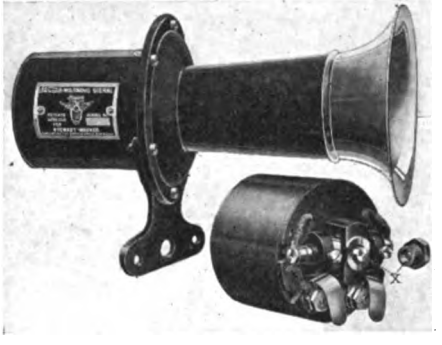
Stewart Motor-Driven Horn

A motor-driven warning signal is the latest addition to the Stewart accessory family. The motor is very simply arranged, with the ratchet rotor on the end of the armature shaft and bearing directly against a stirrup on the diaphragm. This arrangement provides a very simple and direct mechanism for producing the sound. A feature of the instrument is that the motor is completely assembled in itself and can be slipped directly into the housing of the warning signal. With this arrangement, the bearings are always in alignment and the friction and resistance are cut to a minimum. The front bearing at the rotor end is a bronze bushing while at the other end there is a ball thrust *X* as shown in the illustration. The lubrication of the instrument is taken care of by a ball oiler which provides a passage directly to the armature shaft.

Some of the advantages claimed for the instrument by the manufacturers are light weight, high speed with small amperage, water-tight winding, firm fastenings to resist centrifugal force, hard drawn copper commutator and the winding which is so arranged as to provide maximum saturation of the fields. The tone of the signal may be adjusted by a sounding button in the center of the diaphragm. The button provided with the warning signal is quite large, being mushroom like in shape and covering the entire top of the holder so that when it is desired to press it, there is no danger of merely pressing on the switch frame. Price, $7.50.—Stewart-Warner Speedometer Corp., Chicago, Ill.



Utility floor machine which is electrically operated and is especially suited to cleaning garage floors



Above—The new Stewart motor-driven horn which sells for $7.50. Below—Part section of the motor which drives it. X is a ball thrust

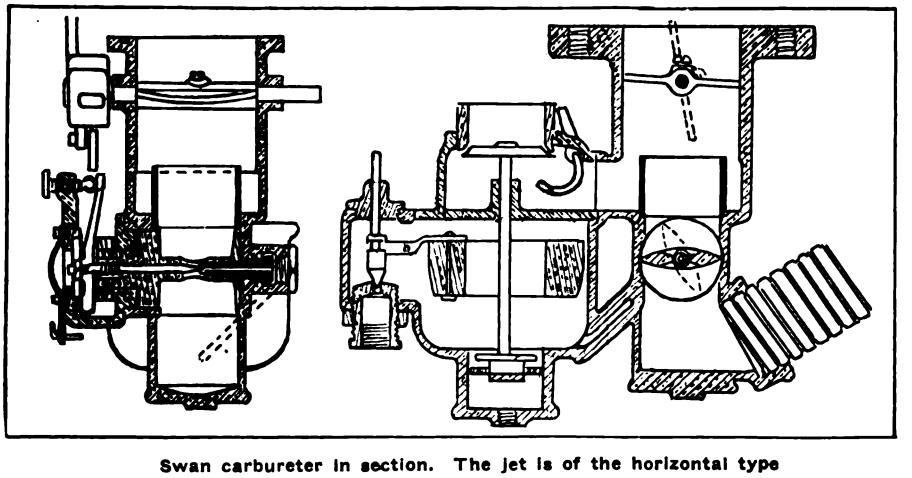
Utility Floor Machine

An electrically operated apparatus which scrubs floors at the rate of 2000 sq. ft. per hour and polishes waxed floors at 2500 sq. ft. per hour is the Utility floor machine. This will scrub, sandpaper, polish and otherwise treat floors of all kinds, being provided with a steel wire brush for rough surface floors, a palmetto brush for the smoother variety and a black tampico brush for polishing wax surfaces, with a sandpaper disk for wood and cork tile floors. The Utility machine is especially suited to garage work, as it cleans the most difficult floor surface in a thorough manner, and an ordinary porter can quickly learn to operate it.

For scrubbing, the cheapest of pure grit powders costing about 1¼ cents per pound can be used. The machine carries a 1/6-hp. motor and drives the brushes through reduction gears. Four types of motors are built, 110-volt alternating, 110-volt direct, 220-volt alternating and 220-volt direct; the alternating current motors are for 60 cycles, single phase. Control is by a flush switch in the tubular steel handle which has a toggle joint and adjustment so that the operator may vary the angle. Ball bearings are used throughout and the weight is but 45-hp. Current is obtained from any lamp socket.—Vacuna Sales Co., New York City.

Swan Carbureter

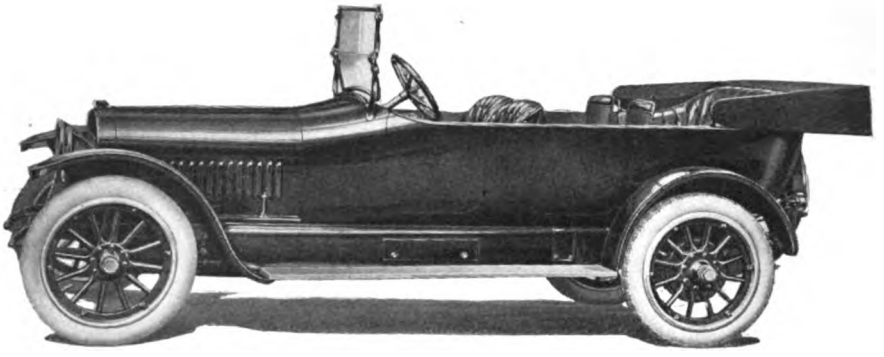
Accurate adjustability and simplicity of construction are the main feature of the Swan horizontal jet carbureter. The float chamber is offset from the mixing chamber; a single passage carries the fuel to the jet which is horizontal and opens into the middle of the mixing chamber and is controlled by a needle-valve projecting from the opposite side of the mixing chamber and interconnected with the throttle. Thus the gasoline supply is increased or diminished with the throttle opening. The air passage at the nozzle is sufficiently high to break up the gasoline. An automatic valve above the float chamber supplies auxiliary air, the auxiliary valve stem being extended downward and terminating in a piston which works in a dashpot in the bottom of the float chamber, preventing fluttering and too rapid opening and closing. The ratios of openings are adjustable and the gasoline flow can be adjusted to any throttle opening. A special model is made which is adapted for use on Ford cars.—Swan Carbureter Co., San Francisco, Cal.



Swan carbureter in section. The jet is of the horizontal type

Davis Line Is Four, Two Sixes and Twelve

New Bodies the Feature— Design of All Cars Similar — Continental Motors Used— Revised Four $70 Lower in Price



Davis six-cylinder, seven-passenger touring car which sells at $1,495

THE George W. Davis Motor Car Co., Richmond, Ind., will continue to market a line of cars made of standard units but for 1916 the bodies are entirely new on all models, and one of them, the four-cylinder, has received slight changes otherwise, and a price reduction of $70, making it $1,165. The model 6-50, which was listed at $2,150, has been discontinued. The 1916 line consists of the improved four, a five-passenger six at $1,250, a seven-passenger at $1,495 and a twelve in the same chassis at a price under $2,000, but as yet undecided.

Design of All Models Similar

All Davis cars are alike, insofar as the make and design of their component parts are concerned, the motors being Continentals, the clutches and gearsets Warner-Muncie, axles Weston-Mott, universals Hartford, steering Warner, etc. The differences lie mainly in the dimensions. The $1,250 six has a 120-in. wheelbase, 34 by 4 tires and a 3¼ by 4½ motor, while the larger six has a 3½ by 5 motor, 124-in. wheelbase and 34 by 4½ tires.

Four Has Delco System

The improvements in the four-cylinder model consist of the adoption of Delco cranking, lighting and ignition, the shifting of the fuel tank from under the seat to the rear and the fitting of a Stewart vacuum gravity gasoline feed, a new windshield and one-man top, a new type of rear axle and a new body. The wheelbase remains at 112 in. and tires 34 by 4.

It is in the Davis bodies that a departure has been made from ordinary practice. The front seats now are divided and both seats are movable, that for the driver being mounted on a track, so that the seat may be slid back and forth to meet the driver's needs and that of the other passenger is mounted on a revolving base. This makes a most convenient arrangement, for the front seat passenger may turn his seat in any direction from straight forward to backward.

Bodies are Roomier

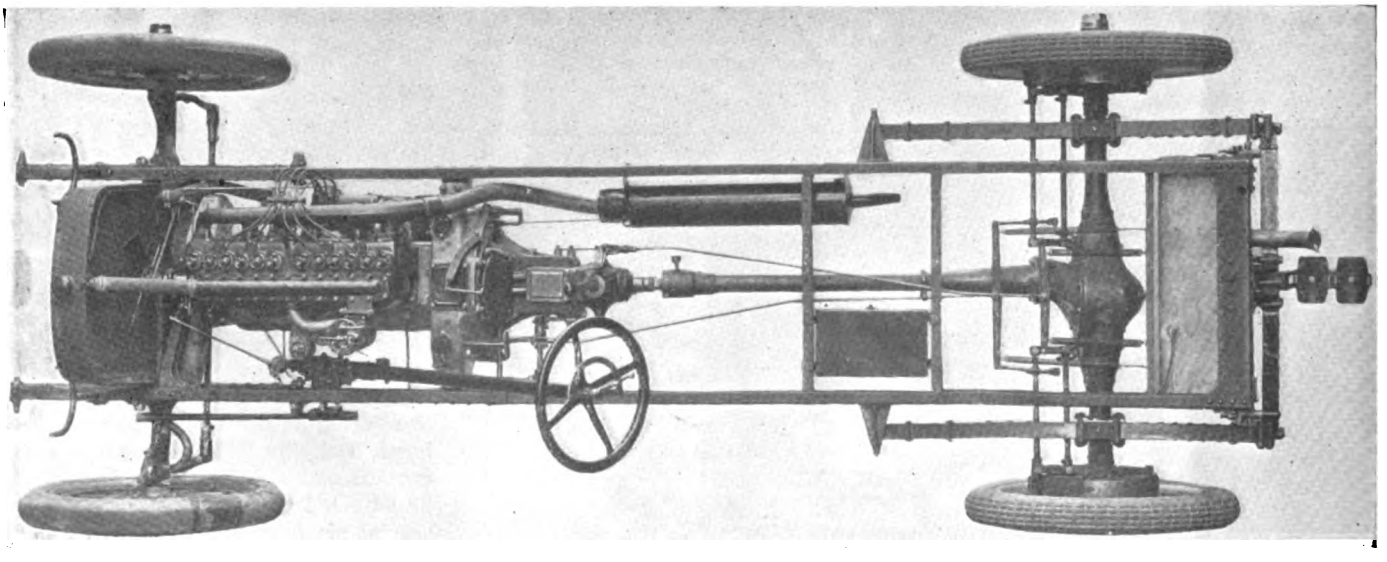
The bodies are roomier than those of 1915, have better lines and use metal molding instead of wood. The doors are flush and now are hinged at the forward end. A new Neverleek top with Handy curtains, made by the Davis company, is used.

The five-passenger six uses the new model 7W Continental motor. The motor accessories are a Stromberg model HB carbureter, Delco electrical apparatus and Stewart fuel feed. The power plant uses a cone clutch and three-speed gearset driving a shaft, with Hartford universal joints to a floating type of rear axle.

The larger six has exactly the same design of units but uses the 6N Continental motor and running gear parts of larger size and greater strength.

Twelve Like Bix Six

The twelve-cylinder model will be exactly like the large six except, of course, for the motor, which will be a Continental 3 by 4 with valves in the head. Details of this motor have not yet been made known.



Chassis of Davis six for 1916, showing mounting of the new Continental motor with Delco electrical units

A Battery Alarm

IN not properly attending to their cars many motorists are extremely remiss, though they are much better mechanics on the average than many people would have it believed. Judging by the comments of service men, it seems that one of the most frequent lapses on the part of owners is that of forgetting the need to add water to the storage battery except at too rare intervals. It is a natural enough mistake, because the battery is commonly so well concealed that, so long as it continues to do its work, its very existence can be forgotten, and the modern storage battery will withstand an amount of ill usage which is amazing when the shortcomings of the ignition batteries of 1906 are remembered.

Since it seems that this neglect to water the battery is really somewhat serious as a service trouble, it suggests the opportunity for some ingenious inventor to devise a simple and inexpensive attachment which will automatically call the attention of the driver, as soon as the water level falls too low. It ought not to be difficult to find some fitting which would sound a buzzer intermittently, or even a purely mechanical warning should be possible in connection with some sort of float mechanism. Of course it may already have been done, but if so why has not the device become part of every electrically equipped automobile? This is a condition which should have been attained long since in this era of refinement.

A Wider Range of Bodies

ONE striking feature of the announcements of new cars is the increasing tendency toward a rounded-out line of body types. A number of instances might be cited where prominent makers who several seasons ago—in some cases not over a year ago—offered only two body types on their chassis, have for 1916 increased the body line to include inclosed types as well. Several quantity producers have even gone so far as to offer what might be termed all-year cars, with convertible touring and roadster bodies.

The average automobile buyer is not able to have two or more cars. Thus there is a large field in cars which can be opened up sufficiently to be considered as open cars for summer driving in good weather, and which can be readily changed to closed types for winter weather and for rainy days. The most noteworthy point about this convertible scheme is that the manufacturers are able to offer such models at only slight increases in price over the open models.

The movement should serve to extend the usefulness of the average man's car, making winter driving less the privilege of those who can afford limousines and other inclosed types for winter use alone. It is just another step, going hand in hand with the general reduction of prices, in the increasing of automobile democracy.

Stowing Tools

A FEATURE wherein the majority of automobiles are deficient is in the provision of storage space for tools and simple spares. Of course, tools are not needed very frequently, but this is no argument for putting them away in places where they are difficult of access. The motorist of experience usually carries some half-dozen tools which he finds are needed most constantly in the pocket on one of the doors, and the example of a few makers in fitting up a door flap to cover a regular small tool rack is very much to be commended. It costs very little and it saves hours of the driver's time in an ordinary year of use.

Tools for operating demountable rims, for changing a spark plug or for opening up a carbureter to clean it out, ought to be as handy as possible, because they are always wanted sooner or later, and when they are wanted it is usually in a hurry. The big, heavy tools like hub cap spanners and such spares as valves, which are needed very seldom, may be stowed away anywhere as long as they are prevented from rattling, but the little things which form the most important part of the kit should not be jumbled up together in an untidy heap beneath one of the seat cushions. In these days of complete equipment there is no excuse for the absence of a proper tool and spare cabinet.

Another point which might be touched upon in this connection is the lack of provision for preventing rattling of the tools. Some makers provide wooden racks for this purpose but these are usually inadequate to accommodate the additional tools which most automobilists consider necessary.

703,527 Cars Built in Past Year

665,826 Passenger Cars and 37,000 Trucks Valued at $523,463,803

NEW YORK CITY, Sept. 4.—Continued demand for automobiles and trucks in this country and abroad has brought a remarkable increase in sales, the statistics for the past year, as compiled by Alfred Reeves, general manager of the National Automobile Chamber of Commerce, Inc., showing the production to have been 703,527 cars, valued wholesale at $523,463,803, which is an advance of 36 per cent in the number of cars and more than 10 per cent in value over the previous twelve months.

Sales of passenger cars of all types to June 30, which is the end of the year in the industry, were 665,826, for which the manufacturers received $450,941,131, while the sales of commercial vehicles of all types are estimated at 37,700, valued at $72,522,692. The figures for twelve months ending June 30, 1914, were 515,101 cars, passenger and commercial, valued at slightly more than $485,000,000.

It will be noted that while the number of cars increased 36 per cent, the value increased only 10 per cent, indicating the greater value the makers have been giving purchasers as manufacturing costs were brought down and fewer changes were made in chassis construction.

Franklin to Increase Production to 4,500 for 1916

SYRACUSE, N. Y., Sept. 7—The H. H. Franklin Mfg. Co., this city, will increase production above original estimates. The company planned at first to turn out 3800 of the 1916 cars, an increase of 35 per cent over the previous year. This production will be increased to 4500 cars, or 1700 more than last year. When additions now under way are finished the company will have a capacity of 7000 cars annually. These new buildings will give 200,000 ft. additional floorspace. Sales reports of the Franklin Atomobile Co. for July and August show an increase of 31 per cent over the same period last year.

Drummond Four, $1,095; Six, $1,275

OMAHA, NEB., Sept. 2—As reported in THE AUTOMOBILE last week, the Drummond Motor Car Co. has completed arrangements for building automobiles in this city and will hereafter push the product of its own plant. The new car will be called the Drummond and will be put out in both four- and six-cylinder types, selling for $1,095 and $1,275 respectively. The body parts of the car are touring, roadster and the standard closed types.

Late machinery necessary for the assembling of the Drummond has been installed and the first cars will be put on the salesroom floor soon.

The Drummond Motor Co. has been in the business of overhauling and rebuilding vehicles for more than twenty-five years. Its building has a floorspace of 42,000 sq. ft.

The personnel of the Drummond company directly interested in the new car is: J. W. Griffith, president; F. W. Bacon, vice-president and general manager; W. L. Griffith, secretary and treasurer, and R. W. Craig, general sales manager.

Hodgkins Studebaker Sales Manager

DETROIT, MICH., Sept. 6—R. T. Hodgkins, who was assistant sales manager of the Studebaker Corp., has been appointed sales manager, succeeding L. J. Ollier, who was made a vice-president and director some time ago.

Mr. Hodgkins, previous to joining the Studebaker organization, was for ten years with the New York naval militia, being an ordnance officer during five years. He started with the Studebaker Corp. as branch manager of the vehicle division in New York and also had charge of the export business of that department. His efficiency was such that he was called to Detroit to become assistant sales manager of the Studebaker organization.

The Studebaker business has been growing to such an extent that it has been found advisable to increase the personnel of the sales department and to that effect G. L. Willman, the corporation's advertising manager, and W. T. Bush, manager of the Detroit Studebaker branch, have been appointed assistant sales managers. Mr. Willman will also continue to have charge of the advertising department. He will look after the sales end in the territory west of Detroit to the Pacific Coast, while Mr. Bush will supervise the territory east of Detroit.

To celebrate his election Mr. Ollier gave a dinner to forty associates and friends at the Detroit Athletic Club, Sept. 3.

DETROIT, MICH., Sept. 3—Most of the officials of the local Studebaker Corp. plants and several from the South Bend, Ind., plant tendered a luncheon to-day to E. R. Benson, who until recently was a vice-president and director of the corporation, and who resigned to become distributor of the Studebaker in the State of Maine and part of New York. The luncheon was given at the Detroit Athletic Club to-day.

Match Races for Twin Cities

100-Mile Event Scheduled for Sept. 12 and 200-Mile for Oct.

MINNEAPOLIS, MINN., Sept. 7—The second race on the Twin City Motor Speedway track is to be Sept. 12 between Dario Resta, Ralph De Palma, Bob Burman, Eddie O'Donnell and Pete Henderson, the last two in Duesenberg cars. It is to be a 100-mile event for a purse of $5,000.

The third race will be in October, 200 miles, in which the Stutz winners of Sept. 4 are expected to take part, Earl Cooper and Gil Anderson, also Resta, Burman, De Palma, Johnny Aitken and Howard Wilcox, and possibly Oldfield. A sanction has been asked following the Chicago race of Oct. 17.

Treasurer J. F. Sperry of the Speedway reported that the attendance last Saturday was more than 40,000 and that the receipts were about $190,000. More than 300 Minnesota cars outside the Twin Cities were in the Speedway Sept. 4 and 125 from other States.

Maker Can Fix Retail Price

CHICAGO, ILL., Sept. 8—*Special Telegram*—A decision was filed Sept. 4 in the U. S. district court by Judge Geiger which sets the precedent upon the legality of fixing prices upon patented articles by the patentee. The American Graphophone Co., the complainant, charged the defendant, a Boston store, with the sale of phonograph records at cut prices. The court ruled that the dealer must sell the article at the retail price fixed by the manufacturer without deviation.

Truck Standards Discussed

NEW YORK CITY, Sept. 8—The meeting of the Truck Standards Division of the Standards Committee of the S. A. E. was held on Sept. 7 as scheduled and a variety of subjects were discussed, the principal one being the possibility of reducing the S. A. E. standard diameters for wheels for solid tires to two sizes only. The conclusion reached was that a little more investigation was needed before any sort of action could be taken.

The Foreign Co-operation Division also met jointly with the other division, most of the members being common to both and sundry methods for advancing the work of obtaining universal solid tire standards were considered. Several valuable suggestions were made and it is expected that a progress report will be submitted to the meeting of the Standards Committee to be held in Chicago on Oct. 14.

Chalmers' Record Month

Value of Cars Shipped in August $2,000,000—Outlook Promising

DETROIT, MICH., Sept. 7—August was one of the best business months in the history of the Chalmers Motor Co. The value of the cars shipped during the twenty-six working days was $2,000,000. To August also goes the record for the cars shipped during July and August totaled considerably more than the total number shipped during the first six months of the past fiscal year, that is from July to January. According to officers of the company the outlook is for a continued increase in business. Chalmers representatives in their reports to the company show the business prospects to be as good in one part of the country as in the others. It is general and should affect the whole automobile industry and trade.

Cadillac Auto-Truck Co. Formed

CADILLAC, MICH., Sept. 2—Stockholders in the new automobile truck company organized here have decided to name the concern the Cadillac Auto-Truck Co. They elected the following officers: W. A. Kysor, president and general manager; J. P. Wilcox, vice-president, and C. J. Helm, secretary-treasurer. The three officers with F. O. Gaffney, J. C. Ford, Henry Ballou, Henry Knowlton, P. F. Powers and C. J. Shoff form the board of directors, all of which are Cadillac men. Details as to the truck that will be made will not be disclosed until the plans have been ratified by the officers.

Gibney Tire Business Gains

CONSHOHOCKEN, PA., Sept. 8—The annual meeting of the Gibney Tire & Rubber Co., this city, was held in Philadelphia, yesterday. A dividend of 6 per cent was declared. The factory is running night and day and its monthly business is showing an increase of several hundred per cent over corresponding months of last year. The plant is turning out five times the quantity of tires it was producing four months ago.

Gasoline Prices Based on Cost of Production

KANSAS CITY, MO., Sept. 7—The independent refiners and jobbers of the Middle West have boldly declared that henceforth, in that district, the prices of gasoline and kerosene shall be based solely on the cost of production. They are now in the midst of an apparently successful demonstration of their power to make good. They have taken the bit in their teeth and raised the price of gasoline against the competition of the Standard. They say they will be equally resolute in lowering prices on their own accord, when conditions warrant.

As a result of the conclusion by the independent refiners of the Middle West that an advance was necessary to save them from loss, the price of gasoline at the independent filling stations in Kansas City has been advanced from 8.8 cents to 9.8 cents. The Standard is still selling at 8.8 cents.

15,141 Carloads of Automobiles Shipped in August

NEW YORK CITY, Sept. 8—At a meeting of directors of the National Automobile Chamber of Commerce, Inc., held here to-day, it was reported that shipments of automobiles for the month of August totaled 15,141 carloads, as compared with 8352 for August, 1914.

The traffic department reported a pronounced shortage of freight cars due to the tremendous demand and is taking up the matter with every railroad in the country in the endeavor to prevent automobile freight cars being used for other purposes.

Drawings for space at the New York and Chicago shows will be held at the office of the Chamber Thursday, Oct. 7, members drawing in the morning and non-members in the afternoon.

Reports were made by the various committees, among them patents, good roads, jitney buses and a preliminary report by the committee on a proposed uniform time for the announcement of new models. A final report will be made at a meeting to be held later in the month.

Alfred Reeves, general manager of the Chamber, is to proceed with the organization of the local service managers in Detroit, Chicago and Cleveland, this having been already done in Indianapolis.

Resolutions of respect and sympathy were tendered the family of the late S. T. Davis, Jr., president of the Locomobile Co. of America, who was one of the organizers of the national body.

Those present at the meeting were: Charles Clifton, Pierce-Arrow; Alvan MacCauley, Packard; Carl H. Pelton, Maxwell; R. E. Olds, Reo; H. H. Rice, Waverley; W. H. Van Dervoort, Moline-Knight; Wm. E. Metzger, Argo; Windsor T. White, White; J. Walter Drake, Hupmobile; Howard E. Coffin, Hudson; John N. Willys, Willys-Overland; H. T. Dunn, Willys-Overland, and Alfred Reeves.

86,000 Cars in Minnesota

MINNEAPOLIS, MINN., Sept. 3—Every one of the 86,000 licensed automobile owners of Minnesota have been card-indexed by Julius Schmahl, Secretary of State.

3-Cent Gasoline by New Process

Patent Claimed to Render 100 Gal. from 100 Gal. Crude Oil Possible

ST. LOUIS, MO., Sept. 4—The perfection of a process whereby 100 gal. of crude oil will yield 100 gal. of a kind of gasoline 50 per cent more efficient than the present grade of automobile gasoline, is the achievement claimed by W. H. Stevens, for many years an employee of the St. Louis Water Department.

Stevens, after experimenting for three years to find a substitute for gasoline, has obtained a patent on his process. He is now negotiating with the Standard Oil Co. for the sale of his patent and the formula of chemicals used in his process. This process, Stevens says, is not simple, but is very economical and can produce gasoline at a cost of 3 cents a gallon.

The first step in Stevens' process is to strain the crude oil to remove from it all traces of carbon. After this chemicals, of which Stevens alone knows the formula, are added and the result is—according to the inventor—an amber colored fluid which does not leave carbon deposits on the cylinders.

Stevens has tried his substitute gasoline in a Ford, Dorris, Maxwell, Buick and Overland and to-day made a final test of it in a motorcycle. He claims that a car which will run 12 miles on a gallon of gasoline will run 18 miles on his substitute.

At present independent oil producers are able to get but 1 gal. of gasoline from 4 gal. of crude oil by distillation. The Standard Oil Co. has a process by which it gets 1 gal. of gasoline from 2½ gal. of crude oil. Stevens' process will produce gallon for gallon, the inventor says.

Complain of Poor Gasoline

BLOOMINGTON, ILL., Sept. 4—Some garage men of central Illinois are complaining about the poor quality of gasoline that is being supplied in some instances of late. They assert that kerosene is being mixed with it as an adulterant, creating difficulty in starting some cars when the engine grows cold, the kerosene requiring greater heat than pure gasoline before it will explode. After the engine has been running for some time the coal oil constituent vaporizes and burns more readily.

Miller Continental Purchasing Agent

DETROIT, MICH., Sept. 7—L. T. Miller has been appointed purchasing agent for the Continental Motor Mfg. Co., succeeding R. C. McMillen, whose assistant he was. Mr. McMillen will take up another line of work.

Trade Review of the Week

Firm Demand for Cars Continues—Factories Prolong Production Schedule

DETROIT, MICH., Sept. 7—A firm demand for cars coupled with a striking continuance of the optimistic views which have been held since the first of the manufacturing season stand out most strongly in a reviewing of the automobile industry here during the past week. There seems to be no cessation of the cry for cars from dealers everywhere, and with great impetus given to retail business by the generally good weather, it was a week of great manufacturing and selling activity.

Dealers Are Optimistic

Several district representatives of one of the larger companies were here for a conference, and as their views are those of men who are intimately familiar with the sections which they represent, their words are of special value. From the reports of these men, it is evident that the demand for cars never was so great, and that there is practically no section of the country which shows a striking lead over any other in the matter of selling. In most instances, the dealer with the cars does the business. The people do not want to wait, and going on the assumption that you get your money's worth in nearly any car you buy these days, they buy where they can get quickest delivery.

Heavy Crops

In some States, bumper crops are reported, while in other localities where there is a lively business in horses for the warring nations, the inhabitants are taking advantage of the prices offered for their stock and are grabbing the automobiles as fast as they can get them. This is particularly true in the Middle West.

Dealers Sold Out

Most of the dealers in representative cars here are well sold on their allotments and have a place for every car they get. Many of the Detroit sales agencies are doing business throughout the State with sub-dealers, and on this account they are able to say that business here is no brisker in proportion than it is in other parts of Michigan. The Reo agent here says that he has sold every 1915 model Reo he could get, and thinks others are in the same boat.

Materials Scarcity Relieved

Factories are laying their plans to continue their present manufacturing schedules well into the late fall, so confident are they that present conditions will hold out for several months yet. The activity cannot be expected to maintain its present status all winter, but it is very evident that manufacturing curtailment will be later than ever before.

The situation seems somewhat relieved as regards the obtaining of raw materials.

—

$1,500,000 Order for Selden

ROCHESTER, N. Y., Sept. 2—The Selden Truck Sales Co. to-day confirmed the report that a large order for Selden trucks had been received for export. The order was placed by Gaston, Williams & Wigmore of New York and London, and is said to amount to more than $1,500,000. The chassis will be disposed of largely for commercial purposes, it is said, and are not a war order.

—

Few Changes in Mercer Models

TRENTON, N. J., Sept. 8—Mercer's new series is now going through the factory on regular production schedule and shows no marked change over the series of last season. The new model is known as 22-72 and succeeds the 22-70, which was marketed for 1915 and what changes there are, are merely in the way of fittings. The prices remain the same, the six-passenger touring being $3,000, sporting four-passenger $3,000, runabout $2,900, and raceabout $2,750 or $2,900 with electric starting.

The Mercer motors are four-cylinder 3¾ by 6¾ with L-head block cylinders having the valves on the right. The wheelbase of the sporting and touring models is 130 in. and the raceabout and runabout 115 in.

—

Cadillac School Gives Prizes

DETROIT, MICH., Sept. 3—At the semi-annual distribution of prizes to the pupils of the Cadillac Motor Car Co.'s School of Applied Mechanics, $250 in cash were distributed to-night. The first prize was $50, three were of $25, five of $15 and six of $10, and were given for perfect attendance. Although attending the school, the students are paid for the work they perform. Most of them after graduating secure good positions with the company. The school was started by Henry M. Leland in 1907.

—

Tractor Demonstration at Bloomington

BLOOMINGTON, ILL., Sept. 3—Seventy tractors by actual count, representing nearly as many manufacturers of the United States, gave a demonstration in plowing upon a tract of 700 acres near here recently. A magnificent sight was afforded when thirty-two tractors, in perfect alignment, started across a 60-acre field of green stubble, with thousands of farmers following in the rear. The operator in charge of each machine was intent to plow a straight furrow. Ten thousand spectators assembled on each side of the great field. It was the climax of the Middle West Tractor Farming Demonstration which was successful far beyond the anticipations of the promoters.

—

No Tire Plants in Brazil

RIO DE JANEIRO, Aug. 23—Although crude rubber constitutes the second great export product of Brazil, there are no automobile tire factories here, and the country is entirely dependent on foreign tires to supply its large number of automobiles.

English, French, German Italian and Belgian makes have dominated the Brazilian market. This has been due not so much to the excellence of the European product as to skill in marketing it, to the establishment of good local connections, and granting favorable credit terms to reputable local dealers. The European plants even went so far as to make tires in the standard American sizes. Despite a loss of nearly $10,000 in its sales of automobile tires to Brazil during 1914, the United States maintained its proportionate share of the year's trade, but this share is only 3 per cent of the total. France, Germany and Italy suffered severe losses during the year as compared with their trade in 1913, but Belgium and Great Britain made substantial trade advances. Brazil bought $477,086 worth of tires in 1914 as compared with $746,195 in 1913. Although France suffered a large loss, still it maintained the highest figures for 1914, which was $188,247. The United Kingdom was second with $100,965. The United States exported in $15,714 in tires during that year.

—

Ford Buys 583 Acres

DETROIT, MICH., Sept. 3—According to the records in the register of deeds office, Henry Ford has purchased thus far 583 acres of real estate in the River Rouge district where the new Ford plants are to be erected. The total value of the land purchased is estimated at about $583,000.

A further purchase of 39.3 acres in the district was made by the representatives of Mr. Ford a few days ago.

—

Jamison Gets Gold Medal

PITTSBURGH, PA., Sept. 3—H. V. Jamison, Advertising Manager of American Sheet & Tin Plate Co., Pittsburgh, has been awarded a gold medal by the Panama-Pacific International Exposition Society for valuable services rendered in the installation of the large exhibits of the United States Steel Corp. and its subsidiary companies.

Missouri Farmers Buying Cars

71,257 Registered—Gain of 40 Per Cent Over Entire Year 1914

JEFFERSON CITY, Mo., Sept. 4.—During the first seven months of the current year 71,257 passenger automobiles were registered in Missouri, while during the whole of 1914 little more than 50,000 were registered, showing an increase of 40 per cent for the seven months' registration of 1915 over the twelve months' registration of 1914.

Almost half the automobiles owned in Missouri, outside of St. Louis and Kansas City, are the property of farmers, an extraordinary increase being shown from the southeastern part of the state where crops this year were unusually good. As a result of this registration $299,570 already has been turned into the treasury and Good Road fund of the state.

Including motor trucks, motorcycles, transfers and dealers plates, the total registration to Sept. 1 was 83,980. The figures show 1089 automobile licenses for dealers and 1010 extra plates for demonstrating cars. St. Louis has a registration of 15,419 and Kansas City 8784. The counties having the largest registration are: Jasper, 2289; Buchanan, 2111; St. Louis County, 1908; Green, 1249; Jackson, 1157, and Nodaway, 1141. Six counties in the state have less than ten machines each.

—

Additions for Warner Gear

MUNCIE, IND., Sept. 1—The Warner Gear Co. has recently added to its factory equipment a two-story brick structure 60 by 300 ft. The new addition is now in full operation, and that, together with additions which are at present under way to its older buildings, gives it an increased floorspace of 39,000 sq. ft. and a total force of more than 1200 men on a twenty-three-hour basis.

—

$1,348,124 in Trucks Shipped from New York

NEW YORK CITY, Sept. 7—The total automobile and truck exports from this city, reported during the week ended Aug. 28, amounted to $1,348,124 in trucks and $365,926 in automobiles, compared with only $108,059 in automobiles last year.

—

Flint Varnish Will Double Working Force

FLINT, MICH., Sept. 2—The Flint Varnish Works, which were formerly a department of the Durant-Dort Carriage Co., and are one of the largest varnish makers in the country, supplying automobile manufacturers and many railroads, will double their working force and employ at least 300 men when four additional factory buildings, to be started at once, will be completed. At a meeting of the directors, a 10 per cent dividend was declared on the $500,000 of common stock, which is half of the capitalization. The officers are: W. W. Mountain, president and general manager; J. E. Kepperly, vice-president and William Glidden, secretary-treasurer.

—

All-Steel Motor Car Co. Locates in Macon

MACON, MO., Sept. 1—The plant of the All-Steel Motor Car Co., recently organized with a capital of $400,000, will be located in Macon, Mo. Gen. E. J. Spencer has been elected president and O. A. Trolicht, secretary. Among those financially interested are A. G. W. Simmons, J. E. Smith, and J. E. Pilcher.

The company will manufacture a roadster to sell at $350 and a touring car at $410. The capacity of the plant will be about 100 cars a day, and about 175 men will be employed.

The body of the car and its general makeup are patented, and is made of one piece of 22-gage steel. The sides are welded to the floor of the car, and the whole body can be removed from the running frame. The cars have solid disc wheels.

—

Marion Tire To Start

MARION, OHIO, Sept. 4—The Marion Tire & Rubber Co., which was incorporated recently, has taken over the plant formerly occupied by a shoe company and will install tire-making machinery. It is announced that an Akron rubber man has been secured as general manager, but the name is not divulged. The capitalization of the company is $300,000, of which half is preferred and the other half common stock. The largest stockholders in the corporation are J. L. Price, S. B. Lippincott, W. H. Holverstott, R. T. Lewis, A. J. Berry, W. T. Jones and W. F. Moyer.

It is planned to start active manufacturing in about six months, when it is expected to employ seventy-five workmen.

—

700 Pistons a Day

HOWELL, MICH., Sept. 3—An average of 700 pistons a day are now being made by the Spencer-Smith Machine Co., which had a daily output of only 150 a few months ago. Several large new contracts were recently secured from concerns which had not been on the customer's list. Indications are that night work will have to be started soon. There are over forty men on the working force now.

75,701 Registrations in Wisconsin

Gain of 22,540 Cars Over Total for 1914—1553 Dealers Registered

MILWAUKEE, Wis., Sept. 6.—Wisconsin passed the 75,000 mark in automobile registrations late in August, and on Sept. 1, at the beginning of business, license No. 75701 was issued. The total registration for 1914 was 53,161, so that already there are 22,540 new cars in Wisconsin this year. With four months to go, there is little doubt that the registration figures for 1915 will show that 25,000 cars have been absorbed by the Badger State this year. The figures of Aug. 31 show a gain of 25,500 over the corresponding date a year ago.

The 1553 dealers licensed in Wisconsin during 1914 showed a decrease of more than 250 from 1913, but the 1915 figures show a gain of 373.

—

$70,000,000 in Wisconsin Cars

MILWAUKEE, WIS., Sept. 3—At the recent convention of the Wisconsin Bankers' Assn., it was brought out that there is an investment in automobiles of some $70,000,000 in that State, 90 per cent of which has been withdrawn from banks, either by withdrawal of deposits, money borrowed or notes purchased. This condition has caused a shortage of capital.

—

Luck Tire Plant for Dallas

SAN ANTONIO, TEX., Sept. 4—A $100,000 factory to manufacture the new Luck pneumatic puncture-proof tire for automobiles is to be erected at San Antonio by the Luck Tire & Mfg. Co. The new tire was invented by John J. Luck of San Antonio. A demonstration of the qualities of the tire has been conducted for the past eighteen months by those who are supporting the enterprise. A set of the tires traveled 14,000 miles across some of the roughest roads in Texas.

—

Detroiter in New Plant

DETROIT, MICH., Sept. 6—The Detroiter Motor Car Co., which succeeded to the Briggs-Detroiter Co. when Alfred O. Dunk purchased the latter's assets and which has been occupying the Briggs plant, has leased the plant which at one time was the home of the Wolverine Mfg. Co. In its new quarters the Detroiter company will have more room. Within a few weeks it is expected that the 1916 models will be ready for announcement.

Autocar To Build Addition

Five-Story Steel and Glass Structure for Engineering and Production Depts.

ARDMORE, PA., Sept. 7—The Autocar Co., this city, will start an addition in the near future to be finished before winter sets in. The new building will contain five stories and basement and will adjoin the recently enlarged three-story and basement building. Its frontage will be 100 ft. There will be a separate wing, 40 by 30 ft. The lighting specifications call for modern steel fireproof sash, and the plan is so arranged that 79 per cent of the area is lighting space against 21 per cent brick. The first floor will be used for general offices for the production department and the top floor for engineering and experiments.

—

Hartford Automobile Parts Moves to New Britain, Conn.

HARTFORD, CONN., Sept. 7—The Hartford Automobile Parts Co., this city, will move to New Britain, Conn. A building company has been formed to erect a factory on East Ellis Street, New Britain. The building will be 60 by 200 ft., two stories, and so constructed that two additional stories can be added.

—

Cadillac Ships Fifty-five Cars a Day

DETROIT, MICH., Sept. 4—During August the Cadillac Motor Car Co. shipped 1455 cars, or an average of fifty-five for each of the twenty-six working days of the month. Up to Sept. 3 there have been shipped 1854 of the new models. As in the case of most all other manufacturers of automobiles, the Cadillac company is experiencing some trouble in getting all the supplies of raw and finished materials needed.

—

Eisemann Strike Off

NEW YORK CITY, Sept. 7—The strike of about 600 employees of the Eisemann Magneto Co. at the Bush Terminal, Brooklyn, has been called off, the workers having agreed to return to work tomorrow. The workers quit when their demand for a 48-hr. week with 52-hr. pay was refused, after negotiations lasting 2 weeks. The company is so rushed with orders, however, that the demands were agreed to.

—

Fisher in New Factory

DETROIT, MICH., Sept. 6—The Fisher Electrical Works, manufacturers of the Fisher electrical starting and lighting system for Ford cars, are moving into their new plant at 32 Lynn Street. It is a two-story structure, 64 by 400 ft. The business of this concern has been consistently increasing, and for some time the quarters at 182 Learned Street were inadequate for manufacturing purposes. The concern has arranged with Nelson Hall, formerly instructor of electrical engineering at Tri-State College, to give daily lectures to the employees on the theoretical as well as the practical side of the fundamental principles of electrical engineering,

—

1916 Moline Knight $1,375

EAST MOLINE, Ill.—A reduction of $100 in price and many refinements in connection with the new Moline-Knight 40 have been announced. The price is now $1,375 and although the materials used heretofore are continued, refinements have been made which make this an even better car than its predecessor at a lower price. Some of the specifications of the car, which is fitted with the Knight sleeve-valve motor, are bore 3¾ in., stroke 5 in., wheelbase 118 in., tires 34 by 4, three-speed gearbox, spiral bevel floating rear axle and up-to-date equipment throughout.

The bodies furnished are five-passenger touring and two-passenger roadster.

—

Continental May Buy Property

MUSKEGON, MICH., Sept. 2—Negotiations are now going on between the Continental Motor Mfg. Co. and the P. J. Connell Co. which will probably lead to the purchase of the latter's property by the former. Should this happen, it is the intention, it is said, of the motor manufacturer to erect a drop forge steel plant on the property.

—

Kelly Truck Now Sunset Truck Co.

SPRINGFIELD, OHIO, Sept. 6—One of the most important changes in the name of truck manufacturers has been made by the Kelly Motor Truck Co., of Springfield. The name of the concern has been changed to the Sunset Truck Co., by papers filed with the Ohio Secretary of State.

—

O'Neil Tire Changes Name

AKRON, OHIO, Sept. 6—Papers have been filed changing the name of the O'Neil Tire & Protector Co. to the O'Neil Tire & Rubber Co.

—

Gordon Rubber Changes Name

CANTON, OHIO, Sept. 6—The name of the Gordon Rubber Co. has been changed to the Gordon Rubber & Tire Co. The concern will specialize in the manufacture of automobile tires.

Two New Federal Trucks

Light Type and 6-Tonner To Be Built—August Sales Gain 125%

DETROIT, Mich., Sept. 4.—The annual convention of Federal Motor Truck Co.'s dealers and distributors was held this week. The announcement was made that the Federal company intends bringing out a new light truck, also a 6-ton model. It was also stated that in the near future the company may start to make its own motors. In fact tests and experiments are now being made with new designs to that effect. Although an addition to the plant has been just completed, the concern has purchased 5 acres of land adjoining the plant and will start shortly the erection of additional factory buildings.

About seventy-five dealers and distributors took part in the three-days' convention. Without exception those who cared to talk stated that the motor truck business has been very good thus far this year and indications are, that, provided the plant is able to keep its delivery promises, the sales will show great increases in all parts of the country. The biggest problem, in fact, the only important one which is giving the agents or distributors a lot of worry is the delivery question. This is in turn the big stumbling block for the manufacturer, as he is being held up in the receipt of materials and parts.

It is likely that a change in the contract policy will be made, it being the intention of the Federal company to start its fiscal year Jan. 1, instead of in September.

The past month was the biggest in the history of the Federal company, being 125 per cent ahead of August, 1914. To date, since the beginning of the year, the business increase is from 25 to 35 per cent ahead of 1914.

—

Hupp Men Predict Big Year

DETROIT, MICH., Sept. 4—At the recent meeting of district salesmen of the Hupp Motor Car Co., there was but one word which practically every visitor expressed time and again, it being the word optimistic. No matter whether it was Ward Keller, the Pennsylvania Hupp man, or J. R. Overstreet from Texas or the Canadian Hupp overseer, K. R. Spencer, or eastern sales manager O. C. Hutchinson, the story was the same, namely, that this will be the biggest year the Hupp organization ever had.

These and many other men who have been on the ground and should know conditions pretty thoroughly, said that

the crops will be the biggest some States ever had, that on account of the great demand for horses for the warring nations, the ranchmen, farmers and others are selling their horses in such States as Wyoming, Colorado and Southern Montana and buying automobiles as fast as they are coming into the States. In the South, owing to the help of the Federal Reserve deposits conditions are very satisfactory for a big year. In Canada a bumper crop is predicted and this will have a corresponding effect upon the automobile trade.

—

Signal Raises Prices on Three Models

DETROIT, MICH., Sept. 3—Beginning Sept. 15 the price of three out of the four models of trucks made by the Signal Motor Truck Co. will be raised.

The prices will be as follows: 1-ton model, $1,550 instead of $1,500; 1½-ton model, $1,750 instead of $1,700; 2-ton model, $2,100 instead of $2,000. The price of the 3½-ton remains $3,000. All models are worm-driven.

At the new prices the ton and the 1½-ton models will be furnished either with a 120 or a 144-in. wheelbase. Heretofore it cost $50 more for the latter-sized model. The 2-ton model is only made with a 150-in. wheelbase, and the 3½-ton model has a wheelbase of 168 in.

—

A New Truck Wheel

MT. GILEAD, OHIO, Sept. 4—B. J. Aurand has tested a new steel motor truck wheel, and it has proved successful. The device is said to be noiseless, resilient and so fastened as to make it secure on all kinds of streets. The wheel is a continuous piece of steel coiled three times, the middle coil being slightly greater in circumference than the other ones. This provides for the resiliency. It is said that the wheels can be manufactured at considerably less cost than the rubber ones, and that they will last longer.

—

More Homes Needed in Flint

FLINT, MICH., Sept. 4—Although up to date 207 more permits for new houses have been issued in this city during all of 1914, the business extension of the local plants is such that at least 500 more homes must be put up before winter in order to accommodate even only a part of the many workers who are without a house. It is estimated that between 2000 and 2500 more men are being employed now in the plants than at this time last year.

As an evidence of this constant growth, the pay roll of the Buick Motor Co. for the second half of August shows an increase of $37,450.18 over the previous biggest two weeks' pay, which was the second half of July. The August record was $330,573.18.

Would Increase Fees in Mass.

—

Special State Revenue Commission Would Double Tax Per. Hp.—Fight Promised

BOSTON, MASS., Sept. 4.—That the automobile manufacturers and dealers will have another fight on their hands when the legislature meets next January is foreshadowed by the results of the meeting this week of the special commission appointed by the last legislature to devise ways and means to increase the State revenues. The commission devoted one forenoon to the problem of motor vehicles. Frederick T. Fuller, a member of the commission, stated that in his opinion all cars of 60 or more horsepower should pay at least $100 and that other cars should be made pay a proportionate part.

Frank D. Kemp, representing the Highway Commission, stated that he did not advocate an increase on passenger cars because the State now gets about $3,000,000 in taxes and fees from the owners of the 100,000 vehicles in Massachusetts. But he did favor increasing the fees on trucks to $1 per horsepower instead of the present tonnage rate. Mr. Kemp stated that at present the passenger cars pay about 80 cents per horsepower, but that Col. William D. Sohier, chairman, and James W. Synan, the two other commissioners, feel that this rate should be doubled.

This means, of course, that the special commission will report a plan for increased taxes, and with two members of the Highway Commission favoring increased fees for cars, and the other member advocating an increase in truck fees that the legislature will get two reports along those lines.

—

Pope Holders Will Realize 91 to 92 Per Cent

BOSTON, MASS., Sept. 7—Holders of the Pope company's $1,600,000 notes and paper will receive within the next ten days their final dividend in settlement, thus about winding up the liquidation.

This payment will amount to around 38 per cent, and will make the total amount realized by holders of these notes equal to between 91 and 92 cents on the dollar.

The war saved the stockholders. It afforded a market for the Hartford plant, which was bought by the Pratt & Whitney people, and it made the Westfield works attractive enough for bankers to take up and use as the nucleus of a corporation which may develop a substantial amount of war orders.

BOSTON, MASS., Sept. 2—In a report filed in the U. S. district court to-day, the receivers for the Pope Mfg. Co. report that claims aggregating $1,649,000 have been allowed and approved, and that three claims amounting to $20,000 are still in dispute. After paying taxes and other charges the balance from the purchase price amounts to $722,095.

Two of the receivers, George Pope and C. A. Parsons, have asked the court to discharge them and to retain their colleague, C. A. Morse, for the purpose of winding up the receivership.

—

Decree Issued in Rim Suit — Standard Welding Co. to Appeal

NEW YORK CITY, Sept. 4—Following the opinion of Judge Hunt in the case of Louis H. Perlman against the Standard Welding Co., reported in THE AUTOMOBILE for Aug. 26, an interlocutory decree has been issued in favor of Perlman, perpetually enjoining the Standard Welding Co. from further infringement of his patent No. 1,052,270 on rim construction and appointing Clarence S. Houghton of this city a special master to determine the amount of damages. Costs of the suit are to be paid by the Standard Welding Co. The decree upholds the validity of the patent and rules that Perlman's exclusive rights thereunder were violated. The decree was issued in the U. S. District Court for the Southern District of New York.

A brief survey of the decree indicates that not only do all side wedge demountable rims infringe the Perlman patent but also all split wedge-ring types fall within its scope.

An order has been issued allowing the Standard Welding Co. to appeal to the circuit court of appeals and bond has been fixed at $50,000.

—

City Tax in Lincoln, Ill.

LINCOLN, ILL., Sept. 4—The City Council of Lincoln has adopted an ordinance which provides for a license for vehicles of all kinds. A previous ordinance was declared unconstitutional by the Supreme Court. The new measure avoids the defects of the old. The tax for motorcycles is $3; for all motor vehicles of 45 hp. or less, $5; for those of greater horsepower, $8, while those for public hire, $10. A reduction is made where a license is issued for less than a year. The ordinance takes effect Sept. 15. Automobile owners believe that a test case would win again in the upper court, and may decide to fight the city on the ground that it is illegal to collect both a state and a city tax.

—

Stop Automobiling on Railroad Tracks

MILWAUKEE, WIS., Sept. 4—The practice of automobilists in isolated districts of Wisconsin in equipping their cars with flanged steel wheels for use on railroad

tracks and carrying passengers at regular rates has been stopped by a decision of the attorney general of Wisconsin to the district attorney at Medford, Wis., declaring it to be a violation of the statutes for a person to operate a motor car on railroad tracks without the permission of the company owning the tracks. The attention of the district attorney was called to the fact that a man is operating a car on the Soo line between Riblake and Chelsea, Wis., carrying passengers at 50 cents the trip. The idea had become quite popular between cities having few trains daily.

—

Detroit Post Office Cars Are Now Government Owned

DETROIT, MICH., Sept. 1—Beginning to-day all the automobiles used by the local post office department are government owned. Those which had been used for more than one year up to last night were operated on a contract basis, being merely rented by the government.

There will be thirty-six postal automobiles in the service here for the present, and, as the local post office business is increasing most rapidly, there is no doubt that more motor vehicles will have to be added ere long.

The vehicles now operated consist of twenty-four Fords and twelve Whites, the latter being made up of seven 1½-ton vehicles, four ¾-ton and three 3-ton trucks. The latter will be used exclusively on runs between the post office and the railroad stations, while the other trucks will be used to carry mail between the main post office and the substations, also the depots. The Fords will be used especially for parcel post work and runs between sub-stations.

—

Los Angeles Motor Reserve Formed

LOS ANGELES, CAL., Sept. 3—The Los Angeles Motor Reserve is now a completed organization with many of the most prominent men in the automobile industry of the city as active members. The object of the organization is to perfect an adequate motor reserve to serve the United States in time of war, to foster military training, especially rifle practice, among the automobile men of the city, and to co-operate with the National Guard in adding to its efficiency.

Ten prominent automobile dealers are on the executive board. The military officers are all men of long experience in military service, and army men declare that the organization promises to be one of the most efficient reserve corps in the country.

Such men as Teddy Tetzlaff, R. C. Hamlin, H. M. Hanshue, Louis Nikrent, T. Beaudette and Clifford Durant are on the roll.

To Boom Denatured Alcohol

—

Fuel Becomes French Govt. Monopoly in 1917 and Will Be More Widely Used

PARIS, Aug. 28.—Denatured alcohol will become a French government monopoly in 1917 and measures will be taken to extend the use of this fuel for automobile purposes. This movement is part of a drastic scheme for the reform of the liquor traffic. It is intended to raise the duty on alcohol from $44 to $100 per 22 gallons. In 1900 there was an increased duty of $12.80, resulting in an immediate decrease of 88,000,000 gal. per annum in the annual human consumption of alcohol. Now that it is intended to increase the tax by $56—practically 4½ times the original tax—it is obvious that there will be a great drop in the amount of alcohol drunk in France. The question of state monopoly of the entire production of alcohol has been considered and abandoned in favor of the monopolization of denaturized alcohol only. A variety of interests must inevitably suffer by reason of the heavy taxation of alcohol, but by monopolizing denaturized alcohol the vital interests of the industry and the nation will be safeguarded. In other words the French nation which has drunk much alcohol and burned none will be made to drink less and burn much.

To Fix Price

Exactly what machinery will be employed to effect this radical change is not yet known. It is obvious, however, that the first and most important step will be the fixing of a market price for denaturized and carbureted alcohol. Up to the present the supply has been so uncertain and the price subject to such variations that denaturized alcohol has not been a commercial product capable of competing with other hydrocarbons. Nevertheless, the French have always taken an interest in alcohol as an alternative automobile fuel and the army authorities have insisted on every army automobile truck being built to run on alcohol. This was done in the annual army truck competition when for one-third of the time the vehicles ran on gasoline, for a third on benzol, and for the remainder of the time on denaturized alcohol. The same load and the same average speed had to be maintained on each fuel. No change of carbureter or compression was allowed, but the changing of jets and the making of adjustments was permitted. These competitions, which have been held for six or seven years, have shown that alcohol is a suitable fuel for all internal combustion motors, but it is doubtful if there has ever been a gallon of gasoline used on the road outside of these competitions. The object of the army authorities was to provide alternative fuels in case the supply of gasoline should be cut off by reason of war. Now that war has come, gasoline is the only fuel for army automobiles, benzol is monopolized for the making of explosives, and alcohol is ignored.

It has not yet been stated in what way the government intends to popularize the use of alcohol for driving automobiles. As there is no difficulty in getting an adequate supply of this fuel, the problem naturally resolves itself to one of price. It is thus safe to assume that denaturized alcohol suitable for automobile consumption will be put on the market at a considerably lower price than gasoline. The drop will have to be considerable to affect the ordinary motorist, for although benzol is a reliable substitute and costs appreciably less than gasoline it has only been adopted by commercial firms using big fleets of trucks. The private motorist is somewhat prejudiced and does not consider the reduction in price sufficient compensation for the supposed inferiority of benzol. The same will apply in a greater degree to alcohol, which is an unknown fuel for 90 per cent of ordinary motorists.

Gasoline 52 Cents a Gallon

However, it will not be a difficult matter to put home-produced alcohol on the market at a lower rate than imported gasoline. The average retail price for this latter is now 52 cents per gallon. Prior to the war the price varied between 46 and 48 cents per gallon. These rates are practically double those existing in England, to which country transportation rates are about the same as to France, and are due to the high import duty and local taxes on gasoline. It will be possible for the French government to sell alcohol for automobile use at nearly the same rates as gasoline in America and still secure a substantial revenue. This would cause an immense automobile development, for it cannot be denied that the high cost of fuel has had a restrictive influence on motoring, and particularly commercial motoring, in France.

—

$148,509 for Automobile Education

MILWAUKEE, WIS., Sept. 4—Industrial education in Wisconsin, which includes as an important course the study of automobile engines and chassis, cost the State of Wisconsin $382,352 during the fiscal year ending June 30, 1915. The Milwaukee continuation school, where a course in automobile practice has been developed, spent $148,509 of the total, and had a total attendance of 10,908.

Cars Indispensable at the Front

Guyot, Racing Driver, Says Artillery Uses Tractors Extensively for Gun Hauling

PARIS, Aug. 28.—After thirteen months' active service at the front, during which time he has driven the General in command of one of the French army corps, Albert Guyot has returned to Paris on his first leave of absence for six days. The French race driver describes the automobile as one of the most essential instruments in modern warfare. Even at the present time, when the opposing troops are buried in 6-ft. trenches only 150 yd. apart, and progress either way is a matter of inches, often secured at tremendous loss of life, automobiles are indispensable. Large numbers of American trucks are employed by the army to which Guyot is attached, most of these trucks being Packards and Whites.

At the present time the automobile service consists in carrying ammunition and food from the depots to the trenches; in taking fresh men to the trenches and bringing away the men who have finished their spell of service; in moving wounded from the dressing stations to the main hospitals or hospital trains; in carrying material for mine digging and entrenching. There is no present use for armored cars, but the artillery is making extensive use of tractors for quick transportation of their guns from point to point. Guyot, who was one of the first men to learn to fly a Bleriot monoplane, expects to enter the aviation corps as a pilot within a short time.

—

White Gets Grand Prize

CLEVELAND, O., Sept. 7—The Superior Jury of Award of the Panama-Pacific International Exposition at San Francisco has awarded the grand prize for motor trucks to the White Co., this city.

—

Rowe Co. Raises Wages

DOWNINGTOWN, PA., Sept. 7—The Rowe Motor Mfg. Co., this city, has raised the wages of its machinists 10 per cent. It has also commenced work on a 100-ft. addition to the plant.

—

No Touring in Switzerland

PARIS, Aug. 28—Statistics dealing with automobile traffic across the Swiss frontier show that motor touring in this part of Europe is practically non-existent. From the first day of January to the last day of June of the present year only 151 automobiles went by road from France to Switzerland. For the corresponding periods of 1914 the number was 3500. During the month of July of the present year thirty-nine automobiles passed over the French-Swiss frontier. The number for the month of July, 1914, was 2048. During the first seven months of 1914 the number of cars going across the frontier was 5548; the number has fallen to 190 for the corresponding period of 1915. As most of the cars reported at the frontier stations this year are owned by diplomats and government officials, it is obvious that the ordinary tourist is a negligible quantity.

—

Tire Shortage in Sweden

STOCKHOLM, SWEDEN, Aug. 2—The situation of the automobile traffic in this city is becoming worse daily because of the inability to get tires. Now there are twenty-five machines out of service, and next week the number will be increased.

In this city there are 336 taxicabs, most of which belong to persons who own only one or two cars. The largest company is the Taxameter Co., owning twenty-five machines. It is estimated that this company can keep them going until Dec. 1. According to an investigation it is estimated that the traffic can be kept up two or three months longer with 150 or 160 automobiles. One rubber company here is renting out tires by the day to automobile owners.

—

MacManus with Erwin & Wasey Co.

DETROIT, MICH., Sept. 4—Theodore F. MacManus, one of the best known automobile advertising men in this city, is now vice-president of the Erwin & Wasey Co. advertising agency in Chicago, and is in charge of the Detroit offices in the Kresge Building. Mr. MacManus will handle the advertising campaign of the Goodyear Tire & Rubber Co., Akron, Ohio, besides continuing to take care of his old accounts. Among former associates of Mr. MacManus who remain with him is Gerald Page-Wood, who will have charge of the art department. The Erwin & Wasey company was organized eighteen months ago, and C. R. Erwin is president.

—

Severe Sentences in Milwaukee

MILWAUKEE, WIS., Sept. 4—Milwaukee courts have ceased to be lenient with motor car thieves. John Anderson was sent to the House of Correction for sixty days for stealing a laprobe and overcoat out of a car standing at Grand Avenue and Fourth Street. The man was caught before he had gone a block. For taking a car without the owner's consent Harvey Weeks was sent to the State Reformatory for three years. Weeks had been in trouble before and the penalty was made especially severe on this account.

Cut Accidents 54% at Ford Plant

Teaching of English to Workers in Factories Decreases Accidents 54 Per Cent

DETROIT, MICH., Sept. 3.—Speaking on the subject of teaching English to the foreign shop workers, R. Lee, in charge of the sociological department at the Ford Motor Co. stated a few days ago that since the English school has been established at the plant the number of accidents in the shops had decreased by 54 per cent.

This is but one of many advantages directly traceable to the English lessons given to the Ford foreign workers. Another important change brought about by these lessons is the fact that it eventually does away with the employ of interpreters who were very often influenced by the boss padrone or shop bosses who made no serious effort to really teach the laborer or worker the English language, as it was rather materially advantageous for the boss that these workers should remain ignorant as long as possible of our language. Still another advantage for the workers as well as the plant was that once they knew enough English they were less in fear or in doubt that they were not being treated or handled squarely. After they understood English and talked a little they were like new men, became more efficient and more pleased, which brought about better results.

Of the 18,000 men in the employ of the Ford company a year ago more than 50 per cent did not speak English. According to Mr. Lee every one of these foreigners if still in the employ of the company next year will speak nothing but English.

The Ford English classes are held twice a week and the entire course of teaching the foreigner to read, write and speak, extends over a period of thirty-four weeks, or sixty-eight lessons. Long before the sixty-eighth lesson is given the pupil is able to grasp enough of the language to understand. In fact there have been cases where the foreigner showed remarkable ability and learned exceptionally quick. The teachers are all volunteers and all belong to the Ford organization. Many of them are foremen and they teach the men of their department.

—

Moon's August Sales Gain 77.21 per Cent

ST. LOUIS, MO., Sept. 8—Sales of the Moon Motor Car Co., this city, for the month of August, 1915, showed a gain of 77.21 per cent over the same period last year.

Falls Motor Co. to Expand

Orders for 12,000 High-Speed Motors Render Enlargement Necessary

SHEBOYGAN FALLS, WIS., Sept. 4.—So urgent is the demand for Falls motors from automobile manufacturers that the Falls Motor Co., Sheboygan Falls, Wis., has decided to make radical changes in its plant at once. The gray iron foundry, where all cylinders and similar work was cast, is being dismantled and will be transformed into a machine shop. Contracts have been closed with gray iron founders in Grafton, Manitowoc and Racine, Wis., and Muskegon, Mich., for these supplies. The erection of a large assembling shop is progressing rapidly. The company is now employing in excess of 300 mechanics and intends to put on a 24-hr. schedule when the improvements are completed. The Falls company has contracts calling for the delivery of more than 12,000 high-speed motors before spring. To accommodate this business, it was decided to discontinue the casting shop and buy castings outside, so that machining and assembling at Sheboygan Falls would be carried on without interruption and in the required quantities.

—

Firestone Declares a 4 Per Cent Extra Dividend

AKRON, OHIO, Sept. 1—The Firestone Tire & Rubber Co. has declared an extra dividend of 4 per cent on its common stock, payable Oct. 15. This makes 16 per cent for the year. It is probable that the common dividends hereafter will be paid on a basis of 5 per cent per quarter.

Net profits after charges and dividends for the year were $4,343,000, a gain of $2,800,000. There was carried to surplus $3,853,000.

Sales during the fiscal year were $25,187,884.33, an increase of $5,937,774.41, or 31 per cent over the preceding year. Sales in 1914 amounted to $19,000,000; in 1913, $16,600,000; $11,500,000 in 1912; $7,500,000 in 1911 and $5,000,000 in 1910.

The company is now producing 7500 pneumatic tires daily. After the plant additions are completed it is expected that the output will be 12,000 tires daily, or an increase of 60 per cent. This increase of 4500 tires per day is larger than the output of the original new Firestone plant which was erected on its present site 4 years ago. Eleven hundred solid tires are made daily. Arrangements are being made to largely increase this production.

At the annual meeting of the stockholders held to-day, the following financial statement was submitted:

QUICK ASSETS	
Accounts receivable	$5,269,034.30
Bills receivable	123,480.91
Cash (set aside for new buildings and equipment contracted for)	800,000.00
Cash	1,103,427.64
Stock sold employees	112,200.11
Material and finished goods	3,643,477.83
	$11,251,620.79
LIABILITIES	
Accounts payable	$675,064.79
Net quick assets	10,576,556.00
	$11,251,620.79

—

Few Market Changes

NEW YORK CITY, Sept. 7—The feature of the markets this week was the advance of 1 cent for gasoline, effective yesterday. Markets this week were dull with very few changes, the highest change taking place in the metal markets. Tin which had all week been irregular, rose 25 cents on Thursday. This rise continued throughout the rest of the week. The check in the advance on steel due to the mills which are unable to give early deliveries constitutes the chief obstacle toward booking much of the steel business that is in the market. Aluminum, which for several months has been steady, rose on Monday to 35 cents and on Thursday to 40 cents. The copper markets reacted last week to 17½ cents for electrolytic and 18½ cents for lake. The unlooked for demoralization of the foreign exchange was practically an insurmountable barrier to purchasing of the metal by England. Antimony was weak with some importers asking 26 cents. There was no change in the crude rubber situation either here or abroad. Locally, trading was quiet.

—

N. Y. Gasoline Now 20 Cents a Gal.

NEW YORK CITY, Sept. 8—Gasoline is selling in this city for 20 cents a gallon, an advance of 4 cents in four weeks, and garage proprietors predict a further increase. Some garage owners who had a supply of gasoline are still selling it at 17 and 18 cents.

The upward tendency of prices is due to the enormous increase in the demand for the automobile grades, both for domestic and foreign consumption. For the fiscal year ended with June 30 the United States exported 240,018,306 gal. of naphthas and gasoline, which compares with 185,578,776 gal. in 1914 and 174,073,477 gal. in 1913. The exports in 1915 were valued at $27,102,501 against $26,568,682 in 1914 and $23,883,424 in 1913.

—

Schwartzkopf Leaves Gray & Davis

NEW YORK CITY, Sept. 7—E. E. Schwartzkopf, who has held the title of sales manager for Gray & Davis, Boston, has resigned that position. The resignation takes effect Oct. 1. He has not yet made public his plans for the future.

—

Big Automobile Shipments a Problem for Railroads

DETROIT, MICH., Sept. 4—That the great prosperity of the automobile factories of this city is a problem for the railroads is evident from a statement recently made by E. D. Bronner, General Manager of the Michigan Central Railroad. Demand for railroad cars is very strong, and the importance of this traffic in automobiles is recognized by this railroad, the most important one entering Detroit, in the recent order for 500 more 40-ft. box cars of the type required for automobile shipments.

Chairman A. T. Waterfall, Traffic Commissioner of the Detroit Board of Commerce, points out that much of the scarcity of box-car equipment of the automobile type, which is becoming more and more acute, is due to the fact that these same cars are also adaptable to other lines of shipping, and are in demand elsewhere as well as here. Then the large crops of the West are also contributing to the shortage, as these crops can be shipped in an automobile car as well as any other.

It is clearly up to the manufacturers of automobiles to make the most efficient use of the cars they do get hold of, and to make strenuous efforts to have their customers at the other end of the line

see that the cars are unloaded promptly and released. Concerted action of this kind will do much to relieve the condition.

Probably some of the tight box car situation is also due to the delays of motor vehicles while in transit, and the meeting of the traffic managers of the various manufacturers who are members of the National Automobile Chamber of Commerce here on Sept. 14 will probably throw considerable light upon this phase of motor-car shipping.

—

Cardway a Packard Representative

DETROIT, MICH., Sept. 4—Fred Cardway, formerly director of the Saginaw Valley Bureau of Foreign and Domestic Commerce, Saginaw, Mich., and also formerly connected with the American Cash Register Co., is now a foreign representative of the Packard Motor Car Co.

—

Winslow Secretary to Hupp Head

DETROIT, MICH., Sept. 4—Palmer E. Winslow, who during the past one and one-half years was with the advertising department of the Hupp Motor Car Co., has been appointed secretary to President J. Walter Drake of that company.

—

Dividends Declared

Linde Air Products Co.; quarterly of 1½ per cent on preferred, payable Oct. 1; and 2 per cent on common, payable Sept. 30.

Kelly-Springfield Tire Co., New York City; quarterly 1½ per cent on 6 per cent preferred, payable Oct. 1.

Gibney Tire & Rubber Co., Conshohocken, Pa., 6 per cent.

Peerless Motor Car Co., Cleveland, Ohio, quarterly of 1¾ per cent on preferred, Oct. 1.

Security Prices Higher

—

Steady Stream of Selling on Foreign Account—General Motors Features Market

NEW YORK CITY, Sept. 7—Securities have a decidedly restricted market at the moment. The best evidence of this is the fact that the great majority of the securities recorded advances. The strongest features were found in the specialties, some of which closed with noteworthy gains. General Motors once again features the market with a twenty-two-point gain on Saturday. Peerless rose twenty points. There were many other substantial gains but the latter two were the most noted. The tire issues also showed heavy gains. While the actual trade in the rubber stocks was light, the price tendency was firm and stronger. There were offerings of Firestone at five points higher, with no sales reported and no firm bids. Goodyear sold at 270 and closed at the figure bid. Portage common sold at 46 and 46½, establishing a new high record, and closing firm at 46½ bid. Kelly-Springfield made another high record of 195. The market appeared to pay no attention to the fact that Miller preferred is now ex-dividend. It closed at 107½ bid with a complete recovery of the quarterly disbursement of 1¾. It was reported after some hours that the market would again advance with some further activity at prices well above the 200 mark.

The Detroit issues were very active with many changes being noted and many stocks changing hands. General motors made a total gain of twenty-three points while Chalmer's closing bid was 99, a gain of 9½ points. The inactive stocks were dull, there being but one change this being a decline of one point for the Atlas Drop Forge Co. The rest of the active and inactive stocks made either small or no gains. The bond markets were weak with no trading and no changes.

—

Paige Listed in Detroit Stocks

DETROIT, MICH., Sept. 4—This week the stock of the Paige-Detroit Motor Car Co. was added to the regular list of stocks to be quoted upon the Detroit Stock Exchange. The stock, which has a par value of $100, was quoted at $450 asked and $440 bid.

—

Rawle Driggs-Seabury Director

NEW YORK CITY, Sept. 3—J. W. Rawle, for many years associated with the Bethlehem Steel Co. and at present vice-president of the J. G. Brill Co., has been elected a director of the Driggs-Seabury Ordnance Co.

The board of representatives of the New York Market Assn., has formally listed the 30,000 shares of common stock, par value $100, of the Driggs-Seabury Ordnance Co. The company is negotiating with foreign governments for war orders totaling over $20,000,000.

—

Brooks Out of Pontiac Chassis

PONTIAC, MICH., Sept. 3—H. H. Brooks has disposed of his interest in the Pontiac Chassis Co. to R. A. Palmer, president of the company.

Michigan Fair Show Opens

Fourteen Trucks and 73 Cars Exhibited—1916 Grant Six Shown

DETROIT, MICH., Sept. 6.—Probably the most interesting and noteworthy feature in connection with the automobile show at the Michigan State Fair, which opened to-day, is the comparatively large number of commercial vehicles on display. Out of a total of seventy-three cars and chassis there are fourteen for commercial purposes. Last year there were scarcely half a dozen at the show.

As a matter of fact an exhibitor who also was there last year stated that while no trucks were sold at the show in 1914 five sales were made thereafter and were exclusively to prospects who had registered their names during the show. Another commercial car representative said that after checking up the prospects who registered during the fair show and those who gave their names at the big city show, it was found that more prospects were found among the state fair visitors.

The Grant Six

There is only one new 1916 passenger car shown which had not yet been announced this year, namely the Grant six. It has a 112-in. wheelbase or 6 in. more than the 1915 model; the bore is 3 in. instead of 2⅞; the stroke is the same or 4¼ in. The radiator design is new, being of the double shell type, or similar to the radiator on the Grant four. The body is flush, of the modified boat line design and besides being of much neater design provides much more room, the front seats now being 40 in. wide and the rear seats 47 in. wide. There are other minor improvements but the price remains the same, $795 completely equipped.

A car which is making its début in Detroit in connection with this fair is the Allen, a touring car being shown. This car sells at $795 with either touring or roadster body.

In the truck line the new ones are the Kalamazoo and the Independent. The 2-ton Kalamazoo made by the Kalamazoo Motor Vehicle Co., Kalamazoo, Mich., selling at $1,650 without body and at $1,775 with the body, has a four-cylinder block Buda motor, 3¾ by 5½, a Shakespeare carbureter, Bosch ignition, Timken front and Russel rear axles, Firestone tires, 37 by 4 on the front and 37 x 3½ dual on the rear. The wheelbase is 146 in.

The Independent 1500-lb. truck is made in Port Huron, Mich., by the Independent Motors Co. and sells at $1,285 without body, with either a 112-in. or 128-in. wheelbase. The motor is a four-cylinder Continental block, 3½ by 5. The carbureter is a Marvel; ignition, Eisemann; transmission Brown-Lipe sliding gear. Solid tires, 36 by 3 front and 36 by 3½ rear, are furnished.

The passenger cars on display to-day are the Buick, Hudson, Oldsmobile, Mitchell, Allen, Paterson, Studebaker, Cadillac, Maxwell, Ross, Hupmobile, Saxon, Dodge, Chalmers, Ford, Chevrolet, Monroe, Scripps-Booth, Chandler, Oakland, Grant, Haynes, Overland. Both Buick and Overland show also a light delivery truck. Commercial vehicles shown are the Commerce, Denby, Federal, Vim, Standard, Independent, Kalamazoo and Reo.

Before the fair ends Sept. 15, the distributor for the Reo expects to receive the 1916 Reo passenger models.

Trucks to be shown for which space is reserved are the Signal and Tosmath.

Like last year the Ford Motor Co. has installed a miniature assembling plant where twenty-five cars are to be assembled daily.

Tractor Section of Interest

Another feature of the fair this year is the tractor section where the Ford motor tractor is shown for the first time in public. When all the tractor machines will be on the ground this section of the fair will be quite important.

The Olson tractor wheel for Ford cars also other cars is shown for the first time. It is made by the Swedish Crucible Steel Co., Detroit and Windsor. The wheels are all steel and manufactured with combination rims for tractor with either solid or pneumatic tires. They can be applied to any Ford model T by the removal of the latter's wheels and when the owner wishes to use his car as a passenger car he can easily take off the tractor wheels and put back his original set of wheels.

—

Open Air Shows in New England

BOSTON, MASS., Sept. 6—The Boston Automobile Dealers' Association has approved plans made by the managers of the two big fairs in New England, the Brockton Fair in October and the Rockingham Park fair the latter part of September, to hold open-air automobile shows. A number of the Boston dealers plan to exhibit their 1916 models in both shows, and large sections of space have been set aside for the purpose, where the cars will be housed in tents. At the Marshfield fair last week there was a show, and it proved very profitable.

—

Annual Electrical Show Oct. 6-16

NEW YORK CITY, Sept. 1—The ninth annual Electrical Exposition and Motor Show will be held in this city Oct. 6 to 16, at the Grand Central Palace.

Astor Cup Five-Year Trophy

To Be Won on Points—Five Makes of Cars Required for Each Race

NEW YORK CITY, Sept. 3.—Vincent Astor has made public the deed of gift and the conditions governing the series of contests for the permanent possession of the Astor Cup, the first race for which will be run on Oct. 2 at the new Sheepshead Bay Speedway.

The design of the cup is a Classic Grecian Bowl. It bears the inscription "Astor Challenge Cup" in raised letters. The decorations are bands of laurel and oak leaves. The height of the cup itself, which rests on an ebony base, is 28½ in. and its width is 20 in. It has a chased cover.

The conditions imposed by Mr. Astor in his deed of gift call for five annual competitions on the Sheepshead Bay Speedway, the cup going to the entrant and not the driver. The final possession of the trophy will be determined on a point basis, as follows:

1—The cup shall be contested for five successive times, at intervals of not less than one year.

2—The cup shall be loaned each year to the entrant whose cars finish first in competition. Said entrant to retain possession of same for a period of one year.

SCALE FOR WINNING CAR EACH YEAR

PLACE	POINTS	PLACE	POINTS
1	20	6	7
2	15	7	6
3	12	8	5
4	10	9	4
5	8	10	3

3—In case of a tie for the permanent possession of the trophy, the disposition of such shall be determined by a series of three 100-mile races on said speedway, one car each to be nominated by entrants' time tying for possession. Best two out of three in these sprints to be winner.

4—Not fewer than five different makes of cars shall constitute a competition, any year.

5—If any entrant should obtain sufficient points to insure permanent possession of trophy in fewer than five competitions, the fifth competition shall take place in due course.

—

Transform Hall for Fall Show

MILWAUKEE, WIS., Sept. 4—The Milwaukee Automobile Dealers, Inc., is spending nearly $6,000 in rebuilding Machinery Hall at State Fair Park to make it an exposition palace for the first annual fall show, Sept. 13 to 17. In addition, about $5,000 will be spent for decorations and lighting effects. Machinery

Hall was built as a great, gaunt structure of concrete, without side walls, and designed for agricultural machinery and automobile exhibits indiscriminately. The M. A. D., however, plans to make the fall show a success and is transforming the structure into an inclosed auditorium. Space has already been sold to forty dealers and at least fifty are expected to sign before the lists close. These fifty will represent about eighty different makes of cars.

The recent booster tour undertaken by the M. A. D. is expected to result in the largest attendance ever known.

—

Hyatt Offers $1,000 in Cash Prizes

DETROIT, MICH., Sept. 6—Cash prizes totaling $1,000 will be given by the Hyatt Roller Bearing Co. to the winners of a contest having for its object to find out the greatest mileage obtained from any car fitted with Hyatt bearings which have not been replaced since the car was first put into service. The winner of the contest, which is open to all car owners, will receive $500, second prize will be $200, third prize, $100, fourth, fifth and sixth prizes respectively $50, $30 and $20, and the next ten prizes $10 each. No one connected with the Hyatt company is eligible. The contest closes November first and the judges will be Alfred Reeves, general manager of the National Automobile Chamber of Commerce; Coker F. Clarkson, general manager of the Society of Automobile Engineers, and Julian Chase, editor of *Horseless Age*.

—

Norma Offers Parade Prizes

NEW YORK CITY, Sept. 2—Among the special prizes to be awarded winners in the automobile parade and inspection on Sept 18, prior to the Sheepshead Bay races, is a silver plaque presented by the Norma Co. of America, to go to the winner in the class of decorated gasoline runabouts.

The Norma company is also to give two special prizes for the Astor Cup race on Oct. 2—a purse of $100 to be awarded the winner of the race, and a purse of $50 to go to the driver making the fastest lap during the race—provided their cars carry ignition apparatus equipped with Norma ball bearings.

—

A Lozier Racing Team?

DETROIT, MICH., Sept. 4.—It was reported in some automobile quarters today that the Lozier Motor Co. expects to have a team of three racing cars next year and that Ralph Mulford, who was connected with the old Lozier organization and drove Lozier racing cars, will be in charge of the racing team and drive one of the cars. After his recent victory in Des Moines, Iowa, Mulford came to Detroit, and the matter was taken up with the officials of the company.

Wis. Jitneys Under New Law

—

225 Out of 1100 Resume Business in Milwaukee After Meeting Requirements

MILWAUKEE, WIS., Sept. 6—Milwaukee was practically without jitney bus service for several days last week, due to the inability of jitney operators to qualify under the new State law regulating this mode of transportation, effective Sept. 1. Nearly every one of the 1100 jitneys licensed to operate under the city ordinances went out of business temporarily, but on Saturday night 225 resumed service under the permits granted by the Wisconsin public utilities commission. In the interim hundreds of people rode free, or ostensibly so, for no less than fifty operators remained on the city streets carrying signs, "Free Service," in retaliation of the efforts of the traction companies to put the business down and out by a stringent State law requiring indemnity bonds, regular schedules, hours of service and similar burdens.

When the law was passed about the middle of August, the jitney men's association organized a mutual insurance company to issue bonds as required by the new law. It was found impossible to perfect the details by Sept. 1, and the police of Milwaukee, Racine, Kenosha and other cities were obliged to stop operations until drivers qualified by filing an indemnity bond, routes, schedules, etc. The public utilities commission made an extraordinary effort to promote qualification and by Saturday night the mutual insurance company was able to issue policies, following which the holders were able to file their applications for permits to do business.

It is expected that not more than 300 of the total number of 1200 jitney operators licensed since May 1 will stay in business under the new law, because of the prohibitive premiums and selection of risks by the jitney mutual.

—

Miller Rubber Starts Free Tire Service

AKRON, OHIO, Sept. 6—The Miller Rubber Co., Akron, Ohio, has started a free tire service in that city, which has attracted widespread attention. Five service cars have been placed in service, and no matter what make of tire is used a telephone call will bring a service car to fix the trouble free of charge.

—

70 Texas Overland Dealers Meet

DALLAS, TEX., Sept. 4—Seventy automobile dealers were entertained Tuesday night in Dallas by the Overland Automobile Co. of Dallas at the Automobile Country Club. John F. Toole, special representative of the Knight division of the Willys-Overland Co., was guest of honor and principal speaker. The dealers discussed optimistically the automobile field and conditions in general. After the dinner the party met at the Overland company's headquarters in Dallas and discussed the business in different phases.

—

Cleveland Ajax Dealer to Give Free Tire Service on Road

CLEVELAND, OHIO, Sept. 6—The Cleveland Free Tire Service Co., Ajax tire dealer here, originated a free service plan that is being widely copied. A motorcycle squad is in readiness at all times to go out on calls. The men change tires of any make, it matters not, without charge.

If it is a puncture the tube goes back to the service company to be repaired. The motorist has to have this done somewhere, and the Cleveland company wants the work chiefly to remind the motorist of the service he got. The repair charge is just as low as anywhere. Of course if a new tire or tube is supplied it is charged for at regular prices. But the motorist is not expected to pay for having the goods brought to him, no matter what the run is.

—

Gets Ohio Cadillac Distribution

COLUMBUS, OHIO, Sept. 4—The Columbus Cadillac Co., organized several weeks ago with an authorized capital of $25,000, has taken over the Cadillac agency in twenty-two counties in central Ohio. The agency was formerly held by the Curtin-Williams Automobile Co. T. H. Towell is president, and E C. Mollitor, treasurer and general manager. Mr. Towell is also president of the Cleveland-Cadillac Co. and the Toledo-Cadillac Co., distributors of that make in those cities. The Columbus-Cadillac Co. will name a number of sub-agents in the territory controlled by it.

—

New York Taxicab Rates Lowered

NEW YORK CITY, Sept. 3—The Public Service Commission has granted permission to the Westcott Express Co. to put into effect immediately a new tariff of taxicab rates from the Grand Central Station, the D. L. & W. and the Erie Railroad terminals at the foot of West Twenty-third Street, and the West Shore Railroad Terminal at the foot of West Forty-second Street.

The new tariff embodies a reduction in the rates heretofore charged. Under the previous tariff the lowest rate for the first zone was 60 cents for one or two passengers. Under the new rule this rate is reduced to 50 cents, and the number of passengers that may be carried for it is either one, two, three or four.

Factory Miscellany

Weber Adding—The Weber Implement & Automobile Co., St. Louis, Mo., is building an addition to its plant.

Apperson Building—The Apperson Bros. Automobile Co., Kokomo, Ind., is building a 150,000-sq.-ft. addition to its plant.

Canadian Ford Adds—Another addition is being made to the plant of the Ford Motor Co., Ford, Ont., to cost $60,000.

Friddle Car Co. to Build—The Friddle Motor Car Co., Tacoma, Wash., will build a plant, estimated to cost $50,000. J. A. Friddle is president.

Trenton Body Builds—Fitzgibbon & Crisp, Trenton, N. J., maker of automobile bodies, will build an addition to its plant on Bank street.

Dunlop Tire Enlarges—The Dunlop Tire & Rubber Co., Booth Avenue, Toronto, will build a three-story brick addition to its factory to cost $30,000.

Houk to Add—The Houk Mfg. Co., Buffalo, N. Y., has completed plans for an addition to its plant at Elmwood avenue and the New York Central Railroad Belt Line.

To Make Tires—A company is being organized by John Hotchkiss, William Stevenson and others to build a plant for the manufacture of tires in Sebring, Ohio. No details of construction have been decided.

New Tarrytown Addition—The Chevrolet Motor Co. will soon be ready for bids for construction of a two-story plant to be built at Tarrytown, N. Y., at an estimated cost of $40,000. The company has purchased a building at Toronto, Ont., and will install machinery and equipment.

To Make Automobile Clocks—The Thompson Electric Clock Co., Memphis, Tenn., is planning the manufacture of automobile timepieces. Its principal requirement will be electric batteries.

To Make Spark Plugs—The National Service Corp., Hummelstown, Pa., is equipping a plant and installing machinery for the manufacture of spark plugs, and will be ready to make delivery in 4 or 5 weeks.

General Vehicle Expands—The General Vehicle Co. has applied for permits for the erection of an additional unit, 200 by 400 ft., to its Long Island City plant. It is to be one-story, brick and concrete, located at Starr Avenue, east of Borden Avenue.

Puritan House Organ—The Puritan Machine Co., Detroit, Mich., intends publishing a house organ for general distribution among car owners and dealers. The title of the new magazine will be "Puritan Motor News." F. M. Eldredge, advertising manager, will edit the new magazine, the first edition having appeared Sept. 1, and to be published monthly thereafter.

Binghamton Plant to Be Enlarged—The plant of Crandal, Stone & Co., Binghamton, N. Y., will be enlarged in the near future, giving an additional 16,000 sq. ft. The company manufactures automobile accessories. The company has been specializing lately in bow sockets, the output of which has been greatly increased during the past 2 months from a large contract to manufacture for the Ford company. The new addition will be 100 by 40 ft. in size and one story high.

Waukesha Co. Builds Tractors—The Federal Bridge Co., Waukesha, Wis., formerly the Modern Steel Structural Co., started last week on the regular production of gasoline tractors. The company is building the machines for another interest and acts only as producer. The enterprise is in the hands of Waukesha capital, however, and the design is by Waukesha inventors. The tractor is to be sold at a price said to be attractive to even small farmers and orders are being received from all parts of the Middle West.

Stamping Co. Purchases Plant—The Geuder, Paeschke & Frey Co., Milwaukee, which recently established a department for the production of stampings for motor car manufacturers, has purchased the plant of the National Blower Works, adjoining its present plant, to obtain much-needed space. The Geuder-Paeschke working force will immediately be increased by 200 skilled workmen. The National plant consists of a main building, 100 by 200 ft., and several smaller structures, equipped for sheet metal work. The Geuder company is a large producer of tin, sheet iron and enameled products.

The Week in the Industry

Hoar Manager Now—F. A. Hoar, for the past fifteen years with the International Harvester Co., has become manager of the Boston agency for the Moline Knight cars handled by Harrison Turner.

Manley Goes West—N. G. Manley, manager of the Metz branch at Worcester, Mass., for the past six months, has been promoted and sent West to manage the new Metz branch opened recently at Omaha, Neb.

Cobb Takes Charge—W. E. Cobb has taken charge as manager of the Locomobile branch in St. Louis, succeeding W. H. Roesch, who returned to resume his former position with the Locomobile branch in Chicago.

Asmus Dodge Assistant Export Manager—Oscar Asmus has been appointed assistant export manager of Dodge Bros., Detroit, Mich. He was formerly manager of the tourist cruise department of the Hamburg-American steamship line in New York.

—

Dealer

Larger Quarters Needed—The Bradford Automobile Co. at New Haven, Conn., handling the Paige line has been so successful that it has had to lease the store at 240 George Street, two doors above its present quarters for additional sales and service quarters.

Reo at Worcester—W. T. McOwen, formerly with the J. M. Linscot Co., Boston, Mass., has gone to Worcester, where he has formed the Worcester Reo Co. to distribute that make in the territory with his salesrooms at 696 Main Street. The Reo was formerly represented in Worcester by E. J. Kehoe.

New Company Formed—G. W. Turner, who has been in the automobile business in Boston, Mass., for many years has just formed the Turner-Ring Co., with C. B. Ring of Springfield, and they have opened a place of business at 1118 Boylston Street, to handle Ford cars at retail and specialize in building commercial bodies for this type of car.

Builds New Garage—C. T. Wetherell, manager of the Co-operative Delivery Service, Springfield, Mo., is building a two-story brick garage opposite the present quarters of the company, which will be completed by Oct. 1. The upper story will be used for storage, the ground floor will be equipped for repair work. The present quarters will be continued.

Motor Men in New Roles

Herrington Leaves American Electric—Roy Herrington, general manager of the American Electric Car Co., Chicago, Ill., has resigned to become manager of the Rockford, Ill., branch of the Anderson Electric Car Co.

Collins King Special Representative—The King Motor Car Co., Detroit, Mich., has created the position of special factory salesman for Bert Collins, whose principal duty it will be to make quick trips to localities where co-operation with dealers is necessary. He will cover the entire country.

Otto Von Bachelle, who was formerly consulting engineer with the Hupp Motor Car Co. and prior to that with the E. R. Thomas Co., Buffalo, is now associated with the A. A. Crumley Co., which was recently formed and which is the Michigan State distributor for the King and also handles the Dort.

Whitney with Willard Chicago Branch—C. S. Whitney has been appointed sales manager and assistant to the manager of the Chicago branch of the Willard Storage Battery Co., Cleveland, Ohio. Mr. Whitney was formerly manager of the Chicago automobile department of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Burk Returns to the Coast—W. E. Burk, until recently general manager and vice-president of the local Master Carbureter Corp., has returned to the Pacific Coast and will be associated with the Master Carbureter Co. of Los Angeles. Arthur L. Jelley, formerly of Kansas City, Mo. has been appointed general manager succeeding Mr. Burk.

Franklin Is Crumley Sales Manager—G. W. Franklin, manager of the local branch of the Regal Motor Car Co., Detroit, Mich., until this branch was discontinued, and who was a district sales manager for the Regal company during seven years, has been appointed sales manager of the A. A. Crumley Co., which was recently organized to handle the King in the State of Michigan.

Bromley and Jordan with Consolidated—E. W. Bromley, formerly with the Marmon organization, has been appointed district manager of Abbott-Detroit interests in Illinois and Indiana by the Consolidated Car Co., this city.

W. I. Jordan, formerly with the Hupmobile distributing organization in Chicago, has joined the Abbott-Detroit sales forces and is handling the distribution of this car in the State of Iowa.

Reynolds United States Tire Manager—F. I. Reynolds, formerly tire sales manager of the B. F. Goodrich Co., has been appointed manager of the automobile tire department of the United States Tire Co., New York City. O. S. Tweedy, the assistant general sales manager, will take on the complete charge and direction of all of the company's branches and depots throughout the country, in which work he will be assisted by the central district manager, G. S. Shugart, whose headquarters are in Chicago.

—

Dealer

Philadelphia Paige Moves—The Bigelow-Willey Motor Co., distributer of the Paige car in Philadelphia, is moving its agency headquarters from 204 North Broad Street to 304 North Broad Street.

To Handle Paige Business—J. B. Sperry has assumed charge of the Paige Motor Co. of Rhode Island, just formed to handle that line in the State with headquarters at Providence in the salesrooms, 26-28 Snow Street.

Sebring Tire Co.—A company with $200,000 capital stock is being organized in Sebring to manufacture automobile tires. The capacity of the plant will be 500 tires a day, but only 100 tires a day will be made to start with.

Sheldon Relief Association Holds Outing—The annual outing and field day of the Sheldon Relief Association was held in Wilkes-Barre last week. This is an association of the Sheldon Axle & Spring Co.'s employees, formed for relief of any members sick or injured.

Two New Tire Agencies—Two tire agency and service companies have resulted in Kansas City, Mo., from the dissolution of the Byerly-Hoole Tire & Repair Co. at 2214 McGee Street. C. T. Byerly of that firm and Edward H. Mengel, for two years manager of the Byerly-Hoole company, have formed the Byerly Tire & Repair Co., and have opened a tire service establishment with complete new equipment at 1906 Grand Avenue. They have the agency for the Goodyear and the Republic Quality Tires, and the service stations for those tires. Mr. J. C. Hoole had personally been the agent for the Kelly-Springfield Tire, and retains that agency with the new company he has formed, the Hoole Tire & Repair Co. He has also obtained the agency for the Goodrich tire. His establishment is at the old Byerly-Hoole stand.

Recent News from Dealers' Field

Midgley Tire in Rochester—The Alpha Motor Car Co., Rochester, N. Y., has secured the agency in that city for The Midgley Tire and Rubber Co., of Lancaster.

Los Angeles Federal Tire Moves—The Los Angeles branch of the Federal Rubber Co. has moved from South Olive Street to larger and better equipped quarters in the Morrison Hotel Building at Pico and Hope Streets.

New St. Louis King Station—The Monarch Auto Sales Co., a newly organized concern, has opened a service station and salesroom at 1419 Locust Street, St. Louis, Mo., from which it will distribute the King line of automobiles.

New Studebaker District—Santa Barbara, Cal., is headquarters for a new Studebaker district, including northern Los Angeles and several counties. L. H. Boydston, who has been with the Studebaker Corp., for several years, is in charge.

Dallas Ford Increases Output—The Ford assembling plant in Dallas, Tex., will have a daily output of forty-five to fifty cars during the coming year, as compared with about forty cars for last year.

St. Paul Trade Happenings—The Joswich Mfg. Co., St. Paul, has moved from 352 Cedar Street to Fifth and Market Streets. It carries the Chandler and Saxon cars. The Bartles Oil Co. has leased a plot of ground and will erect a filling station and a two-story building for automobile sundries. Seven stores adjoining will be designed for automobile accessory firms.

Maxwell Divides Canadian Territory—To facilitate the distribution of Maxwell cars in Western Canada, the territory in the Prairie Provinces has been re-divided and three new branch offices have been opened. One division has been placed in charge of J. T. Dohn, who has his headquarters in Calgary. N. J. C. Henderson is in charge of the district for which Saskatoon is the center, and F. W. Wilkins will look after the interests of the company in the district surrounding Regina. J. Lever has been appointed salesman for Manitoba and he will look after the agencies there, while P. B. Lyman will act in a similar capacity. C. L. Ackerson of Winnipeg will act as supervisor for the whole Western territory.

Recent Incorporations in the Automobile Field

MINNEAPOLIS—Power Gas Products Co.; $125,000; automobile chemicals. S. A. Stockwell, E. H. Sherwin, C. F. Heberle, J. S. Calder, T. O. Ofstun, A. J. Edwards, George Wollman.

Mississippi

YAZOO CITY—Orr Modern Motor Co.; $2,000,000. No incorporators named.

Missouri

EAST ST. LOUIS—Rothe Motor Co.; $10,000. W. F. Rothe, A. Straub, A. Lantz.
JEFFERSON CITY—Central Machine, Garage, Supply & Power Co.; $2,000. A. Stout, A. H. Lyons, E. J. Short.
JEFFERSON CITY—Gate City Motor Co. of Kansas City; $10,000. H. P. Sutton, J. R. Castor, W. C. Riggs.
KANSAS CITY—Dorris Motor Sales Co.; $2,000. C. M. Blackmar, H. A. Bundschu, E. Swartz.
KANSAS CITY—Kansas City Auto Parts Co.; $200,000. G. Nelson, O. H. Nelson, L. F. Kempton.
ST. LOUIS—Stearns-Knight Auto Co.; $10,000. D. D. Brownback, E. H. Conrad, I. F. Brownback, T. A. Conrad.
ST. LOUIS—Union Vulcanizing Co.; $10,000. G. S. Brunton, F. Warner, M. E. Brunton, C. Warner.

New York

BARKER—Barker Oil Co.; $2,000; manufacturing and dealing in lubricating oils, greases, etc. A. J. Todkill, J. E. Morgan, A. J. McAdam.
BROOKHAVEN—135th Street Garage Corporation; $20,000. J. Martin, F. C. Martin, D. V. D. Reiley.
BROOKLYN—Quincy Automobile Co.; $4,000. M. Dempsey, J. Soden, Charles P. Frizelle.
BROOKLYN—Fox Accessories Co.; $15,000; manufacturer. A. M. Eddy, G. E. Eddy, A. S. Hart.
BROOKLYN—Berger-Madden Garage; $20,000; O. R. Berger, W. J. Madden, K. C. McDonald, 641 McDonough Street.
BROOKLYN—Machine Appliance Corp.; $2,000; manufacturer of motors, trucks, etc. A. C. Kellogg, 30 Broad Street, New York City; C. E. Buckley, L. E. Taft.
BROOKLYN—B. M. C. Co.; $1,000; dealer. H. Onwin, C. M. Bishop, W. A. Sellon.
BRONX—McGee Garage Co.; $10,000. W. C. McGee, M. O. O'Halloran, T. J. Ryan.
BUFFALO—Love Automobile and Coach Co.; $10,000; renting. John Martin, W. A. Irving, R. J. Mahar.
BUFFALO—Schoepflin-Baxter Co.; $6,000; dealer. A. F. Baxter, H. C. Schoepflin, L. G. Schoepflin, all of Buffalo.
EASTCHESTER—Roeben's Scarsdale Garage, Inc.; $1,000; to do a general garage business. R. M. Roeben, J. Roeben, H. Hauswirth, all Johnson Street, Scarsdale, N. Y.
FARMINGDALE—Farmingdale Auto Garage Co.; $3,000. Arne Meyer, E. Agren, G. A. Conroy.
HUDSON FALLS—Community Auto Co.; $10,000; dealer. F. H. Packer, F. E. Jones, J. B. Davis.
HUNTINGTON—Supreme Tire and Rubber Co.; $10,000; manufacturer. H. T. Mahan, B. C. Young, R. S. Snevily.
HUNTINGTON—Carson-Orcutt Sales Co.; $5,000; garage. J. A. Carson, H. E. Orcutt, J. H. Velsor.
ITHACA—Guardol Oil Co.; $10,000; manufacturer. R. J. Lindsau, C. W. Bennett, Arnold Fahnestock.
LONG ISLAND CITY—Comet Storage Battery Co.; $10,000; manufacturer. Gustav Kiel, Hugo Kiel, J. A. Hurst, 14 Steinway avenue.
MINEOLA—Interstate Motor Corp.; $5,000. J. A. Wilkens, J. A. Bloom, J. B. Sackmann.
NIAGARA FALLS—Reiger-Meisler Auto Sales Co.; $15,000. H. M. Reiger, J. Reiger, H. A. Constantine.
OSSINING—Westchester County Auto Bus Line; $2,500; bus line between Ossining, Briarcliff and Pleasantville. F. S. Yardley, G. B. Hubbell, Albert Kamp.
QUEENS—Private Auto Rental Service; $10,000. H. Whitney, C. A. Abel, Frank Schwarz.
RICHMOND BORO.—St. Paul's Motor Co.; $10,000. A. M. Shake, A. W. Shake, H. Kuhn.
ROCHESTER—Alpha Motor Car Co.; $16,000. L. K. Opdyke, Jr., H. F. Heughes, F. L. Heughes, 190 South street.
ROME—Rome Taxi and Garage Co.; $5,000. G. T. Tunbridge, A. Tunbridge, E. H. Evans.
SCHENECTADY—Dworkowitz Garage; $600. David Dworkowitz, Abe Dworkowitz, Annie Dworkowitz.
SAVANNAH—Enkel Motor Co.; $100,000. C. A. Thomas, C. H. Williams, K. Deligren.
SYRACUSE—The Mac Mfg. Co.; $50,000. F. F. MacLean, E. E. Tilton, B. Wiles.
TROY—Troy Auto Car Co.; $35,000; dealer. L. W. Schupp, J. E. Schupp, G. A. Vanderbilt, 701 Fifth avenue, Upper Troy.
UTICA—L. R. Gardinier Motor Co.; $15,000; dealer. J. R., E. M. and I. R. Gardinier, 1561 Kemble Street.
YONKERS—The Mitchell Shop; $1,000. W. E. Willis, E. F. Germain, D. Morris.

New York City

NEW YORK CITY—Ashley Rim Co.; $10,000; manufacture auto supplies and appliances. R. W. Ashley, E. G. Kittel, R. H. Kittel, all of 505 Fifth Avenue, New York City.
NEW YORK CITY—Automobile Patents Corporation; $1,000. P. M. Pelletreau, D. J. Wagner, C. H. Ludder.
NEW YORK CITY—Auto Utilities Corporation; $25,000. A. H. Rosen, T. C. O'Connor, F. B. Wood.
NEW YORK CITY—John W. Briarly Auto Service Co.; $10,000. John W. Briarly, S. Marx, Louis Bayer.
NEW YORK CITY—Braun Wagon Lock Co.; $10,000; to manufacture vehicle locks. H. Minners, Otto E. Brain, A. Dubber.
NEW YORK CITY—Bonnite Insulator Co.; $4,000. G. H. Clark, A. H. Bergman, P. Bergman.
NEW YORK CITY—Burford & Co.; $2,000. H. C. Burford, F. C. Lord, T. H. Wight.
NEW YORK CITY—Coney Auto Co.; $10,000. A. E. Black, M. Solomon, M. Hyman.
NEW YORK CITY—C. B. C. Auto Specialty Co.; $50,000; dealer. N. Lipman, F. V. Goldstein, M. Shienhart, 439 E. Seventeenth Street.
NEW YORK CITY—Floating Wedge Lock Nut Co.; $50,000. C. E. Eckel, H. H. Waller, M. S. Wilson.
NEW YORK CITY—Hupmobile Company; $2,500. O. C. Hutchinson, Detroit, Mich.; K. R. Miner, Yonkers, N. Y.; H. Sumnich, Mountain Lakes, N. J.
NEW YORK CITY—Kansas City Tire & Rubber Corporation; $335,000. L. M. Lehr.
NEW YORK CITY—Motor-Vim Co.; $30,000. Charles W. Forbes, J. G. Guinn, Jr., F. W. Sonther.
NEW YORK CITY—Phillips Auto Seat Co.; $5,000. N. M. Lynn, C. A. Phillips, F. A. Phillips.
NEW YORK CITY—Primax Motor Co.; $10,000. A. Kaiser, H. Gabel, J. Karpa.
NEW YORK CITY—Safety Ford Starter Corporation; $3,000. J. Collins, J. S. Merton, D. L. ConkMn.
NEW YORK CITY—Smith-Haines; $5,000. R. L. Smith, D. R. Smith, R. M. Procter.
NEW YORK CITY—Speedy Carbon Eradicator Co.; $3,000. T. H. McCarrick, J. B. Maxwell, H. W. McIntyre.
NEW YORK CITY—Spitler Puncture Plug Co.; $4,950. J. B. Dulany, T. N. Tull, J. Spitler.
NEW YORK CITY—Superior Motor Power Co.; $20,000. N. Loeb, B. D. Cahn, L. D. Cahn.
NEW YORK CITY—State Motor Car Co.; $10,000. A. Parkinson, W. Parkinson, A. H. Stephens.
NEW YORK CITY—Time Clock Auto Co.; $3,000. M. J. O'Brien, T. St. John Lacy, C. A. Lewis.

Ohio

CARLISLE—Carlisle Garage; $3,000. R. Harper, Mrs. R. Harper, W. Harper, C. W. Colliver.
CLEVELAND—The Automobile Owners Casualty Co.; $50,000; to insure automobiles. M. E. Balcom, L. A. Bechler, J. J. Angel, G. B. Thomas, E. Rider.
CLEVELAND—The Auto Record Co.; $5,000; to do automobile advertising. J. W. Hickey, D. G. Hickey, F. J. Ross, C. J. Brown, C. L. Sexton.
CLEVELAND—The Federal Gear Co.; $1,000; to manufacture gears. P. C. Kassaulker, C. N. Shaver, J. Stephens, A. A. Stephens, K. Kornfeld.
CLEVELAND—The Grant-Meriam-Ford Co.; $50,000. Horatio Ford.
CLEVELAND—The Lohse Automobile Improvement Co.; $25,000 to $100,000.
CLEVELAND—The Highway Traffic Signal Co.; $10,000; to manufacture traffic signalling devices. F. B. Shonff, T. B. Jones, N. Burroughs, R. Hyatt, G. Higgins.
CLEVELAND—The Manhattan Tire Co.; $10,000; to handle tires and accessories. D. J. Dye, F. R. Dye, J. Cantillon, J. D. Fackle, E. F. Gardner.
COLUMBUS—The Vincent-Franz Automobile Co.; $5,000. H. Franz, F. L. Vincent, K. W. Rittenhouse, W. H. Love, F. F. Little.
CLEVELAND—The Ohio Tire & Supply Co.; $5,000. R. B. Tripp, G. T. Miller, L. G. King, M. R. Burnage, C. T. Townes.
CINCINNATI—The H. G. Burford Co.; $250,000; motor vehicles. W. A. Lucas, J. W. Forsythe, J. W. Worst, L. C. Worst and J. W. Fero.
COLUMBUS—The Columbus Auto Show Co.; $1,200; to give motor shows. J. P. Gordon, Frank B. Raymond, H. D. Brasher, Hugh Huntington, G. R. Hedges.
FREMONT—The H. G. Burford Co.; $250,000; to manufacture motor vehicles. W. A. Lucas, J. W. Forsythe, J. W. Worst, L. C. Worst, J. W. Fero.
PIQUA—The W. F. Robbins & Sons Co.; $5,000; to operate a bus line. W. F. Robbins, M. R. Robbins, B. C. Robbins.
TOLEDO—The Toledo Jitney Service Co.; $5,000; to operate a jitney line. J. Fisher, S. Slotnick, W. Friberg, L. Levine, J. Frednar.
WILMINGTON—The Brown Accessory Mfg. Co.; $12,000; to make automobile accessories. R. M. Brown, L. C. Barnes, R. E. McCoy, C. O. Murrell, B. J. Hiatt.

Oklahoma

OKLAHOMA CITY—Sutton-Johnson Motor Co.; $1,000. G. M. Sutton, E. C. Johnson.

Tennessee

CHATTANOOGA—Hamilton Motor Car Co.; $10,000. A. R. Pryor, L. T. Prigmore, E. M. Prigmore, H. C. Kelly, L. R. Darr.

Texas

BROWNSVILLE—Harrison-Charney; $4,000. H. M. Harrison, H. C. Harrison, Ellis Charney.
KINGSVILLE—Kingsville Auto & Electric Co.; $2,000. C. H. Flato, Jr., J. D. Finnegan, E. W. House.

Virginia

RICHMOND—Baines Automobile Corporation; $10,000. K. H. Khorr, president; T. C. Baines, secretary.
RICHMOND—Imperial Auto Supply Co.; $10,000. C. S. Sampton, H. A. Grant.
RICHMOND—Staunton Auto Transportation Co.; $25,000. T. K. Hackman, president; W. F. Brower, secretary.
RICHMOND—Staunton & Monterey Auto Transportation Co.; $5,000. J. W. Spitler, president; L. C. Davison, secretary and treasurer.

Washington

SEATTLE—Washington Auto Bus Co.; $25,000. K. K. Carrick, Everett; Forest P. Dexter, Seattle; James B. Howe, Seattle.

Wisconsin

MILWAUKEE — Wisconsin-Oakland Co.; $100,000; dealer. R. Hokanson, G. P. Miller, W. M. Thompson.
MILWAUKEE—The Demerath Two Minute Quick Detachable Rim Co.; $25,000. Theodore Sternemann, Joseph Demerath, Edward M. Sullivan and Theodore Naus.
MILWAUKEE—The Wisconsin Auto Exchange; $10,000. Harry Kohn, Fred W. Smith, N. L. Bierbach and L. J. Klug.
RACINE—The Wisconsin Metal Products Co.; $20,000. J. H. Dwight, Taylor Jolliffe.

VOL. XXXIII. NEW YORK—THURSDAY, SEPTEMBER 16, 1915—CHICAGO NO. 12

The AUTOMOBILE

Middle West Crops Presage Increased Car Sales

Automobile Registrations Make Rapid Gains—Wheat and Corn Bring Unprecedented Prosperity to Farmers—Prices Higher for Lead, Zinc and Oil —Livestock Booms with High Prices for Cattle

KANSAS CITY, MO., Sept. 11—If good crops and high prices make for good times, the West never faced a period of greater prosperity. The reasons are: The second greatest wheat crop in the history of the West. The second largest of all corn crops in the making, depending only on the late frosts in States north of Kansas. A great impetus in the oil industry, due to a rise in price. Big prices for lead and zinc. The highest prices ever paid at this season of the year for sheep and lambs. High prices for cattle. A heavy demand for horses and mules, and double prices due to the exportation of 425,000 horses since the war began. Bank deposits greater than last year, due to the sale of livestock, farm and mineral products to supply foreign demands therefor. A thriving milling industry due to war exports. Unusually fine pastures, due to a rainy summer. Freedom from labor troubles. The general employment of all skilled and unskilled labor.

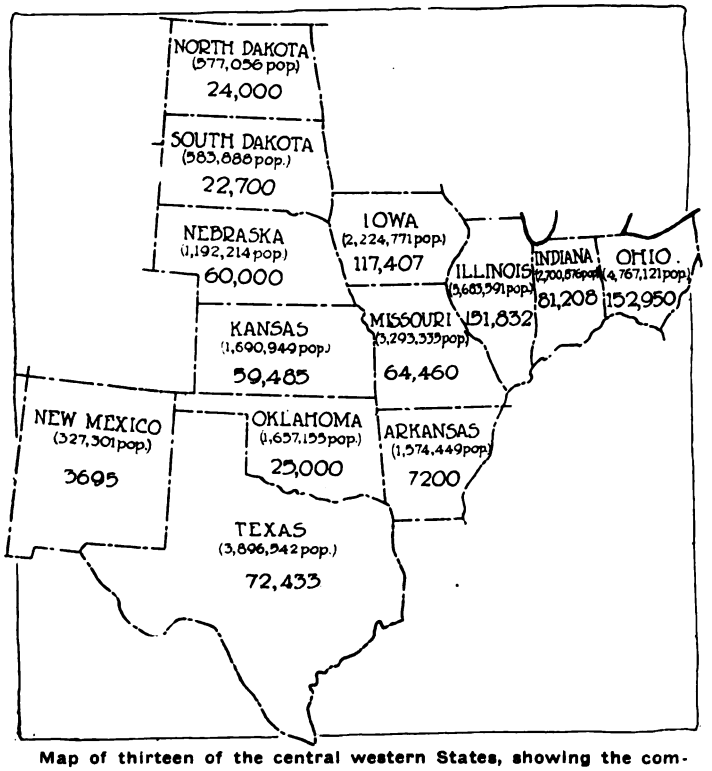
Record Corn Crop

The big rains that came to the West just as the wheat harvest was beginning cut the winter wheat crop in the big grain States by a tremendous amount, amounting in Kansas alone to 60,000,000 bu., but the same heavy precipitation is giving to these States the greatest corn crop of their history.

The losses in winter wheat will be offset by the gains in corn which could not have resulted in a year of hot winds and high temperatures. Automobile dealers in the West have been watching reductions in the wheat estimate during the last month with some chagrin, although the Southwest will have a crop exceeded only by one other, that of last year. But they failed generally to take into account that the reductions of wheat have meant big increases in corn and the farmer makes more money from corn than he does from wheat, although it is not such a ready money crop. And the spring wheat crop in the northern tier of western States is the greatest in their history. Kansas estimates for wheat at the beginning of the season were for 160,000,000 bu. of wheat and as late as the latter part of July J. C. Mohler, of the Kansas Agricultural Department looked for 135,000,000 bu. of wheat. This month, however, Mr. Mohler, with reports from all counties on threshing, says Kansas will raise 100,000,000 bu. of wheat, which is, however, a bumper crop even for Kansas.

Eleven Reasons for Prosperity in the West

1—Second greatest wheat crop in West's history.
2—Second largest of all corn crops in the making.
3—Oil industry given impetus by higher prices.
4—Lead and zinc mines rushed by demand due to war.
5—Record prices for sheep and lambs at this season.
6—Cattle selling for prices steadily above normal.
7—Double prices for horses and mules for war purposes.
8—Increased bank deposits due to large foreign business.
9—Milling industry thrives—Business steadily gaining.
10—Unusually fine pastures due to a rainy summer.
11—Employment plentiful—Freedom from labor troubles.



Map of thirteen of the central western States, showing the comparative population and registration of automobiles. This section of the country has been making tremendous gains in car registration during the past two years and the record crops now being harvested presage a still greater advance in this respect

After the big wheat crop of last year, thousands of mortgages were paid off or reduced in the Southwest, so that the big corn returns this year and the wheat crop which would be a record breaker for any year except last year will put the farmer in splendid condition and give him money to spend he would not otherwise have. Illinois, however, will come forward, the latest returns indicate, with an increased wheat yield, while Oklahoma will reach its original estimate of 40,000,000 bu. The loss will be considerable in Kansas, Missouri and Nebraska, but the panhandle of Texas, as big as most other States, will show a tremendous increase in its wheat production.

Corn—2,900,000,000 Bushels

The size of the corn crop is largely dependent upon a late growing season. If frosts hold off until the middle of October in the Dakotas and Nebraska and later in the States further south and east, the corn crop of the country will be second only to that of 1912, when 3,124,000,000 bu. were raised. This year's crop should exceed 2,900,000,000 bu., 230,000,000 bu. more than last year. The corn crop is practically made in Oklahoma, Texas and the South generally and will make a high record in these States. The southern planters diverted several million acres of cotton land this year to corn, 25 per cent more than last year and they are going to be in better shape than when the war was tearing cotton prices to pieces.

There is slight danger of frost in Kansas. That State will have a record crop, although the acreage is smaller than in the last twenty years. It was this small acreage that blinded the eyes of grain men generally to the possibilities of the corn crop and under no other conditions could it have happened except where rain fell practically every few days through the corn belt, all through the time that generally brings hot winds and high temperatures.

Frost Only Danger

This is true also in all the big corn States. Well informed grain men say that if there is no frost damage to corn, yields in the big corn States will be practically as follows:

State	This Year Bu.	Last Year Bu.
Illinois	400,000,000	300,000,000
Iowa	350,000,000	390,000,000
Nebraska	200,000,000	174,000,000
Kansas	140,000,000	108,000,000
Missouri	190,000,000	158,000,000
Indiana	200,000,000	163,000,000
Ohio	150,000,000	142,000,000
Oklahoma	120,000,000	50,000,000
Texas	175,000,000	125,000,000

Livestock Booms

The livestock industry everywhere in the western States is in first class condition and most of the western States have recovered from their scare about the foot-and-mouth disease and lifted their quarantines. While this scare existed it upset one of the greatest industries of the West. Prices are high for cattle, horses and sheep and fair for hogs. The steady sale of horses for war purposes has raised the price of all breeds of horses in the West from 50 to 100 per cent since the war began a year ago. And the demand continues. Since a year ago 425,000 horses have been exported for war purposes.

The West never had finer pastures or crops of hay and all the minor feeding stuffs such as kafir and the various forms of feeding sorghums which are an important factor in farm prosperity in the western Dakotas, western Nebraska, western Kansas, Oklahoma and the Texas panhandle.

Kansas City Gains

Just what the livestock market is to the West cannot be understood by eastern men who have not had experience in the West, but thousands of men are employed in the central markets themselves from livestock commission brokers and cattle money lenders to the packing house laborers. Omaha and Kansas City are largely dependent on the livestock market for their prosperity, so that figures from the livestock yards of these two cities are of especial interest right now. In the month just ended, 9381 carloads of live stock were received at the Kansas City Stock Yards. This is an increase of 981 cars, or 11 per cent over the receipts in August, 1914, and represents a gain of 10,800 cattle, 26,200 hogs, 34,200 sheep and 938 horses.

Kansas City and Omaha, the big western markets, show increases in all departments for the month just ended. In Chicago there were increases in cattle and hogs and a decrease in sheep. St. Louis reported decreases in cattle, hogs and sheep.

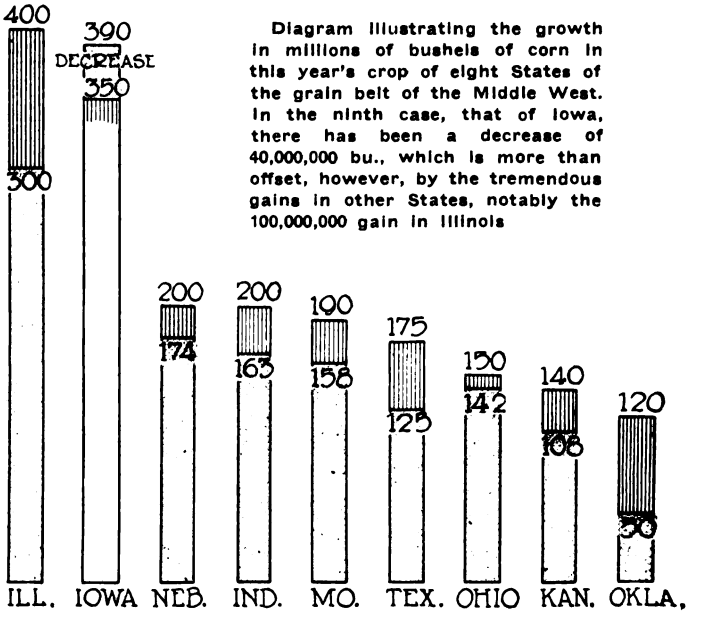


Diagram illustrating the growth in millions of bushels of corn in this year's crop of eight States of the grain belt of the Middle West. In the ninth case, that of Iowa, there has been a decrease of 40,000,000 bu., which is more than offset, however, by the tremendous gains in other States, notably the 100,000,000 gain in Illinois

In sheep, the most interesting feature in years is developing and is reflected in increased receipts in Kansas City and Omaha, and a big drop in the Chicago supply. Here sheep increased 31 per cent over a year ago and in Omaha there was an increase of 13 per cent.

Official reports at the Kansas City Stock Yards for August were: 173,636 cattle; 12,197 calves; 142,729 hogs; 145,598 sheep, 3030 horses.

Receipts of cattle, calves included, hogs and sheep in the five big western markets are here shown as an index to western prosperity. Receipts in eight months this year and last:

Cattle	Five Western Markets
Eight months 1915	4,139,100
Eight months 1914	3,992,250
Increase	146,850
Hogs	
Eight months 1915	11,393,850
Eight months 1914	10,023,450
Increase	1,370,400
Sheep	
Eight months 1915	5,854,900
Eight months 1914	7,238,800
Decrease	1,373,900

Lead and Zinc Develop

The lead and zinc district, comprising an important area in Kansas, Oklahoma, Arkansas and Missouri, has come into renewed prosperity in the last few weeks. For a time, in fact, for about ten months after the war broke out, zinc ore was selling for three times what it formerly sold at and then came a sudden slump that sent the price down more than 50 per cent. A revival in price, however, has followed that has put the district into good humor again. Zinc blend sold last week at $70 to $86 a ton, where it had sold the week before at $50 to $70 and the market was still climbing.

More Cars Registered

Just how important the price of zinc ore is may be understood from the fact it is often said that every other man in southwest Missouri and southeast Kansas owns stock in a zinc mine. Also thousands of investors are represented in the western cities in the thousands of zinc mines in the Joplin district. And while many more investors are represented than appears in the half dozen counties where the mines are located, the effect on the automobile industry may be gaged by the fact that Jasper County, Missouri, in the mining district, has shown an increase alone from 1768 to 2450 cars since the first of the year.

$25,000,000 in Ores

It means something when it is said that the Kansas-Missouri-Oklahoma-Arkansas lead and zinc district will produce $25,000,000 of lead and zinc in ores alone. To get the comparison a little better, possibly; all the gold mined in the United States and Alaska in 1913 amounted to only $88,000,000.

This is a condition that has come about only in the last year and one that will last a year at least and probably longer after the war is over. The cause is simple. Before the outbreak of the war, about one-half of the world's output came from Germany and Belgium. The war has shut down nearly every zinc mine in Germany and Belgium. The trouble in Mexico has cut off production there and the Australian zinc ore can not be smelted in America at a profit, so that the world is dependent on America for zinc.

Brass Demand Great

Now, while the war lessened by one-half the production of zinc, it vastly increased the demand for it, because brass

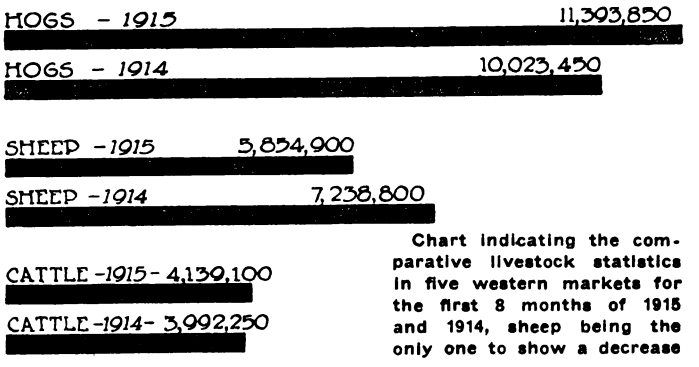

Chart indicating the comparative livestock statistics in five western markets for the first 8 months of 1915 and 1914, sheep being the only one to show a decrease

is made of about 50 per cent of zinc. Brass enters into the making of almost every cartridge.

In 1914 the Joplin district produced 257,047 tons of zinc ore, valued at $9,702,804, which is a little less than $40 a ton. This year with the increased activity, the output ought to be 300,000 tons, the experts say, and at $75 a ton this would bring into the district $22,500,000. This much zinc ore would make 150,000 tons of spelter valued at $45,000,000.

But zinc ore is not smelted in the Joplin district because of lack of fuel there. It is cheaper to carry the ore to the Kansas districts of cheap fuel than to carry fuel to the zinc districts, so the smelters are in the gas and coal fields.

Everywhere in the zinc fields around Webb City and Joplin are men who are becoming rich, men who a year ago had nothing and are making thousands of dollars a month now with prospects of that income keeping up as long as the war lasts and a year or two afterward, for even after the war ends, it will take a year or two to get the Belgian and German industry on its feet again. Nearly everybody in the Joplin district has some interest in a mine.

Prospective Car Owners

In Webb City and Joplin, the barber who shaves you may have an income of $100 a week from his one-eighth or one-sixteenth interest in a zinc mine. The waiter who serves you may be getting from $50 to $100 a week from his mining interest; and the man in overalls over on the corner, who was a shoveler a year ago earning $2.50 a day, may have an income now of several hundred or even a thousand dollars a week. There are lots of instances of that kind.

Road Improvement a Factor

These mines of this district produce a grit that makes fine roads and radiating out of Joplin are 600 miles of grit roadway. These roads help to make the automobile industry grow, too. The mines are located all over the district and some of them are twenty miles from a good-sized town so that the automobile is not only a luxury, but a necessity. The light cars are most in demand, but the most expensive kind are also to be seen.

Field Widens in Texas

A territory that the automobile trade is hearing from now and is to hear more from this fall is the panhandle of Texas. This empire, which formerly was given over to the open range and frequented by coyotes and prairie dogs, is being broken up into farms. The present season is the greatest in its history. Wheat is threshing an average of 25 bu. to the acre and forage crops are very luxuriant. It's the panhandle's greatest year since any record of rainfall and crops has been kept.

Amarillo, the commercial center, with a population of about 13,000 has a licensed registry of more than 900 cars of all makes. Its newspapers are carrying expensive automobile advertisements and the smaller towns are rapidly establishing car agencies. This blanket of prosperity extends

(*Continued on page* 519)

Physical Qualities of Castor Oil

Careful Experiments Determine Densities and Viscosities as Functions of Temperature, Chill Point, Flash Point and Boiling Point

IN order to arrive at a set of scientifically accurate figures on the qualities of castor oil, THE AUTOMOBILE has submitted to the Sibley College of Cornell University a sample of grade AA castor oil as produced by the Baker Castor Oil Co., New York City, for test.

The results of the test are shown in the curve herewith. The experiments were performed by P. G. McVetty, of Sibley College, using formulæ derived by Prof. G. B. Upton for the determination of absolute viscosity. The curve shows the attempt to bring the viscosity readings down to a basis which is absolute and not in the arbitrary scale of any one viscometer. The report of the test is as follows:

Tests have been made to determine the density and viscosity as functions of temperature; also the chill point, flash point, and burning point.

Density of Sample .9599

The density of the sample at 21.0 deg. C. or 69.8 deg. Fahr., was determined by weighing a known volume (200 c.c.) which gave a value of 0.9599, distilled water at 4.0 deg. C. being taken as unity. Also a hydrometer was used to determine the variation of density with temperature, resulting in the following data:

In distilled water at 62.4 deg. Fahr., hydrometer read. = 0.994
Actual density of water at 62.4 deg. Fahr. = 0.9989
Constant of hydrometer is then $\frac{0.9989}{0.994}$ = 1.0049

Oil Temp. Deg. Fahr.	Density of Castor Oil Water at 4.0 Deg. C. = Unity Hydrometer Reading	Corrected Density
68.7	0.956	0.961
115.0	0.940	0.945
135.0	0.932	0.937
150.0	0.927	0.932

The hydrometer used had an enclosed thermometer which read to 150 deg. Fahr. This prevented the use of higher temperatures.

As a check on this work, the following data have been taken from "Lubrication and Lubricants," by Archbutt & Deeley, page 185.

Temp. deg. Fahr.	Density
100	0.9473
150	0.9284
212	0.9050

Also at 60 deg. Fahr. the density of a number of samples varied from 0.958 to 0.967, the usual value being 0.962 to 0.963.

Curves have been plotted from both these sets of data and it will be noted that the difference between the two curves is less than half of 1 per cent, while the variation given by Archbutt & Deeley as existing between different samples of the oil is about 1 per cent.

Upton's Formulæ Employed

The determination of *absolute viscosity* from the time readings obtained with practically any form of flow viscometer (viscosimeter) has been made possible by the use of a theoretical equation derived by Prof. G. B. Upton, the peculiarities of any individual instrument being taken care of in the constants of the equation. These constants may be obtained experimentally or computed from the dimensions of the instrument. The following discussion is abridged from a paper by Prof. Upton.

"A flow viscometer does not measure viscosity. It measures the ratio of viscosity to density, at atmospheric pressure, and at the temperature which the fluid possesses as it approaches and runs through the discharge tube of the viscometer. The general form of the equation, connecting the ratio of viscosity to density with the time of flow of a set quantity of fluid from a given viscometer is:

$$\frac{n}{d} = At - \frac{B}{t}$$

in which

n = absolute viscosity in dynes per sq. cm.
d = density at the temperature of measurment.
t = time in seconds for the efflux of a fixed quantity of fluid.
A and B are instrument constants readily found."

In reporting tests on the Engler viscometer it has been customary to use the term "Engler number," which is defined as the ratio of the actual efflux time at any constant temperature for 200 c.c. of the fluid being tested, to the time for the same volume of water at 20 deg. C. Since the Engler number is proportional to time, the general equation may be written:

$$\frac{n}{d} = Ae - \frac{B}{e}$$

in which e is the Engler number.

The following equations are given by Professor Upton for the *average* instrument of each type, and are used in the following computations where the data at hand are insufficient for determining the time constants of the individual instruments:

Standard Engler $\frac{n}{d} = 0.0730\,e - \frac{0.06294}{e}$

Saybolt Universal $\frac{n}{d} = 0.001930\,t - \frac{1.242}{t}$

Redwood $\frac{n}{d} = 0.002322\,t - \frac{1.387}{t}$

Reduce to Absolute Figures

The following data were obtained by test of a sample of the oil in a Standard Engler viscosimeter on March 18 and 22, 1915, and are reduced to absolute viscosities by means of the Upton formula, making allowance for the constants of the instrument used ($e = \frac{t}{52.3}$, for this instrument).

Temp., Deg. Fahr.	Engler Time (t)	Engler Number (e)	$0.0730\,e$	$\frac{0.06394}{e}$	$\frac{n}{d}$	d	n
208.5	144.0	2.76	0.2016	0.02283	0.1788	0.910	0.163
80.0	4150.0	79.40	5.80	0.0008	5.799	0.956	5.55
77.0	4696.0	89.80	6.56	0.0007	6.559	0.958	6.28
73.0	6352.0	121.55	8.87	0.0005	8.87	0.959	8.50

These viscosities have been plotted against temperatures as shown on curve sheet.

To check the above work, and the reliability of Upton's equations in general, all the available data on castor oil viscosities have been collected and plotted on the same curve.

On page 355 of "Lubrication and Lubricants" by Archbutt & Deeley, we find the following data:

"Twenty-three samples of Indian castor oil, tested by Deering and Redwood in the Redwood viscometer required from 1160 to 1190 sec. for the outflow of 50 c.c. at 100 deg. Fahr."

Taking the average time = 1175 sec., we have

$$\frac{n}{d} = 0.002322 \times 1175 - \frac{1.387}{1175} = 2.728$$

From density curve, d at 100 deg. Fahr. = 0.949.
Hence, $n = 0.949 \times 2.728 = 2.59$ at 100 deg. Fahr.

Cites Stratford's Paper

In a paper entitled "How to Test and Use Oils and Greases," by C. W. Stratford, read at the June, 1915, meeting of the Society of Automobile Engineers, is given a curve in which times of efflux from a Saybolt universal viscometer are plotted against temperatures.

The following values have been picked from this curve:

Temp. Deg. Fahr.	Saybolt time Seconds
100	1350
150	300
200	110
250	60+
300	50—

These values reduce to absolute viscosities as follows:

Time, Seconds (t)	0.001930 t	$\frac{1.242}{t}$	$\frac{n}{d}$	Temp., Deg. Fahr.	d	n
1350	2.605	0.00092	2.604	100	0.949	2.471
300	0.579	0.00414	0.575	150	0.931	0.535
110	0.212	0.01130	0.201	200	0.913	0.184
60	0.116	0.02070	0.095	250	0.896	0.085
50	0.0965	0.02484	0.072	300	0.878	0.063

As a check on all the computed values, the following from Archbutt and Deeley have also been plotted.

Temp. Deg. Fahr.	Absolute Viscosity
100	2.729
150	0.605
212	0.169

An inspection of the curve will show that all the data agree very closely, which confirms the accuracy of the method of computation.

Chill Point Not Determined

The *chill point* has not been definitely determined, and it is evident from the attempts that have been made to obtain this value that some special apparatus must be arranged for the purpose. One sample of the oil was kept at a temperature of —4.5 deg. Fahr. for 1 hr. but no apparent solidification resulted. Another sample was cooled below —100 deg. Fahr. by surrounding it with liquid air. This solidified suddenly with the formation of plate-like crystals, probably due to entrained moisture. The subsequent reheating on exposure to the air was too rapid for the determination of the chill point. It is probable that this determination might be made by using carbon dioxide snow. Archbutt and Deeley give ±0 to 14 deg. Fahr. as the approximate solidifying point. The value obtained depends largely upon the method used.

Open Cup Tester Used

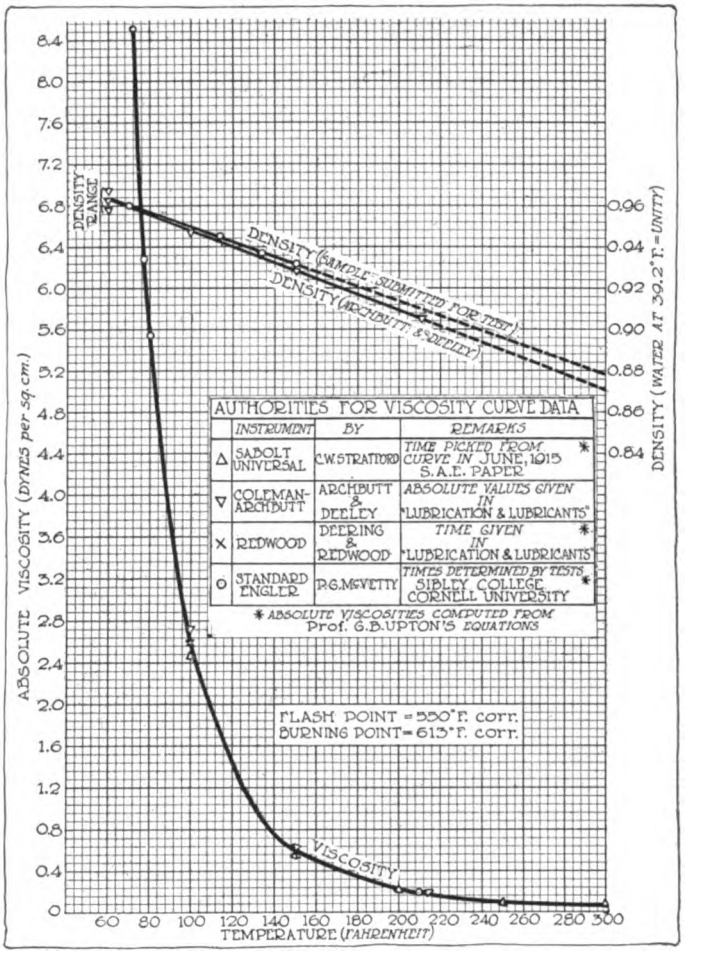
The *Flash Point* and *Burning Point* were determined in an open cup tester, using care to avoid air currents across the apparatus. The reason for not using the standard Pensky-Martens instrument was that the temperatures involved were considerably beyond its working range. As the open cup tester does not give close check values, eight tests were made for both flash and burning points and the average of the best readings used. One thermometer was placed in the oil and was used to keep it stirred; another was so placed as to give the mean temperature of the emergent stem of the first. Both were calibrated and the proper corrections applied. From these data were obtained

Flash point = 550 deg. Fahr. corrected;

Burning point = 613 deg. Fahr. corrected.

In conclusion, the following points may well be emphasized:

(1) The value of any oil as a lubricant depends upon its viscosity in the working range of temperature. On account of the importance of this property, the viscosity-temperature curve has received more consideration than the other items. The viscosity values of castor oil are approximately the same as those of a "heavy" petroleum oil, and its lubricating action will be similar to such an oil. The choice of one or the other will then be controlled by considerations of price. Reference may be made to Mr. C. W. Stratford's paper, previously mentioned, for a discussion of this point.



Curves showing castor oil densities and viscosities as functions of temperature, determined by tests at Sibley College, Cornell University

(2) A knowledge of the density of an oil has little practical value. The temperature-density relations have been determined with a fair degree of accuracy because they are necessary for the computation of absolute viscosities.

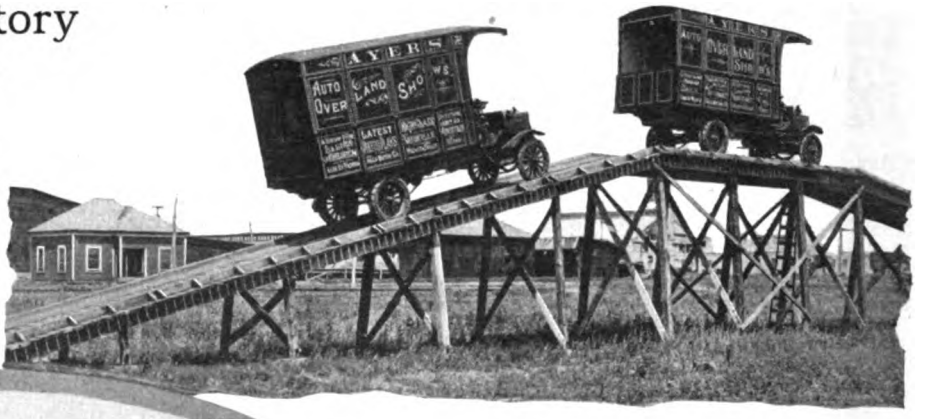
(3) The chill point affects the distribution of the oil to the bearings and the starting of a machine in very cold weather.

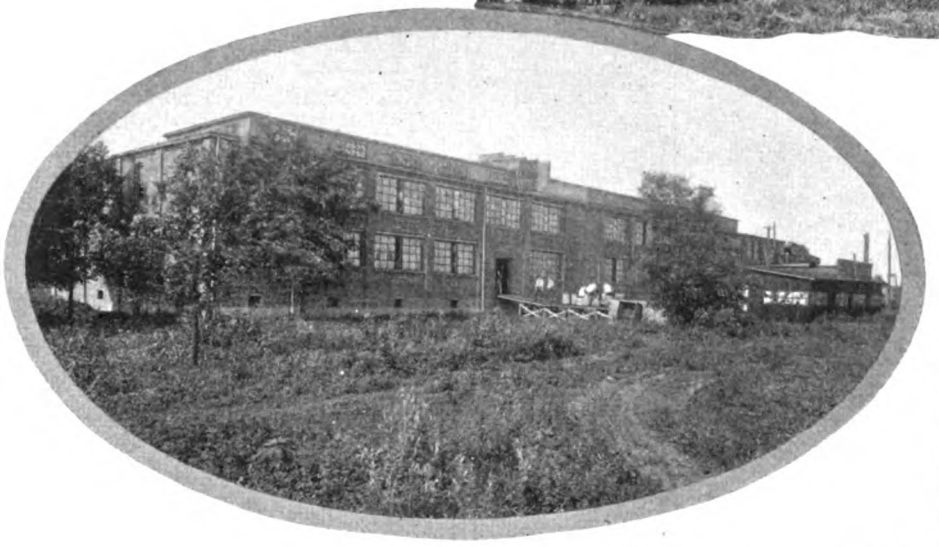
(4) The flash and burning points of an oil used for motor cylinder lubrication have practically no importance, if above 300 to 350 deg. Fahr. For a discussion of this point, see the paper by Lieut. G. S. Bryan in the February, 1915, Journal of the American Society of Naval Engineers.

(5) The absolute values obtained in all tests of castor oil may be considerably in error. It is a glyceride and, like glycerine, has the property of absorbing water from the air. On this account, it is evident that both viscosity and density will change with the atmospheric conditions and the time of exposure of the oil to them. Upon heating the oil to determine the change in its properties with temperature, this water is driven off, which causes a change in composition during the test. There is also evidence that the chemical composition changes even when heated only slightly because the oil becomes darker in color. These variations, which cannot well be controlled, may seriously influence the results of any test, but reasonable care has been taken to make the results as nearly accurate as possible.—P. G. McVETTY, Instructor, Experimental Engineering, Cornell.

Some Recent Factory Developments

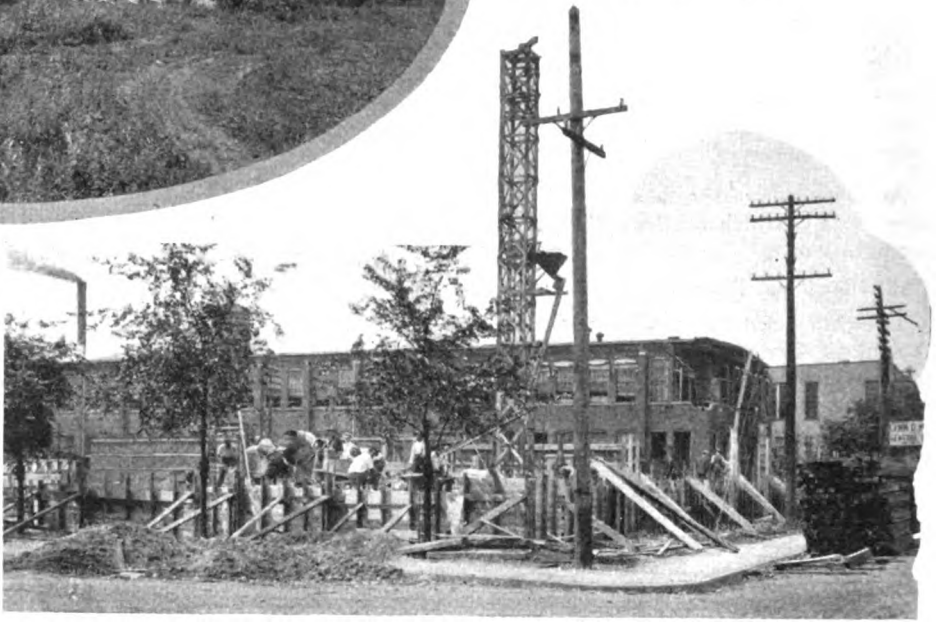
At the right is illustrated the testing trestle in use at the factory of the Wichita Falls Motor Co., Wichita Falls, Tex., with a 27 per cent grade on one side and 18 per cent on the other. This trestle is located just outside the Wichita factory and all Wichita trucks are tested on it in addition to making test runs over the plains.





At the left is illustrated one side of plant No. 2 of the Warner Gear Co., Muncie, Ind., this building having recently been added to the factory equipment of the company. It is a two-story brick structure 60 by 300 ft. and is now in full operation. Another view appears at the bottom right of this page.

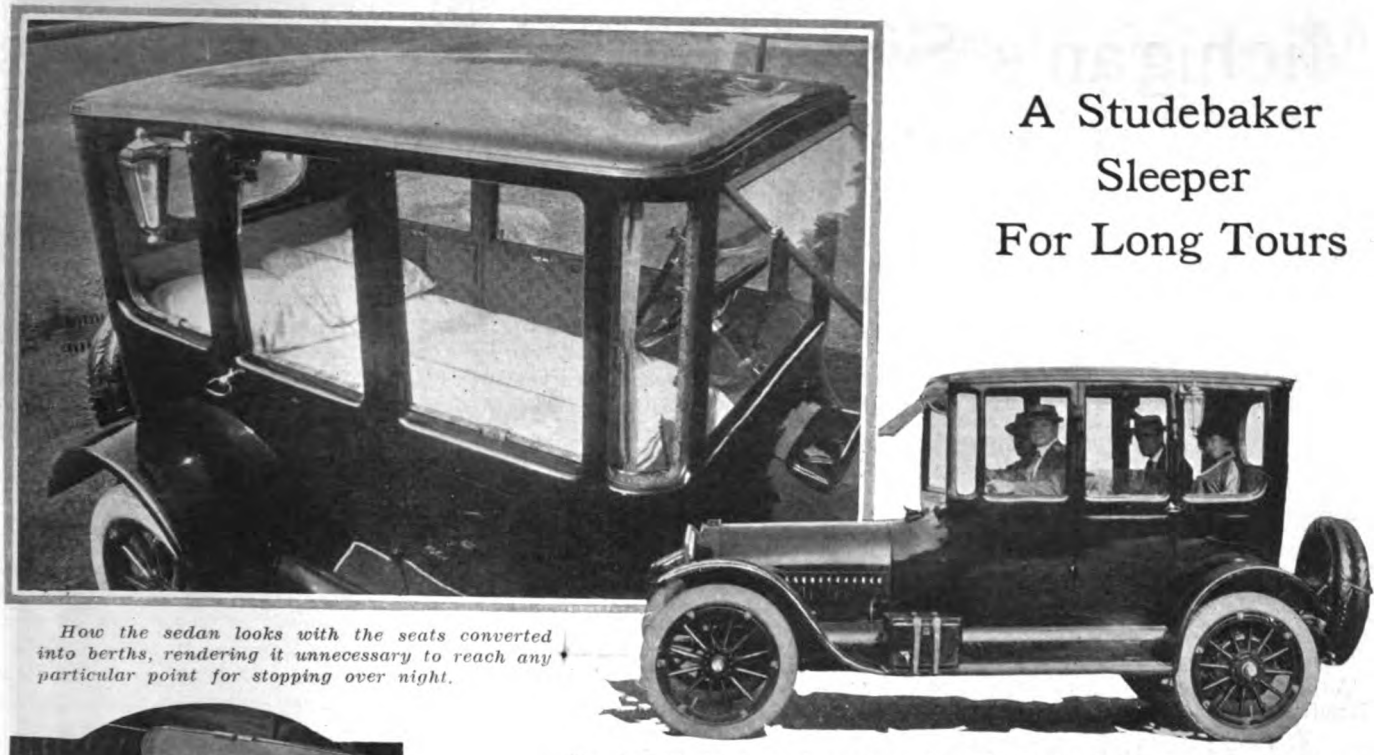
At the right is construction on the new factory buildings erected by the National Motor Vehicle Co., Indianapolis, Ind. One building is 38 by 278 ft., the other is 80 by 400 and both are two stories in height, being of concrete and steel construction and absolutely fireproof. One of the new buildings will include the general offices of the company. The National company's plant now occupies a solid city block. Work is being rushed on the additions.



***At the left is the assembly plant of the** Ford Motor Co. of Louisville, Ky., now being completed so as to be ready for occupancy October 1. It is a four-story steel and concrete structure with basement and sub-basement and trimmed with terra cotta and ornamental brick. Floorspace is 88,000 sq. ft., with 53,500 sq. ft. of window space.*

At the right is another view of plant No. 2 of the Warner Gear Co., Muncie, Ind., illustrated in the oval above. With this addition the increased floorspace of the company's plant is 39,000 sq. ft., the total working force being 1200 men on a twenty-three hour basis.

A Studebaker Sleeper For Long Tours

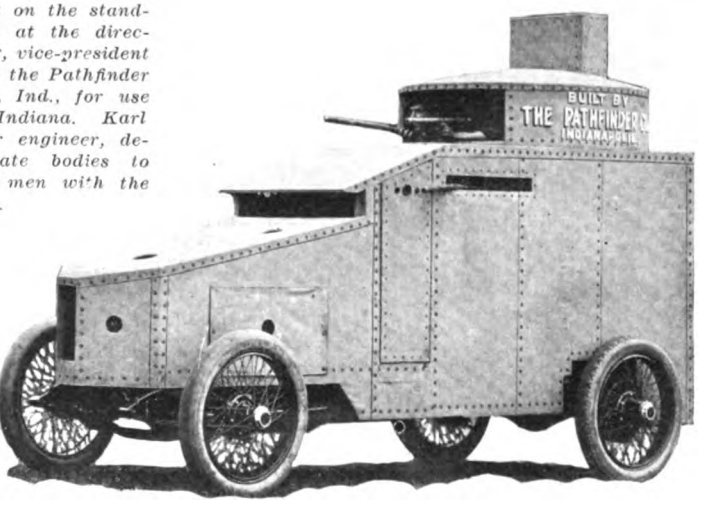


How the sedan looks with the seats converted into berths, rendering it unnecessary to reach any particular point for stopping over night.

The two illustrations above show the 1916 Studebaker sedan specially designed for S. Sproat of New York City, which is fitted with seats convertible into berths and with the ingeniously constructed compact refrigerator illustrated at the left. With this car Mr. and Mrs. Sproat, who have started on a tour to extend over a period of 2 to 3 months through New England, Canada and the West, are relieved of any dependence upon hotels since they may make their overnight stop where they wish without pushing forward or going back for sleeping or eating

The ingeniously designed, compactly constructed refrigerator which is carried strapped to the left runningboard of the special Studebaker sedan illustrated above.

At the right is illustrated one of the two armored cars built on the standard Pathfinder chassis at the direction of W. E. Stalnaker, vice-president and director of sales of the Pathfinder Company, Indianapolis, Ind., for use in the recent war in Indiana. Karl Feilcke, the Pathfinder engineer, designed these boiler-plate bodies to carry a crew of four men with the usual quick-firing guns.



An interesting method of making a tractor has been originated by A. W. Bell, a resident of Saskatoon, Sask. The car from which the improvised tractor has been made is a 1912 Overland and it was converted into a tractor by the simple arrangement of putting in an extra axle under the frame 2 ft. in front of the rear axle of the car on which were placed two binder wheels. After removing the rear wheels of the car, Mr. Bell replaced them with small sprocket wheels which were connected with larger sprockets on the drive wheels by chains.

Michigan's Six Months' Registrations

First Half of 1915 Shows Over 20,000 More Cars Licensed Than During Entire Year 1914

AUTOMOBILE licenses numbering 96,368 were issued by the Secretary of State of Michigan from Jan. 1 to June 30, 1915. In those six months 20,046 more cars were registered in Michigan than during 1914.

Taking the State official's records since 1909, when the first official count was taken, it is shown that the half-year record for 1915 is 84,650 licenses ahead of all of 1909, 78,013 more than that of 1910, 68,572 over the 1911 record, 56,999 better than the registrations of 1912, 42,002 beyond the 1913 total and, as stated above, already 20,046 past the total of last year.

Canadian Element Not Counted

In going through the motor vehicle license lists as compiled by the State license department and in making the count of the various, or different cars, no cars credited to Canadian residents or to residents of other States were taken into account, it being the intention to make a record only of the cars owned in the State of Michigan. This will account for the difference of 2106 cars or license numbers when the total as recorded by the Secretary of State and the total as compiled by the writer are compared. The State records give the total number as 98,474.

Among the 96,368 cars counted, there are to be found the makes of 390 different automobile manufacturers, a great many of whom long ago ceased to make automobiles, or have either been absorbed by other concerns, or given up the automobile end of their business.

Of the total of 96,368 cars 94,182 are gasoline driven, and 1663 are electric vehicles. There are 91,644 gasoline passenger cars and 1552 electric vehicles, for passenger use. Commercial cars total 2610 of which 2499 are gasoline trucks

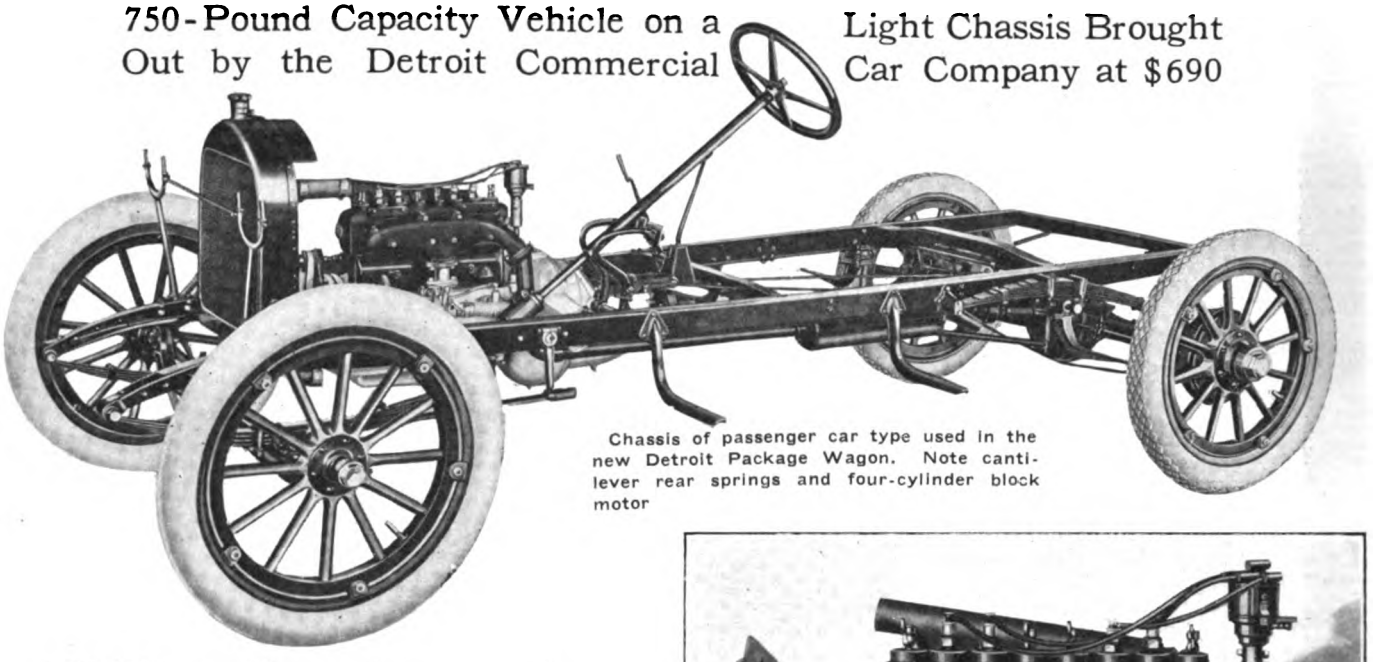
Detroit Package Wagon Enters Field

750-Pound Capacity Vehicle on a Light Chassis Brought Out by the Detroit Commercial Car Company at $690



Chassis of passenger car type used in the new Detroit Package Wagon. Note cantilever rear springs and four-cylinder block motor

DETROIT'S automobile roster is to carry another name. The Detroit Commercial Car Co. has been formed with W. D. Paine, formerly a zone supervisor of the Maxwell Motor Co., as its president and general manager. The personnel of the company other than Mr. Paine has not been made public, but it is understood that sufficient capital is available for extensive manufacturing operations. Headquarters are being established at 1225 Woodward Avenue.

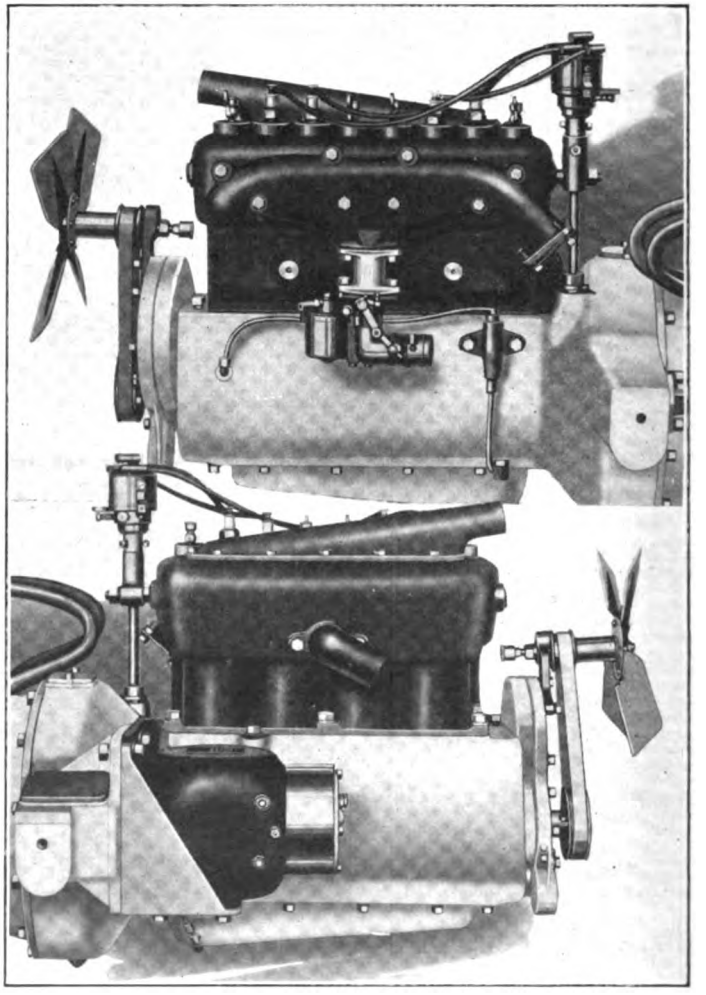
The product of the Detroit Commercial Car Co. is to be a light delivery vehicle, known as the Detroit Package Wagon, and having a rated capacity of 750 lb. Three types of light-delivery bodies are listed, one a standard panel body form of vehicle selling at $690; another style having an open express body and also selling at $690; and the third a full panel type of more elaborate body construction at $745.

The chassis is practically the same as that used by a passenger car of similar size. This is quite a logical thing, because the load rating of 750 lb. along with the desirability of moderate speed in getting from place to place put the requirements of such a business vehicle very much in the same class as those of the average moderately light passenger automobile.

3¼ by 4 Block Motor

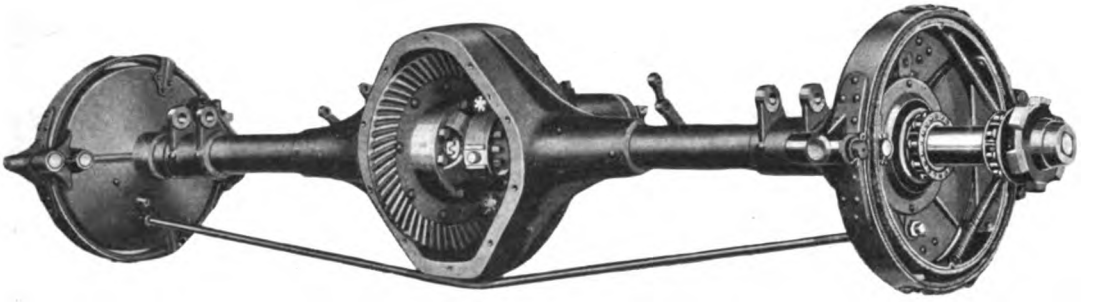
The chassis possesses a wheelbase of 106 inches and is powered with a four-cylinder block motor, 3¼ by 4. This develops 25 hp., it is claimed. The springing is rather out of the ordinary for a delivery car in that the rear suspension is by full cantilever springs. Tires are 30 by 3½ pneumatic. Also suggestive of the passenger type of vehicle is the floating rear axle which incorporates spiral-bevel gearing. Gearset and clutch, both in unit with the engine, are compactly designed. The clutch is a multiple disk type, and the gearset gives the conventional three speeds. The equipment at the prices above includes a single unit electric cranking and lighting system, which is a desirable feature in light delivery work, saving time of stopping and re-starting the engine, and also having an effect upon the fuel economy.

In detail, the engine offers nothing out of the standard beaten bath, being a compact unit. The cylinders are of the L-head form with all valves on the left, cover plates inclosing the rods in good fashion. To promote lightness the crankcase, which is of barrel form, is of aluminum, being in unit with the housing of the flywheel. The cylinder block

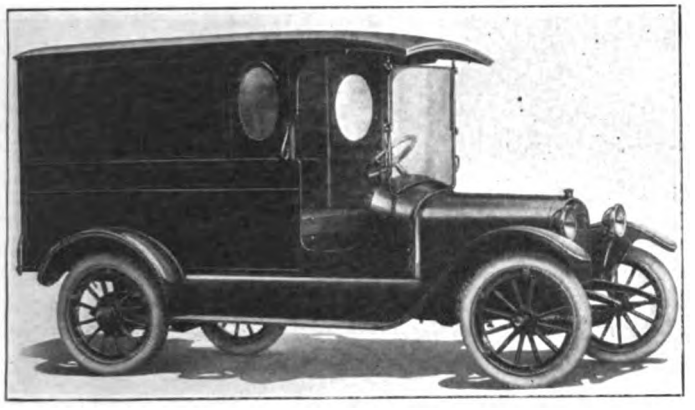


Above—Manifold side of the 3¼ by 4-in. four-cylinder block motor used in the Detroit Package Wagon showing mounting of carbureter and ignition distributer. Below—Right side of motor, showing motor generator

Right—Floating type of rear axle used on Detroit Package Wagon, with cover plate removed showing spiral bevel driving gear. Brakes are 12-in. in diameter with a width of 2 in.



Below—Detroit Package Wagon with standard panel body selling for $690



bolts to the case, and a bottom portion serves as the oil reservoir and cover for the bottom of the power plant as well. Its removal exposes all of the main bearings.

One-Piece Combined Manifold

Simplification of the intake and exhaust manifolding is brought about by the casting of both in one piece. The intake portion is below the exhaust part, and opening at the bottom center of the combination being for the carbureter attachment, while the exhaust-pipe connection is at the rear. This not only serves to clear up the valve side of the engine, but it has the advantage of bringing the incoming gases into intimate contact with the hot-exhaust piping, thus doing much in the interests of vaporization of the fuel.

Chrome-nickel steel is used for the camshaft and crankshaft alike. Each is carried on two bearings of good size, and numerous tests are said to have developed no weaknesses in these important parts. Standard construction is rigidly adhered to in the design of the valves, pistons, connecting-rods, and other internal parts, with lightness one of the aims. The idea has been to attain speeds which would put the engine in the so-called high-speed class. This ought to be most desirable for commercial car work, as the higher speed must necessarily have a beneficial influence on the gasoline economy.

The helical timing gears are neatly inclosed in aluminum housings at the front, while the drive for the motor-generator is provided for by a silent chain running in oil. This electric unit is carried on the right rear side of the crankcase on a specially-provided bracket. The end of the electric-unit housing is flanged to bolt directly to the crankcase support, thus making for good alignment of the parts concerned. Operating in the customary manner, the electric unit drives the crankshaft through its chain connection when doing its starting duty, and is in turn driven from the crankshaft when ordinarily running as a generator.

Connecticut Ignition System

Energy for ignition comes from the storage battery, its distribution being taken care of by a Connecticut coil and distributer mounted in a vertical position at the rear of the cylinder block and driven from the rear end of the camshaft by spiral gear connection.

Thermo-syphon cooling in conjunction with a honeycomb-type radiator has been well adapted to the car, and splash lubrication has also been nicely laid out for the motor. These two items are very important for commercial work especially, for the cars get little rest, and must have substantial oiling arrangements along with adequate cooling facilities.

Smooth action of the clutch is also very important, and the maker states that the matter of gradual starting has not been neglected. Many times costly and fragile merchandise must be handled without jarring, and thus the clutch is called upon to be sweet of action. The clutch is therefore made to run in oil, with the plates held in engagement by one large main spring operating on four levers, the construction permitting the use of a comparatively light spring, and at the same time, owing to the large leverage obtained, providing a heavy gripping power.

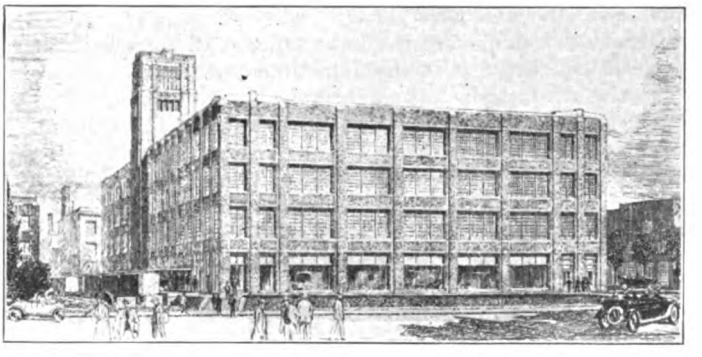
Hotchkiss Drive

Drive is transmitted by a chrome-nickel steel shaft and two universals. The drive is taken on the Hotchkiss principle. That is, instead of having a torsion tube or a torsion rod alongside of the propeller shaft, the springs are used to push the car as well as to take the torque. This makes for a flexible chassis, and is doubtless well fitted for work in the light delivery-vehicle field, although somewhat unusual as compared with the average truck or delivery-car chassis.

Both differential and driving gears are of chrome-nickel steel, and the mechanism of the rear axle is all mounted on ball and roller bearings. At each side of the spiral bevel gearing there are both ball and roller bearings, the latter taking the thrust. At the wheel ends of the axle shafts they are carried by two roller bearings. Brakes should prove amply powerful for the vehicle with their width of 2-in. and 12-in. diameter.

—

Willys-Overland Building in St. Paul



The Willys-Overland Co. has started work on a new four-story and basement building in St. Paul, Minn., with a frontage of 461 ft. and a depth of 188 ft., 6 in. Part of the structure will be used as a service station and salesroom and the balance will be utilized for warehouse purposes. The structure will be of brick and steel and fireproof throughout. When completed it will contain 435,000 sq. ft. or approximately 10 acres of floor space, or about the area contained in four city blocks. St. Paul was chosen as a distributing point because of its location in the heart of a prosperous farm belt and being the largest railroad center in the Northwest. The records of the company show that 60 per cent of the Overland product goes to farmers, and Wisconsin, Minnesota and the Dakotas rank high in its sales reports.

The Engineers' Forum

Aluminum versus Steel in Motor Construction—J. E. Diamond Replies to F. R. Porter

By James E. Diamond
Engineer, Aluminum Castings Company

CLEVELAND, OHIO—Editor THE AUTOMOBILE:—Mr. Finley R. Porter's letter published in THE AUTOMOBILE of Sept. 2, equals in interest his contribution in the Aug. 12 issue. However, in several major particulars there still remains the same lack of coincidence in our respective views, though on one or two points we seem to be in a little closer agreement. Your contributor concedes that where rigidity is a main consideration, as in crank and transmission cases, aluminum is the proper material. This would leave undecided the question of the motor in which crankcase and motor block are cast integrally, the conclusions drawn by Mr. Porter being against the aluminum cylinder proper. As a matter of fact this design is rapidly gaining favor, and is a most desirable proposition from the aluminum standpoint.

Aluminum Piston Aids Efficiency

There seems to be as much of a difference of opinion concerning the aluminum alloy piston as before existed. I feel just as strongly that the aluminum piston will prove entirely successful in a high-duty motor as Mr. Porter does that it will not. Not only will the Lynite piston go hand in hand with this new type of motor, but it will be a factor in its greater successes. My conclusions are based as much on experience as anything else. Certainly some of the recent racing creations may truthfully be characterized as high-duty motors, and unless I am misinformed, practically all of the motors competing in recent speedway events have been equipped with aluminum alloy pistons, and that in addition, less piston trouble was experienced with those of this type than with the steel ones.

Mr. Porter minimizes the importance of the much greater thermal conductivity of the aluminum piston. My belief is that the advantages this offers may not be minimized. He bases his belief that this thermal property of the aluminum pistons has no real value due to the clearance between piston and cylinder, that is, that the piston is heat insulated. Unquestionably there is a retardation in the transference of heat, due to this condition, the heat having to pass through either an air space or an oil film, but in the final analysis is this the governing consideration? After all, is not the conduction of heat away from the piston head the main consideration?

The temperature generated by the explosion is conceivably momentarily intense, possibly exceeding even the melting point of iron, but in an exceedingly brief period of time this heat is being conducted to every portion of the piston. While this is taking place it is reasonable to suppose that the cylinder wall is abstracting a large quantity of this heat. In the distribution of the remainder of this heat throughout the entire piston, it will assume a higher mean temperature, and yet well within the safe temperature limit of the alloy.

That the cylinder walls will abstract a great deal of this heat in the succeeding strokes, or until the next power one, may not be doubted. The fact that the carbon deposit on the head of aluminum pistons is much less than on iron ones would seem to show that the piston head is always cooler. Possibly the foregoing reasoning is false but it is the only one that seems to explain the results obtained in some recent experimental work. The case might be cited of a 5-in. Lynite piston being used in a high compression motor developing 170 hp. or thereabouts, well ripped, the transverse rib running nearly to the bottom of the skirt, with a skirt clearance of but 0.008 in. Without the ribs much greater clearances were necessary. In my opinion the significance of this is that these ribs conduct the heat away from the head, distributing it uniformly throughout the entire piston. Perhaps the additional radiating surface has something to do with it also. I am convinced that there is no weakening of the head of the Lynite piston, due to the exceedingly brief duration of the explosive temperature, and its immediate distribution. In any event, the head might be made three times thicker, and yet introduce no additional weight. Mass for mass the head of the light piston would compare very favorably in strength with the head of the steel piston advocated by Mr. Porter.

Unquestionably, the high-duty motor is the motor of the future, but as stated previously the Lynite piston is not going to be left behind. Regardless of the horsepower to be developed per cubic inch of displacement (0.5 hp. per cubic inch seems extraordinarily high), this type of piston will answer all requirements, and especially there need be no worry whatever about substituting this type for motors of the bores mentioned, namely 3 in. and it is self-evident that the steel pistons will always cost much more than the aluminum one.

Failures with Steel Pistons

I believe it quite proper to state that several engineers here have at one time or another looked longingly toward the steel piston, and where tried, that realization has fallen short of anticipation in many respects. One of these engineers has told me that he had found it necessary to allow much greater clearances than for luminum alloy ones, the permissibly thinner sections used, and necessary with weight-saving an object, expanding exceedingly quicker, and the expansion no mean amount. This seemed to be the main source of trouble. Further when the steel piston seized it invariably damaged the cylinder, whereas the seizure of the aluminum alloy pistons very rarely did any damage. The question of clearances with the aluminum pistons has not proved to be the troublesome problem anticipated, and several methods of eliminating piston slaps have been developed.

Question of Tensile Strength

The writer purposely placed the figure for the tensile strength of aluminum low, merely for purposes of com-

parison. In stating that the average strength of the steel used in an all-steel job would be nearer 60,000 lb. than 120,000, which figure is arrived at by accepting as fact Mr. Porter's statement that the strength of aluminum is but one-sixth that of the modern steel, the steel casting was assumed to play a very important factor in the all-steel motor. Merely as a matter of general interest, my company is prepared to furnish Lynite alloys which have a tensile strength between 40,000 and 50,000 lb. per sq. in. I certainly appreciate the extraordinary strength of some of the recent steels after proper heat treatment. I assumed that steels with a strength ranging between 200,000 and 300,000 lb. would be used for the camshaft, crankshaft, wristpin, etc. Concerning cast iron, my opinion still is that the average tensile strength will not exceed 20,000 lb. and that if a strength of 38,000 lb. is being obtained the material must be a semi-steel and it is not fair to classify it as an iron.

Aluminum Motors on Stocks

Mr. Porter still seems to be doubtful as to the feasibility of the sleeve construction in the design of the all-aluminum motor. My personal opinion is that the matter has passed beyond the stages of academic discussion in view of the fact that one manufacturer of the highest grade cars already has started fairly large production (nearly 1000 motors) and will, I believe, shortly announce an all-aluminum motor. Certainly an intense interest has recently been displayed in the possibilities of this material in motor construction. Certain other manufacturers have told the writer of their determination to build aluminum motors exclusively when conditions again become normal.

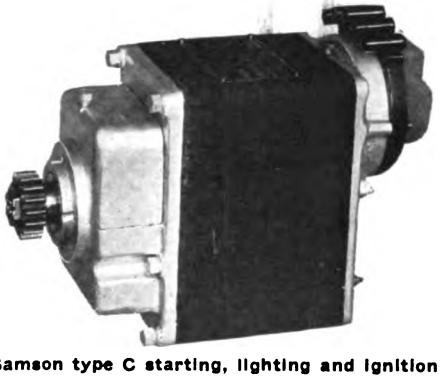
Were the writer given to prophecy he would say that the aluminum motor was going to play a mighty part in the future of the motor industry, though he hastens to agree with your contributor that an all-steel motor may be built that will occupy a position of superiority all its own—but at what cost? The Mercedes aeronautical motor can never become a production proposition, and can never be less than extravagantly costly, and the matter of cost is certainly a vital factor to-day.

My impression is the same as your contributor's that the goal is the elimination of useless expenditure for material and methods not consistent with the results obtained. The writer submits that if the desired results are attainable by the use of aluminum; and where this is the case, why use the all-steel job, the cost of which is infinitely higher than the aluminum?—JAMES E. DIAMOND, Engineer, Aluminum Castings Co.

Samson Electric System for Cars Under 25 Hp.

Starting and Ignition Switch Are Combined

FOR small cars having motors developing not in excess of 25 hp., the Samson Engineering Co., Louisville, Ky., has brought out, under the name of type C, a complete electrical system for starting, lighting and ignition. The entire system comprises three units with the various accessories necessary for their operation. These units are a small motor generator with ignition apparatus built integrally with it, a 30-amp. hr. storage battery and a combination starting and ignition switch.



Samson type C starting, lighting and ignition system

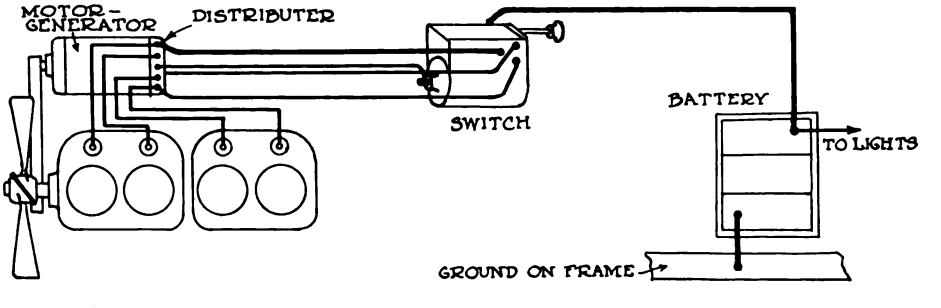
Inherent Regulation

The motor generator has inherent regulation, the winding being so arranged that below certain speeds it acts as a motor and above certain speeds, as a generator. It is connected to the crankshaft by a silent chain with 3 to 1 gear reduction and exerts 40 ft. lb. at the armature shaft. The motor generator is constantly engaged with the crankshaft and when the latter is running under its own power the motor generator acts as a dynamo furnishing current to the storage battery at a constant rate.

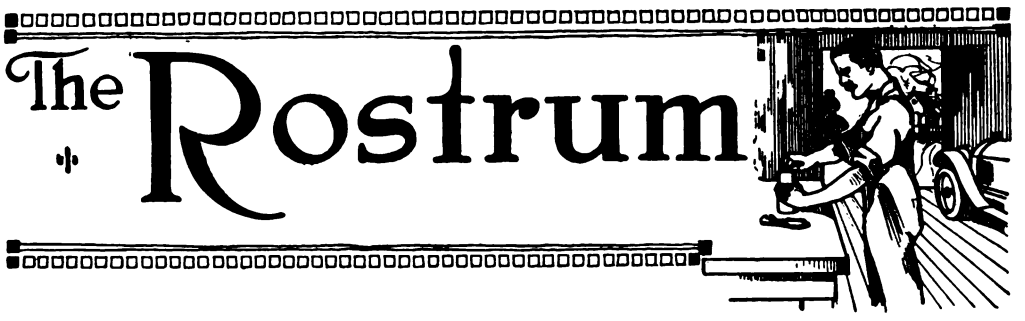
Easily Accessible

The ignition apparatus is a high-tension battery system having either automatic or hand advance. The interrupter mechanism is designed to eliminate lag and the breaker box and distributer are arranged to be accessible. The entire ignition outfit can be examined by the removal of a thumb screw which releases a small aluminum cap and exposes all the working parts. The system operates on the closed circuit principle and the transformer coil is a part of the dash unit, thus giving a convenient mounting. For the ignition wires at the back of the dash unit there are suitable terminals and a housing to protect the connection. The starting and ignition switches operate together, thus giving an adaptation of the so-called non-stalling principle in which at low engine speeds, additional torque is furnished by the starting motor.

The operation is simple and is well adapted for the lower priced cars. To start, the switch knob is pushed all the way in, which cranks the engine, and as soon as the latter is running under its own power, the knob is released connecting the battery for recharging. In stopping the car, the knob is pulled out until it is held which breaks the connection between the dynamo and the battery disconnects the ignition and when the key is removed, leaves it locked in this position. There are no automatic reverse current relays or cutouts, and everything has been done to keep the device simple and efficient and at the same time of low price. A special design is being made for Ford cars. The type C motor generator is 8 in. high, 5 in. wide and 13½ in. long, weighing 40 lb., and an arrangement has been made with the Columbia Machine Co. of Brooklyn, N. Y., whereby the latter concern will manufacture the Samson system. The headquarters of the Samson company, however, will remain at Louisville, and the marketing of the product will be handled from the Louisville office. The price has not as yet been fixed.



Wiring diagram of the new Samson type C electric system for cars under 25 hp.



Refers to Power Consumption in Motor Braking

EDITOR THE AUTOMOBILE:—Referring to your reply to A. W. P.'s inquiry of Fort Barry, Cal., in the Rostrum Department for Aug. 19, this seems to me to be such an important subject that I cannot refrain from giving my views on the tooth pressure question. I have always thought it the best practice to use the motor as a brake, thus saving the brakes as well as running less chance of accident through failure of the brakes. Many of my friends drive in the same way, and I have yet to hear of a stripped gear due to this practice.

Referring to your illustration of the train of gears: If when you turn a train of gears by the pinion you use a crank equal to the radius of the pinion, and when you turn the large gear, a crank equal to its radius, you will find the pressure required on the two cranks will be the same, and is exactly the pressure exerted on the teeth of the gears.

In other words, the tooth pressure on each gear of a pair must be approximately the same at any moment, because the teeth of the driven gear cannot receive more pressure than is transmitted by the teeth of the driving gear. This being true, the tooth pressure will be the same, when transmitting the same power, no matter which gear is driving.

As you state, the gears will transmit the same power whether starting or stopping in the same distance, provided we do not consider friction. But, when we consider that the friction of the rear axle and front wheels as well as the road friction must be overcome by the motor in starting, while this friction helps to bring the car to a stop, it will be seen that the power transmitted by the gears in stopping will be considerably less than in starting.

Los Angeles, Cal. C. V. C.

Points on Tire and Tube Repair

Editor THE AUTOMOBILE:—It appears to me that you might publish some good points from time to time on repairs for tires and tubes. There are many minor repairs that the individual can do in his own garage, but he lacks the courage or proper knowledge of how to do the thing well. An interesting question is, what can a man do properly, and the manner of doing it, explaining any useful tools and their use? Should tubes be repaired by self-vulcanizing patches for minor troubles and limitations of same? Why are same more apt to blister, etc? Where a vulcanizer is used, should there be an outside or inside repair and what will be the dividing line between the two types. Note that very small outside repairs with heavy tubes are apt to mean a thin wall at point of puncture, and kindly give the best method for preventing same, etc., etc.

2—For shoes: means of repair and limits of ordinary equipment? Advisability of plastics, doughs, etc.? Treatment of blowouts by inside and outside patches, together with reliners, etc., and best types.

South Bethlehem, Pa. W. P. J.

—Such a treatise was given in THE AUTOMOBILE for Sept. 18, 1913, and the subsequent issue. This covered in two parts a complete course in what to do for tire repairs both on the roadside and garage. In this it was pointed out exactly how to repair different kinds of punctures, what tools to use, how to go about the work, and the necessary precautions to take to do a good, complete job. Shoes and vulcanizers are also carefully treated, and if you have a copy of this issue on file it will answer all the questions asked in your inquiry.

Bijur Electric System on Packard

Editor THE AUTOMOBILE:—Will you please explain the self-starting system used by the Packard cars, and the name of same?

2—Does a mechanical lubricator need any adjusting as to how much oil to feed is needed?

3—How can one tell whether the height of level in the splash system is correct?

N. Y. City. L. K.

—For starting and lighting the Bijur constant voltage two-unit system is employed on the Packard. Ignition is by a timer with both automatic and hand advance; this is a special Delco product with one breaker cam operating two complete six-cylinder systems.

2—A mechanical lubricator generally has adjustments for each of the individual pumps which force the oil through the independent leads. The adjustment generally controls the length of the pump stroke, which in turn governs the amount of oil fed.

3—The oil level in a splash system can generally be determined by a riser gage mounted on one side of the crankcase. The level in the troughs is generally governed automatically, and if the oil is of sufficient depth in the pan to give a feed to the pump, the oil in the troughs will be correct. If the motor smokes it is sometimes an indication that the level is too high in the crankcase, but as a rule, the splash level is worked out in the factory and need not be touched by the driver.

Wants to Increase Motor Power

Editor THE AUTOMOBILE:—I have a 1913 Hupmobile 32 which I intend overhauling this fall, and in doing so would like to make a few changes. I would like to cut some weight off the reciprocating parts and I thought of boring some holes in the lower part of the piston and reducing some of the weight this way. Would you advise this?

If so, how close to the rings would I dare bore and what size holes and how close from center to center, the bore and stroke being 3¼ by 5½? Would there be any other way in which I could reduce the weight without interfering with the strength of the parts? I notice also that on the timing marks on the flywheel, the valves do not open until the mark is about ½-in. past center and closes about ½-in. before the mark reaches center. I believe the cams are worn too much, thus affecting proper valve action. Am I correct in this, and if so, what would you recommend me to do to overcome this?

I would like to increase the power of this motor, also reduce the vibration at the higher speeds. Anything further which you may think of to suggest would be appreciated.

Lancaster, Pa. E. W. K.

—Drilling holes through the pistons would not so much endanger the strength of the piston as it would the supply of oil to the rings. A number of these holes, if carelessly arranged, would act to starve the cylinders of lubrication with the result that the cylinders would rapidly wear. There would probably be no harm in drilling a few ¼-in. holes scattered about the skirt of the piston, but the weight reduction gained in that way would amount to very little.

There is a possibility that the timing is incorrect due to cam wear, but you can readily determine this by checking up the timing with the following:

If the car is model *K*, inlet opens 11 deg. past top center, closes 43 deg. past bottom center. Exhaust opens 38 deg. before bottom center, closes 6 deg. after top center. If the car is model *H*, inlet opens 25 deg. past top center, closes 35 deg. past bottom center. Exhaust opens 40 deg. before botton center, and closes 20 deg. past top center.

You could probably increase the power of this motor if you wanted to go to the expense by putting in a new camshaft with flat-faced racing cams and by having aluminum pistons, and tubular connecting-rods made. This would be quite an expense however, and it is doubtful if the gain would justify the expense. The ignition timing can also be advanced to give the earliest possible spark at extreme high speeds.

Some Automobile and Other Terms

Editor THE AUTOMOBILE:—What does Grand Prix mean?

2—What does Marathon mean when used in connection with races?

3—What is the meaning of garage? Does it mean a barn and is it a French word?

4—What speed should a racing car be capable of making with a four cylinder motor 3 7-8 by 5 1-2? The motor speed on the block is 3500 r.p.m., and the car weighs 1190 lb. and has 30 by 3 tires on wire wheels. The car is a special. The builder claims a maximum speed of 120 m.p.h. The present owner claims that at a recent test on a beach, the course straightaway, that a full mile was made in 34.09. This would be close to 103 m.p.h. Do you think it reasonable to expect from the foregoing description that the car would make that speed?

Center Village, N. Y. M. J. C.

—Grand Prix are the French words signifying grand prize.

2—The word Marathon in connection with races signifies a contest held as a test of endurance and speed over a course on the open road, 26 miles, 385 yd. in length, or around a track in which the same distance must be covered, an imitation of a race run originally during the new Olympic games at Athens, Greece, in April, 1896. The name is derived from the legendary run of Pheidippides, who is supposed to have run to Athens after the Battle of Marathon, announced the victory and dropped dead in the market place. The distance the legendary runner covered is said to have been that given above. This name is never used in connection with automobile races except at the Montamarathon, where the name has been given as a pun on the Montamara Festival, which is held at the time of the race.

3—The meaning of the word garage is a building for the storage of automobiles. It is derived from the French word meaning the same.

4—It would be impossible from the data which you furnish to give any estimate of what the speed of the car can be as there are too many other factors which enter into the determination of speed.

Speedometer Shaft Should Be Tight

Editor THE AUTOMOBILE:—Following is a little experience which I have had and which may be of value to some of the readers of THE AUTOMOBILE. A year ago I had a speedometer which bothered me by the speed indicating dial not remaining steady but oscillating back and forth. I tried a number of different experiments and finally tightened the swivel joint on the end of the flexible shaft near the gear. I also strapped the shaft to the radius rod of the car, thus preventing it from swinging. This remedied the trouble. This year I have another speedometer and it gave me the same trouble which I remedied by tightening the swivel joint.

There are two cases which I know of where the garagemen have told the owners of the cars that the inside parts of their speedometers were worn out and would have to be renewed. Their trouble was finally remedied by simply preventing the flexible shaft from swinging.

W. Somerville, Mass. J. H. M.

Ammeter Wanted on Cole 1915 4-40

Editor THE AUTOMOBILE:—I have a 1915 model 4-40 Cole car equipped with Delco electric system. I have recently purchased a Weston ammeter which I have connected to this system. While it works it only seems to record about half the amount that it should.

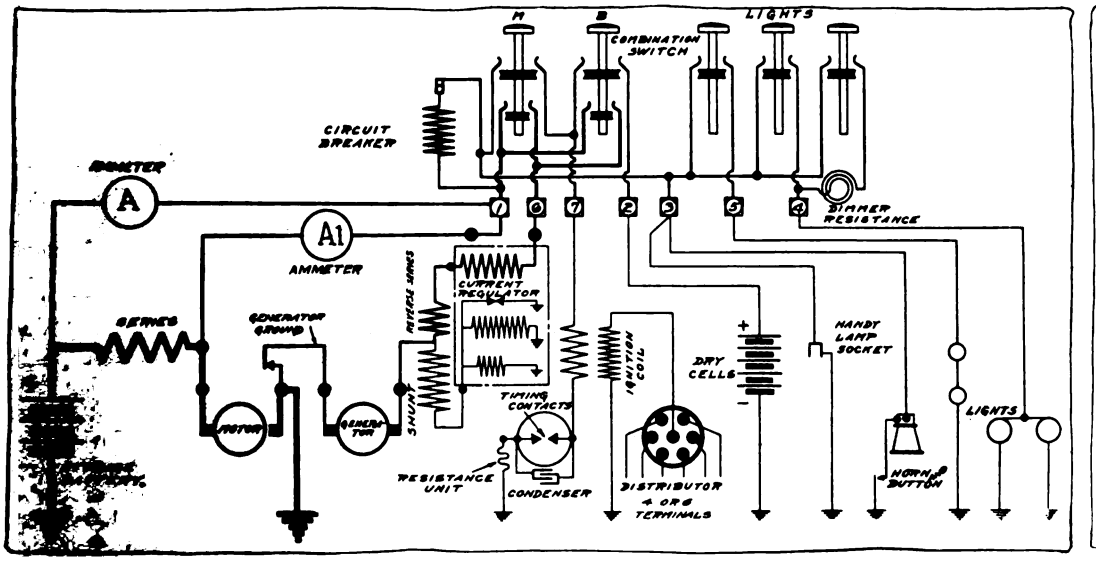


Fig. 1—Wiring diagram showing the installation of the ammeter on the Delco system. When connected at A1, the ammeter only shows a portion of the current. It should be connected at A

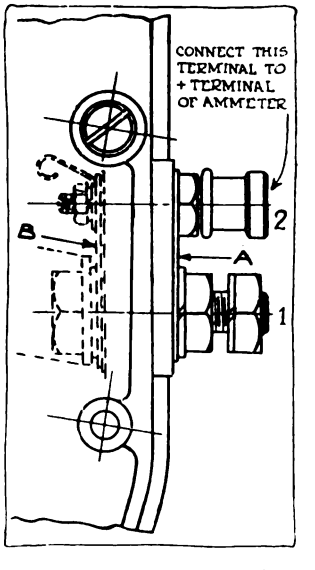

Fig. 2—Strap to be cut in connecting ammeter to Delco

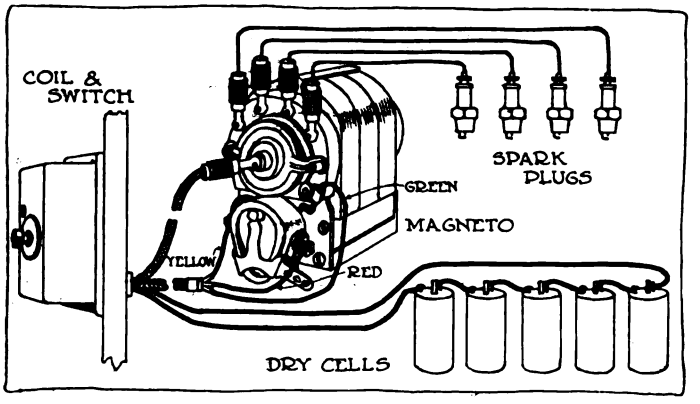

Fig. 3—Remy ignition for Regal model A 1909 cars

This ammeter is connected from the positive pole of the battery through the ammeter to the button marked M or to the circuit numbered 1, which is supposed to be in parallel with the charging circuit, as I understand it, and as I was so instructed to connect it by the Weston people.

It seems to me that by connecting it in the above manner I am only getting half the current through the ammeter, and any information which you can give me or a rough sketch of the manner of connecting this instrument will be greatly appreciated.

Paterson, N. J. A. F. W.

By referring to Fig. 1, the ammeter should be installed in the circuit given as No. 1 between No. 1 post on the combination switch and the lines running to the storage battery, connecting the positive pole of the ammeter nearest the combination switch and the negative pole of the ammeter on the wire running to the storage battery, as the current runs from the combination switch to the battery. The highest charging rate on the generator on this model is 14 amperes or thereabouts, and the average is considerably lower than this.

From your letter it is not quite possible to tell how the ammeter is installed, but from what you say, it seems to be correct, although the generator does not charge as high as it should. Nevertheless, the charging rate is never higher than 14 amperes.

As you state this meter is connected in parallel with the charging circuit as shown by A' would indicate only a part of the charging current. This meter should be connected in the charging line as shown by A.

Connecting Ammeter on Hudson 6-40

Editor THE AUTOMOBILE:—Kindly advise me whether an ammeter can be put on a Hudson 1914 six-cylinder 40 hp. car.

Oil City, Pa. H. J. F.

—To connect an ammeter on the 1914 6-40 model of the Hudson car proceed as follows: Remove three cap screws from top cover plate of motor generator housing and remove cover plate. This will expose the cutout relay; disconnect the black wire at the top right hand terminal of cutout relay and connect to positive ammeter wire; connect the negative wire of the ammeter to the cutout relay top right hand terminal where the black wire was disconnected; start the engine running and the ammeter will give the entire charging rate. Weston ammeter model 301 is generally used for this purpose and may be obtained from the Weston Electrical Instrument Co., of Newark, N. J., at a price of $6.

Magneto Armature Windings Vary

Editor THE AUTOMOBILE:—What is the length, size and weight of wire used in the low-tension winding of a high-tension magneto of any standard make?

2—What is the length, size and weight of wire used in the high-tension winding?

3—What is the strength of the permanent magnets used on high-tension magnetos and how are they magnetized?

West Milford, W. Va. P. W.

—The amount of wire used on the armature winding of the different high-tension magnetos varies with the different makes. A good example, however, of practice in this respect is that used on the armature of the Remy model P magneto where 1 lb. of number 18 Cotenamel wire is used. In the separate winding 8 1-2 lb. of secondary wire and 0.156 lb. of single primary wire are used.

2—This is answered under the previous paragraph.

3—The magnet of the Remy model P magneto will sustain about 3 lb. The magnets are magnetized by passing an electric current through a coil which surrounds the magnet in a charging apparatus.

Wants to Buy an S. A. E. Handbook

Editor THE AUTOMOBILE:—Kindly tell me how I could obtain an S. A. E. handbook, complete as described in the July 29 issue of THE AUTOMOBILE on page 210.

If possible to secure, could I do so free of charge, and if not, what would the cost be?

Dayton, O. H. T.

—The S. A. E. Handbook can be obtained from the Society of Automobile Engineers, 29 West Thirty-ninth Street, New York City. It cannot be secured free of charge, but must be purchased from the Society, which will furnish you the price upon request.

Wiring Diagram for 1909 Regal

Editor THE AUTOMOBILE:—Kindly give me a diagram of the correct wiring of a Regal model A 1909 equipped with a Remy high-tension magneto.

2—In what turns do the cylinders fire?

3—Could you give me the commencing and closing serial numbers of the 1916 Fords?

Horton, N. Y. H. B. C.

—The wiring diagram showing how the ignition is connected on the Remy system for the Regal 1909 model A is given in Fig. 3. According to the Regal company, the Remy low-tension system was used on this car and not the high-tension, and if the high-tension was put on, it must have been installed after the car left the factory.

2—The cylinders in the 1909 model A car fire in the order 1, 2, 4, 3.

3—The Ford fiscal year ended July 31, 1915, and August 1, 1915, was the beginning of the 1916 year. The first car built on August 1, 1915, had serial No. 856,516, and this is the first or opening number of the 1916 Fords.

Timing Valves by the Flywheel

Editor THE AUTOMOBILE:—Kindly explain in the columns of THE AUTOMOBILE how to time valves on the ordinary car by the flywheel in a simple manner for an amateur?

2—What is the best speed of a 1912 Winton six, in good condition?

Berkley, Va. P. M. P.

—In general you will find the flywheel of a motor marked for the proper timing so that you will not have to do anything further than to see that the marks register with the indicator at the proper time. In case the flywheel is not marked, however, the method of procedure is as follows:

Bring the piston of No. 1 cylinder to upper dead center. On the frame of the motor, close to the flywheel, make a mark and then on the flywheel directly opposite this mark make another so that the two register when the piston of No. 1 cylinder is on upper dead center. If there is no portion of the engine frame sufficiently close to the flywheel for the

two marks to register it will be necessary to fasten to the engine some sort of an indicating mark such as a piece of sheet metal which extends close to the flywheel. The marks can then be made on this indicator. It is very often possible to slip a piece of sheet metal bent in a Z-shape between the two halves of the crank case with a hole so arranged that one of the bolts passes through the sheet of metal and holds it solidly.

With the piston of No. 1 cylinder on upper dead center, which can be determined by placing a stick of wood on the top of the piston and moving the crank upward until the stick is at its highest point or by some other means which will vary with the make of engine, the valves are allowed to both be closed resting against their seats. The intake valve is then arranged to open at anywhere between dead center and 10 deg. past. This is determined on the flywheel by passing a tape around the circumference starting with the mark for upper dead center of No. 1 cylinder and going entirely around and then laying off the length of the tape in 360 equal parts, each of which when laid around the flywheel will represent a degree. The timing gears are then meshed so that the intake starts to open a few degrees past top center. The exact number of degrees will be determined by the arrangement of the gear teeth, but it must be kept close to the top center. The time of closing of the intake will be determined by the cam and need not trouble you. When you have the mark on the flywheel for the point at which the intake starts to open for a No. 1 cylinder you should mark it I.O. No. 1. The point of exhaust opening is then determined in about the same manner, the opening of the exhaust starting between 35 and 40 deg. before lower center on the down stroke succeeding the intake stroke which, of course, is a down stroke. With the cams determined by the fact that the camshaft is in your possession, only the openings of the valves need be determined.

After you have marked on the flywheel E.O. No. 1, signifying the exhaust opens for No. 1 cylinder, you should go to the next cylinder which comes into operation, and mark the flywheel. After having determined the proper firing position for the No. 1 cylinder, the other cylinders will take care of themselves, since the camshaft and crankshaft have been designed to act in unison.

2—This car should be able to make 60 m.p.h. or better.

Width and Height of Two 1916 Cars

Editor THE AUTOMOBILE:—What is the entire width and height of the 1916 Overland and Maxwell cars? At what points are these the widest?

New York City. C. G. S.

The width of the 1916 model 83 Overland is 67 in. and the widest point is across the rear fenders from tip to tip. The length with the top up is 148 1-2 in. and with the top down 161 1-2 in. The height of the car with the top up in 82 in.

The Maxwell touring car is 6 ft. 10½ in. high at the highest point, which is directly over the third bow of the touring car top when it is up. The widest point is from the outer end of the front hub caps at which point the width is 5 ft. 7 1-4 in.

Light Weight Cuts Fuel Consumption

Editor THE AUTOMOBILE:—How is it that the Franklin car obtains such a wonderful mileage on gasoline? What make of carbureter do they use?

2—What make of car is the Disbrow's Jay-Eye-See?

3—Did the Chalmers company ever try out a Weidely motor?

4—Why did the Premier company discontinue its use?

5—When in good running order, what speed should an Overland, model 60, 1912, car attain?

Somerville, Mass. C. R. N.

—The reasons given by the Franklin company for their good mileage on gasoline are the following: 1—light weight; 2—air cooling, giving high thermal efficiency; 3—valve-in-head construction giving high thermal efficiency; 4—good mechanical efficiency for moving parts under load; 5—dash control of carbureter needle valve permitting mixture to be adjusted to suit varying conditions; 6—cord tires. The Franklin carbureter is used as shown in Fig. 4.

2—The Jay-Eye-See was made by the J. I. Case Threshing Machine Co., Racine, Wis.

3—The Chalmers company has never tried out the Weidely motor in their plant; nor made a full investigation of it.

4—The Premier company has not discontinued or abandoned the Weidely motor but, on the contrary, is building at the present time cars regularly equipped with this power plant.

5—According to the claims of the Willys-Overland Co., the Overland model 60 will develop 45 to 50 m.p.h. on good roads.

Valve Timing of Ford Opposed Motor

Editor THE AUTOMOBILE:—What is the correct valve timing, or as near as you can give it, of the old Ford double opposed motor? There is nothing which will tell me just when this motor was made.

White City, Kans. L. W. G.

—There were three types of two-cylinder motors built by the Ford company known as Models A, C, and F, and the following information will advise you as to the way of determing which model the car is and also as to the valve timing of each of the three models.

The Model A has an 8-hp. motor with two cylinders with a stroke and bore of 4 in. each. The Model C, two-cylinder motor, 10 hp., with a stroke and bore of 4¼ in. each, and the Model F, two-cylinder motor, 12 hp., has a bore of 4½ in. and a stroke of 4 in.

In a Model A car the inlet valve opens 3⅜ in. after center and closes at 3⅛ in. before center. The exhaust opens 7¼ in. before center and closes on center. In the Model C the inlet valve opens 4 in. after center and closes at 3 3/16 in. after center; the exhaust valve opens at 6¼ in. before center and closes on center. The Model F inlet valve opens at 4⅛ in. after center and closes at 7⅝ in. after center, while the exhaust valve opens at 3 1/16 in. before center and closes on center. These measurements given above apply on the rim of the flywheel.

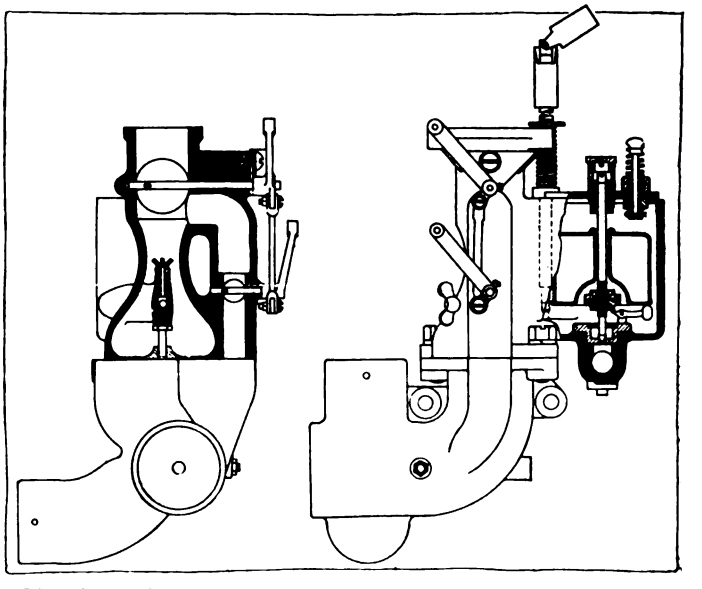

Fig. 4—Sectional views through the carbureter used on the Franklin car. This is a Franklin product, and according to that company is a factor in securing low fuel consumption

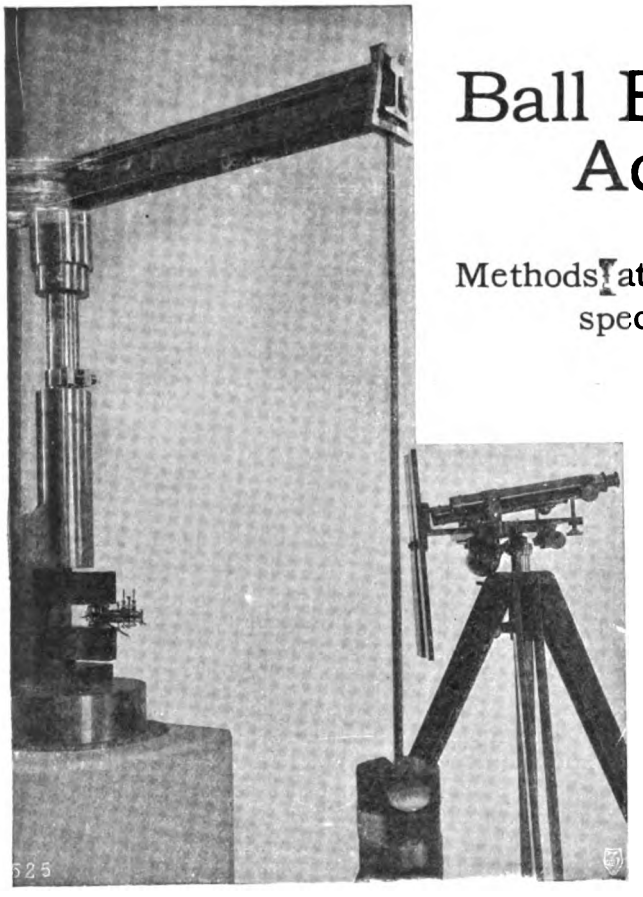

Fig. 1—Determining the elastic limit in the S. K. F. laboratory by Professor Stribeck's bending test

Ball Bearing Tests Involve Accurate Apparatus

Methods at S.K.F. Ball Bearing Factory Include Inspection of Material and Finished Balls with Latest Apparatus

By Arthur V. Farr

IN the new laboratory which has recently been completed in connection with the factory in Gothenburg, Sweden, of the S.K.F. Ball Bearing Co., a series of tests are installed for its ball bearings which are an example of up-to-dateness in the care and precision of bearing finish, and inspection. In no industry which involves the use of modern steels is it necessary to be more careful with the material. Fineness of structure is a necessity, and for this reason the steel is refined from the best Swedish ores in small charcoal furnaces and then melted in small crucibles with the alloying substances added to form the special S.K.F. steel.

Three Important Properties

After all the care has been taken in the selection of the initial materials and in the manufacturing processes, there are three important properties which a ball bearing must have. They are first, high fatigue limit; second, high resistance to

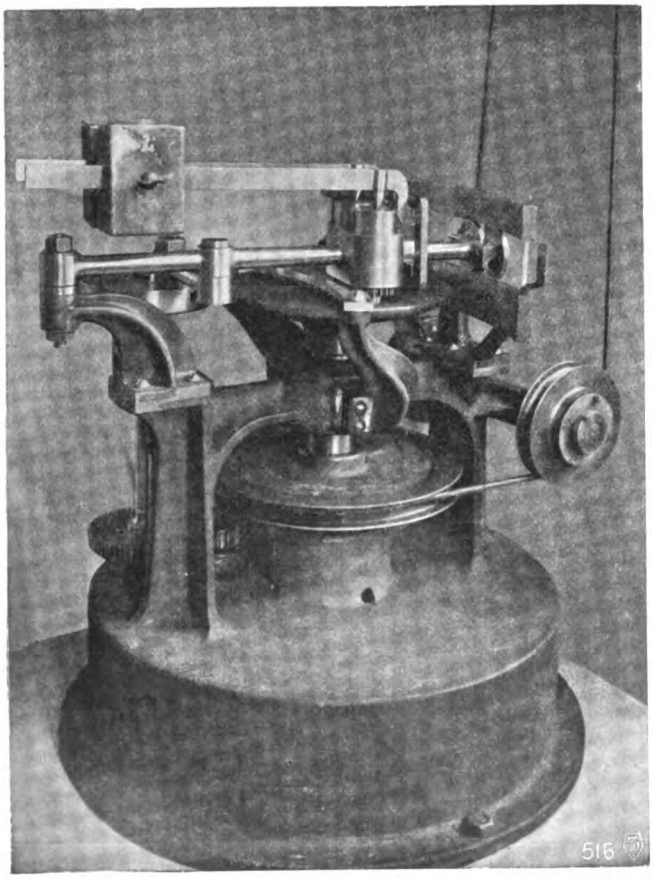

Fig. 2—Machine used in S. K. F. laboratory for wear tests by direct grinding

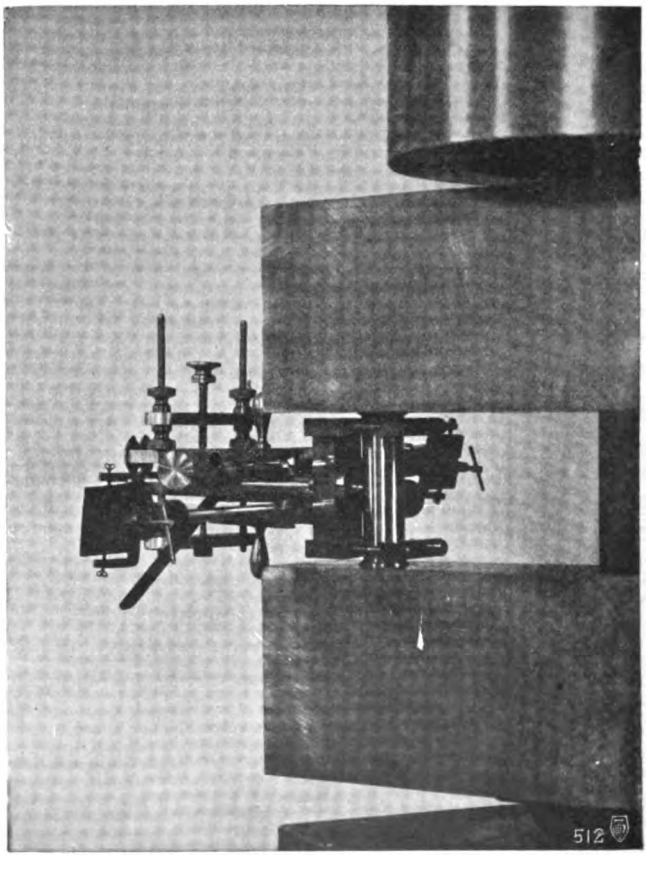

Fig. 3—For determining the elastic limit and modulus of elasticity, the above arrangement is used

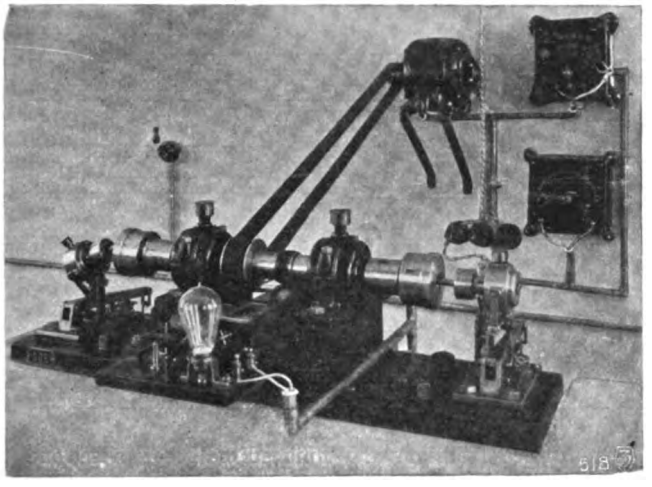

Fig. 4—The Woehler machine for testing the limit of fatigue by direct fatigue tests

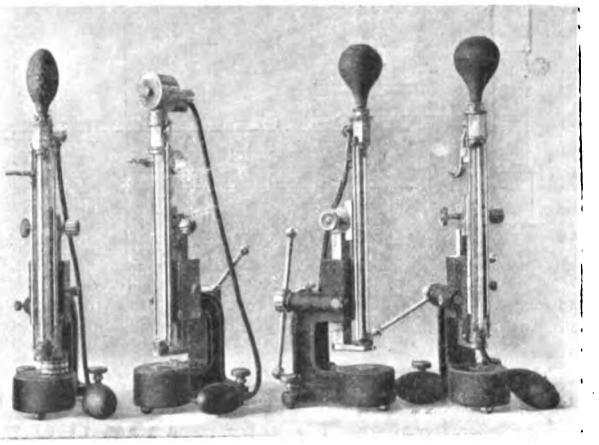

Fig. 6—Reboundimeter or scleroscope used for testing for hardness

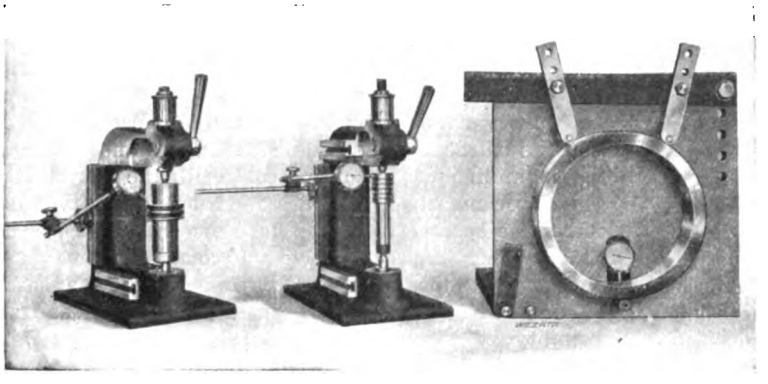

Fig. 5—Testing the finished balls for accuracy in a special appliance

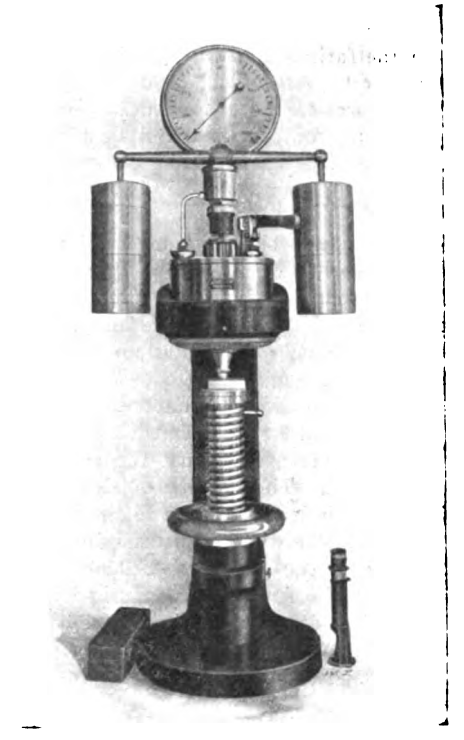

Fig. 7—Center of right column—The Alpha machine. This machine is used in Brinnell's ball pressure test for hardness

blows and shocks, and third, highest resistance to wear. In other words, high tensile and compressive strengths and hardness with great elastic limit are the requirements.

Two Tests Are Necessary

There are two ways in which tests for these qualities can be carried out and both are necessary. First, by test pieces which have been treated exactly the same as the finished product, and second, tests on the actual finished balls. In the S. K. F. laboratory for the heat treatment of the test pieces there is an electric Heracus 300 to 1300 deg. C. adjustable furnace, and an American gas furnace for temperatures up to 1100 deg. C., which is a muffle design with the muffle inclosed by a fire-clay chamber approximately of the same shape as the muffle. The burners project into the combustion chamber from opposite sides and force the flame into the space surrounding the muffle. There is also an oil bath heated by gas for lower temperatures up to 300 deg. C. In these furnaces the measuring of the temperatures is accomplished by a Le Chatelier pyrometer which operates upon the principle of measurement of a current of electricity produced by heating a couple of two wires composed one of platinum, and the other platinum with 10 per cent rhodium. The current is measured by a galvanometer.

The Bending Tests

After the proper heat treatment has been accorded with the apparatus described, the work of determining the elastic limit and the breaking load, or fatigue limit, is done by making bending tests. The method consists of inserting a test piece in two parallel jaws which are loaded and operated as shown in Figs. 1, 3, and 8. In determining the elastic limit and the modulus of elasticity, the deflection for each successive load is carefully determined, as in Fig. 3, by transmitting the deflections to a steel pin which is pressed against the middle of the test bar by a spiral spring. The movements of the pin are measured by the aid of a Marten's mirror apparatus. The test is so carried out that as soon as a permanent set has taken place, the load has been noted.

For fatigue limit, direct fatigue tests are performed in accordance with

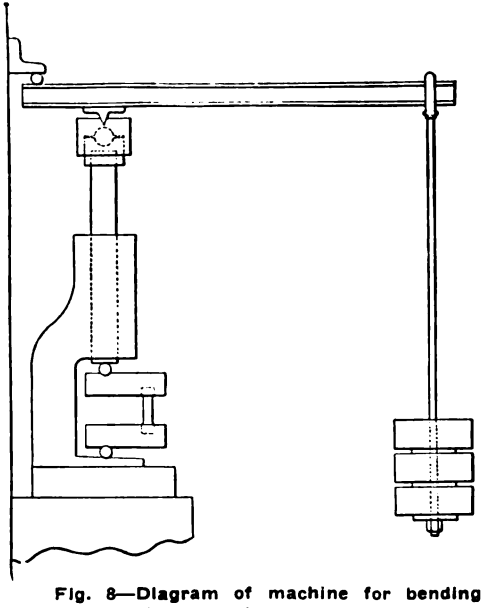

Fig. 8—Diagram of machine for bending tests, showing how the test piece is held in jaws and the system of levers

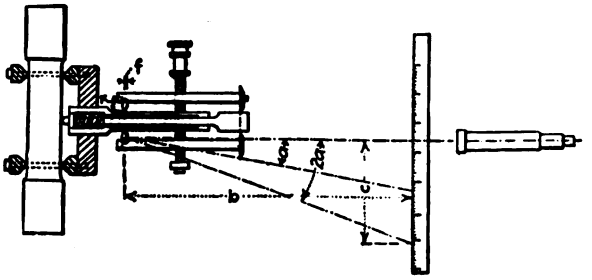

Fig. 9—Diagram of deflectometer, showing how the deflections, produced in the hardened steel test piece, are measured on the scale, the readings being made by the telescope, shown to the right

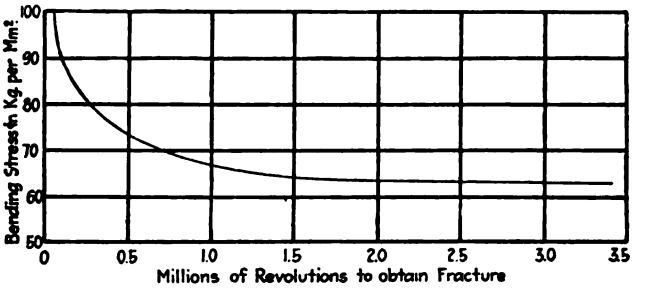

Fig. 10—Curve plotted to show the highest load reached without causing a fracture. This is the limit of fatigue

Woehler's method, which briefly consists of a shaft of steel rotating in two ball bearings and driven by a belt pulley from an electric motor, as shown in Fig. 4. The test piece is at each end of the shaft and is loaded at its outer end with a load resting with a ball bearing on the test piece. For each revolution a surface fiber of the material passes through a cycle of rest and maximum stress in each direction. A speed of 1400 r.p.m. is used with the starting load as near the fatigue limit as possible in order to shorten the time of the test. After each 2,000,000 revolutions, the load is increased until fracture ensues. The highest load, without causing a fracture, is the limit of fatigue. The method is illustrated in Fig. 10.

Resistance to Shock

Resistance to shock is measured by tenacity, and to ascertain the degree of this property, shock tests are made with a Charpy's hammer having a capacity of 72-ft. lb. This hammer gives a blow of measured impact by permitting a known weight attached as a pendulum to fall through a given number of degrees against the test piece.

Resistance to wear or hardness is tested for in the Brinnell machine. With this a hardened steel ball is forced under hydraulic pressure against the polished surface of the steel being tested. The quality of the material is judged by the size of the indentation due to the pressure of the ball on the test piece. The ball size used in the S. K. F. laboratory is 0.2 in. and the pressure 22,000 lb. For very hard steel, Professor Marten's scoring method is used. By this process the polished surface is scratched by a diamond under a fixed load. The width of the scratch gives a comparison of the hardness. Reboundimeter or scleroscope tests are also used.

Direct Grinding Testing

Fig. 2 shows the S. K. F. direct grinding wear testing machine on which two test pieces are fixed simultaneously to a moving arm which carries them backward and forward over a rotating disk. This method gives a combined comprehension of hardness and elasticity and is exceedingly accurate in its work.

The direct tests on the finished ball comprise one for elasticity by the Marten's mirror process as shown in Fig. 13, and one for hardness as shown in the illustration in which three balls are placed one upon the other. These are loaded and unloaded three times up to a certain given pressure, and after each series of loadings the center ball is taken out and the permanent set measured. If trials are performed with a number of balls of different diameters, the curves as shown in Fig. 12 are obtained by plotting the squares of the ball diameter as abscissae and the permanent set in millimeters as ordinates. With the curves it is possible by comparison with a standard set of curves to determine whether the balls are hard enough or not. This provides a ready and exact means of comparison.

In testing the finished races for accuracy, a special appliance such as shown in Fig. 5 is used to determine the equality of the thickness of the outer race. With this apparatus the race is slowly revolved on a mandrel, and the small errors are indicated on the dial of the instrument. For the inner race a similar method is used. In meeting the limit requirement, the measurements are made on combination gages which are designed to be accurate to within 0.000039 in.

Allowable Tolerances

The following tabulation gives the allowable limits:

For the bore—

Maximum + 0.005	mm.	(0.0002 in.)
Minimum — 0.010	mm.	(0.0004 in.)

For the outside diameter of small and medium brgs.

The Car That Stays Young

By M. C. K.

(*Continued from Sept. 2, page 431*)

ONE paragraph was devoted to fenders in the foregoing, the object being to present the most important considerations which have to do with their durability, especially their protection against disfigurement. Although fenders constitute one of the simplest features that could have been selected for beginning the sifting of data from which The Car That Stays Young may eventually be mentally evolved, it became plain at once that a whole little book could be written on fenders alone if it were desirable to mention every detail by which they may influence the style, durability and value of a car. Yet, fenders are not an organic element in automobile construction; a car can have the worst kind of fenders and be a good car in every other respect, and a sensible opinion of them can be formed without much previous study of automobile engineering. Though the nature and operation of the vehicle affect the durability of the fenders, they do not react upon the working parts of the power mechanism or the steering and therefore do not affect the operation. Perhaps for the reason that "there is nothing to understand" about features of this accessory nature, scarcely any attention has been given to explanations of their influence upon car values—not even in catalogs, where there would be room for complete monographs to help the public, as well as salesmen, to keep in mind the numerous little details which bear on car value but are easily overlooked.

Building an Opinion

In this place, where room must be made for all reasonable differences of opinion, each of the many subjects related to the fixed accessories or similar features can be followed only in its larger lines. The thing to be done, on this plan for quickly establishing a working basis for a final discussion, is thus to force one self to give definite expression in writing, for the purpose of ready reference, to the most important relations to durability and car value which seem associated with each of the simple construction features of an accessory character in automobiles, and to do the same, in so far as it seems practicable, with regard to working parts, exercising one's judgment during the progress of the compilation to limit the amount of material by excluding factors whose bearing upon durability and value is too difficult to determine, too indefinite or purely quantitative.

In each instance, after actual and tried forms of construction have been considered, there remains always the question if higher durability and value, as well as style, could not be attained by some method which has never been tried or which has been tried insufficiently or indifferently. In this respect the whole process for getting the subject under consideration should be of value for suggesting improvements, and these may subsequently, after being tried long enough, be turned into fresh data for a later type of The Car That Stays Young.

In the matter of fenders—to illustrate the method—the question of the gage and weight of the material was not referred to, as it is very hard to decide. Dents and bent corners are noticed in many very heavy fenders of city cars, and while thin fenders suffer more and more conspicuously they can also be more cheaply replaced. The matter of leather fenders stretched over a frame was also left unmentioned, as this type is being used less and less for automobiles. The use of cloth fabric and of thin boards was passed by as an evident makeshift in point of style. Shaped sole leather fenders with unsupported edges were ignored because they have never been regularly manufactured and no means for making them hold their shape and giving them an attractive and waterproof finish has been developed.

There remained the following proposition of data, subject to proof, disproof or elaboration from the funds of superior experience or special knowledge on the subject:

Fender Requirements Restated

For cars of high price: Full-crowned fenders with rolled edges front and rear; secured to brackets in such manner as to leave outer edges as free as possible to yield a trifle. Material, sheet steel probably not more than 1/16 in. thick or aluminum alloy about twice as thick. Finish, paint or chemical coloration.

For cars of medium price: Crown-top fenders with reinforced edges. Material, sheet steel. Finish, paint.

For low-priced cars: Flat fenders of sheet steel, painted, with outer edges preferably flared at the most exposed portions in front and at the rear.

For all cars: Fenders should be so short and narrow as not to become buffers in all directions, even with some sacrifice of the protection against mud splashing. Front and rear ends (which are nearly always disfigured first) are either curved down to hug the wheels or reinforced with visor-like tips that are bent down sharply to catch the last of the splash, and the latter method seems to have the advantage in the matter of avoiding disfigurement and for style and light weight. Which of these conformations is preferable seems, however, to depend largely on the positions of the wheels; the down-curved fenders being most suitable for a wheelbase that is short in comparison with the over-all length of the vehicle and the short and tipped fenders for wheels that are placed far to the front and rear, respectively. The inference may be that wheels so placed provide a very considerable measure of protection for other portions of the car, by causing the pneumatic tires to act as bumpers much more frequently than where other portions project farther at the front and rear.

Since the protection obtained for fenders by making them narrow and short is due to the relatively greater projection of other portions of the car obtained by this means, it follows that additional protection can be obtained by making such parts as hub caps and running-boards unusually prominent and that the carrying of spare tires at the side or rear may be turned to account on the same principle. But little deliberate development of these provisions is seen in practice; fenders are usually more exposed than strictly necessary. The choice for the purchaser lies therefore at the present time, so far as fenders are concerned, among a number of more or less satisfactory compromises.

A Suggested Innovation

With regard to the future, one can imagine improvements of different sorts. The writer would be inclined to look hopefully upon experiments, for example, with sheet metal fenders having less than half the width that is now usual and arranged to receive an extension at the outer edge of much more pliable yet fairly stiff light material requiring no special finish, such as may be found among cellite or fiber compositions, or impregnated textiles. It might not be easy to make such a built-up fender compare well in style with a perfectly new full-crown or crown-top all-metal

fender, but much more difficult style-problems have been solved and the comparison with a more or less disfigured all-metal fender in its third or fourth year of service might be to the advantage of the innovation. In lightness and in the convenience and cheapness of replacement—which should affect only the extension edge—it could no doubt be made superior and in efficiency as a mud guard fully equal. Fenders with channel iron reinforcement of the edge already suggest a method for attaching a non-metallic extension in the form of a down-flaring rim, whose shape would be supported by the curvature of the line of attachment while its moderate width of four to six inches would lend it sufficient resilience to make it resume its original conformation and surface after an accidental impact. The strongest advance argument against a fender of this nature is perhaps that the extension edge would not be substantial enough for a person to lean against or to resist malicious meddlers, but the ordinary leather fender as well as the pneumatic tire and all fine and lustrous finish are more or less open to one or the other of these objections, and they are not found important in practice.

Radiators

Louis Renault many years ago presented to the world his solution of the problem relating to radiators for The Car That Stays Young. It is effective on the point of contributing to the preservation of the car's appearance, not only by taking the radiator out of harm's way but also by rendering the motor accessible, so that adjustments and repairs can be made with small chance of denting the motor hood. But the Renault method involves the technical principle of cooling the motor by means of a relatively larger quantity of very slowly circulating water, meaning considerable weight and incumbrance. With the height required of a thermo-syphon radiator to make it function acceptably for the average modern motor of 2000 r.p.m. or more, the only place for the radiator is between the motor and the dash, as selected by Renault in the first place, and by this disposition the feet and legs of the driver are heated uncomfortably unless the dash is double-walled and provided with heat insulation. These and other factors make it necessary to consider the standard radiator located at the front end of the vehicle frame and operated with forced circulation as the type to be kept in mind.

Widespread Desire for Strength

Assuming that a radiator of this type has been found capable of taking care of its thermal work when new and that the same may be said of a number of other radiators which are of the same general type but varying in details, the practical question is one relating to these details and to the provision made in each case for protecting the radiator against deteriorating influences. These are in the main torsion of the car frame, vibration, rust and external shocks and are all fully recognized in the practice of automobile building. Opinions differ only with regard to the price that should be paid for minimizing them and for reconciling any precautions that may be adopted with considerations of traditions and style. It is safe to say that, if The Car That Stays Young had been the ideal ordinarily guiding the public's choice of a car, robust construction and flexible mounting for pleasure car radiators would have come into fashion before truck makers had shown the way and certain standards would in that case have been developed by this time and would have been satisfactory even for cars which are driven roughly. Actually, however, the condition of a radiator after one year of use indicates mostly how the car has been treated and whether suitable shock absorbers have been fitted to the front springs or not. If the radiator remains as good as new in spite of rough car service there is apparently always question of a construction of much higher first cost than could be contemplated for a popular car, and, if the past year has brought out any radiator equipment for a low-priced car of which something decidedly better can be said, testimony to that effect has not yet been made known broadly. For The Car That Stays Young a radiator that steams too easily is better than one which springs leaks from either rust or vibration or frame torsion, and it is also usually cheaper, having larger water channels, thicker metal and fewer joints, but it should of course be possible to combine mechanical strength with thermal efficacy and economical construction. A good part of the problem involved in this need lies, according to testimony of radiator engineers, in making the air current produced by the cooling fan or by the car motion strike all of the water channels instead of only a portion of their surface and reconciling this with moderate dimensions by having the air spaces as small as practicable. In the Solex type, used for trucks and omnibuses, these requirements seem to be met except in so far as the centrifugal fan in the middle of the radiator occupies a considerable space which could not be spared so well in the case of pleasure cars. On the whole the development tends toward the use of plain thin vertical or circular water tubes of copper or aluminum, a top reservoir of more than nominal capacity and a centrifugal water pump of rather small dimensions—a sort of compromise between thermo-syphon and forced circulation but with all the needed improvements in the matters of flexible mounting of the radiator and increased efficiency in the management of the cooling air current still awaiting the final word of approval.

External Protection

Only in the external means for protecting the radiator against impacts is there anything definite whose undoubted value for tending to keep the radiator from deteriorating may be weighed against simple considerations of price and style. The use of a tie rod between the two lamp brackets, the transverse buffer and a well advanced position of the front wheels operate together with the sheet metal apron now frequently placed between the frame horns to keep a honeycomb radiator intact in its somewhat frail ornateness, though they scarcely suffice to prevent the thin metallic cooling fins on tubular radiators from being mussed or mashed.

Fastidious motorists complain that the use of all the four factors referred to—tie rod, buffer, apron and advanced wheels—which incidentally with their other purposes serve as outer defenses for the radiator, gives the front part of the vehicle a cluttered appearance, and hold that in point of style only the wheel position and the buffer are admissible. Coupled with the fact that the principal weakness of the radiator is internal and should be remedied first, this objection, which seems well taken if clean style is bound to prevail in the long run and to influence prices and values, points apparently to something entirely new which may give the radiator a more positive external protection than it now receives while also rendering possible the proper bracing of lamps and perhaps in some manner connecting with the installation of a motor starter. The whole situation seems complex with reference to The Car That Stays Young and suggests the need of a good deal of hard work on the part of designers.

Rusty Mufflers and Exhaust Pipes

Aluminum paint does not stay long on the muffler or the end of the exhaust pipe and they are usually freely abandoned to the inroads of corrosion, a running-board apron concealing the eyesore, and there the matter is dropped. Perhaps this matter is too small to dwell upon, yet it is noticed that sticklers for a clean style in vehicle lines are not enamored with running-board aprons or with the general plan of concealing unpresentable details, so much less as these thereby usually become still more unpresentable through

neglected accumulations of dirt. At least for high-priced cars it might be demanded that the muffler and the exhaust pipe should be made of aluminum rather than of sheet iron, especially as the high conductivity of aluminum would help to cool and contract the exhaust gases, reduce the noise and obviate muffler explosions.

The Fashion in Valances

More actual, and probably more important, at the present time is the question of the running-board apron, or valance, itself. It is fixed, semi-detachable or detachable and in some cases a small portion of it can be unbuttoned to make a gateway. Apparently its purpose is wholly one relating to appearances and the methods for grooming the vehicle. Whether it is desirable or not, when new, may therefore be considered a matter of taste, but experience must also be consulted when one is to decide whether it is always a good feature for The Car That Stays Young. It is unavoidably scuffed more or less, so that a high finish for it seems unlikely to last as long as that of the rest of the car body, and this is clearly against the high finish. In other instances, when the running-board is high and the car frame low, its appearance is less obtrusive and perhaps entirely acceptable, and again its place is taken by a piece of thick but pliable leather of rough finish which is buttoned or hooked to the board and the frame. The considerations which arise with reference to The Car That Stays Young are in all cases perfectly plain and elementary, once mentioned, but it would be interesting to make sure of what the general opinion is with regard to the prospective permanence of the fixed valance as a style feature.

Motor Hoods

Sheet metal which has received an exceptionally smooth surface in the rolling mill is indispensable for taking a high finish which is also thin and therefore hard and lasting, but the difficulties formerly met in obtaining such material, and having it also sufficiently plastic, no longer exist, being reduced to a question of price. In the cheap car, paint is therefore as durable as enamel, for the hood. Some shapes take and hold a dent which under otherwise similar circumstances would be avoided with other shapes, but probably no other rule on this subject could be formulated except that sharp curvatures are most liable to be dented. Much more tangible are the simple questions relating to joints and hinges and to the fastenings of the hood on the frame. Where edges come together rainwater lodges and unless special precautions are taken streaks of rust are formed and spread to the sides under the finish. These precautions take so many different forms in well-built cars that no special mention of any of them is necessary and are withal so inexpensive that they might be found in every car. The fastenings at the base of the hood used to be troublesome and noisy but now nearly always include the necessary element of elasticity which prevents rattling permanently.

(*To be continued*)

Middle West Crops Presage Increased Car Sales

(*Continued from page* 499)

over the semi-arid plains of western Oklahoma and New Mexico as well.

A 20-cent raise in the price of oil has caused great activity in the Kansas and Oklahoma fields. The impression is abroad in the oil field that the Standard Oil Co., whose field company sets the price for the mid-continent district, is badly in need of crude for refined purposes. It is offering all kinds of inducements to operators who open up leases and the oil men are taking the statement of the Prairie Oil & Gas Co. that it wishes to open up production at its face value. Independent producers predicted a month ago that the "big raise" was due. It means nearly $50,000 a day more money to Oklahoma producers alone.

The banks continue to hold immense deposits in the West and money is easy for all legitimate purposes, although the war makes many persons chary of starting in new enterprises.

Manganese in Missouri

Of interest to the automobile industry is a discovery reported by the mining bureaus in Springfield, Mo., in the Ozark Mountains. What is said to be the first manganese discovered in Missouri has been uncovered in Christian County. It is believed that there are other rich deposits in these mountains. Manganese is used in hardening steel and has been in great demand since the war began.

Jitney Business Settles Down

The jitney business in Kansas City, which looked bad for a time, has recovered somewhat and the 5-cent cars are doing a good business although there are not more than 100 small cars and twenty buses operating now, where three months ago the number of small cars was about 250 and the number of buses about forty. The failure of one line of buses—capitalized, as some said, on a "shoestring"—put a crimp in the business and kept new jitney men from entering the field. The other buses put their prices up to 10 cents, but lack of patronage forced them down to the original "jitney" a few days later.

No More Failures

No more bus failures have been reported. The line which failed was operating fifteen buses and carrying a very heavy overhead expense, which seems to have been recognized in the jitney business as a sure "jitney breaker." Many jitney drivers who went into the game with rattle-trap cars or cars of high cost have dropped out, leaving the men who were equipped with cars more suitable for the traffic. Many of these say they are making good money and that they expect to continue in it.

Michigan's Six Months' Registrations

(*Continued from page* 504)

and delivery cars, and 111 are electric vehicles. Only thirty-nine foreign or European-made cars were found, all being gasoline passenger cars.

Registration Heaviest in January

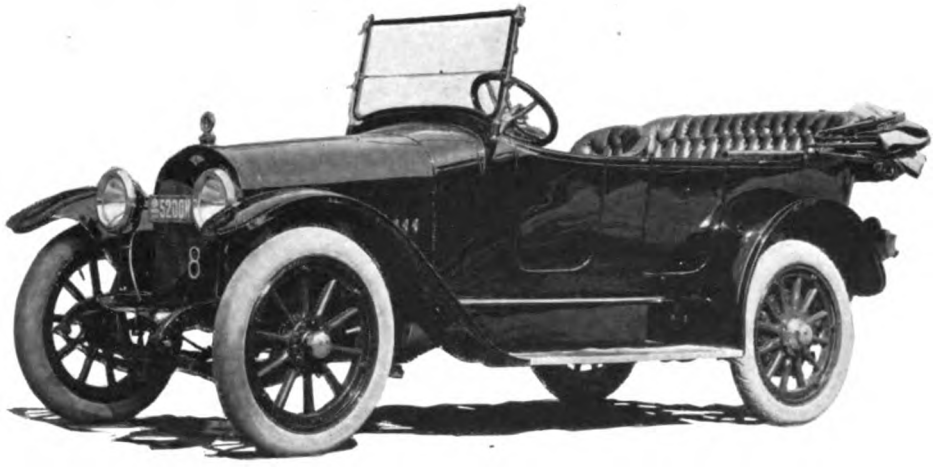
The heaviest registration was recorded in January, the total for the month being 25,343. March was the second big month with a total of 22,262, and is followed by April with a total registration of 17,942. In February 9691 licenses were supplied, in May 9419, and in June only 6987. This is the record for the gasoline passenger cars only.

Commercial vehicles to the number of 1259 were registered the first month of the year, while for the succeeding five months the registration licenses issued were respectively 170,304, 362,248, and 156.

The biggest registration of electrics took place in January when 1219 were recorded. February shows a total of 93, March 118, April 56, May 44, and June only 22.

Bore Larger in Abbott-Detroit Eight

Increased from 3 to 3 1-4 In.—Piston Displacement 332 Cu. In.—Individual Front Seats—New Folding Type in Tonneau



The new Abbott-Detroit eight-cylinder, seven-passenger touring car which sells at $1,950

THE 1916 Abbott-Detroit model, made by the Consolidated Car Co., Detroit, Mich., the successor of the old Abbott-Detroit Co., is a high-powered and gracefully designed machine offered at $1,950. Equipped with an eight-cylinder engine, it follows a somewhat foreign body trend, with an accentuated slope to the hood and a consistently parallel slope to the body.

Bore Increased to 3¼

Chief among the changes, as compared with the model of 1915, is the increasing of the bore of the Herschell-Spillman V-type eight from 3 to 3¼ in., with the stroke remaining at 5 in. The motor is said to have a maximum horsepower of 80, this giving rise to the model designation of 8-80. The S. A. E. horsepower accorded it is 33.8, and the piston displacement is 332 cu. in. The car is said to be handled by the motor at from 1 to 70 miles an hour on high, and that it will do 40 miles an hour nicely on second speed.

Described on several occasions, this eight is not new to the public. It was used in the 1915 Abbott, and follows the same general lines as before with the increase in bore practically the only change of importance. The cylinder blocks, arranged at 90 deg. on the two-piece aluminum crankcase, are offset from one another the width of the connecting-rod and bearing so that the two rods of opposite cylinders attach side by side to the bearing, instead of using a yoke or a knuckle construction. This makes all the rod ends alike and interchangeable.

Separate Cam for Each Valve

Three main bearings support the crankshaft, and the camshaft, with sixteen integral cams, is also a three-bearing design. The offsetting of the two cylinder blocks makes possible the use of a separate cam for the operation of each valve instead of using one cam for two opposite valves.

Driven by spiral gear at the front is the pump shaft which operates the centrifugal water pump at the right front side of the engine. This is a double type of pump, effecting plenty of water circulation through the two blocks of cylinders. There are four water outlet connections to each of the water outlet manifolds, these being at the upper edge of the castings, thus taking the water off from the highest and hottest part of the cylinders.

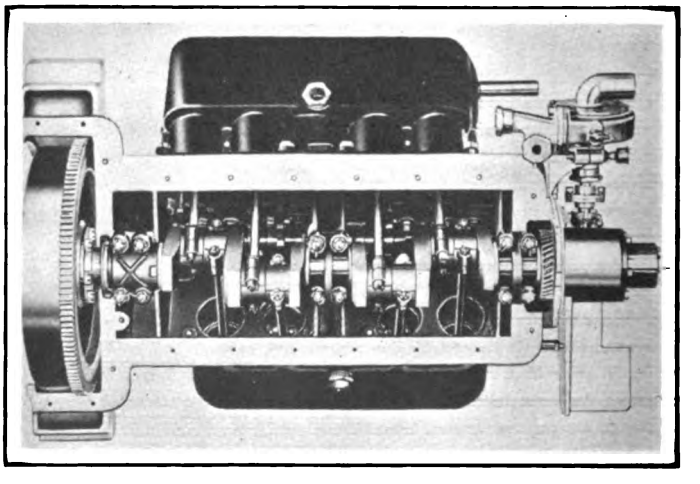
Pressure Lubrication

Pressure lubrication maintains a constant feed of oil on the main bearings, and it is regulated by a valve which discharges the excess pressure of oil onto the spiral gears at the front.

Chassis differences over the model 8-44, the 1915 type, are few. The springs are longer by 1 in. than previously and somewhat straighter. This gives a better riding proposition, and there is less strain upon the springs. Mounted almost horizontally, and with less of a bow, the action is more nearly on both sides of the horizontal, and the springs are under less initial tension. This uniform action above and below the horizontal serves to make the spring strain more equal, with better results upon the metal. The springs are underslung, permitting the joints to be hung low, and also aiding the riding qualities. The spring perches are swiveled on the axle.

Three-Speed Gearset

In the driving system, a three-speed gearset and multiple-disk clutch with ball throwout are employed. These units deliver their power through an ample propeller shaft to the floating rear axle. This is of the same design as heretofore, but instead of straight bevel gears, the later type of spiral bevels are fitted. In this construction, the teeth are given a curved form, and there is a rolling action of the teeth of pinion and gear. Silence is thereby promoted, and another point of the spiral-bevel is that the force is distributed over



Bottom view of Herschell-Spillman eight-cylinder motor used in the 1916 Abbott-Detroit

more tooth surface. Chrome-vanadium steel shafts have been adopted, along with chrome-nickel steel for the gears.

Individual Front Seats

The main features of the entirely new body design, in addition to the sloping lines already mentioned, are the use of individual front seats and the new type of concealed auxiliary seats. The front seats are entirely separate as in the commonly called phaeton models, and there is an aisle between them allowing access to the rear seat from the front.

A type of folding seat has been worked out which slides under the front seat and entirely out of view. A leather flap is provided on the back of the front seat, thus completely hiding the folding seat. They are also adjustable as to position, which is a commendable feature. In fact, the Consolidated concern thinks so much of these new auxiliary chairs that it has applied for patents upon them, it is said.

Enamelled leather upholstery has been applied, with the inner sides of the body trimmed with a vertical roll, and the tops of the doors with a double metallic Spanish roll, so called.

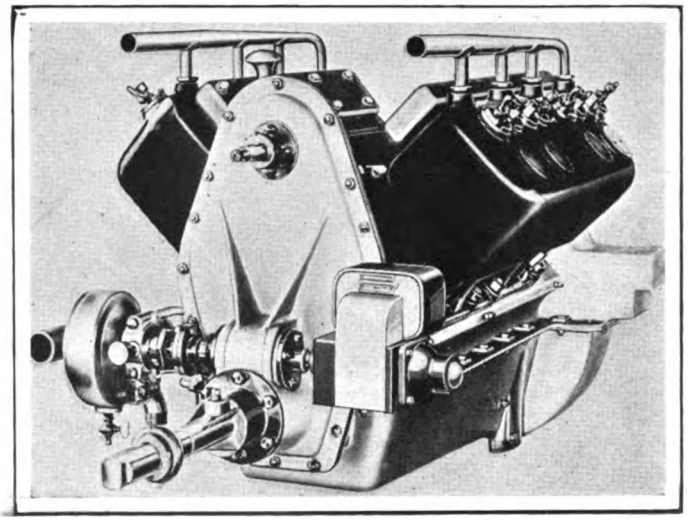
Windshield Slopes Backward

A feature which adds to the appearance is the mounting of the windshield. It is made to slope backward from the bottom to the top. There is said to be a special utilitarian value to this, as it makes it possible for the driver to see the road ahead when cars with glaring headlights are coming toward him. The idea is that the slanting shield glass reflects the rays of the approaching headlights downward so that they do not trouble the man at the wheel. It is also useful in eliminating back draft, insuring good ventilation, and acts as a storm-vision shield.

Fuel Tank at Rear

In the new car, the gasoline tank has been shifted from under the front seat to the back of the chassis, and the feed is by the Stewart vacuum tank system. Should the tank get out of order for any reason, there is a hand pressure pump provided which may be used to force gasoline to the carbureter. Special precaution against gasoline line troubles has been taken in the use of a rubber covering over the copper piping. This cushions jars, and has other obvious advantages.

A tilting steering wheel has been fitted, this not having so much use for getting into the drive seat, but being of special merit when it is desired to move about and turn around in getting from the front seat into the back of the car, through the aisle between the seats. The wheel hinges at the column and may be swung so as to be either above or below the post. A latch holds it in driving position. It controls a triple-pitch worm and full gear steering mechanism, and is on the left, the control levers being in the center.



The 3¼ by 5-in. eight-cylinder Herschell-Spillman motor used in the 1916 Abbott-Detroit

In fitting a new type of top, a special feature has been incorporated, in that the entire back portion can be rolled up out of the way, making the top really a sunshade with free air circulation all around, when desired.

Equipment Is Complete

Equipment is unusually complete, some of the special items being a Boyce Motometer on the radiator cap, showing the temperature of the cooling water; power tire pump; trouble lamp; aisle-way lamp, and a master-key and lock system providing one key for the tire lock and other locks on the car.

The wheelbase is 121 in., and 35 by 4½-in. tires are used, the rear set being of the non-skid variety.

—

Armored Cars Cut Wire Entanglements

REPORTS from the front in the battle for the Dardanelles indicate that the armored automobiles are rendering valuable service, particularly in destroying wire entanglements erected before trenches or fortifications. The cars dart up to the wires, their armor protecting the crew from the fire of the enemy, grapple the wire with short hooks attached to chains and then make full speed to the rear, tearing away the wire so that a gap of over 150 yd. was open for a bayonet charge by the infantry.

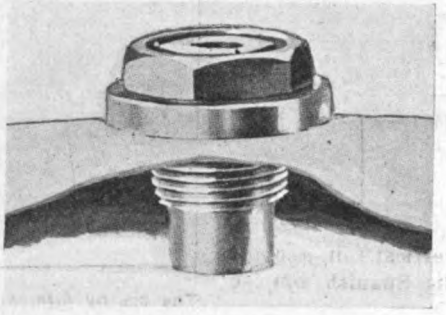
ACCESSORIES

McNutt Non-Explosive Cans

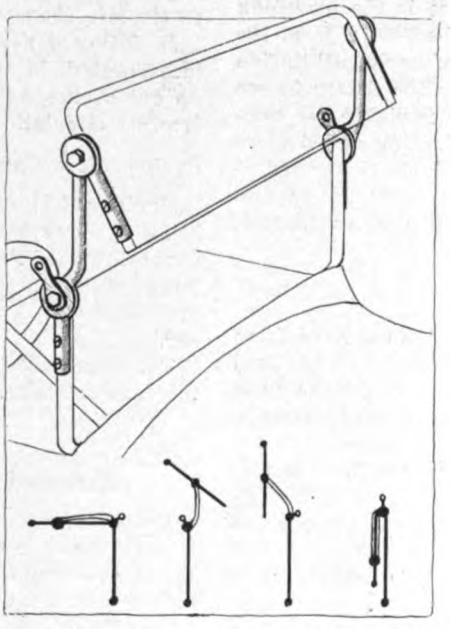
THE principle of all McNutt cans is to allow a gradual outlet for the expanding gas in case of great heat. In the safety bung, the plug closure garage can and the larger Eclipse can made by this concern, this pressure outlet is automatically protected by a fusible plug. When the internal pressure reaches 10 lb. or when the temperature rises to 400 deg. the valve in the plug is raised and allows the expanding gas to escape and burn instead of causing an explosion. Under extreme heat the fusible plug will melt, making the escape of expanding gas doubly certain. These cans can be thrown into the fire full of liquid, according to tests made by the manufacturer, without ever causing an explosion. The fusible plug prevents the explosion and the fire screen acts the same way as the screen in a miner's lamp, preventing the fire from starting. The price of the tank safety bung which generally fits motor boat tanks and small cars, such as the Ford, is $4.50. The plug closure can of 5 gal. capacity is $5. The large Eclipse can of 5 gal. capacity is $6.—John C. Eames, Inc., New York City.



Fusible plug used in McNutt non-explosive cans and similar products

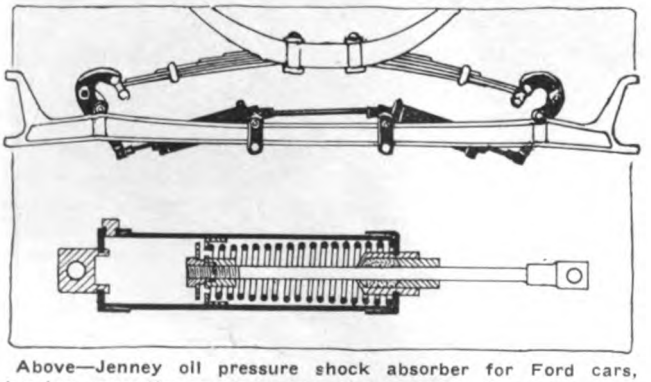
Jenney Shock Absorber

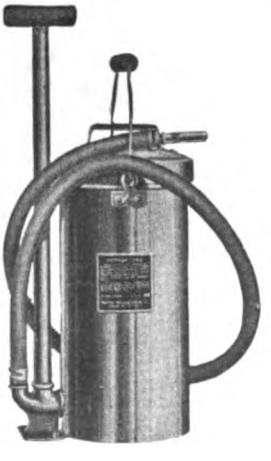
An oil pressure shock absorber for Ford cars has been brought out, in which the rebound of the springs is checked through a liquid absorbing medium. The shock absorbing medium is fastened to the springs in such a way that when the springs are depressed a plunger is forced through an oil cylinder, compressing a spring contained therein. Thus the spring acts in one direction and the oil pressure in the cylinder in the other. The spring, which is inclosed in the steel tube, is compressed by a downward pressure on the main leaf by means of linkage connected at the spring shackles. The tube is filled with oil, and as the piston is filled with a series of holes, the oil passes through these freely while the spring is being compressed on its outward stroke, but as soon as the plunger starts back on the return stroke, due to the rebound of the spring, a washer presses against the piston, closing the holes, thus compelling the oil to be squeezed between the piston and the tube. This space is so small that considerable pressure is created, causing the return stroke to be retarded, thereby preventing the tossing action generally found on front spring rebound. A stuffing box prevents the oil from leaking past the piston rod. The manufacturers claim that a full set can be attached to a Ford car in about 2 hr. No holes need be drilled nor any parts altered. The price of the absorber is $20 for a complete set of four.—Jenney Shock Absorber Co., Indianapolis, Ind.



Illinois windshield hinge for Ford cars with diagrams of various positions

Smith rubber handled insulating screwdriver





Above—Jenney oil pressure shock absorber for Ford cars, showing mounting and construction. Right—Runyen grease cabinet with air pump

Illinois Windshield Hinge

To transform the windshield of the Ford 1915 model to a rain-vision, ventilating type, this device has been brought out, and fits directly on the 1915 Ford with the cowl dash. All that is necessary to do is to take off the hinges as applied by the factory, which are on the windshield, open the Illinois windshield so that the hinge is at an angle of about 35 deg. to make it convenient for attaching, and then place the hinges on, the lower half first, afterward applying to the upper half. The same tapped holes and screws which are on the car may be used. The price is $5.—Illinois Brass Mfg. Co., Chicago, Ill.

Runyen Grease Container

The Runyen grease container works on much the same principle as the ordinary hand grease gun, only is much larger and uses air pressure delivered by a pump to force the grease or oil through a long hose and nozzle direct to the desired point.

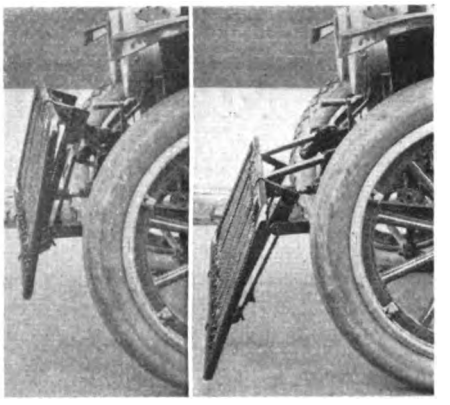
The illustration shows the device with the hose and nozzle in place. This apparatus is also self-measuring, for with each stroke of the handle it delivers ¼ lb. of grease or oil into the differential, timing gears, universals or gearset, and hence by counting the number of strokes or part strokes it is very easy to know exactly how much of the lubricant is being supplied.

There is obviously a saving of time with a device of this kind, for it takes much less time than hand application would. There is also no handling of the grease, and consequently any waste through handling is obviated. Then, too, such grease or oil ought to be cleaner when it reaches the part than it might be under hand operating circumstances.

The Runyen cabinet comes in three sizes. These are No. 1, which is of 7.5-lb. capacity, and which sells at $6; No. 2 of 15-lb. capacity, and costing $7; and No. 3, which can hold 23 lb., and is offered at $8.—Runyen Mfg. Co., Grand Rapids, Mich.

Hero Safety Fender

The Hero safety fender is a device adaptable to any car or truck which places under the control of the driver a safeguard against running over pedestrians, animals, etc., which may happen to stray in the path of the vehicle. The device is folded out of the way when not needed, but when an emergency arises a pressure on the brake pedal releases it and the protection against accidents is automatic. The device, which is under the driver's control, is quick-acting, and in city traffic and on the country road is out of the way.—The Hero Mfg. Co., Philadelphia, Pa.



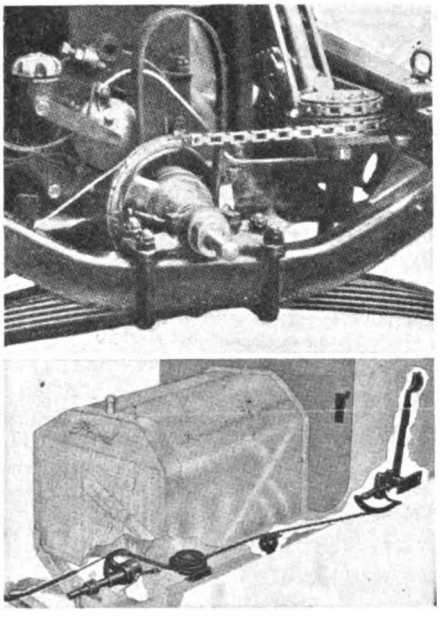
Two positions of the Hero safety fender

Taylor Tire Pump

The Taylor is a diaphragm pump, there being no communication between the crankcase and the compression chamber so that oil cannot get to the tires. The pump is mounted on the end of the crankshaft when in use, and carried in the tool box or other convenient place at other times. Has no gears or brackets. Made for Hudson, Overland, Reo, Chandler, Studebaker, Stearns-Knight, Dodge and Chalmers cars. Price $12.50 each.—Taylor Mfg. Co., Detroit, Mich.

Giant Ford Starter

The Giant starter is a mechanical instrument intended especially for Ford cars. It is mounted on the forward end of the crankshaft and is entirely under the hood, with the exception of a pedal which is fastened to the dash except when in use. The operation of starting consists of releasing the pedal, allowing it to rise upright in a convenient position, and it is then pressed forward with the foot, rotating the crankshaft and starting the motor. The pedal is geared in such a way that one stroke gives a half turn to the motor.



Detail and mounting of Giant starter for Fords

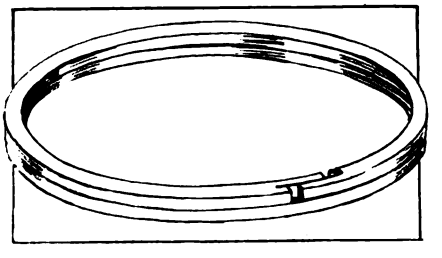
The starter is so arranged that should the motor backfire at any time, the pedal is held by a spring and the starter itself automatically releases. The working parts are all of nickel steel, and the chain used is motorcycle link, which is heavily designed to avoid breakage and stretching. It is stated that the starter can be attached in about 2 hr., as no boring need be done, the starter bolting directly to the motor and car frame as they are. In ordering it is necessary to specify whether the Ford is 1914 or 1915. The entire outfit, f.o.b. factory, sells for $25.—Standard Starter & Specialty Co., Cleveland, Ohio.

Smith Insulating Screwdriver

An insulating covering of rubber is moulded over the handle and part of the blade of the Smith screwdriver which is 11¼ in. long over all and has a 6-in. blade; the rubber provides insulation against shocks which are likely to occur when work is done on any machinery or apparatus where current is flowing at high tension—especially ignition systems. The covering meets the blade flush so that there is no shoulder; the tool is smooth from end to end. Width of blade, ⅜ in. Price $9 per dozen.—H. D. Smith & Co., Plantsville, Conn.

Detroit Power Tire Pump

The Detroit is a power tire pump of the type mounted at the forward end of the crankshaft where the crank is usually applied, and may be dismounted and stowed away in the toolbox or other part of the car when not in use. It drives directly without the use of gears and weighs 4½ lb. It is adapted to Chandler, Dodge, Overland, Hudson, Reo, and Studebaker cars. Price, $7.75.—Detroit Motor Accessories Co., Detroit, Mich.



B-W piston ring, showing joints

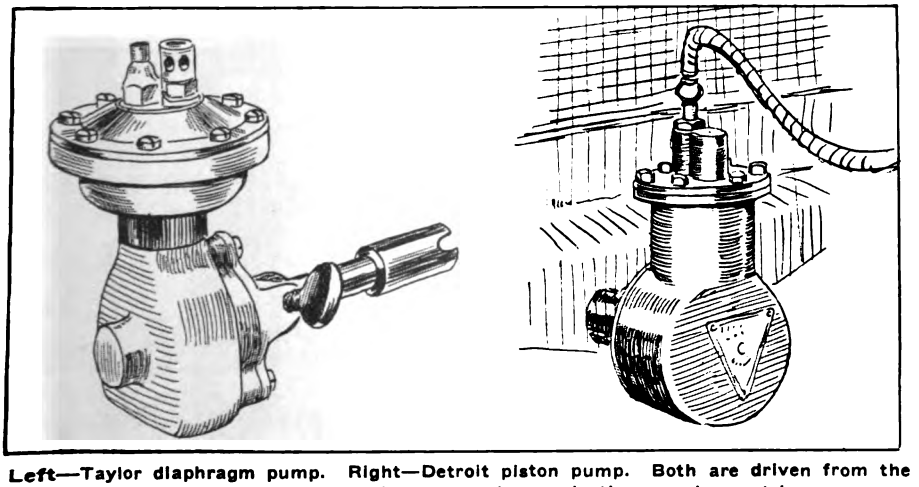
B-W Piston Ring

In this piston ring two eccentric rings are pinned so that their joints are opposite, the thick section of one ring being over the joint in the other. Leakage at the joints is prevented by the scarfing of the ends. The material is soft so that it will not wear the cylinders, yet it is said to possess considerable resiliency. The rings are tool finished and the surface is not ground.—Ballman-Whitten Mfg. Co., St. Louis, Mo.

Cyclone Carbon Remover

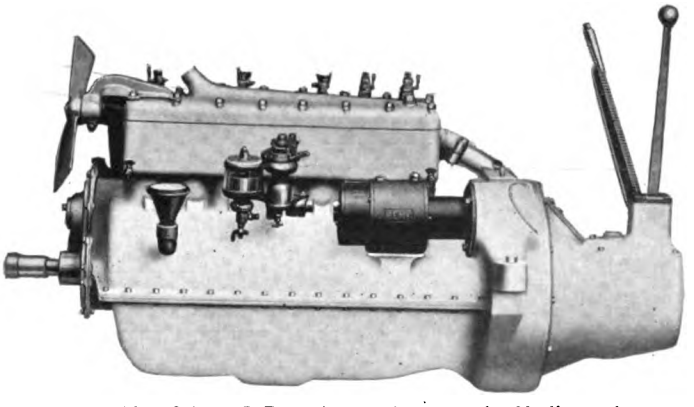
Cyclone is the name of a carbon remover in liquid form which, when sprayed into the motor while the cylinders are warm, though not hot, is said to loosen the deposits so that they are easily blown out through the exhaust when the motor is started. A pint is sufficient for four or five cleanings. The liquid is harmless.

Price, $1 per pint.—Cyclone Co., Greenwich, Conn.



Left—Taylor diaphragm pump. Right—Detroit piston pump. Both are driven from the front end of the crankshaft and are stowed away in the car when not in use

Three Bodies on Madison Six Chassis



Left side of 3 by 5 Rutenber motor used in Madison six

ANNOUNCEMENTS of the Madison six-cylinder cars show the line of the Madison Motors Co., Anderson, Ind., to include a roadster and a touring car at $985 and a seven-passenger car at $1,085. These bodies are all on a single chassis model which is fitted with a Rutenber unit power plant with 3 by 5 L-head cylinders. The catalog rating of the Rutenber motor is 40 hp. It has a three-bearing crankshaft of six throws drop forged from 0.35 to 0.45 carbon steel heat treated to give an elastic limit of at least 70,000 lb. per square inch. The elongation is 20 per cent in 2½ in. and the reduction of area 50 per cent. The maximum stress put on the shaft section is 20,000 lb. per square inch. The bearings and pins are accurate to within 0.001 in. limit. Each shaft is balanced on the Norton machine.

Oil Relief Groove in Piston

The piston pin bearing is phosphor bronze. It is carried in the upper end of the connecting-rod with the pin fastened with a set screw directly into the piston. The pistons have three rings with an oil relief groove directly under the lower ring. This eliminates any possibility of an over-supply of oil in the combustion space. The motor has for additional features detachable head, and nickel steel valves of 1 5/16 in. diameter and 5/16 in. lift.

The timing gears have helical teeth and the valve lifters are of the mushroom type both of which features tend to quiet the valve operation. Lubrication is provided by a constant splash and a vane pump feed direct to the bearings. Cooling is taken care of by a centrifugal pump and full cellular radiator of the modified V-shape with a German silver crown.

Remy equipment constitutes the electric plant of the car, ignition and lamps being taken care of by a generator with which is combined a magneto type distributer. The other portion of the two-unit system, the starter, drives through the flywheel by means of gearing inclosed in the flywheel housing.

From the engine power is transmitted through a dry plate clutch of the Detroit Gear & Mfg. Co. make. This design uses 13 disks, alternating asbestos face and steel. The gearset is made by the same concern and offers three speeds forward. New departure bearings are used throughout the gearset. The drive is taken through an open propeller shaft with universal at either end on the Hotchkiss system, the driving effort being carried through the three-quarter elliptic springs. A specially heavy forward attachment is provided for the lower half of the springs to take this extra effort. The rear axle is an American Gear & Mfg. Co. product, is of the floating type with large Gurney annular bearings and Brown-Lipe nickel steel spiral gears in the final drive. The steering is a Warner worm and full gear with an 18-in. corrugated rim and carries the horn button in the center.

Braking system consists of internal and external brakes operating on 1¾ by 14-in. brake drums. Tires are 34 by 4 in. with Stanweld demountable rims. Equipment is complete on all models.

Banks and Automobiles

FINANCIAL America now recognizes the automobile. One of the largest banking institutions in the country calls it a great public utility. Bankers everywhere are ready to do their part in lending financial aid to the automobile industry—ready to help boost it and make it a still greater success. Dealers find a more open mind on the part of the banks as regards financing them and loaning on their stock.

Everywhere in financial circles the old antagonism against the automobile is rapidly giving way to a spirit of understanding and realization that the motor vehicle is bringing closer intercourse between all sections. They see what it is doing to increase property values in otherwise isolated districts. They know of its helpful influence through the greater general prosperity of the people as a whole, for this is at once reflected in their own business, which has increased in every financial district.

The bankers used to say that the vastly increasing use of automobiles was making the people extravagant. Now they realize that by opening up greater distances, making possible more thorough intercourse and decreasing non-productive transportation time the motor car has a very important place in the general scheme of things, and that it is really a factor for economy, all things considered. It is a necessity.

The Multicylinder V Engine

ABOUT a year ago the S. A. E. had McCall White's paper on the Cadillac eight, and this week J. G. Vincent gives his ideas on the twelve, treating the latter rather as a development of the eight so far as the V principle is concerned, but as a development of the six from the wider aspect of automobile design generally. The important point in Mr. Vincent's paper is the fact that his reasoning leads to the twelve entirely without regard to the eight.

Excluding interested parties, there is a remarkable tendency amongst engineers to regard both eight and twelve as here to stay, at least as long as the automobile remains much the same generally as it is now, but a point which is likely to be discussed vigorously at the meeting where the paper is read is whether we have yet done all possible with the six. Here opinion divides into two schools, one holding that the eight and twelve will between them drive the six almost out of existence, and the other that there is plenty of room for all types. Next year will show some sixes of a higher grade of engineering than most that have been made so far, and it is likely to be several years before the matter is settled either way.

Meanwhile it is interesting to observe how quietly the twelve has been accepted, which is explained no doubt by the fact that the eight has proved the V motor principle and proved the advantage of small impulses in quick succession. The eight and twelve together have had the effect of raising the standard of automobile engine design and construction for all types, but the effect of that raising is only apparent in very recent new designs and will not reach its full expression for at least another twelve months.

Before a company adopts a new product involving the expenditure of thousands of dollars for new tools and the scrapping of thousands of dollars of old, good reasons must be shown for this policy.

The All-Weather Car

WITH the coming of autumn and cooler weather, which naturally may be expected to follow, the car owner begins to consider the approach of winter. But this year, in a much more marked degree than ever before, the prospect is less likely to cool his ardor as an automobilist, for both automobile and body manufacturers are bringing out the widest assortment of all-weather bodies that has ever been put on the market.

These all-weather cars embody a combination of the best features of the conventional, open touring car and the limousine which used to be practically a monopoly with the wealthier automobilists, and have the added advantage that they may be converted from one to the other in a very short time, according to weather conditions and the mood of the owner. Every improvement in this direction of making the automobile an all-year comfort and convenience is to be commended, and the manufacturers should continue their efforts and surpass their already excellent designs.

Dealers to Blame for Car Shortage

Delay Unloading and Thus Hold Up Railroads, N. A. C. C. Traffic Managers Find

DETROIT, MICH., Sept. 14—*Special Telegram*—At to-day's meeting of traffic managers of the National Automobile Chamber of Commerce, Inc., there were representatives from the Dodge, Cadillac, Ford, Briscoe, Maxwell, Studebaker, Reo, Olds, General Motors, Willys-Overland, Hupmobile, Kelly-Springfield, Anderson electric, Chalmers, National, Mercer and Nordyke and Marmon companies.

The principal topic was the car situation and it was brought out that the automobile dealers are much to blame for the shortage of cars because of a great many delays from several days to sometimes more than two weeks before taking delivery of their automobiles. This not only causes prejudice to the railroads but greatly handicaps the manufacturers in getting back the cars from the roads. The railroads now threaten to charge the dealers $5 a day instead of $1 for delay in taking delivery.

It was also announced that the chamber had received assurance from almost all the railroads in the country that they will co-operate in the car matter. Many other minor topics were discussed.

Rittman Process a Success

WASHINGTON, D. C., Sept. 11—Secretary Lane cancelled a contract to-day made by the Department of the Interior with the Aetna Explosive Co. of New York, under which the company had agreed to expend $200,000 in the development of the process discovered by Dr. Walter F. Rittman for the manufacture of benzol and tuluol from petroleum. This action was taken because it is certain that the process is in such shape as to warrant its use by plants on a commercial basis.

Briscoe May Take Over Flanders Building

PONTIAC, MICH., Sept. 11—It is reported but not confirmed that Frank Briscoe is negotiating for one of the factory buildings making up the Flanders estate. It is said that Mr. Briscoe may start a new industry in the city.

Peerless to Build F.W.D.

CLEVELAND, OHIO, Sept. 11—An unconfirmed report is current here that the Peerless Motor Car Co. has received another large truck order from abroad, among which four-wheel-driven trucks are included and that arrangements have been made to manufacture the latter under license from the Four Wheel Drive Auto Co., Clintonville, Wis. It is expected that for the next four months, twenty-five trucks will be manufactured daily, or a total of 3000 in that time.

It is said that a recent French order, amounting to 500 trucks has been split between the White and Peerless companies, the former getting the contract for 300 and the latter for 200. The Russian four-wheel-driven truck order is said to amount to 200.

New Pilot Eight and Six

RICHMOND, IND., Sept. 14—*Special Telegram*—The Pilot Motor Car Co., which has heretofore confined itself to making high-priced, high-powered cars has announced two new models at much lower prices for 1916. One of these is a six known as the six-45 to sell as five-passenger touring and four-passenger roadster at $1,100; the other is an eight-cylinder, known as the eight-55 in two- and five-passenger form at $1,785.

This gives four chassis for the 1916 Pilot line, the six-75 at $2,485 and $2,400; the six-55 at $1,685, and the two new cars. The new pilot models are featured by double cowl streamline bodies, the four-passenger roadster being even more unusual it is called the Get Chummy type by the maker. In this car the front seats are individual with an aisle between which gives access to the rear seat which accommodates two people. The six-45 has an L-head 3 by 5-in. block motor, cantilever springs and Delco electric system. The eight-55 has 3 by 5⅛-in. cylinders and the valves are operated by a single camshaft. Wheelbase of this car is 126 in.

To Sell Cars Direct

In connection with the announcement of the new models a change in selling methods also is announced. Heretofore the sales have been handled entirely by the Pilot Car Sales Co., a separate selling organization, this arrangement now has been discontinued and the cars will be marketed by the Pilot Motor Car Co. through branch houses and distributors. George E. Seidel, president and general manager, has assumed active management of the company's affairs. Joseph W. Connor, formerly district sales manager for the Leyman Buick Co., Cincinnati, Ohio, has been appointed sales manager.

Ford Buys Tractor Plant Site

DETROIT, MICH., Sept. 24—*Special Telegram*—There is an unconfirmed report afloat that Henry Ford has purchased a 200-acre tract near Libertyville, Ill., for a demonstrating ground for the Ford tractor and that later an assembly plant will be erected there when the manufacture of tractors starts in Detroit.

Prest-O-Lite Buys Brown Battery

Also Purchases Four Special Maxwell Racing Cars—Rickenbacher to Manage Team

INDIANAPOLIS, IND., Sept. 14—*Special Telegram*—The Prest-O-Lite Co., this city, has purchased the Brown-Smith Battery Co., Bloomington, Ind., which has specialized on batteries for house lighting purposes. This acquisition broadens the Prest-O-Lite battery line which heretofore included ignition and starting and lighting batteries.

At the same time, the Prest-O-Lite company has entered racing, purchasing from the Maxwell Co. the four special Maxwell racing cars which will be raced in the speedway circuit as a Prest-O-Lite team under the management of E. V. Rickenbacher. These are four-cylinder cars 3.75 by 6.75 and can be used with either eight or sixteen valves.

Two of these cars will be entered at the Sheepshead Bay speedway race, one driven by Rickenbacher and the other probably by Harry Grant. It is understood that the price was in excess of $25,000, this to include repair parts damaged in practice or races during one year and engineering advisory service.

Mason Plant Brings $35,000

WATERLOO, IOWA, Sept. 10—*Special Telegram*—The plant and assets of the Mason Motor Co. were sold yesterday to the Blackhawk Improvement Co., a recently organized concern whose members are interested in automobile construction for $35,000, $20,000 of which will be used to pay preferred claims on the Mason company. For some time past the company has been building and assembling cars for L. C. Erbes and the plant will continue in this work producing machines bearing the L. C. E. trademark.

Walker-Weiss Axle Adds Men

FLINT, MICH., Sept. 11—The Walker-Weiss Axle Co., which has been employing 350 men, is adding 200 to its force and is going to operate its plant night and day. Owing to the lack of houses in the city it has been difficult to get all the skilled workers needed as they generally look for good houses.

$100,000 Hayes Truck Wheel Co.

ST. JOHNS, MICH., Sept. 11—The new Hayes concern which is now occupying the plant formerly operated by the St. Johns Table Co. will be operated under the name of Hayes Truck Wheel Co. It will be incorporated and have a capital stock of $100,000. C. B. Hayes, president of the Hayes Wheel Co., Jackson, is president of the concern.

$12,302,345 in July Exports

4118 Passenger Cars and 2469 Trucks Shipped—Parts $1,663,997

WASHINGTON, D. C., Sept. 13—The Department of Commerce announces that $12,302,345 in automobiles, trucks and their allied parts, were shipped during the month of July, 1915, as compared with $1,670,794 in the same month in 1914.

Passenger cars were valued at $3,835,347 and numbered 4118 as compared with $1,143,419 and 1265 in 1914. Trucks were valued at $6,803,001 and numbered 2469 as compared with only $106,400 and 50 in the same period in 1914. The parts amounted to $1,663,997 against $420,975 in 1914.

—

4908 Packards Built in Year

DETROIT, MICH., Sept. 14—Although the detailed annual statement of the Packard Motor Car Co. covering the fiscal year ending Aug. 31 will not be forthcoming for about a month, preliminary figures as to total business are available. The report will show that during this past fiscal year, a total of 4908 automobiles and trucks were built and sold. The total value of these vehicles, including parts and service for same, was $15,553,650, approximately.

—

Norton Resigns as Case V.-P.

RACINE, WIS., Sept. 9—F. Lee Norton, vice-president and general manager of the J. I. Case T. M. Co., Racine, Wis., has resigned and will devote his time to the conduct of his large stock farm at Racine. Frederick Robinson, vice-president, resigned a short time ago. Mr. Norton was associated with the company twenty-six years and it is stated that he retains his financial interest in the company.

—

Grady Canadian Studebaker Manager

WALKERVILLE, ONT., Sept. 10—J. E. Grady has succeeded W. T. Bush as general sales manager of the Studebaker Corp. of Canada. After the factory gets abreast with the orders, Mr. Grady is expected to take a trip to western Canada. In future Mr. Bush will devote his whole time to the retail sales department.

—

Gasoline Lower in Northwest

TACOMA, WASH., Sept. 14—While the price of gasoline is inclined to soar in the eastern states, it has been gradually lowered in the Pacific Northwest. Figures obtained from the Standard Oil Co., Tacoma give a record of wholesale price on gasoline for the past year and are as follows:

Sept. 1, 1914—12½c.	Sept. 7—12c.
12 cts until Oct. 22	Oct. 22 red. to 11 cts.
11 cts. until Feb. 2-15	Feb. 2 red. to 10 cts.
10 cts. until July 7	July 7 red. to 9½c.

Price of 9½ cents. wholesale still in effect Sept. 8.

Texas and Gulf gasoline are not sold in the Northwest, but instead Shell and Union gasoline are used in this field. These companies maintain the same prices as those put into effect by Standard Oil Co. Retailers making price from 1 cent to 1½ cents above wholesale price to customers.

—

Jay Succeeds Vail as Chairman of Maxwell Board

NEW YORK CITY, Sept. 14—At the meeting of the board of directors of the Maxwell Motor Co., Detroit, Mich., held here to-day, John P. Jay, Jr., vice-president and sales manager of the Pennsylvania Steel Co., Philadelphia, Pa., was elected a director and chairman of the board to succeed J. A. Vail who resigned last week, wishing to retire from business.

—

Wollering a Studebaker Director

SOUTH BEND, IND., Sept. 9.—M. F. Wollering, production manager of the Studebaker Corp., has been elected a member of the board of directors of the company. Mr. Wollering is a son of Fred Wollering, Milwaukee, and gained his experience in Milwaukee shops, becoming associated with Studebaker when that concern first embarked in the motor car field.

—

Portage on Cleveland Exchange

CLEVELAND, OHIO, Sept. 11—Portage Rubber common and preferred stocks yesterday were listed for trading on the outside board of the Cleveland stock exchange. There was outstanding April 30, 1915, the date of the last available statement, $586,200 of 7 per cent cumulative preferred out of an authorized $750,000 and $472,900 common out of an authorized $500,000. There are no bonds. No dividends are being paid on the common.

—

Ideal Light Car Co. Formed

COLUMBUS, OHIO, Sept. 10.—A new automobile manufacturing company has been launched in Columbus by the incorporation of the Ideal Light Car Co. with an authorized capital of $100,000 by J. H. Axline, C. O. Howard, S. C. Hill, F. E. Hill and Barton Griffity. The company has been temporarily organized by the election of J. H. Axline, president and general manager; F. E. Hill, secretary and treasurer and S. C. Hill, vice-president.

Claims Front-Wheel-Drive Rights

J. W. Moakler Issues Patent Notice Stating All Makers of That Type Infringe

NEW YORK CITY, Sept. 13—Claiming United States patents priority for the front-wheel-drive, as used on motor vehicles at the present time, John W. Moakler, East Worcester, N. Y., has issued a patent notice dated August, 1915, stating that all manufacturers of front-wheel-driven vehicles are violating his U. S. patent No. 766,191, of Aug. 2, 1904, and that all parties making such vehicles, their agents and customers will be held responsible for damages.

The claims allowed in patent No. 766,191 cover broadly the use of a universal joint in proximity to the pivoted parts of a steering knuckle, either above or below the knuckle or at its center.

Mr. Moakler claims to have built a three-wheeled electric vehicle in June, 1888, and to have patented a four-wheel-driven, worm-driven electric vehicle under patent No. 500,022, dated June 20, 1893.

—

Motor and Accessory Manufacturers Adds Five Members

NEW YORK CITY, Sept. 11.—The following concerns have been added to the list of members of the Motor and Accessory Manufacturers: Eclipse Machine Co., maker of Eclipse Bendix starter and steering gears, Elmira, N. Y.; The John O. Heinze Co., starters and electrical apparatus, Springfield, Ohio; the Oakes Co., fans, horns, etc., Indianapolis, Ind.; William Shakespeare, Jr., Co., carbureters, Kalamazoo, Mich., and the Penberthy Injector Co., carbureters, 360 Holden Avenue, Detroit, Mich.

—

$1,000,000 Du Pont Co. Formed

DOVER, DEL., Sept. 9—The Du Pont Co., New York City, has filed a charter here with a capital of $1,000,000, to manufacture, sell and deal in and with automobiles, trucks, etc. S. A. Anderson, J. F. Curen, and S. B. Howard of New York City, are the incorporators.

—

Chemical Engineering in Columbia

NEW YORK CITY, Sept. 14—The department of chemistry of Columbia University has established a separate department of chemical engineering. The head of the new department will be Prof. M. C. Whitaker.

—

Bijur Strike Off

HOBOKEN, N. J., Sept. 13—The strike of 450 workers in the plant of the Bijur Motor Lighting Co., this city, since Aug. 20, has been declared off.

Reasons for Twelve-Cylinder Motor

Extracts from a Paper Read Before the Detroit Section of the Society of Automobile Engineers by J. G. Vincent, Vice-President of the Packard Motor Car Co.

DETROIT, MICH., Sept. 16—At the opening meeting of the fall season of the Detroit section of the Society of Automobile Engineers held here to-night, J. G. Vincent, vice-president of the Packard Motor Car Co., was scheduled for a paper on "The Reasons for the Twelve-Cylinder Motor." Some of the more important parts of Mr. Vincent's paper are here extracted as follows:

"While getting the data together for this paper, I came across a copy of my recommendation addressed to Mr. Henry B. Joy, president Packard Motor Car Co., written just after I had completed exhaustive experimental work with various types of motors, in which I finally recommended the adoption of the twin six type of motor in our cars. In this recommendation I went into the subject very thoroughly in order to put the entire situation before Mr. Joy in a manner to enable him to properly present it to the business men composing our board of directors, and I know of no better way to explain why we adopted this type of motor than to quote from this report, which I will do, in part, as follows:

How Many Cylinders?

"Now in regard to how far it pays to go in the number of cylinders, let us consider the possibilities of the twin four type of motor, as this is a type that had received considerable attention and seems to be the next logical step after the six.

"For the purpose of comparison, let us consider that we desire a motor of about the same cubic inch piston displacement as our Packard 338 six-cylinder motor, which is 4-in. bore by 5½-in. stroke and contains 414.7 cu. in. It would be entirely practical to design a twin four motor of practically this same cubic-inch piston displacement within the above-mentioned desirable bore-stroke limits; in other words, a motor of 3 7/16-in. bore by 5¾-in. stroke will contain just over 53 cu. in. per cylinder, or a total of just over 424 cu. in. Such a motor of proper design and workmanship would have certain advantages and disadvantages when compared with our 38 six-cylinder motor. I will outline them briefly, as follows:

"So far as the character of the *torque* is concerned, the twin four motor would have the advantage over the six by reason of the more frequent impulses of lesser intensity.

"So far as weight is concerned, a twin four would have some advantage over a six, particularly in the crankcase, the crankshaft and flywheel, as the shorter crankshaft can be made smaller, both because it is shorter and because the light pistons and small impulses do not have the same tendency to twist the shaft.

"So far as smoothness is concerned, the eight would be better than the six at moderate speeds because the more even torque would show to advantage at these speeds, and the inherent vibration due to unbalanced inertia forces would not be a factor, but at the higher engine speeds, the advantage would switch to the six-cylinder motor, as the unbalanced inertia forces become a very important factor and in spite of the lighter pistons and shorter crankshaft, the vibration would be a great deal more pronounced in the eight than in the six. This is a very undesirable feature, because one of the reasons for using more cylinders is to increase the range of motor ability and at the same time increase its smoothness.

Accessibility Is Desirable

"So far as *accessibility* is concerned, the twin four is at a very great disadvantage when compared with the six, as the 90-deg. angle makes it impractical to mount the generator, water pump, starting motor, etc., in the usual place alongside the crankcase and just inside the frame. This makes it necessary to mount this equipment either below the frame or between the cylinder blocks. Any of the equipment mounted below the frame is, of course, exposed to mud and water, and in addition to being very inaccessible is very apt to be damaged. The larger part of these units are usually mounted between the cylinder blocks or in what might be called 'valve alley,' with the result that the valves are rendered very inaccessible, and this is not a desirable result, to say the least. The required angle of the cylinders also makes it very difficult to design into the car a proper substantial steering gear and still render assembling practical. In the best workouts that I have seen, the assembling and disassembling of the steering gear is a very difficult matter and, in most cases, at least, it is necessary to remove the body and partially remove the motor in order to get the steering gear out.

"So far as the *turning radius* is concerned, the twin four is at a disadvantage when compared with the six, as the frame must be made wider than is necessary for the six-cylinder motor in order to get the steering gear in at all. An inch in width on each side of the frame will increase the length of the turning radius a great deal more than 3 or 4 in. added to the wheelbase. In other words, the amount that the wheelbase can be shortened in the twin four will not make up so far as turning radius is concerned, for the extra width required at the front end of the frame.

"All things considered, it was obvious that along with the acknowledged advantages obtained from the twin four, reappear the characteristics of the four which the six was designed to overcome, and the search for further refinement was, therefore, insistently pressed, as it was desired to obtain the advantage of the small-bore, high-efficiency, multi-cylinder motor without inheriting any disvantages.

Properly Designed Six Is Balanced

"As mentioned above, the six-cylinder motor is in absolute theoretical and practical balance, providing it is properly designed with a crankshaft that is strong enough to take care of the inertia forces in order to enable them to properly cancel out.

"As further explained above, the only disadvantage of a six-cylinder motor is the fact that in order to get a reasonable size motor the crankshaft must be rather long and the inertia forces are rather large owing to the necessarily large pistons. Since a single six-cylinder motor is in perfect balance, however, there is no reason why we cannot combine with it another six-cylinder motor, V-type, and still have a motor that is in absolute theoretical and practical balance. In designing this twin six motor, however, it is necessary to set the cylinders at an included angle of 60 instead of 90 deg., as there will be six impulses per crankshaft revolution instead of four, and a circle divided into six parts gives 60 deg. In order words, the impulses follow each other at inter-

vals of 60 deg., and this, of course, determines the angular position of the cylinders.

"Let us see how this type of motor compares with the six and the twin four as regards advantages and disadvantages.

"It is obvious that the character of the *torque* of this twin six motor is bound to be 50 per cent better than the twin four and 100 per cent better than the single six. Six impulses per crankshaft revolution blend together so closely as to make it absolutely impossible to distinguish any pause between impulses, even at very low engine speeds pulling through traffic on up-grades. The only thing that I can liken it to is the action of steam.

"So far as *weight* is concerned, the twin six motor is just about a stand-off as compared with the twin four, but lighter than the single six. The twin six motor is slightly longer than the twin four, but owing to its smaller bore and stroke and lesser angle it makes up in absence of width for what it exceeds the twin four in length. The weighing up of actual motors proves this to be a fact.

"Owing to the perfect balance of the six-cylinder principle, this twin six motor is absolutely *smooth* at all speeds.

Twin Six Has Accessibility

"So far as *accessibility* is concerned, the twin six motor is far superior to the twin four and just as good as the single six. The 60-deg. included angle allows us to build a 424-cu. in. motor 21⅛ in. wide over-all, as compared with 28 9/16 in., as in the case of the twin four. This allows the placing of the generator, water pump, starting motor, etc., in the usual place alongside the crankcase and between it and the frame, without widening the frame over the Packard narrow standard. It also allows the easy assembling and disassembling of a properly designed steering gear. This leaves only the carbureter to be placed between the cylinders, and by placing it well above the motor 'valve alley' is left entirely open and all valves are easily accessible for adjustment or replacement.

"So far as the *turning radius* is concerned, the twin six is far superior to the twin four and slightly better than the single six, as it assembles into the same width of frame as the single six, but allows a substantial reduction in the length of wheelbase.

The tremendous difference in power output of different motor types at the higher speeds is, of course, partly due to the increased compression, partly to the more effective valve area, but largely, I believe, to the lightness of the reciprocating parts and the consequent tremendous reduction in friction. In this connection it is interesting to note that both the single six and twin six motors have valves whose diameter in the clear equals half the bore, but that with the single six valves lifting ⅜ in. and the twin six only 5/16 in., the effective valve opening is approximately 22 per cent greater in the twin six. This is due to the fact that the piston area decreases as the square of the diameter, while the effective valve opening decreases directly with the diameter.

The power curve of the single six cylinder motor was, of course, made from a 338 motor such as we used last year, and the output of the high-efficiency six-cylinder motor mentioned in my report to Mr. Joy was considerably higher, as it ran up to approximately 75 hp. at 2200. But, in order to obtain this additional power, I not only had to lighten the reciprocating parts, but I also had to raise the compression, in order to obtain more efficient combustion; or, in other words, I had to increase the intensity of each explosion. This resulted in exactly what we were not looking for, a rougher motor than the 338, while the public was demanding a smoother one, in connection with more range of ability. I believe that the curve, taken from the well limbered up 338 motor represents about the maximum output that can be obtained from a single six-cylinder motor without raising compression to the point where the result will be objectionable to the user. Whereas, on the other hand, power can be obtained from a twin six motor with a degree of smoothness far in advance of the result obtained from the six-cylinder motor, even with its considerably smaller power output.

The Question of Gear Ratio

"While this twin six motor has the ability to turn up to 3000 r.p.m.—smoothly and safely—its magnificent torque at low speed, makes it possible to use a gear ratio that keeps the motor down to a point very little above that of so-called slow speed motors. As our 135 car, equipped with twin six motor is approximately 300 lbs. lighter than our 338 and has on an average 10 per cent more power up to 1500 r.p.m., as outlined above, it will be readily understood that we could have used our 338 gear ratio and secured an excellent performance. I have driven the 135 twin six car, equipped with our standard 338 gear ratio, i. e., 25 m.p.h, at 900 r.p.m. of the motor, and found its performance to be excellent. As this motor has the ability to turn up to high speed without any undue strains on the bearings, however, we decided to make the gear ratio slightly lower, in order to give our customers a measure of ability that would be satisfactory under all conditions. We, therefore, adopted a 23.5 mile gear ratio, or, in other words, when the twin six motor is turning 900 r.p.m. the car is traveling but 1½ miles slower than was the case in last year's single six 338 car. This means at 70 m.p.h., the motor only turns approximately 2700 r.p.m.

"While I have shown by the above that we are not running our engines at extremely high speeds, I still want to make the statement that we could run them at high speeds, that is, up to 3000 r.p.m. and have it safer than a six-cylinder motor at considerably lower speed.

"In this connection, the following comparisons are very interesting. This table shows the comparative weights of the rotating and reciprocating parts and the resulting bearing pressures of not only our 338 single six-cylinder motor and our new twin six motor, but I have also added, as a mater of general information, the corresponding data of the high-efficiency six-cylinder 338 motor mentioned in my report to Mr. Joy:

	338 Six,	Special 338 Six,	Twin Six,
	Lb.	Lb.	Lb.
Piston assembly, complete with rings, piston pin and set screw	4.125	2.11	0.814
Connecting rod, upper end	1.38	.828	.625
Connecting rod, lower end	3.31	2.421	1.52

The following table gives a comparison of forces due to gas pressure and inertia at 2000 r.p.m. of the same motors.

	Lb	Lb.	Lb.
Inertia of one piston assembly complete	2,130	1,140	492
Centrifugal forces of one connecting rod, lower end	1,030	754	430
Centrifugal forces of one pair of connecting rods, lower ends	....	....	860
Crank pin bearing pressure per square inch, due to inertia	768	433	379
Crank pin bearing pressure per square inch, due to gas pressure	916	916	871

As a matter of general information, I will state that the lightening of the parts in the special six-cylinder motor was accomplished by making the connecting rods out of alloy steel and machining them all over and by using alloy pistons. In other words, the rotating and reciprocating parts of this special motor were up to the same standard of engineering as our twin six motor, which makes the comparison of this motor with the twin six very interesting. It will be noted that on account of the lightness of the rotating and reciprocating parts of the twin six motor, the bearing pressures, due to inertia, at 2000 r.p.m., are far below the corresponding pressures, due to gas pressure on the piston, which makes it quite clear that the speed of the motor would have to be raised far above 3000 r.p.m. in order to make the pressure, due to inertia, come anywhere equal to ordinary working pressure of the bearings due to gas pressure.

There are so many interesting engineering problems in connection with the designing of a twin six motor that

I could go on at considerable length, but fear that this paper has already grown too long. I have purposely stuck to a discussion of the results desired and the broad underlying principles of motor design and have refrained from discussing motor details. There are, of course, a great many possible arrangements of a lot of the details of construction of a twin six motor, and in the design of our motor I can only say that we considered each detail as carefully as we knew how, and, after exhaustive research work, selected what we thought to be best. No doubt the discussion of this paper will run somewhat into the details of construction, and I will be very glad indeed to answer any question and give you reasons for our particular arrangement."

Joy Favors North Route Around Salt Lake for Highway

SALT LAKE CITY, UTAH, Sept. 7.—In a recent letter to Chas. Tyng, counsel for Utah for the Lincoln National Highway, Henry B. Joy, president of the highway association, points out the necessity for improving the road south of Great Salt Lake and says that unless this is done Salt Lake City cannot expect to have the automobile travel come by this route. President Joy said: "There is no doubt in my mind, after having driven the southern route in June and having talked with dozens of tourists and citizens of Utah, but what the northern route is to-day the best and most drivable road."

McGraw Makes $300,000 Additions

EAST PALESTINE, OHIO, Sept. 14—Contracts have been let by the McGraw Tire & Rubber Co., this city, for additional steel and brick buildings and machinery to cost $300,000. Three additions are covered by the contracts awarded, as follows: a 195-ft. three-story extension to the vulcanizing building; a 98-ft. three-floor annex to the present mill room, and a 150 by 66 ft. three-floor addition to the compounding department.

In addition to the 98-ft. mill room extension, this department will be enlarged by transferring the present compounding room to its new quarters in the 150 by 66 ft. extension to the main building.

All buildings will be connected with overhead bridges and tunnels which permit direct routing of material through various departments of manufacture.

New mills, calenders, with direct motor drives, elevators, conveyors and other equipment have been ordered, and it is anticipated that all will be in full operation by Nov. 1, 1915. The increased floorspace will approximate 800,000 sq. ft., and the daily output of the plant will be doubled.

Trade Review of the Week

—

State Fair Helps Detroit Sales—Factories Continue Unabated Activity—Other Sections

DETROIT, MICH., Sept. 14—Stimulus to the business of many of the Detroit dealers was given last week by the State Fair held here. This occasion is recognized as an excellent chance for the selling and showing of cars to the farmer element of the State as well as offering a means of gathering a good-sized prospect list among local intending buyers.

In the factories, there is little change over the previous week, activity everywhere being with the aim of keeping pace with demand. Packard has now started shipments of its Twin Sixes, although none of them went out last week. It is expected that before the present week is over there will be twenty-five of them out.

Orders Are Plentiful

From the Scripps-Booth Co. comes the information that a French dealer has contracted for 500 cars within the next year.

Ford factory sales continue to be very strong. The concern is between 80,000 and 90,000 cars behind orders now, which is practically the same as it has been right along. The daily output last week averaged about 1200 cars, this number being made in the parent plant and in the assembly branches throughout the country. At Detroit, the daily average has been running about 500. Ford officials state that there is no prospect of a slackening.

Factories look for increased war business following the completion of the present war loan. It is hard to see how some of them could take on more of this work, but it, of course, would largely be confined to the truck field.

—

50 to 100 Per Cent Increase in Minneapolis Sales Expected

MINNEAPOLIS, MINN., Sept. 13—Automobile trade conditions for this territory as gathered from the attendance at the automobile exhibit at the Minnesota State Fair, Sept. 6-11, and at the agencies in Minneapolis and St. Paul, are for a large business.

Conservative men place the probable increase in sales for 1915-1916 over 1914-1915 season at from 50 per cent to 100 per cent. Some even go higher where they have popular price lines of machines. With a crop in sight for Minnesota of some $300,000,000 and more than $600,000,000 for the ninth federal bank district centering in Minneapolis, the sales possibilities are staggering to the dealers.

The State Fair show developed no more than the normal week's report of new agency contracts, but it showed that the farmer is going to buy automobiles this fall when he realizes on his crops. Some five salesmen for each of the forty-three exhibits of automobiles at the fair were busy most of the time, and the people asking questions were the direct buyers of cars.

—

A New Caille Perfection Motor

DETROIT, MICH., Sept. 15—*Special Telegram*—The Caille Perfection Motor Co., which for the past fifteen to twenty years has been making gasoline and especially marine engines, will start the manufacture of automobile motors within the next thirty days with a light six-cylinder engine designed by Ralph Lewis, former chief engineer and general manager of the Beaver Motor Mfg. Co.

—

Opinion Rendered in Horn Suit

NEW YORK CITY, Sept. 15—In the suit of the Lovell-McConnell Mfg. Works vs. the General Auto Supply Co., Judge A. Hand has written an opinion in which he states that patent No. 1,105,324 issued to George C. Dean, infringement of claim No. 7 of which was the cause of the suit, is void for lack of invention. For this reason the opinion states that the bill should be dismissed. The defendants, the General Auto Supply Co., according to the opinion, have made no contention of non-infringement on the above patent, but anticipation and lack of invention. The particular point in claim seven, which the suit hinged upon, reads—"And a casing having a cylindrical threaded wall and transverse wall, said transverse wall being spaced from and substantially parallel to said diaphragm and serving as a bearing for one end of the armature shaft, . . . the threaded engagement of said shell and said casing serving to adjust the position of said rotor in respect to said diaphragm."

The opinion states that all the elements seem old, but the combination was what was claimed to be new and useful, particularly the threaded engagement which serves as an adjustment, and also a substantially air-tight chamber in the rear of the diaphragm in which air is compressed and expanded during the operation of the horn. According to the opinion, a similar threaded engagement appears in British patent to Rogers No. 23,802 and French patent to Monnot No. 422,256. The air space is substantially the same as in Miller Reese Hutchison's patent No. 1,411,463. Therefore, concludes the opinion, no novelty can be seen in the combination and the patent is void for lack of invention and the bill should be dismissed. The case is in the U. S. district court for the southern district of New York.

212,882 Registration in N. Y.

Ohio 168,000, Illinois 166,886, Pennsylvania 151,523 and California 150,232

NEW YORK CITY, Sept. 14—Registrations in the four leading automobile states are booming. Up to Sept. 1, according to the figures collected by the Ohio State Automobile Association, there were 849,531 cars registered in the five leading states, New York, Ohio, Illinois, Pennsylvania and California.

New York State leads 212,882; Ohio is second with 168,000; Illinois, third, with 166,886; and Pennsylvania, next with 151,523. California is close to Pennsylvania with 150,232 registrations.

10,800 Cars Licensed in Vermont

MONTPELIER, Vt. Sept. 11—The receipts from automobile registration in the State of Vermont during the period between March 1 and Aug. 1, 1915, amounted to $175,992.31. This amount exceeds the receipts of any previous year, the period between March, 1914, and March, 1915, having brought forth registration receipts of $160,362.10, the largest up to that time. The number of cars up to Aug. 1, 1914, is nearly 10,800, or a ratio of more than one automobile to every thirty-two persons living in the state.

—

Daniels 8 at $2,350

READING, PA., Sept. 11—The Daniels eight which, as was stated in THE AUTOMOBILE for Sept. 2, is to be built by the Daniels Motor Car Co., this city, the president of which is Geo. E. Daniels, who was president and general manager of the Oakland Motor Co., Pontiac, Mich., will be a car built practically to order, to sell for $2,350. The wheelbase will be 127 in. and the tires 34 by 4½. Unusual attention will be given to the finish and equipment of the seven-passenger body, which will have a double cowl, heavy mahogany rail all around the top, long grained hand-buffed leather upholstery, mahogany cabinet fittings and other luxurious features.

3¼ by 5 Motor

The motor will have V-type L-head cylinders 3¼ by 5, giving a rating of 33.8 under the S. A. E. formula; the cylinders will be in two blocks with integral intake manifolds and bolted-on exhaust pipes and the valves will be actuated by a single camshaft carrying sixteen cams. Staggering the cylinder blocks permits placing the big ends of the connecting-rods side by side on the crankpins, which are made sufficiently long for the purpose. Water circulation will be by duplex centrifugal pumps, lubrication by pressure feed, ignition, lighting and starting by the Westinghouse system. The carbureter will be a Zenith.

A Brown-Lipe-Chapin three-speed gearset will form a unit with the motor, the disk clutch will run dry and will have a ball-bearing release. Two Spicer universals will be used on the propeller shaft, which will be uninclosed; drive will be taken through the springs, and an arm will resist torque stresses.

Vacuum Fuel Feed

Three-quarters construction will be employed for the rear axle, which will have taper roller bearings, spiral bevel gears and pressed steel housing. Rear springs will be semi-elliptic, underslung, 2½ in. wide. The gasoline tank, of 20 gal. capacity, will be hung at the rear, a vacuum system feeding the carbureter.

—

Can't Shoot from Car in Wisconsin

MILWAUKEE, WIS., Sept. 9—It is lawful to travel to hunting grounds in a motor car, but unlawful to shoot game birds or animals from a car, according to the ruling of the attorney general of Wisconsin. The last Legislature passed a law prohibiting shooting at game from cars, bringing up the question of whether or not such prohibition covered driving to the place where it was intended to hunt. The attorney general interprets the law, for instance, to make it unlawful for a motorist-hunter to scare up a covey of birds with his car and then alight from the car and shoot the birds.

—

Non-Glare Law in Dallas

DALLAS, TEX., Sept. 9—The city of Dallas now has an automobile dim light ordinance. The law became effective only recently. It provides a fine of from $5 to $200 for a violation. It applies only to the corporate limits of the city. A move is on foot to have the Legislature pass a dim light law that will cover the State. So far as Texas is concerned Dallas is the first city to enact this ordinance.

—

To Build Waco Car in Seattle

SEATTLE, WASH., Sept. 9—The Western Automobile Co. has recently been incorporated in Seattle to manufacture the Waco car. Those interested in the new concern are C. A. Cawley, G. L. Grant and S. W. North. A large factory building has been leased at Rainier Avenue and Lane Street for manufacturing purposes. The first Seattle-built car, a Waco, has already run 2000 miles and delivery of cars is promised for March 1, 1916.

1916 Russell-Knight —Two Bodies

Refinements a Feature—Five-Passenger Type Sells for $2,650 and Seven $2,750

TORONTO, ONT., Sept. 11—Several refinements are noted in the 1916 Russell-Knight 32 made by the Russell Motor Car Co., Ltd., West Toronto, Canada. It is made in two body styles, five and seven-passenger the former selling for $2,650 and the latter $2,750. The body is the conventional streamline design with doors having concealed hinges. In the equipment are included Bijur electric starting and lighting system, new dome fenders, improved headlights, power tire pump, Warner speedometer and clock and demountable rims with one spare.

The engine is a four-cylinder, 4⅛ by 5½, rated at 32 hp. The cylinders are cast in pairs with separate removable heads, while the sleeves have 2¼ in. travel. Cooling is accomplished by a centrifugal pump through the cylinder water jackets to a large cellular radiator. A high-tension magneto independent of the lighting and starting system furnishes the ignition. Force-feed lubrication is used, with a special regulator that is said to cut down all consumption.

The Russell-Knight uses a multiple-disk clutch running in oil. It has a selective gearset with three speeds forward and one reverse. Center control and left drive are used. Floating Timken rear axles with worm-bevel gears are to be found on this car; also semi-elliptic springs in front and three-quarter elliptic in the rear. Wheelbase is 120 in.; tires, 36 by 4½; wheels, artillery type with demountable rims.

The upholstering has Turkish type cushions with wood frames. Colors are royal blue for the body and running gear with an option of brewster green or deep wine.

—

Haydock Car at $720

CINCINNATI, OHIO, Sept. 9—The Haydock Motor Car Co., located at Richmond and Carr Streets, Cincinnati, Ohio, announces the completion of a four-cylinder automobile, called the Haydock. The car is of the lighter type and sells for $720.

—

No Successor for Poole

DETROIT, MICH., Sept. 13—No successor has been named by the Hupp Motor Car Co. to take the place of John L. Poole, who was European export manager of the company for the last five years.

Mexican Border Work Tests Trucks

Conveying 4000 Troops During Controversy — Encounter Bad Road Conditions

FORT SAM HOUSTON, TEX., Sept. 11—What is said to be the severest and most practical trials that were ever made of trucks and automobiles in actual military field service by the United States army are now in progress in the lower Rio Grande region of Texas, where more than 4000 troops are operating against raiding bands of Mexican outlaws.

Conditions Are Trying

The conditions under which the new adjuncts to the transportation department of the army are being operated are particularly trying. The border country is almost entirely lacking in good roads, with the exception of a limited system of improved highways radiating out of Brownsville and extending only short distances to nearby towns. In order to reach many of the more remote patrol camps with trucks carrying supplies it was found necessary to cut a road through an almost impenetrable wilderness of chaparral. The low-growing brush that covers the whole country is all thorn-bearing. The mesquite, the cats-clay, the prickly pear and a variety of other plant life, indigent to the border, are covered with thorns that are an ever-present menace to automobile tires. The lack of any convenient repair shops makes it necessary for the motor transportation equipment to provide its own means for its upkeep.

It requires a considerable amount of supplies to keep an army of 4000 men going and the trucks are kept constantly busy. It is planned to greatly increase the number in service.

In former years, when the War Department maintained large garrisons of soldiers at Fort Brown, Fort Ringgold and Fort McIntosh, all military posts on the lower Rio Grande frontier, there was a Government road that extended up the river for a distance of about 250 miles, connecting these different stations. The abandonment of the road for military purposes several years ago caused the highway to rapidly fall into bad condition and there are now long stretches of it that are impassable for almost any kind of vehicle. Temporary improvements have been made recently to some sections of the old highway and plans are on foot to rehabilitate it along its entire length.

Equal to the Test

It is stated that the motor trucks which are now in use on the border have proved equal to the many hard tests that they have been compelled to undergo. The chief difficulty has been the lack of roads. The patrol camps are often situated close to the river bank in localities that are almost inaccessible.

—

5-Year Blair Order

NEWARK, OHIO, Sept. 10—The Blair Motor Truck Co., Newark, Ohio, has received an order for motor trucks to be delivered in fixed quantities over a period of five years. Although the officials of the company are reticent about the details of the order, it is understood that the order emanates from one of the large European exporters with headquarters in New York City and that the number to be delivered monthly exceeds thirty. These trucks, it is understood are to be 3-tonners and of the gasoline, worm-driven type which has been standard with the Blair company for several years. Another order for gasoline-electric vehicles made by the same concern is pending. It is emphatically stated that it is not a war order. The plant has been thoroughly rehabilitated for the steady demand upon it that will result and J. P. McCune, general manager, is arranging for the requisite materials.

—

Bell Forced to Expand

YORK, PA., Sept. 14—Increased production and the demand for cars from its agents have caused the Bell Motor Car Co. to start work this week on the erection of a large addition at its plant along the Columbia & Frederick division of the Pennsylvania Railroad at the intersection of Center Street. The building will be a one-story frame structure of the saw-tooth type, 80 ft. by 60 ft. in dimensions. It will be used as an assembling room and paint shop. The company's rapidly growing business has made it necessary to seek larger quarters and efforts are now being made to secure a site for the erection of a large modern daylight factory building. The present building is leased by the company. Work on the addition is being rushed and it is expected to have it completed within two weeks. The company will have about 25,000 sq. ft. of floorspace.

The daily production of the plant is being increased and an average of one and two cars are being built every day. Night work is now in progress. It is the aim of the company to increase this production to ten cars a day.

—

McCord Buys Wyandotte Plant

DETROIT, MICH., Sept. 11—The McCord Mfg. Co., which makes the McCord radiators, McKim gaskets and other automobile accessories, has purchased a plant at Wyandotte, Mich., and will make its gaskets there. At least 125 men are to be employed.

43 Truck Makers in P. O. Bids

To Furnish Twenty or More Gasoline Trucks in Fiscal Year Ending June 30

WASHINGTON, D. C., Sept. 8—Under a call for bids for furnishing twenty or more gasoline trucks for the postal service during the fiscal year ending June 30, 1916, the purchasing agent of the post-office department to-day opened forty-three bids from various manufacturers and dealers. The quantities to be purchased are five or more of ½-ton capacity; five or more of ¾-ton capacity; five or more of 1½-ton capacity and five or more of 3-ton capacity. It is possible before the end of the contract year that the department will purchase 100 trucks under the propositions received to-day. The contracts are expected to be awarded on or before Oct. 1, next.

The bids were submitted under these classifications: A, trucks of ½-ton capacity, complete with body; B, trucks of ¾-ton capacity, complete with body; D, trucks of 1½-ton capacity, complete with body; DD, trucks of 1½-ton capacity, with slight changes in specifications from class D trucks; F, trucks of 3-ton capacity; FF, trucks of 3-ton capacity, with slight changes in specifications from class F trucks. The bidders and their prices were as follows:

O. K. Motor Truck Co., Flint, Mich., f.o.b. Flint, Class B, $975, $975, $1,000, $975, $1,025, $975, $978.

Warren Motor Truck Co., Warren, Ohio, f.o.b. Warren, Class B, $1,550, $1,450; Class D, $1,885, $1,785; Class DD, $1,925, $1,825; Class F, $2,550, $2,450; Class FF $2,550, $2,450.

Union Garage Co., Washington, D. C., f.o.b. Washington, Ford, Class A, $600.

F. N. Harper, Washington, D. C., f.o.b. Toledo, Overland, Class A, five bids, $830.

Commercial Garage, Washington, D. C., Bessemer, Class B, three bids at $1,225, $1,175, $1,250, $1,225; Class D, $2,090, $2,025, $2,090, $2,065 $2,090, $2,205; Class DD, $2,090, $2,025, $2,090, $2,065, $2,090, $2,205; Class F, $3,280, $3,305, $3,280; Class FF, $3,350, $3,375, $3,350.

Tiffin Wagon Co. Tiffin, Ohio, Class B, $1,244 $1,297, $1,244, $1,322, $1,297; Class D, $1,738, $1,660, $1,685, $1,713, $1,660; Class DD, $1,742, $1,664, $1,689, $1,717, $1,664; Class F, $2,263, $2,238; Class FF, same bids as Class F.

Semmes Motor Co., Washington, D. C., Class A, Wilcox, $1,210; Vim, $775; Class B, Wilcox, $1,775; Class D, Wilcox, $2,050; Class D, $2,100.

Charles A. Leichliter, Chicago, f.o.b. Detroit; Class A, three bids at $831.50, $800; Class B, three bids at $1,872.50, $1,912.50; Class DD, four bids at $1,950, $1,990; Class FF, $3,300, $3,275.

Wadsworth Mfg. Co., Detroit, f.o.b., Detroit, Ford, Class A, $580.80, $578.80, $591.80, $578.80, $590.80, $578.80.

Dart Motor Co., Waterloo, Iowa, f.o.b. Washington, Class A, two bids at $1,145, $1,095, $1,180; Class B, two bids at $1,715, $1,665, $1,750; Class D, $2,265, $2,190, $2,300, $2,265, $2,365; Class F, $3,190, $3,165.

Miller Bros. Automobile & Supply House, Washington, D. C., f.o.b. Washington, Ford, Class A, $638.50, with various supplemental bids; Class B, Flint, $1,364.

Commercial Automobile & Supply Co., Washington, Studebaker; Class A, $940, $965; Class B, $960, $985; this bidder also made several supplemental bids for equipment.

Peerless Motor Car Co., Cleveland; f.o.b. Cleveland; Class F, $3,455, $3,410; Class FF, same prices as Class F.

Lippard-Stewart Motor Car Co., Buffalo,

f.o.b. Buffalo; Class A, $996.50, $1,016.50, $996.50; Class B, $1,438, $1,428, $1,463, $1,438, $1,466, $1,438; Class D, $2,140, $2,115, $2,143, $2,115, $2,115; Class DD, same prices as Class D.

Commerce Motor Car Co., Detroit, f.o.b. Detroit; Class B, $975, $995, $985, $1,030, $1,015.

DeKalb Wagon Co., DeKalb, Ill., Class D, $2,175, $2,100, $2,125, $2,100, $2,100; Class DD, same prices as Class D.

International Harvester Corporation, Chicago, f.o.b. Akron, Ohio, Class A, five bids at $1,040, $1,000; Class B, $1,040, $1,000.

Duplex Power Car Co., Charlotte, Mich., Class F and FF, $3,300.

Buick Motor Co., Detroit, branch, f.o.b. Detroit, Class B, $1,340.90, $1,337.39, $1,340.90, $1,330.90.

Touraine Co., Philadelphia, Pa., f.o.b. Philadelphia, Class A, four bids at $835, $865.

Mais Motor Truck Co., Indianapolis, f.o.b. Indianapolis; Class D, $2,550, $2,515, $2,550, $2,500; Class DD, same prices as Class D; Class F, $3,050, $3,025; Class FF, same prices as Class F.

Packard Motor Car Co., Detroit, f.o.b. Detroit; Class D, $2,712.50, $2,682.50, $2,742.50, $2,682.50, $2,707.50; Class DD, $2,722.50, $2,692.50, $2,752.50, $2,692.50, $2,692.50, $2,717.50; Class F, $3,645, $3,505.85; Class FF, $3,645, $3,585.

Kelly-Springfield Truck Co., Springfield, O., Class D, $1,875, $1,900, $1,925, $1,950, $1,875, $1,900; Class DD, same prices as Class D; Class F, $3,050, $3,000; Class FF, $3,125, $3,075.

Four Wheel Drive Co., Clintonville, Wis., Class F, $4,400 and $4,350, both less 20 per cent; Class FF, same prices as Class F, with same discount.

Beck's Son, Cedar Rapids, Iowa, Class B, $1,200, $1,175.

Service Motor Truck Co., Wabash, Ind., f.o.b. Washington: Class B, $1,492, $1,468; Class D, $2,068: Class DD, $2,100: Class F, $2,744; Class FF, same prices as Class F.

Gabriel Auto Co., Cleveland, Ohio., f.o.b. Cleveland: Class B, $1,700. $1,690. $1,700, $1,675, $1,735, $1,700; Class D. $2,200. $2,175, $2.235, $2.200, $2,200, $2,200; Class DD, same prices as Class D.

Federal Motor Truck Co., Detroit, f.o.b. Detroit: Class D. $2,090, $2.070, $2,107.50, $2,090, $2.090, $2,090; Class DD, same prices as Class D.

Baldwin Locomotive Builds Trucks

300 Under Construction at Eddystone Plant—Flat Iron Wheels and Trailers

PHILADELPHIA, PA., Sept. 11—Three hundred trucks are being made at the Eddystone plant of the Baldwin Locomotive Works for use by the Russian army. It is understood that more trucks will be built later and that the 20-acre plant the company is building will probably be used in carrying out the large war orders. This company is also doing a large parts business for a prominent tractor concern in this State.

Fifty Are Finished

The trucks being built for Russia, fifty of which are already finished, run on flat iron wheels rigged to prevent skidding. When in use, several small trailers will be attached. They will be used to transport foodstuffs and merchandise to railroad and water terminals during the war, as well as to haul munitions.

—

Republic Truck Adds Three New Buildings

ALMA, MICH., Sept. 8—During the last thirty days the Republic Motor Truck Co. has started the erection of three new factory buildings, which will provide a total of 54,500 more square feet of floor space. Work on the latest addition was begun a few days ago. This structure will be one story high and have 35,000 sq. ft. of floorspace. The company will employ at least fifty more men when the buildings are ready. Production at this time is being pushed to the limit. Orders are far ahead of any previous year's business, and will keep the plant running for a long time with a full force.

—

Canadian Ford to Build Tractors

DETROIT, MICH., Sept. 9—Ford tractors are to be made by the Ford Motor Co. of Canada, Ltd. A plant to be devoted exclusively to this end of the Canadian company's business is to be erected soon. It will be of such size that ultimately from 5000 to 10,000 men will be employed there. When the plant will be in operation nobody can fortell, but it is said that it will start about one year before the first tractors will be marketed.

—

Detroit Weatherproof Body Gets Plant

DETROIT, MICH., Sept. 13—The Detroit Weatherproof Body Co., recently organized to make weatherproof tops for Ford and other cars, will occupy the plant formerly occupied by the Kemiweld Can Co. and which has been leased by the C. R. Wilson Body Co. with which the new concern is closely related. The plant is located at Clay Avenue and St. Aubin Street and contains about 80,000 sq. ft. of floorspace. A force of 400 to 500 men will be employed. The Wilson company has secured an option to purchase the plant at a price said to be about $100,000.

—

Warner Mfg. Co. Gives Hour Cut

TOLEDO, OHIO, Sept. 9—During October the Warner Mfg. Co. will reduce its working week to a 48-hr. basis, or a 12-hr. cut. The present scale of wages will be continued. T. W. Warner, president, states that this action will be purely voluntary and that the move is experimental, its permanency depending wholly upon the men.

—

Tractor Uses Gas-Kerosene Carbureter-Electric Lighting

OSHKOSH, WIS., Sept. 11—A. J. and O. G. Patch, Oshkosh, Wis., for ten years associated with the Rumely and Fairbanks-Morse interests as tractor designers, are making exhaustive practical tests of a new gas-kerosene tractor they have developed at the Dauber-Kratsch machine shops in Oshkosh. Among the new features is a full electric lighting equipment, opening new possibilities in agriculture, such as night plowing and general haulage.

—

Hudson to Build on Newly Acquired Land

DETROIT, MICH., Sept. 13—The Hudson Motor Car Co. recently purchased a piece of land 500 by 380 ft. from the Anderson Forge & Machine Co. This property is located across from the present Hudson plant. A new engine-house and power plant will be erected on part of the land at once and later the construction of several large factory buildings similar to those of the present plant will be started.

—

Weed Assembling Plant in York

YORK, PA., Sept. 14—An assembling plant of the Weed Chain Co., Bridgeport, Conn., has been opened in this city in the plant of the York Engineering Co., North George Street and Hamilton Avenue. Employment is given to about sixty men. The automobile chains are manufactured by the Standard Chain Co., of this city, and instead of shipping them to Bridgeport, are assembled at the new factory. The plant will remain in operation here for at least six months. The same assembling plant was in operation last year.

S. K. F. Incorporates in Conn.

American Organization Capitalized at $2,000,000 to Make Bearings in Hartford

NEW YORK CITY, Sept. 10—The S. K. F. Ball Bearing Co., Hartford, Conn., was incorporated Sept. 4, with a capitalization of $2,000,000, having for its object the manufacture and sale of the ball bearings known by this name.

The S. K. F. ball bearing was introduced into the U. S. A. in the year 1910, three years after the patents for the invention exploited by the parent concern, The Aktiebolaget Svenska Kullagerfabriken of Gothenburg, Sweden, had been granted. At that time the present American S. K. F. Ball Bearing Co. was incorporated with a capital of $50,000 as a selling organization for the bearings manufactured by the Swedish concern.

One of the problems of the company has been, how best to take care of its customers in America, so as to avoid undue delay in delivery and it has therefore had to carry at its New York place of business one of the largest stocks of complete ball bearings in the country.

The possibility of manufacturing in the United States has long been under consideration, and after exhaustive inquiries as to the manufacturing facilities and the possibilities of producing in this country a product, which should in every respect be equal to the Swedish-made bearing, steps have been taken to carry out this plan. It is now the intention of the company to build a factory at Hartford, Conn. A suitable factory site of about 8 acres along the New York, New Haven and Hartford Railroad tracks has been acquired and the erection of the first building will be shortly started upon.

Special Crucible Steel

The special Swedish crucible steel, known as S. K. F. steel, used by the parent concern, will be used in the American-made bearings, and will be imported from abroad for this purpose.

To carry out the proposed plans, there has been incorporated the new S. K. F. Ball Bearing Co. in which prominent American interests are represented. This company will as stated be a Connecticut corporation and will have a fully paid-up capital of $2,000,000. Among the directors of the new company will be B. W. Hanson, vice-president of Messrs. Pratt & Whitney of Hartford, Conn. The general selling policy of the company will, however, not in any way be affected by this change, and the executives and other members of the old company will join the new corporation.

Buyers Cared For

Until the new factory is in a position to supply American-made bearings, the S. K. F. company, which has not suffered any interruptions in its source of supply, will continue as hitherto to import Swedish-made bearings and will continue to do so as long as may seem desirable.

It is intended to start with a plant employing about 300 men, which will, to begin with, be able to produce only a portion of the bearings annually sold by the company in this country, the remainder coming from Sweden.

—

Market Prices Firm

NEW YORK CITY, Sept. 14—The markets this week were somewhat firmer with a steady demand in all products. Although there were a number of gains they were not as heavy as usual. The metal markets recorded the largest gains. Steel, which for some weeks had been very steady, rose on Tuesday to a high mark. Bessemer steel rose $1 and open-hearth $1.50. The copper market was dormant and quotations are entirely nominal. Producers are asking 17¼ cents to 17½ cents, but producers are not interested, being well supplied for the next two months at least. Many of the largest selling agencies continue to ask 18 cents. The total sales of all producers during the business week in August, including both 16- and 18-cent copper, were well up to 60,000,000 lb. While during the whole month of August, approximately 125,000,000 lb. were sold.

The aluminum markets continued firm with prices showing marked advances. Antimony is strong with fairly large quantities having been sold here in the past ten days. Trading in crude rubber continued quiet last week, and the market developed an easier tone. Up-River Para fine was available at 55½ cents per pound for prompt delivery. The oil and lubricants markets were a bit unsteady yesterday when a rise on Pennsylvania crude and Kansas crude oil occurred, both of which made a total gain of 5 cents. The rest of the markets remained unchanged.

Detroit Battery Makes 50 per Cent Price Reduction

DETROIT, MICH., Sept. 11—A reduction of 50 per cent from the list prices on all its batteries has been made by the Detroit Battery Co. At the same time a new policy of a fixed retail price, quoting on each battery one price only from which there will be no deviation, has been inaugurated.

As an illustration of some of the reductions it might be mentioned that the price of the standard 6-volt, 80 battery which was $33 is now $16.50; the 6-volt, 100 battery which listed at $39 is now sold at $19.50; the 6-volt, 120 which cost $43 now sells at $21.50.

Allen Motor Co. Elects Officers

FOSTORIA, OHIO, Sept. 10—The annual stockholders' meeting of the Allen Motor Co. was held Tuesday in this city. The following officers were elected: President, E. W. Allen; first vice-president, G. H. Baker; second vice-president and sales manager, J. E. Wright; W. O. Allen, treasurer and general manager; A. E. Wyant, secretary; L. A. Sommer, general superintendent of factories. The officers reported that a "liberal dividend from the profits of 1916," had been declared. The company announces that it will build 10,000 cars in 1916.

—

Morton Truck Capital Increased

HARRISBURG, PA., Sept. 9—The Morton Truck & Tractor Co., this city, has increased its capital from $100,000 to $1,000,000. The actual increase notice, filed with the Secretary of the Commonwealth, however, was from $100,000 to $420,000. The company is busy on tractor orders from the Russian Government.

—

Pope Creditors to Receive a 38½ per Cent Dividend

BOSTON, MASS., Sept. 8—The receivers of the Pope Mfg. Co. were ordered by Judge Dodge in the U. S. District Court

to distribute a dividend of 38½ per cent among the creditors. The total available for this purpose and for the expenses of the receivership amounts to $722,095. The court allowed $67,500 to be paid the receivers as compensation, including counsel fees. Col. George Pope and C. A. Persons, two of the receivers, were discharged at their own request. The third receiver, C. A. Morse, has been retained to settle three disputed claims amounting to $20,000.

—

Reo Pays Extra Dividend of 12½ Per Cent

LANSING, MICH., Sept. 8.—In addition to the regular quarterly dividend of 2½ per cent, the Reo Motor Car Co. will pay an extra cash dividend of 12½ per cent Oct. 1, to stockholders of record Sept. 30.

The stockholders of the Reo Motor Truck Co. will be paid a cash dividend of 10 per cent on the same date.

—

Regular Dividends

Rubber Goods Mfg. Co., New York City: Quarterly of 1¾ per cent on preferred, payable Sept. 15.

J. I. Case Co.: Quarterly preferred of 1¾ per cent, payable Oct. 1.

Gray & Davis, Boston, Mass., quarterly of 1¾ per cent on preferred, payable Oct. 1.

500 Scripps-Booths for Paris

NEW YORK CITY, Sept. 14—Peters & Sons, Ltd., Paris, France, have placed an order for 500 Scripps-Booth cars.

Securities Market Strong

—

Kelly-Springfield Features Market—Goodyear Also Makes High Mark

NEW YORK CITY, Sept. 13—Tire issues last week featured the market with many notable gains. The heaviest gain occurred on Friday when Kelly-Springfield second preferred rose fifteen points and that of the common rose nine points. Goodyear common followed closely behind with a gain of fourteen points. The rest of the tire issues showed small losses. Among the specialties General Motors made a high record on Saturday when it rose fourteen points above last week's rating. Peerless common's closing bid was 127, seven points above last week. The rest of the stocks were irregular, although the tone of speculation in the main was weaker. However, the weakness was prominent in the specialties, some of which suffered losses. The market was active and the dealings were fairly well diversified.

Detroit Quotations Weak

Although General Motors common was the feature of the Detroit markets with a gain of nineteen points and the preferred with a gain of two and one-half points, there was very little trading. Studebaker common closed at 114, a total gain of five and one-half points, while its preferred rose one and one-half points. The rest of the active stocks closed with small losses, ranging from one-half to three and one-quarter points. The inactive stocks were irregular, no gains taking place. There were two losses, Atlas Drop Forge dropping two and one-half points and the W. K. Prudden stock one-quarter point. There was no trading in the bond market.

—

Gilbert Gibney Tire Vice-President and Sales Director

CONSHOHOCKEN, PA., Sept. 10.—J. M. Gilbert was elected vice-president and director of sales of the Gibney Tire and Rubber Co., this city, at a special stockholders' meeting of the company held in Philadelphia, Sept. 7.

Mr. Gilbert, who takes over a substantial stock interest, will direct the entire sales of the company, under the advisory guide of President J. L. Gibney. His offices will be in New York City, where the whole Gibney sales organization will have its center.

—

Duck with United Truck

NEW YORK CITY, Sept. 13—George H. Duck, former president of the Motor Truck Club of America, Inc., and for about a year with the Sewell Cushion Wheel Co., Detroit, Mich., has just been appointed general sales manager of the United Motor Truck Co., Grand Rapids, Mich. Mr. Duck will establish his headquarters at the United plant in Grand Rapids. Before joining the Sewell organization, he was the manager of the motor truck department of the New York City branch of the Locomobile Co. of America, Bridgeport, Conn.

21 Entries for Narragansett

Will Hold Elimination Trials —100-Mile Race Scheduled —$11,000 in Prizes

PROVIDENCE, R. I., Sept. 13.—To date twenty-one drivers have officially entered for the opening races on the 1-mile asphalt speedway at Narragansett Park, Saturday, Sept. 18. Both Babcock and Walter are endeavoring to make post entries with Peugeots. As only fourteen cars can start, it will be necessary to hold elimination trials.

There are three events, namely: 1-hr. motorcycle race; 25-mile automobile free-for-all and a 100-mile for cars for 450 cu. in. displacement. The prizes amount to $11,000. Frank Lowry is starter.

Mulford	Peugeot

Denver Run Is Called Off

DENVER, COL., Sept. 11—After being postponed twice on account of recent obstacles, the 860-mile economy and reliability run scheduled to start from Denver through the Colorado Rockies Sept. 6, was finally called off last night. The starting date was first changed to the 7th on account of Labor Day events, and then to the 12th on account of delayed entries. Now the difficulty on part of nearly all the dealers to get cars from the factories is continuing to such an extent that Charles F. Roehrig, promoter of the tour, believes it best to postpone the run until next season.

Golden Rule Traffic Booklet

CHICAGO, ILL., Sept. 13—Called the Golden Rule Traffic Booklet by the superintendent of the Chicago police department, a small folder entitled, Some Traffic Suggestions, published by the Chicago Section of the Electric Vehicle Assn. of America, earns its appellation because it admonishes motor vehicle drivers to show a little more consideration for the other fellow. It also points out that it seemed to be the disposition of drivers of electric vehicles to cling to the crown of the road whether going slow or fast, thereby impeding traffic, due to the idea that it is necessary to keep an electric vehicle on the level to prevent acid in the battery cells from spilling.

It further points out that there is no danger from that condition when driving on the very slight incline found at the side of any Chicago streets and that the obvious course of a slow-moving electric should be along the curb, leaving the center to those who wish to drive at a higher speed.

Corona 300-Mile Race Is Postponed Until Christmas

CORONA, CAL., Sept. 8—The Corona 300-mile road race, scheduled for Nov. 20, will not be held on that date, but very probably on Christmas Day.

The three main roads into Corona will be under reconstruction on Nov. 20 and also there is to be a 150-mile track race at Phoenix, Ariz., on that date, which the Corona boosters did not want to conflict with. Members of the racing committee which is to handle the Corona classic this year waited upon the members of the Corona Board of Trustees yesterday and were informed that that body would grant a permit for the race if enough stars of the racing game were gathered together to make the race a big league attraction; but it was positively stated that the roads would be in no condition for a great race on Nov. 20.

Contracts Out for K. C. Speedway

KANSAS CITY, MO., Sept. 10—Contracts are now being signed for the building of an automobile speedway at Overland Park, on the Strang Electric Interurban near Kansas City. The Mid-Continent Exposition Club, which was organized several months ago for the purpose of building clubhouses and exposition quarters at Overland, has confined its enterprise solely to the speedway for the present. Dates will be scheduled for June, and fall dates will be secured. The speedway will be ready by the last of May, 1916. Wm. Huttig, president of the National Reserve Bank; W. B. Strang, of the Interurban line, and Frank Ufer, wealthy oil man, are the leaders in the speedway project.

New Traffic Rule in Boston

BOSTON, MASS., Sept. 13—Boston motorists are now faced with another problem, that of stopping machines every time a street car stops. The Board of Street Commissioners got a notion that it would be a good thing to have an additional traffic regulation added to its rules and so it evolved one that says that every motor car approaching a street car that has stopped to take on or let off passengers must come to a stop.

Resta to Try for Record

Sheepshead Opening Will Mark Attempt at Own 10-Mile Mark of 5:45

NEW YORK CITY, Sept. 15—The formal opening of the Sheepshead Bay Speedway, which takes place Sept. 18, will mark an attempt by Resta in a Peugeot at his own 10-mile record of 5:45, an average of 104.35 m.p.h., made at Chicago on Aug. 12, 1915, in the challenge race which he won.

Resta's trial will come as the climax to the formal opening of practice on the speedway. Prior to the practice there will be an automobile parade starting from Columbus Circle and proceeding to the speedway.

Mercer Stars at Wilmington Fair

WILMINGTON, DEL., Sept. 10—The four automobile events staged on the dirt track at Wilmington, in connection with the Delaware State Fair, to-night, gave the laurels in each case to Roy Freck, who drove a Mercer. Other events were canceled owing to a serious accident to R. O. Bacon, whose Renault threw a tire and overturned in the 3-mile event. The summaries:

First event—One mile: Won by Roy Freck, Mercer; second, W. Craig, Regal; third, J. Whitaker, Detamble. Time, 1.15.

Second event—Trials, one mile: Won by Freck; second, Kuser, Renault. Time, 1.24 2-5.

Third event—Five miles, free-for-all: Won by Freck; second, Whitaker. Time, 8.52.

Fourth event—Pursuit race: Won by Freck. Time, 10.9 1-5. Time limit here was 15 min.

Brookmire Elected Treasurer of Pierce Oil Corp.

ST. LOUIS, MO., Sept. 11—Announcement was made here to-day that James H. Brookmire of this city has been elected treasurer of the Pierce Oil Corp. to succeed D. G. Boissevain of New York City. Mr. Brookmire will close his connections with a local brokerage firm of which he is a member as soon as possible and will establish an office under his new title in St. Louis.

Though not a member of the Board of Directors, he will be on the Operating Committee and will have virtual charge of the financial affairs of an oil corporation second in magnitude only to the Standard Oil Co. Mr. Brookmire has had the offer under advisement for two months and accepted the post during a recent visit to New York.

Federal Owners' Contest Closed

DETROIT, MICH., Sept. 13—The contest started some months ago by the Federal Motor Truck Co. of this city among the owners of Federal trucks for the fifteen

best answers to the question, Why I Bought a Federal has been brought to a close and the cash prizes of $300 paid, although the names of the winners have not as yet been announced. The requirements of a motor truck from the user's standpoint as brought out in the hundreds of answers received were as follows: Simplicity in design; economy, not cheapness, in initial price; economy in upkeep and repairs; the reputation of the truck in all lines of work and the stability of the truck manufacturing concern.

In addition to the $300 awarded in cash prizes, every owner who entered the contest was present with a gold-plated Federal watch chain.

—

Milwaukee Independent Issue Price Classifications

MILWAUKEE, WIS., Sept. 10—Independent gasoline marketers in Milwaukee have taken cognizance of the necessity for new price classifications to accommodate large consumers as against motorists getting small supplies at filling stations for practically the same prices. Filling stations dot the city. While the new classification does not increase the price to the small consumer, the large consumer is benefited by a decided reduction. The new classification and quotations now prevailing are:

Gravity	Filling Station, Any Quantity	Tank Wagon Delivery	Tank Wagon Delivery, 100 Gal. or More
60.....	10.5c	9.6c	8.6c
65.....	14.0c	13.5c	12.5c
70.....	16.0c	15.5c	14.5c
72.....	18.0c	17.5c	16.5c

—

Ford System Denounced at Milwaukee Convention

MILWAUKEE, WIS., Sept. 12—The Ford Motor Co.'s $5-a-day minimum wage plan was denounced at the third biennial convention of the International Wagon, Carriage and Automobile Workers' Union, held in Milwaukee, Sept. 7-11.

The convention went on record as opposing the piecework system and in favor of a strict 8-hr. day. The rule in the trades represented by the union is piecework and a 10-hr. day.

—

Rumely Changes Name

LA PORTE, IND., Sept. 8.—Advance Rumely Co. is the name selected by the Rumely corporation for use under the reorganization according to an announcement.

—

N. A. C. C. to Issue Handbook

NEW YORK CITY, Sept. 14—The annual hand book of the products of the ninety-seven companies holding membership in the National Automobile Chamber of Commerce, Inc., to cover the 1916 models will be issued at show time.

2-Mile Speedway for New Orleans

300 Acres 4 Miles from City Secured — $300,000 Board Track

CHICAGO, ILL., Sept. 14—New Orleans, La., is assured of a 2-mile board track and an option has been closed on 300 acres of land four miles from the heart of the city.

It is estimated that the plant will cost $300,000. The low cost is possible because wood native to Louisiana will be used. The track will be built of cypress and the stands and other buildings of yellow pine. The three men most interested in the project are R. Brennison, prominently identified with New Orleans horse racing; George Sarpy, a New Orleans insurance man; and C. J. Dunbar, a wealthy timber owner of Vancouver, B. C.

They probably will finance the undertaking. They have asked D. B. Reid, president, of the Chicago Speedway, to take the presidency of the Association and direct the construction of the plant.

—

Olds Supplies Cold Weather Combination Top

LANSING, MICH., Sept. 11—As a substitute for the conventional winter limousine the Olds Motor Works are supplying dealers with a cold weather top which is so constructed that in the summer the side sills and windows can be removed, thus leaving the sides entirely open. The standard windshield remains in its place and serves as a rigid front support for the top. A glass shield is mounted on the front of the top above the windshield in such a way that it prevents the windshield from becoming coated with snow.

—

Chalmers Employees Are Entertained by Humphrey

DETROIT, MICH., Sept. 11—Between 120 and 130 heads of departments, their assistants, foremen and others all employed by the Chalmers Motor Co. were entertained at a get-together dinner and entertainment at the Hotel Tuller, to-night, by S. H. Humphrey, vice-president and works manager of the Chalmers company.

—

Denver Garage Bill Passed

DENVER, COL., Sept. 10—The bill requiring garages to pay a yearly license fee of $25 was passed at this week's meeting of the city council. There was no opposition from the garagemen after the Automobile Trades Association succeeded in having the amount of the fee reduced from $50 to $25. The new ordinance will affect sixty or more public garages.

A companion measure to permit garages to install curb pumps within certain districts by paying a license fee of $25 a year for each pump, was brought up for consideration but was referred to the city attorney for further advice. The bill is expected to pass.

—

To Build Combination Air Compressor and Starter

BALTIMORE, MD., Sept. 11—A combination air compressor and starter has been invented in the shop of the Auto Air Appliance Co., Industrial Building, this city, by C. G. Eidson and Thomas Davis. The inventors say it has been tested thoroughly and is successful. It is to be put on the market later.

The compressor and starter are cast in one piece and a chain connects the clutch of the compressor with the crankshaft of the automobile. Upon pressing a small button the compressed air is released and starts the chain turning. This, in turn, starts the engine of the car. The air also can be used for pumping up the tires.

When 250 lb. pressure is reached a governor valve prevents the further compressure of air. When the pressure gets below 200 lb. the valve again regulates the compressure. The device is about 17 in. long and 9 in. high.

—

Packard Grants Bonus to Employees in Military Service

DETROIT, MICH., Sept. 9—At a meeting of the board of directors of the Packard Motor Car Co. a resolution was passed to the effect that any one of the 9300 Packard employees shall be granted leave of absence at any time he is eligible to take part in any military instruction, national guard encampment or national reserve cruise. It was further provided that during the time of his absence the employee shall also be credited with his full pay and that the time for military instruction shall not be deducted from his regular vacation period.

—

Lockout of Rutenber Founders

INDIANAPOLIS, IND., Sept. 11 — Hurry-up arrangements have been made by the Rutenber Motor Co., Marion, Ind. for Indianapolis foundries, including the American Foundry Co. to produce castings for Rutenber motors. At the Logansport, Ind., foundry of the Rutenber company, labor troubles have paralyzed the plant. Owing to disputes over piecework rates followed by a lockout of 200 coremakers and molders, the Logansport plant, which is devoted to castings entirely, had to be shut down. To keep the Marion machine, forging and assembly shops busy, outside help has been enlisted to supply castings.

Over 125,000 at Hoosier Fall Show

25 Per Cent of State Fair Visitors Attended Because of Car Exhibit

INDIANAPOLIS, IND., Sept. 14—The automobile show which closed here Saturday and which was held under the auspices of the Indianapolis Automobile Trade Association in connection with the State Fair, was the most successful of any automobile show or exhibit ever held in Indianapolis. Although no admission was charged, therefor, no system could be obtained that would give an actual check on the attendance, it was estimated that over 125,000 visitors attended the show, and that fully 25 per cent of the State Fair visitors attended particularly on account of the automobile display. That this year's attendance at the State Fair exceeded all previous years is directly attributed to the credit of the automobile show, according to State Fair officials.

Never before have so many State Fair visitors driven to Indianapolis in automobiles. This was evidenced by the large number of out-of-town cars seen on the streets each night.

Want Exhibit Building

Officials of the trade association believe that if an exhibit like the one just closed can be given with such tremendous success in a tent, that it is fair to assume that even better records can be made if the State Fair Association would provide a pavilion or building suitable and in keeping with the high character of an automobile display.

The value of the automobile exhibit totaled more than $130,000, and such a display, it has been argued, is entitled to a better setting than a canvas enclosure. Practically all the dealers in Indianapolis exhibited at the Fair, thus the show was a decided benefit to automobile buyers. It gave them an opportunity to see all the new cars—to compare values—to learn of the improvements that manufacturers have been making during the present year. Much business was done at the show both in the complete car and the accessory line.

—

Twenty-Three Makes of Cars at Toledo Fair

TOLEDO, OHIO, Sept. 10—One of the features of the annual Lucas County Fair, held at Toledo the week of Sept. 6 was the display of both pleasure and commercial motor vehicles. The number of cars displayed was large and many of the makes were represented. The cars were displayed under a tent. The dealers taking part in the display were: Blevens Auto Sales Co., Studebaker; Cornelius-Browning Auto Co., Chalmers and Inter-State; Atwood Automobile Co., Overland; Abbott Motor Sales Co., Abbott and Allen; Roberts-Toledo Automobile Co., Ford; Lichtie Auto Co., Chandler; Paige-Toledo Co., Paige; Landman-Griffith Co., Maxwell; Gamble Motor Car Co., Hudson and Dort; Toledo-Saxon Co., Saxon; Bunnell Auto Sales Co., Chevrolet and Kissel; H. W. Lancashire, Dodge; United Garage Co., Reo; Auto Distributing Co., Regal; King Motor Sales Co., King; Elon Gauntlett, Buick; H. E. Throne, Mitchell; G. E. Grant Auto Sales Co., Oldsmobile and Argo.

—

Eighteen Cars Exhibited at Worcester Show

WORCESTER, MASS., Sept. 11.—One of the most successful open air shows ever held in New England ended here when the New England fair closed this week. The exhibition was very well patronized, and it was a much better show than had ever been put on here, there being about forty-five vehicles displayed.

Those who exhibited comprised J. W. Sargent, Maxwell; Henshaw Motor Co., Dodge; O. P. Tyler, Stanley; Paige Motor Car Co., Paige-Detroit and Saxon; Harry J. Murch, Cadillac; Henley-Kimball Co., Hudson; F. S. Howard Motor Car Co., Chevrolet and Mitchell; F. H. Kenney, Chalmers; Harry Boland, Hupmobile; Metz Motor Car Co., Metz; Green & Hale, Jackson and Oakland; J. F. Brosnahan, Chandler; Thorvald Hanson, Cole; J. C. Harvey, Haynes; New England Truck Co., Netco truck.

—

Louisville Trade Association Formed

LOUISVILLE, KY., Sept. 9—Articles of incorporation have been filed in the office of the Jefferson county clerk by the Automobile Trade Association. The object of the association is to bring together in social intercourse the members of the trade in Louisville, to promote betterment of trade conditions, the introduction of new methods in business, the correction of abuses and the conservation of the automobile trade. The corporation has no capital stock and is not authorized to incur any indebtedness, but is authorized to create a fund from membership fees. The incorporators and officers are: W. A. Thomas, president; R. E. Warner, vice-president; A. F. Wolke, secretary, and J. W. G. Hughes, treasurer.

—

Error in Hollier Advertisement

NEW YORK CITY, Sept. 13.—In THE AUTOMOBILE for Sept. 9 appeared an advertisement of the Hollier eight made by the Lewis Spring & Axle Co., Detroit, Mich., which stated that the size of the motor is 3 by 3¼ in. This should have been 3 by 4¼ in. In a description of the Hollier eight roadster it was stated that the size of the tires was 33 by 3½ in. This should have been 32 by 3½ in.

—

Daly and Beyerline Form Co.—To Act as Agents

DETROIT, MICH., Sept. 13—The firm of Daly & Co. has been formed by W. L. Daly and J. G. Beyerline, with headquarters in the Hammond building to act as manufacturers and distributors' agents, also as special automobile advisors on commercial matters. Mr. Beyerline has been in the automobile business for the past thirteen years, being president and general manager of the King Motor Car Co. during the last three years. Mr. Daly was sales manager of the King company.

—

Export House Appoints New Heads of Far Eastern Division

NEW YORK CITY, Sept. 10.—Gaston, Williams & Wigmore, New York City, doing a large export business in automobiles and trucks, announces that its Far Eastern Division, organized and equipped to develop markets for America's industries, will hereafter be in charge of J. J. Keegan and H. J. Rosencrantz as its managing directors. These two men have been prominently identified with American trade development in that section of the world for the past sixteen years, representing American manufacturers.

F. J. Rown of Racine, Wis., former State manager of the Mitchell-Lewis Co. for Texas, also eastern district manager for the American Motor Car Co., sailed on the New York, Aug. 11 for Liverpool, to represent Gaston, Williams & Wigmore as managing director for their automobile department in the British Isles. His address will be Alexandria House, London.

—

Five Electric Vehicles at Show

NEW YORK CITY, Sept. 13—Five electric vehicle manufacturers, of which three are makers of commercial models, will exhibit at the Electrical Exposition and Motor Show to be held at the Grand Central Palace here Oct. 6 to 16 and several makers of electric vehicle parts and accessories.

The U. S. Army will also exhibit field radio sets and one of its wireless telegraph gasoline tractors. Electric vehicle exhibitors so far alloted space follow:

Anderson Electric Car Co., General Vehicle Co., Baker-R. & L. Co., Ward Motor Vehicle Co. Accessory makers are: Philadelphia Storage Battery Co., Edison Storage Battery Co., Electric Storage Battery Co., Cooper Hewitt Electric Co., Westinghouse Electric & Mfg. Co., General Electric Co. and H. W. Johns-Manville Co.

Factory Miscellany

Waukesha Motor Adding—The Waukesha Motor Co., Waukesha, Wis., is adding. The former building will be remodeled for a machine shop.

Piston Ring Co. to Build—The Piston Ring Co., Muskegon Heights, Mich., has purchased adjoining property and will build an addition to its plant.

Foster Gear to Add—The Foster Gear Co., manufacturer of automobile steering gears, will build an addition to its plant on Kaiser Street, Columbus, Ohio.

Twin City Truck's Large Addition—The Twin City Four-Wheel Drive Co., Minneapolis, Minn., is having plans prepared for a plant to cost about $500,000.

Michigan Crown Fender in Ypsilanti.—The Michigan Crown Fender Co., maker of automobile fenders and metal stampings, is to locate at Ypsilanti, Mich., and will occupy a building 80 by 400 ft., to be erected for it.

Steerautomat Co. Doubles Capacity—The Steerautomat Co., Beloit, Wis., manufacturing auxiliary steering devices for Ford cars, is doubling the capacity of its shop established several months ago.

To Make Dimmers—The Shade-O-Lite Co., Indianapolis, has been incorporated with $25,000 capital stock to manufacture automobile searchlight dimming devices. The directors are F. W. Beauchamp. C. H. Thompson and R. F. Davidson.

To Make Fenders—The Clayton & Lambert Mfg. Co., Detroit, Mich., maker of plumbers' firepots, torches, etc., has added to its business a department for the production of automobile fenders, drip-pans and other stamped sheet metal work.

To Make License Tags—The Abbott Stamping Co., Detroit, has been organized by C. S. Abbott, B. B. Bennett and F. B. Borlean to manufacture automobile license tags. The new company has acquired a factory and has installed modern stamping and enameling equipment.

To Make Carbureters—The factory building at 314-316 East Water Street, Milwaukee, has been purchased by W. G. and E. R. Spence, officials of the Rundle-Spence Mfg. Co., Milwaukee, who recently incorporated the Turbo Motor Devices Co., to manufacture carbureters and other devices for internal combustion engines. The building will be remodeled for use at once.

Hayes Takes Over St. Johns Plant—The old plant of the St. Johns Table Co., St. Johns, Mich., has been taken over by the Hayes Wheel Co., Jackson, Mich., which is now installing machinery. Truck wheels will be made and from fifty to seventy-five men will be employed. H. J. Keller, formerly superintendent of the Auto Wheel Co., Lansing, is with the company in a similar position.

Hudson-Stuyvesant to Lease—The Hudson-Stuyvesant Motor Co., Frank Stuyvesant, president, 1914 Euclid Avenue, has increased its capital stock from $25,000 to $50,000 preparatory to taking a lease on two buildings to be erected at 2002 Euclid Avenue, Cleveland. The buildings will be three-story, brick and steel, 45 by 100 ft., and one-story, 45 by 89 ft., brick and steel. They will cost about $50,000.

Falls Making Plant Changes—The Falls Machine Co., Sheboygan Falls, Wis., manufacturing internal combustion engines and specializing in automobile motors, is making radical changes in its plant in addition to building a new assembling shop. The gray-iron foundry is being dismantled and converted into a machine shop. The company has taken contracts for delivering 12,000 engines by May 1 and as soon as changes and additions are completed, a night shift will be put on.

Milwaukee Die Casting Builds—The Milwaukee Die Casting Co., Home Building, Milwaukee, will soon take occupancy of permanent quarters of its own. A two-story brick factory and foundry is being erected for the concern on Fourth Street. It will be 60 by 60 ft. in size and equipped with the latest furnaces, molding machines and other up-to-date equipment. While the company is a large producer of die castings in aluminum, bronze, copper, brass and other metals, it devotes considerable attention to babbitt bearings for internal combustion engines.

Moon Australian Agent Visits Factory—George Duffy, agent for the Moon in Sidney, Australia, is spending a few weeks in the Moon factory in St. Louis.

March 4-11.....Boston, Mass., Truck Show, Mechanics Bldg.

New Beech Creek Plant—Beech Creek Auto Co., Beech Creek, Pa., G. H. Tibbons, secretary, has plans for a $25,000, two-story, automobile factory.

Mohawk Starts Third Annex—Before the masonry of the second addition this year to the plant of the Mohawk Rubber Co., Akron, Ohio, is scarcely above the ground, work has been started on a third annex.

Apperson Starts Addition—It is announced by the Apperson Bros. Automobile Co., Kokomo, Ind., that work on an addition to one of its plants has been started. This will give the company an additional 150,000 ft. floorspace.

Purair Tire Pump Co. Moves—The Hert Mfg. Co., Indianapolis, Ind., maker of the Purair tire pump, has removed from 150 South Delaware Street to its new building, corner Noble & Market Streets, where additional equipment has been installed and production capacity largely increased.

Remy Entertains Employees—One thousand five hundred employees of the Remy Electric Co., their families and friends, a total of nearly 5000 persons, were entertained with a lawn party and dance at the factory of the Remy company at Anderson, Ind., Friday night of last week. There was a continuous procession of persons passing through the factory, which was open for inspection.

Perfection Tire Plant Progressing—The plant of the Perfection Tire & Rubber Co., Fort Madison, Iowa, is progressing. The steel workers are now erecting the skeleton of the main factories and some smaller buildings have been completed. The labor required when the factory is in operation will approximate one man per tire. The company recently received a contract with an Eastern concern for 1000 tires per day for 5 years.

Dunlap Receivership Lifted—The receivership of the Dunlap Manufacturing Co., located at 1432 Parsons Avenue, Columbus, Ohio, maker of automobile parts, has been lifted and a new concern has been organized to run the business. For the time being the attention of the company will be devoted to the manufacture of machine tools. F. B. Chapman is president; H. N. Rose, secretary, and T. C. Dunlap, general manager. Howard Park was receiver.

Wheel Plant for Anderson—Negotiations were practically closed Saturday for locating in Anderson, Ind., an automobile wheel factory by the Hayes Bros., Jackson, Mich., who also have a factory in Michigan. The Anderson plant will occupy a two-story building owned by the Pioneer Pole & Shaft Co. and it was stated that the new factory will employ from 800 to 1200 men. The output of the factory, it is said, will be 25,000 sets of automobile wheels per month.

Equipping Syracuse Differential Plant—The Brown-Lipe-Chapin Co. is equipping the Lipe Model Works in Syracuse, N. Y., with special machinery for making M. & S. differential gears exclusively. In addition to taking care of the demand from the manufacturer, this plant will be used also for making the M. & S. differential special type for Ford cars, though the Ford replacement sales will continue to be handled by the M. & S. Gear Co., 1036 David Whitney Bldg., Detroit.

Sterling Wheel Erects Plant—The Sterling Wheel Co., 245 Oregon Street, Milwaukee, which recently changed its corporate style from T. S. Wheel & Mfg. Co., is erecting a plant of its own at Eighth and Oklahoma Avenues, Milwaukee, to be ready about Sept. 15 or Oct. 1. The company operates a large machine shop, specializing in parts for motor car and engine builders, in addition to building the Sterling steel wheel, a flexible device employing solid tires and suitable for all grades of pleasure cars as well as trucks.

Johns-Manville Moves General Offices—The H. W. Johns-Manville Co., Milwaukee, Wis., has moved its general offices from Milwaukee to Chicago because of the large growth of its business in the Middle West, which requires administrative facilities such as Chicago only can afford. The company operates two large works in Milwaukee, and the change will not affect these operations. T. T. Lyman, general manager, goes to Chicago, and the Milwaukee plants will temporarily be in charge of President C. B. Manville.

American Metal Products Busy—The American Metal Products Co., Milwaukee, Wis., which recently announced a new product called Ampco bronze, claimed to have the strength of steel, with much less weight, is producing the new metal in large quantities for high-speed bearings, particularly motor car engines. The company has appointed 25 Milwaukee garages and service stations as agents and is making bearings for connecting rods, crankshafts, transmissions and wherever plain bearings are used for general repair work.

Empire in New Plant—In the new factory of the Empire Automobile Co., Indianapolis, Ind., now are centered the administration and manufacturing interests of the company, the general offices having been moved to the new plant during the past week. At present the six-cylinder model is being built in the local plant. The type made its first public appearance at the State Fair Auto Show during the past week. The new quarters in addition to giving excellent car building facilities afford greatly enlarged accommodations for executive and sales offices.

To Build Electric Steel Plant—The demand from manufacturers of high-grade motor vehicles for electric steel and the growing use of this material in other lines has induced the Belle City Malleable Iron Co., Racine, Wis., to establish an electric steel plant in connection with its malleable foundries. Ground will be broken at once for a new foundry, 80 by 160 ft. in size and 30 ft. high, costing $125,000 with equipment. One of the furnaces alone will cost $25,000. The plant is to be ready by the end of the year and will employ 250 experts, giving the Belle City company a force of more than 600 workmen.

Rutenber's Four New Buildings—The Rutenber Motor Co., Marion, Ind., is just completing the construction of four new buildings at the main plant at Marion, which increases its floor space some 25,000 ft., this being about a 25 per cent increase of floor space over the original plant. It has added a large battery of automatic screw machines, multiple spindle drill presses, turret lathes, etc., to manufacture the smaller parts. The annual output has been increased from 12,000 to approximately 18,000 motors. The company has cancelled all European orders and has abandoned its London agency.

Firestone Makes Big Additions—Five additions to the factory of the Firestone Tire & Rubber Co. at Akron, Ohio, aggregating over 300,000 sq. ft., or 7 acres of floorspace, are at present well under way and will no doubt be completed before snow flies. These additions will be occupied by offices, tire-making machinery and by rooms for the many processes of the industry. Through these new additions the present output of 7500 tires daily will be increased to 12,000 per day, an increase of 60 per cent. Besides these extensive additions a commodious clubhouse for Firestone employees is being erected across the street from the factory. It will be ready for occupancy next spring.

New Steel Products Building—To accommodate an increase in production in its automobile springs department, the Detroit Steel Products Co., Detroit, Mich., will erect a new building, which will add approximately 15,000 sq. ft. to its present floor space. Work on the new building will start as soon as all the details of the plans are completed. This will be the third addition made to this department of the factory within a year. The building will conform in style to the type of the present buildings—sand-lime brick, concrete and steel construction with steel windows. The spring department has been rushed to capacity every month this year, three shifts of men having been employed even throughout the slack period a few months ago.

The Week in the Industry

Raynor with Herff-Brooks—R. B. Raynor has joined the Herff-Brooks Corp. to cover the Middle West, representing that company in Missouri, Illinois and Indiana.

Reason Adds Two Cars—George Reason, formerly manager of the local branch of the Cartercar Co. and who now operates the Reason Garage, 33 Charlotte Avenue, Detroit, Mich., has taken the agency for the Allen and Paterson cars.

P. E. Winslow Advanced—P. E. Winslow, who has been connected with the advertising department of the Hupp Motor Car Co. for the last eighteen months, has been appointed secretary to J. Walter Drake, president of the company.

Palmer Knight Tire Rep.—H. D. Palmer, formerly with the Globe Tire Co., Trenton, N. J., has been appointed district sales representative in New York State territory for the Knight Tire & Rubber Co. of New York, succeeding E. J. Coniff, resigned.

Moore Cleveland Mgr.—G. P. Moore, formerly prominently identified with the automobile industry in Pittsburgh, has been made manager of the Cleveland Motor Sales Co., 1628 Euclid Avenue, Cleveland, distributor for the Haynes and Hupmobile.

H. J. De Baer Has Assistant—M. C. Manship, who formerly made his headquarters at the Maxwell Motor Sales Corp. factory in Detroit, has been made assistant manager of the company's New York retail branch. He will assist H. J. De Baer, manager of the branch, in looking after local sales.

Lewis J. I. C. Mgr.—P. A. Lewis has been appointed manager of the Milwaukee branch of the J. I. Case T. M. Co., Racine, Wis. The branch, which devotes practically all of its attention to the sale of and service on Case cars, is located at 493 Broadway. Mr. Lewis was formerly associated with the Case branch at Madison, Wis.

Chase Takes Apperson—M. F. Chase, who has handled the Stutz in New England for some years until this season, has taken on the Apperson at retail and will market it from the former Stutz salesrooms on Boylston Street. This will not have any effect upon the selling of Appersons at wholesale in Boston by the Brown-Apperson Co.

Motor Men in New Roles

Stillson Portland Olds Mgr.—W. W. Stillson will manage the Oldsmobile Co. in Portland, Ore., with headquarters at 37-39 North Broadway.

de Catellane Sales Mgr.—A. de Catellane has been appointed sales manager of the Hainsworth Motor Co., Olds distributer at 1409-1413 Broadway, Seattle, Wash.

Coulson Baltimore Mgr.—A. D. Coulson will manage the recently formed Baltimore Buggy Top Co., Baltimore, Md., with quarters at 107 West Mount Royal Avenue.

Dant Heads Louisville Agency—G. W. Dant has been elected president of the Bywater-Ortner Motor Co., Louisville Studebaker dealer. N. W. Bywater is secretary.

Salman Hudson Export Rep.—The Hudson Motor Car Co., Detroit, Mich., is sending A. T. Salman as a special export representative to Australia, Asia and South Africa.

Aull Columbus Sales Mgr.—A. E. Aull has been appointed sales manager of the Central West Motor Car Co., Columbus, Ohio, handling the Oakland and Abbott-Detroit with offices at 80-82 Fourth Street. G. W. Carroll is general manager.

Sullivan Joins St. Louis Enger—J. J Sullivan, formerly of the Enger agency in the Chicago district, has been assigned to the Ottofy Motor Car Co., St. Louis, and will assist that firm in establishing subdealers for the Enger line in the St. Louis district.

Hazzard Hall Switch Mgr.—Besides being president of the Falcon Motor Truck Co., Detroit, Mich., A. B. Hazzard has also been appointed general works manager of the Hall Switch & Signal Co., Garwood, N. J. He will have charge of the manufacturing of parts for the Falcon and other companies.

Foote Joins St. Louis Co.—E. B. Foote, formerly with the Westinghouse company, has been appointed territory sales manager of the Newell Motor Car Co., St. Louis, which has just added the product of the Sun Motor Car Co. to its line. Mr. Foote will make his headquarteres at St. Louis and Memphis, Tenn.

Lindley Hardman Tire Branch Mgr.—H. P. Lindley, for four years a member of the Bart S. Adams Tire Co., St. Louis, has been appointed branch manager of the Chicago office of the Hardman Tire & Rubber Co., Belleville. E. J. Lindley will have charge of the sales in ten States. He will retain his interest in the Adams company.

Jackson Joins Maxwell Agency—C. G. Jackson, former manager of the United States Motor Co., Maxwell distributer in the St. Louis district, and previously zone supervisor for the Maxwell company, has joined the sales force of the George C. Brinkman Motor Car Co., which recently was given the Maxwell agency in the Missouri district.

Cosgrove Pullman Sales Mgr.—A. R. Cosgrove has been appointed sales manager of the Pullman Motor Car Co., York, Pa. Mr. Cosgrove has had wide experience in the selling of automobiles and accessories and up until his connection with the Pullman company was sales manager of the magnetic gear shift department of the Cutler-Hammer Mfg. Co., Milwaukee, Wis.

Barthmaier Takes Agency—E. V. Barthmaier has resigned his position with O. S. Wilson, Studebaker dealer in Philadelphia, Pa., to take territory for the exclusive sale of that car at Norristown, Pa., and surrounding district. Temporary quarters have been established at 318 West Main Street during the construction of a salesroom and office building at Main and Chain Streets.

Clark Retires from Business—P. S. Clark, one of the veteran dealers at Providence, R. I., has retired from business and will devote his time to civil engineering and show matters. The Mitchell line that he has handled has gone to W. R. Richards, long associated with him as a salesman. Mr. Clark will have charge of the annual show of the Rhode Island Dealers' Assn., which takes place early in the winter.

Bull Assisting Crawford—A. A. Bull is an assistant to Charles S. Crawford, chief engineer of the Cole Motor Car Co., Indianapolis. Mr. Bull comes to the Cole company from the Northway Motor Manufacturing Co., Detroit, Mich. He had an extensive experience with the Humber, Ltd., of Great Britain. He was associated with the English branch of the Daimler company, the builders of the Mercedes car. In America he saw service with the Oldsmobile company, Lansing, and later the Northway organization, in Detroit. Mr. Bull is a graduate of the Institute of Automobile Engineers of Great Britain.

Enger in Bucyrus—F. J. Norton & Sons, Bucyrus, O., has taken the agency for the Enger car.

Gaulois Tires in Ottawa—The Ottawa Taxi & Auto Co., Ltd., Ottawa, Ont., represents the Gaulois tire in that city.

Little Rock Buick Builds—The Buick Auto Co., Little Rock, Ark., will construct a two-story garage at 1118 Main Street.

Beltzig a Manager—E. H. Beltzig has been appointed manager of the St. Louis branch of the Firestone Tire & Rubber Co., Akron, Ohio.

New Supply Co. for Utica—The Wood Auto Supply Co., Utica, N. Y., has been incorporated with a capital of $25,000, to deal in automobile accessories.

Smith in Charge—G. A. Smith has been appointed manager by the Ford Motor Co., of the service and repair departments of the Everyman's Car Co., Ottawa, Ont.

Gilmore Goes to New York—E. A. Gilmore, who had the Lewis and Allen cars in Boston for wholesale distribution in New England, has gone to New York to join the salesforce of the Carl H. Page Co.

Robinson in Charge—L. J. Robinson has been put in charge of the exchange department of the Union Garage Co., Chalmer agent in Washington, D. C. This department will act as a clearing house for used automobiles.

Knaus Portland Franklin Sales Mgr.—A. H. Knaus, who was southern California district sales manager of the Chalmers Motor Co., has become sales manager of the Braley Auto Co., Portland, Ore., handling Franklin cars.

Smith Joins Cleveland Co.—J. M. Smith, production expert, has joined the Cole-Cleveland Co., formerly the Richardson Motor Car Co., Cleveland, Ohio. He will inaugurate the new coupon service system.

Roberts Joins Edison—H. M. Roberts, until recently railroad representative of the General Lead Battery Co., has been appointed sales engineer of the railroad department of the Edison Storage Battery Co., Orange, N. J. Mr. Roberts' headquarters will be at the factory and main office at Orange, N. J.

Larson Heads Spokane Agency—D. N. Larson will manage the recently formed Foster-Larson Co., Spokane, Wash. This distributer will handle the Paige car. Newton Foster will continue to manage the Newton Foster Co., Seattle Paige distributor. Salesrooms and service station have been opened at 1218 Second Avenue, Spokane.

Wright Goes to Woods Electric—T. E. Wright, formerly in charge of agencies in extensive Western territory for the Anderson Electric Car Co., has accepted a position as special representative with the Woods Motor Vehicle Co. In his new work Mr. Wright will superintend the work of distributors for the Woods Electric in southern Illinois, Indiana and Ohio.

Williams Gets Detroit Studebaker—R. H. Williams, manager of the Indianapolis, Ind., branch of the Studebaker Corp. since January, has been appointed to the managership of the Studebaker branch at Detroit, controlling the entire State of Michigan and the Detroit retail branch. He is succeeded here by L. A. Tilley, special representative for the Studebaker corporation.

Semmes Heads Washington Co.—The Semmes Motor Co., Washington, D. C., has been formed by the amalgamation of the Congressional Garage Co., Semmes-Kneessi Co. and the Semmes Motor Line. The officers are: C. W. Semmes, president; H. G. Kneesi, first vice-president and treasurer, and Raphael Semmes, vice-president and secretary. The new company will continue to handle the Dodge, Hudson, Wilcox and Vim.

Barnett Retires—Ira S. Barnett has retired as president of the Kentucky Automobile Co., Louisville, Ky., agent for the Cadillac. He has been succeeded by Hubert Levy, who will be assisted by Charles New, who will hold the offices of secretary and treasurer. Mr. Levy formerly held those offices, while Mr. New has been a director without taking any active part in the management. A substantial amount of the stock which had been owned by Mr. Barnett has been purchased by those now comprising the management.

Doctor Uses X-Ray on Car—Dr. V. J. Capron of Friday Harbor, San Juan County, Wash., has what is known as his X-ray automobile power house. By using a bicycle rim clamped on to the hind wheel of his automobile and then bolting the transformer used on an X-ray machine to reduce direct to alternating current which was belted to the bicycle rim. Putting power upon the transformer converted it into a dynamo, out of one side of which he could get the necessary alternating current. When he found it necessary to take X-ray photographs of injuries he simply jacked up the hind wheel and started his engine, putting in the high, throttled down as closely as possible. The combination gives him 110 volts sufficient for X-ray photography or the illumination of a thirty-candle power lamp. The surgical advantage of this simple arrangement is that a physician can carry his whole apparatus with him conveniently, instead of requiring the patient to be brought to him. When on the road the doctor unclamps the bicycle rim from the hind wheel and stows it away.

Recent Incorporations in the Automobile Field

New York

NIAGARA FALLS—Lastic Air Mfg. Co.; $20,000; tire manufacturer. O. M. Mackie, E. M. Mackie, A. T. Stewart.

NORTH HEMPSTEAD—Collins Auto Renting Co.; $1,000; renting. H. M. Day, H. L. Collins, C. R. Collins, Great Neck Station, N. Y.

ROCHESTER—Rochester Vulcanizing Co.; tire repairing. F. E. Denley, J. M. Sill, A. C. Olp, 511 Wilder Bldg.

ROME—Bryant-Noonan Auto and Cycle Co., $5,000; dealer. A. S. Noonan, G. W. Bryant, A. J. O'Connor, all of Rome.

STAPLETON—Clifton Auto and Storage Co.; $5,000. W. L. Scott, F. Scott, J. Winfield Scott, 67 Harrison street, Stapleton.

SYRACUSE—Bell-Tuttle Storage Battery Co.; $3,000; manufacturer electrical goods, in particular for automobiles. F. G. Bell, B. H. Tuttle, A. S. Tuttle, all of Syracuse.

SYRACUSE—Cronin Garage Co.; $1,000. C. E. Brown, J. Crinnin, E. L. Moore.

SYRACUSE—Syracuse Motor Vehicle Trade Corp.; $2,000. F. Crosby, S. W. Munroe, G. W. Bartlett, all of Syracuse.

UTICA—National Auto Service Co.; $100,000. A. J. Seaton, F. J. Seaton, W. H. McCarry, Pittsfield, Mass.

UTICA—Utica Automobile Trade Assn.; $1,000. A. A. Ledermann, G. C. Donahue, W. F. Carroll.

YONKERS—Powers Rubber and Supply Co.; $3,000; dealer in rubber goods and tires. M. C. Powers, L. M. Powers, 749 Crotona Park North, New York City; W. A. Schenck.

New York City

Arena Automobile Co.; $3,000. Jacob Ballenberg, Olga Ballenberg, Joseph Ballenberg, all of 160 East 103d street.

W. H. Duncan Co.; $5,000; manufacturer materials for tops, waterproof cloths, etc. M. M. Duncan, W. H. Duncan, both of Rockaway Park, L. I., and J. N. MacLean, 629 Throop avenue, Brooklyn.

Carlened Co.; $2,000; gasoline dealer. E. M. Grossman, C. C. Siemon, Leonard Batt.

Solo Tire Co.; $100,000; manufacturer. J. W. Suling, Lavinia Leitch, E. F. Price, 489 East 8th street, Brooklyn.

Phillips Auto Seat Co.; $5,000; manufacturer. N. M. Lynn, C. A. Phillips, F. A. Phillips, 248 W. 49th street.

Reliable Touring Car Service; $10,000. C. L. Delehanty, Harry McGonigle, W. F. Byrnes.

Roller Lock Nut Co.; $900,000; to manufacture the Wegener roller lock nut. B. J. Green, 40 Richards street, Brooklyn; A. H. Wegener, 1105 Garden street, Hoboken, N. J.; H. L. C. Wenk.

Ohio

AKRON—Double Service Tire & Rubber Co.; $50,000; manufacturer. C. F. Geyer, M. S. Glover, David Bowlus, U. G. Welton, W. A. Nash.

ARCADIA—The Access Auto Co.; $25,000. C. R. Simkins, E. R. Struble, F. P. Conaway, C. Wheland, R. C. Willis.

CINCINNATI—Citizens Motor Car Co.; $150,000 to $200,000.

CLEVELAND—Auto Rescue Service Co.; $5,000; garage. J. Morgan, A. Cooper, P. W. Hill, Hugo Karman, N. W. Edwards.

CLEVELAND—Globe Accessories Co.; $10,000; dealer. J. F. Engle, F. C. Brew, R. Hendrickson, C. F. Saenger, V. B. Engle.

CLEVELAND—The Ohio Gear Grinding Co.; $10,000; machine shop. M. B. Noyes, F. J. Wing, Leo Ulmer, Max Efres, Irene Bollard.

COLUMBUS—Eureka Mechanical Starter Co.; $30,000. W. A. Ross, J. E. Matthews, C. E. Bonebrake, A. Bunford, C. E. Ross.

COLUMBUS—Vincent-Franz Automobile Co.; $5,000. Henry Franz, F. L. Vincent, K. W. Rittenhouse, W. B. Lover, F. F. Little.

ELYRIA—Coliseum Garage Co.; $5,000. Otto Niemeyer, C. F. Newman, T. P. Robson, J. E. Robson, I. M. Austin.

LANCASTER—Ohio-West Virginia Motor Club Co.; $20,000. B. F. Gayman, C. M. Trimmer, Palmer Howard, L. C. Silbach.

TOLEDO—Meyer Auto Repair Co.; $2,000. Carl Meyer, C. O. Queickke, E. J. Beeman, G. F. Hahn, T. Wooster.

Virginia

RICHMOND—M. D. Stone Motor Co.; $50,000; automobile business. M. D. Stone, Pres.; F. H. Dula, Secy. and Treas., both of Richmond.

Washington

SEATTLE—Metropolitan Garage; $2,000. J. F. Douglas, N. E. Felt, E. H. Sennett.

SEATTLE—Geo. W. Miller Co.; $25,000; general automobile business. George W. Miller and W. H. Sanders.

Recent Developments in Field of Dealer and Repairman

Remy's Atlanta Factory Branch—The Remy Electric Co. has established a factory branch at 14 West Harris Street, Atlanta, Ga.

Knight Tire in Spokane—The Automobile Tire Shop, Spokane, Wash., has secured the agency for the Knight line of tires for Spokane.

Dallas Haynes Moves—The Dallas branch of the Haynes Automobile Co. has moved into handsome new quarters at 2215-2217 Commerce Street.

Buick Agency Moves—The Buick agency at Providence, R. I., has moved to a new location on Broad Street, where it has better facilities for handling the line.

Baltimore Falls Tire Agent—G. E. Blaylock, 1817 Maryland Avenue, Baltimore, Md., has the local agency for the Falls tire manufactured at Cuyahoga Falls, Ohio.

Hercules Tire in Los Angeles—The Roddan-Latimer Sales Co., Los Angeles, has opened a tire house at 1046 South Olive Street with exclusive selling rights for Hercules tires.

Mohawk Tire in Louisville—The Southern Motors Co., 615 South Third Street, Louisville, Ky., has acquired the agency for Mohawk tires.

Handles Baltimore O'Neil Protector—A. P. Moessinger, 127 Richmond Street, Baltimore, Md., is the local distributor of the O'Neil outer tire made by the O'Neil Tire & Protector Co., Akron, Ohio.

Ever Ready Battery Agent—The Erner Electric Co., Cleveland, Ohio, has been appointed agent for the American Ever Ready storage battery. A service station has been established at 1268 Euclid Avenue.

Longuemare Carbureter Moves Salesroom—The Longuemare Carbureter Co. has moved its salesroom from 246 West Fifty-ninth Street, New York City, to new and larger quarters at the Motor Mart Bldg., 1876 Broadway.

Sewell Cushion Wheel in Buffalo—The Sewell Cushion Wheel Co. has opened a Buffalo branch with A. W. Sewell in charge. This is the eighth branch office the concern has established, and it is stated that another is to be opened in St. Louis.

N. Y. Swinehart Moves—The Swinehart Tire and Rubber Co., New York City, now at 1924 Broadway, will move to 41-43 West Sixty-third Street, the building formerly occupied by the Bryant Motor Service Corp. and the Knickerbocker Garage.

Two Federal Rubber Branches Now—The Federal Rubber Mfg. Co., Milwaukee, which recently established a direct factory branch and service station at 509 Broadway, Milwaukee, has established a second Milwaukee branch, to serve the South Side, at 361 Eleventh Avenue.

Kansas City Change—Russell H. Clark & Co. have succeeded to the business of the Simon Bros. Mfg. Co., 1529 Oak Street, Kansas City, Mo. Mr. Clark was for several years manager for the Simon company, which made automobile tops and handled small repairs.

Recent Louisville Trade News—The R. A. Thornton Auto Co. has opened a repair shop for Ford cars at 915½ South Third Street, Louisville. The Martin Motor Co., which has acquired the agency for the Velie, has opened an office and salesroom at 437 South Second Street. W. C. Martin of New York is head of the concern. The Two in One Tire Co. has opened a shop and office at 323 West Market Street, Louisville, Ky. This concern takes two old casings, cleans off the rough places, cements the two together, sews two or three rows of stitches around the edge, and turns out a tire which it is claimed is good for 2500 miles.

Kansas City Tire Co. Moves—The Tire Service Co., Kansas City, Mo., Henry Winter, manager, is moving from 1621 Grand Avenue to 1606 McGee Street into a one-story building now being completed, leased for five years. After two years a second story is to be added for the tire company. It is agent for the Pennsylvania tire in Kansas City and does a general tire-service business.

Recent N. Y. Leases—The Ford Commercial Body Co., New York City, has leased the store and basement at 10 West Sixtieth Street. The store and basement at 1674 Broadway, has been leased to the McAllister Tire Co. The Taxicab Assn. and the Town Taxicab Co. has leased the entire building at 243 West Sixty-fourth Street, New York City. Space at 1896 Broadway has been leased for the Oakland Motor Car Co.

Late Baltimore Trade News—The Poehlmann Automobile Co., Baltimore representative of the Chevrolet, is in its new building at Cathedral and Chase Streets. The new quarters are fireproof throughout, four stories high. The machine shop is on the fourth floor, where plenty of light may be had.

The Pneumatic Tire & Rubber Co., Baltimore representatives of the Racine tires, has entered its new place, 23 West North Avenue. The company is operated by F. J. Rowe and C. M. Green.

Late Hartford Trade Items—The U-Auto-Varnish Co., 2 American Row, Hartford, Conn., has established a service station in the rear of 1125 Main Street, East Hartford, Conn.

The Britton Co., 121 Allyn Street, Hartford, State distributor of the Stearns-Knight, has established the following sub-agencies: H. E. Bradford, Waterbury, Conn.; F. W. Roberts, Northampton, Mass., and R. H. Britt, Springfield, Mass.

F. L. Caulkins, Middletown (Conn.) Chalmers distributor, has taken on the Dodge in Middlesex County, operating under the Hartford Motor Car Co., 410 Main Street, Hartford.

The Hartford Auto Painting Co., now located in the Kingsley & Smith garage on Elm Street, has leased the top floor of the new Hartford Motor Car Co. building in the rear of the salesroom at 410 Main Street.

Recent Milwaukee Trade Notes—The Alben Co., Twenty-seventh and Wahl Avenues, Milwaukee, is marketing a new portable jack and crane for use in garages. The combination instrument lifts any car up to 5000 lb. to a height of 9 ft. and weighs only 300 lb.

The Racine Auto Tire Co., Racine, Wis., manufacturing the Racine Horseshoe tire and other rubber goods, has established a branch depot and distributing station at 140 Oneida Street. W. M. Smith of Milwaukee has been appointed manager. The branch will handle all Wisconsin business.

The Badger Tire Repair Co., State agent for the Kelly-Springfield tire, and operating a large tire-repair shop at 454-457 Jackson Street, Milwaukee, has moved to new and larger quarters at 142-144 Oneida Street.

The Dayton Rubber Sales Co., 290 Fifth Street, has moved to new and larger quarters at 415 Cedar Street. The concern is State distributer of the Dayton airless tire and Dayton pneumatic tire and operates a large repair shop.

A new supply and accessory store has been established at 427 Chestnut Street, Milwaukee, by L. Baum & Sons.

S. G. V. in New Home—The S. G. V. Co., Newark, N. J., formerly located on Lafayette Street, has moved into its new home, the Colyear Building, 500-504 Central Avenue. The company has leased the premises for a period of six years. The salesroom will occupy the first floor and on the second floor there will be a service station and machine shop. The third floor will be given over to an assembling department, and the body building department and paint shop will be on the fourth floor.

The company is now going through the process of incorporation under the laws of New Jersey. G. A. Grant, the manager of the company, says that the objects of the new company are to maintain the service of cars manufactured by the S. G. V. Co., Reading, Pa., and to build new cars under the new organization.

Royal Equipment Adding—The Royal Equipment Co., Bridgeport, Conn., will add a third story to its 60 by 200-ft. factory.

Whitfield Takes Stearns—N. B. Whitfield of New Haven, Conn., has just secured the agency for the Stearns car in that territory.

Rider Opens Office—Cleremont Rider, western distributor of the H. & D. shock absorber, has opened an office at 3667 Olive Street, St. Louis, Mo.

Polson's New Plant—The Polson Mfg. Co., Buffalo, N. Y., will build a two-story, 85 by 100-ft., reinforced concrete plant at Main Street and Lafayette Avenue.

Philadelphia Tire Co. Moves—The Kelly-Springfield Tire Co., Philadelphia, Pa., has removed from 208 North Broad Street to 257-259 North Broad Street.

Opens Battery Station—The Battery Service Co., St. Louis, Mo., has opened a station at Twenty-third and Locust Streets, where it will render all day and night service.

Chevrolet Assembling Plant Contemplated—The Chevrolet Motor Co., Los Angeles, Cal., contemplates building an assembling plant and machine shop near Los Angeles, Cal.

Interstate in Marion—F. D. Bentz has taken the agency for the Interstate in Marion, Ohio. After Sept. 15, the garage and salesrooms will be located at Main and Church Streets.

Opens in St. Louis—The Uniplex Construction Mfg. Co., St. Louis, Mo., has opened a salesroom at 2314 Locust Street. The company makes and retails the Uniplex knock-down garage.

Ten Broeck Agency Moves—The Ten Broeck Tyre Sales Co., Louisville, Ky., has closed its downtown store at 542 South Third Street and moved its salesroom to the factory at Twenty-sixth and Courtney Streets.

Los Angeles Pullman Moves—The Aston Motor Car Co., Los Angeles, Cal., southern California distributor of the Pullman, is located at 1310-12 South Grand Avenue in the large building formerly occupied by the Mission Motor Car Co.

Distribute from St. Louis—The Schoellhorn-Albrecht Machine Co., 416 North Main Street, St. Louis, Mo., has been appointed distributor for the Imperial and Marion in eastern Missouri and southern Illinois. The Jeffery Motor Sales Co. will handle both lines in St. Louis and will continue as distributor of the Jeffery lines.

Philadelphia Co. Takes on Oakland—The Baker-Bell Motor Co., 665-669 North Broad Street, Philadelphia, Pa., has taken over the local retail business and service department and the wholesale business for Bucks, Montgomery, Chester and Delaware Counties in Pennsylvania, and Camden County in New Jersey, of the Oakland Motor Co.

Hercules Tire in Ore.—Hercules Tire Sales Co., Portland, Ore., has been formed by Noah Frederick and H. J. Nielson and established themselves as distributors of Hercules tires for the entire State of Oregon. They have opened headquarters at 302 Oak Street.

New Haven White Adds Chalmers—The White Motors Co. of New Haven has recently been appointed Chalmers distributor for New Haven County, with the exception of Meriden. In addition to the Chalmers the White company handles White and Buick passenger and commercial cars. The company has engaged the service station operated by the W. A. Maynard Co., the former Chalmers agent.

Handling U. S. Tires in Nine Cities—The Quick Tire Co. is now operating in nine cities as follows: Dallas, San Antonio, Houston, El Paso, Fort Worth, Little Rock, Memphis, Louisville and Nashville. Dallas is the pioneer Texas city in which the concern established a business. It was recently incorporated and is handling United States tires exclusively. Its officers are: Thornton Newsum, president; R. B. Young, vice-president and treasurer, and H. L. Williford, secretary.

Late Columbus Trade Items—The Central West Motor Car Co., Columbus, Ohio, has been organized with G. W. Carroll, general manager, and A. E. Aull, manager of sales, to handle the Oakland and Abbott-Detroit in central Ohio territory. The concern occupied new salesrooms and offices at 80-82 North Fourth Street.

S. W. Schott & Co., central Ohio distributors for the Empire, has placed the sub-agency for Knox and Licking Counties with the Anderson Motor Sales Co., which will have headquarters probably at Newark, Ohio.

Anthony Appoints New Packard Agencies—The increased production of the Packard factory has enabled Earle C. Anthony, Inc., Packard distributors throughout southern California, to establish sub-agencies in the more important southern California centers. In the past practically all Packards sold in this end of the State were sold at retail by the Anthony organization, but with his increased allotment, Anthony has announced the following sub-agencies: Bakersfield, W. F. Gouty; Riverside, Riverside Motor Car Co.; Long Beach, Arthur E. Evans; Monrovia, A. T. Badillo; San Luis Obispo, C. H. Kamm; Ventura, R. M. Seeley; Santa Barbara, Oscar Fitch; Anaheim, Rockwell & Sidnam.

Denver Announcements—The Wilson Auto Co., 801 Broadway, Denver, Chandler distributor, has taken the State agency for the Empire and also the Denver agency for the National.

L. G. Palmer, Paige distributor for Colorado, has closed his salesroom at 1515 Cheyenne Place, and announces that he will retire from the automobile business. The Paige agency has not yet been taken by any other dealer.

L. M. Patrick, 533 Marion Street, has just taken the agency for the Lewis car.

Hoiser Bros. have taken the agency for the Velie, and have opened a salesroom at 1236 Broadway.

The Hupp Motor Sales Co., Colorado distributor of the Hupmobile and Locomobile, is moving from 220 Sixteenth Street, Denver, into its new building at 1260 Broadway.

The Auto Sales Co., a new $25,000 corporation, has opened a used car and rental business at 1840 Walton Street, and also a garage and a separate filling station. H. W. Curtis is manager.

Late St. Louis Trade News—The St. Louis branch of the L-Ty-To-Co., which handles a special preparation for the treatment of tires, has opened a salesroom at 1135 Locust Street, with G. R. Hutchings in charge. The company formerly had only offices here at 428 Frisco Bldg. The Koochook Rubber Co., handling automobile supplies, will move within the next few weeks from 3152 Locust Street to 1120 Pine Street.

The Best Service Truck Co., 1120 North Twelfth Street, has been appointed Southwestern sales representative of the Gramm-Bernstein Co. The St. Louis agency for Saxon cars has been transferred from the Page Automobile Co. to the Frye Motor Car Co., of 3333 Locust Street. This agency's territory includes the southern half of Illinois and the eastern half of Missouri. G. A. Root will supervise the country sales of Saxons and of Paige cars, for which the Frye company also has the local agency.

The United Sales Co. has been organized to handle the United States tires in St. Louis. The new concern is fitting up salesrooms at 3567 Lindell Avenue and will render a twenty-four-hour service. The officers are E. G. Niggeman, president; G. J. Breaker, treasurer, and F. C. D. Dobson, secretary and manager. The Paterson, formerly handled in the St. Louis district by the Bleeck Automobile Co., henceforth will be sold here by the Donovan Automobile Co. The latter recently discontinued the Interstate. The Brisk Blast Mfg. Co., maker of tire pumps, has opened a plant at 1515-1527 North Twenty-first Street.

The Tate-Gillham Motor Car Co. has opened a service station and salesroom in the Gorlock Bldg. at Webster Groves. The Commercial Auto Body Co., now at 3003 Locust Street, has leased a four-story building at the southwest corner of Sixteenth and Pine Streets for a number of years.

VOL. XXXIII. NEW YORK—THURSDAY, SEPTEMBER 23, 1915—CHICAGO No. 13

The AUTOMOBILE

Reasons for the Twelve

Valuable Discussion on Engineering Principles Brought Out by J. G. Vincent's Paper Read Before the Detroit Section of the S. A. E.

QUESTIONS of balance, vibration, displacement per foot of travel, and carburetion were the high spots brought out in the discussion which followed the presentation of the paper by J. G. Vincent, vice-president in charge of engineering of the Packard Motor Car Co., Detroit, Mich., on the twin six motor. Last week a large part of this paper was published in THE AUTOMOBILE and this week appear the remaining portions of the paper together with the diagrams and the discussion which followed. Mr. Vincent's remarks follow in part:

J. G. VINCENT

Unbalanced Forces Due to Inertia

In my report to Mr. Joy, I referred to the unbalanced forces due to inertia in a four or twin four motor, and explained that these forces were cancelled out in a properly designed single six or twin six motor. I believe that these forces are thoroughly understood by engineers generally, but I have thought it best to go into the matter briefly in this paper in order to make it more complete.

Fig. 1 shows a partial cross-section of a twin four motor of 3 7/16 in. bore by 5¾ in. stroke, or a total piston displacement for the motor of 424 cu. in.

This drawing is made primarily to show the rotating and reciprocating parts of the motor. I have considered that the center of gravity of each piston is located at the piston pin, and in order to locate the center of gravity of all four pistons in the right hand block when the pistons are at dead center, as shown on the drawing, it is only necessary to bisect the distance between the piston pins and we obtain the center of gravity of all four pistons, as indicated at *A*.

With the crankshaft in this position, it is very easy to locate the center of gravity in the left hand block, as in this position the pistons in the left hand block are all lined up. Or, in other words, the center of gravity is located at the piston pin, as indicated at *B*.

The drawing shows an arc struck from the center of the crankshaft and passing through the center of gravity of the pistons in the right hand block at *A*, and it will be noted that it does not pass through the center of gravity in the left hand block but instead, passes considerably above it. This result is, of course, due to angularity of the connecting-rods and it can be increased or decreased according to the ratio of connecting-rod length to stroke. The longer the rod ratio it is found possible to use, the less the error will be, and the shorter the rod the greater the error. With any permissible length of connecting-rod, however, this error cannot be cut below approximately ⅜ in. and it is apt to run considerably more than that amount.

A rough way to calculate the magnitude of this out-of-balance is to consider that the engine is equipped with one additional piston, whose weight is equal to the combined weight of all the pistons, and that this piston is reciprocated at twice the crankshaft speed through a stroke equal to the movement of the center of gravity of the pistons.

A Vertical Vibration

In a single four motor, this movement of the center of gravity, of course, causes a vertical vibration, but in a twin four motor, the conditions are somewhat altered, as the movement of the center of gravity in one four-cylinder motor cancels the movement in the other four-cylinder motor, so far as the vertical components of these forces are concerned, but add on to each other so far as the horizontal components are concerned.

Fig. 1 shows a line drawn between the two centers of gravity and this line is bisected at *C* to show the horizontal movement of the combined center of gravity to the right of the vertical center line with the crankshaft in the position shown. Revolving the crankshaft 90 deg. will, of course, move this combined center of gravity an equal amount to the opposite side of the vertical center line. It is the horizontal movement of this combined center of gravity that causes horizontal vibrations in a twin four motor.

Fig. 2 shows a partial cross section of a twin six motor of 3-in. bore by 5-in. stroke, or a total piston displacement of 424 cu. in. In other words, this figure shows a twin six motor of the same total piston displacement as the twin four

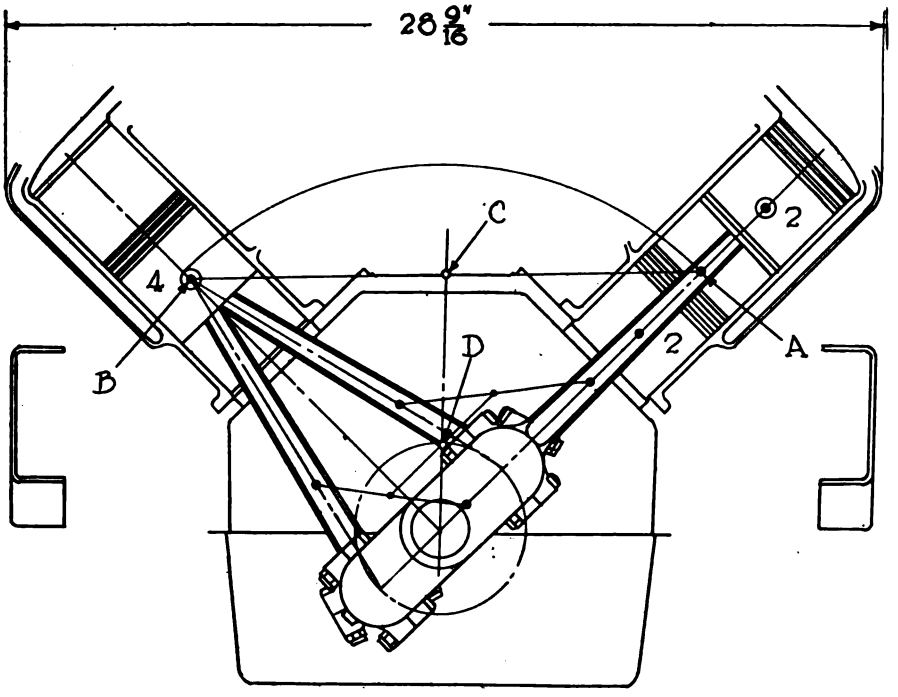

Fig. 1—Partial cross section of the twin four motor is 3 7-16 bore by 5 3-4 stroke, having 424 cu. in. displacement

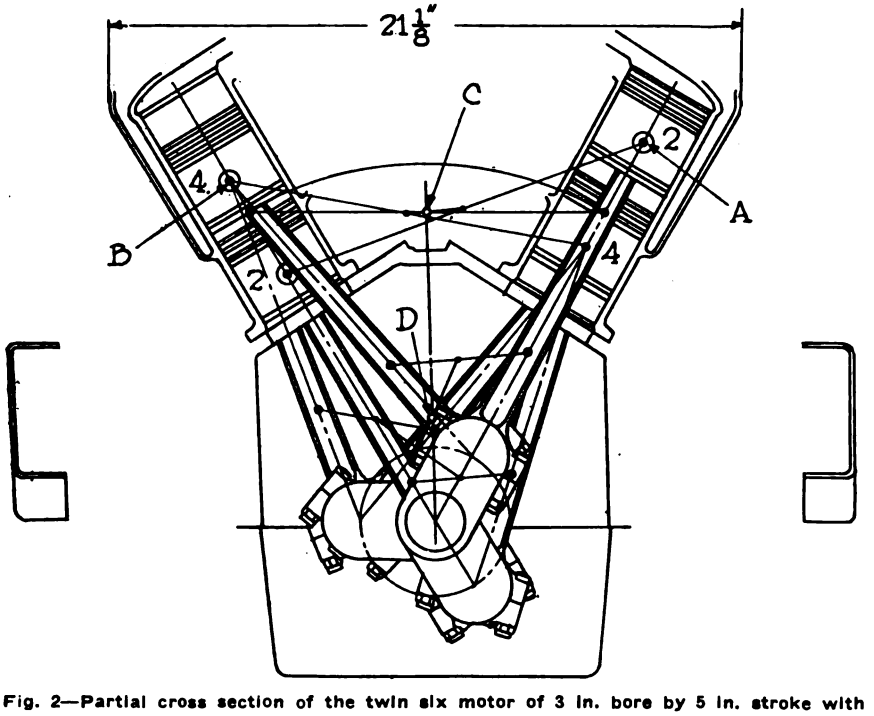

Fig. 2—Partial cross section of the twin six motor of 3 in. bore by 5 in. stroke with a total piston displacement of 424 cu. in.

motor shown in Fig. 1. Like Fig. 1, this drawing is made primarily to show the rotating and reciprocating parts of the motor. I have had the centers of gravity of the pistons in each block located on this drawing in the same manner as described above in connection with Fig. 1, but it will be noted that the arc struck from the center line of the crankshaft passes through the center of gravity in both blocks, and also that the combined center of gravity of all pistons falls exactly on the vertical center line instead of to one side, as in the case of the twin four motor.

The reference letters *A*, *B*, and *C* indicate the same points in this drawing as in Fig. 1.

This drawing, of course, shows the relationship of the parts at only one position of the crankshaft, but by plotting the parts in 360 different positions, in other words, at every degree of movement of the crankshaft, it will be found that the center of gravity does not move from a fixed point.

It will be noted that I have had the centers of gravity of all the connecting-rods plotted for both types of motor, and in the case of the twin four motor, this point moves off the center line, as indicated at *D* in Fig. 4, while it remains absolutely fixed on the center line in the twin six motor, as indicated at *D* in Fig. 2.

I believe that these drawings indicate clearly the difference in forces due to inertia of the two types of motors and prove conclusively the correctness of the six-cylinder principle. The real proof of the correctness of these arguments is, of course, that motors built according to this twin six layout are running absolutely smooth up to speeds as high as 3000 r.p.m.

Regarding Accessibility

Figs. 1 and 2 are made to the same scale, and it will be noted that I have had a section of a desirable width of frame shown in connection with each drawing, in order to give a good idea of the general layout of the two motors and the possibilities of locating equipment, etc.

Fig. 1 of the twin four motor shows clearly the difficulty of locating accessories in the usual place alongside of the crankcase, and between it and the frame, and also makes it clear that the steering gear in this twin four type of motor must be located to the rear of the cylinder blocks. On the other hand, Fig. 2 of the twin six motor shows the ease with which the accessories can be located alongside the crankcase, and between it and the frame, and also the additional room for the accommodation of the steering gear. This makes it possible to use a triangular drive and single chain for driving the camshaft, generator and water pump.

The water pump, located just back of the generator and driven by it, is really no more complicated than the ordinary six-cylinder water pump, and it is just as accessible. It has two impellors so placed that the end thrust is balanced, and one delivers directly to one-cylinder block, and the other to the opposite block. With this pump, it is only necessary to have a single stuffing box, which is very accessible for repacking.

The starting motor is located directly back of the water pump and it is arranged to crank the motor through compound gearing, acting on the flywheel the same as has been standard on our six-cylinder motors for some time past.

The air pump and oil pump are driven by small spiral gears at the rear end of the cam shaft, and the ignition timer unit is driven by a pair of small spiral gears located at the front end of the cam shaft. This makes a remarkably simple, light and quiet arrangement and, in fact, it is more simple and cheaper to manufacture than in the majority of four or six-cylinder motors. This arrangement makes it unnecessary to locate any equipment in the V between the cylinder blocks, with the exception of the carbureter, which is located high up, thus leaving every valve perfectly accessible for adjustment.

Considering this twin six motor as a complete unit, I believe it to be just as accessible as a well-designed single four or six-cylinder motor.

Turning Radius Longer

As stated above, Figs. 1 and 2 are drawn to the same scale and make it very clear that the bonnet and, therefore, the frame for a twin four motor must be considerably wider than for a twin six motor of the same piston displacement. It will be noted that the twin six motor is approximately 21⅛ in. wide over the cylinder blocks, while the twin four is 28 9/16 in. While it is, of course, true that the twin four motor would be a little shorter than the twin six, that is approximately 3 in., it is quite clear that the frame will have to be made enough wider so that the resultant turning radius will be larger with the twin four motor.

A single six-cylinder motor would, of course, assemble into the same width of frame as shown in Fig. 2, but a motor of this type of the same piston displacement would be some 5 in. longer than the twin six and this would, of course, necessitate a longer wheelbase and increase the turning radius. Of the three types of motor, the twin six, is therefore, the best, so far as turning radius is concerned.

Weight Saved in V Motors

As indicated in my report to Mr. Joy, I have weighed up a great many motors and have proved to my own satisfaction that of the three types, the six-cylinder will be the heaviest, and that the twin four and twin six will be just about a stand off, granting, of course, that all three types of motor are made up to a corresponding standard of engineering.

Continuity of Torque

As mentioned in my report to Mr. Joy, it is obvious that the character of the torque of the twin six is bound to be 50 per cent better than the twin four and 100 per cent better than the single six, and in order to show the characteristics of these three types of motor I have had Fig. 3 prepared.

The diagrams shown in this drawing cover 360 deg. of crankshaft rotation, or, in other words, one-half cycle. All three diagrams are made to the same scale and are all based on equal size motors; *i.e.*, 424 cu. in. of piston displacement.

It is, of course, obvious that the center diagram represents the power impulses of a twin six, the upper diagram a twin four, and the lower diagram a single six,

In each diagram the horizontal lines *O-O* represent zero, the solid line curves *B-B*, below the zero line, represent negative crank effort due to compression, while the solid line curves *C-C* represent crank efforts due to the working strokes. The dotted line curve *D* represents the net crank effort. This curve was plotted by taking the value of the crank effort curves above the zero line and subtracting the negative crank effort curves due to compression, as indicated below the line. These curves *D* show clearly the relative work to be accomplished by the flywheel in the three different types of motor. The uniformity of the torque of the twin six as shown by the curve *D* gives a fair idea of what this torque should be, and I can assure you that the actual performance of the motors is well up to what might be expected.

The frequency of the impulses and the small amount of difference in effort between the peak of one power stroke and the lowest point in between impulses absolutely do away with any indication of separate motor impulses.

I have driven a car equipped with one of these twin six motors down to speeds as low as 1 mile per hour, representing a motor speed of considerably less than 100 r.p.m. and under these conditions there is no sense of separate impulses whatever, even when accelerating quickly from this speed.

This continuity of torque, which makes for smoothness at low speed, coupled with the light, accurately machined reciprocating parts, plus the six-cylinder principle, which make for smoothness at high speed, result in a wide range of smooth ability which, when once experienced, is bound to be desired.

Fig. 4 shows the actual horsepower output of a Packard 338 single six-cylinder motor of 415 cu. in. of piston displacement and a Packard twin six motor of 424 cu. in. of piston displacement.

Discussion Along Varied Lines

C. C. Hinkley, chief engineer, Chalmers company: Isn't it true that in the Packard twin six, the crank is a 2-in. crank? Am I correct?

J. G. Vincent: That is correct.

C. C. Hinkley: For a 3 by 5 twin six; I believe we would call it common practice to use at least a 2-in. crank, in a single six engine with that displacement, with perfect propriety. In the type of engine that I noticed in the cut, Mr. Vincent uses a vibration damper. I would like to ask Mr. Vincent if he compensates for the lack of crank diameter by the vibration damper, or what is the function of the damper?

J. G. Vincent: In experimenting with this motor, we ran into the same thing we would have run into had we designed a single six high-speed motor. That is, the synchronized vibration due to the slight oscillation of the crankshaft. Now, that is not affected by the twin six design, but to a very limited degree. That is, the added rotative weight just mentioned has a very slight effect on the periodicity in the crankshaft. By that I mean that when the front throw of the crankshaft is slightly displaced by the impulse due to the piston working stroke, it will come back more slowly with a little added rotative weight, with the result that the impulses in the motor will get into step with it at slightly slower speed than if the rotative weight was lighter. To that extent, the V type of motor does affect crankshaft design. Now, we could have overcome the vibration, the periodic vibration, by making the crankshaft larger. That is, we could have overcome it at lower speeds, but it would have

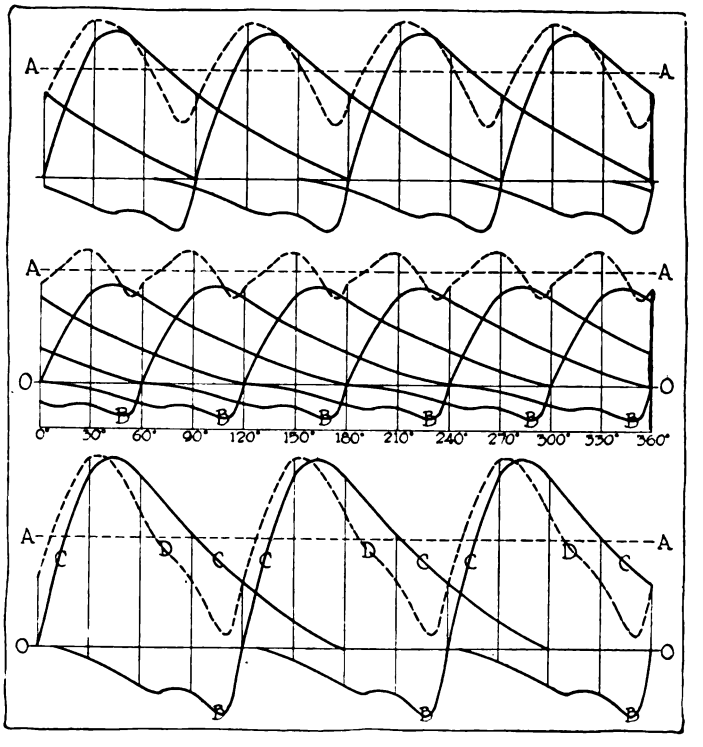

Fig. 3—Chart showing continuity of torque covering 360 deg. of crankshaft rotation, or, in other words, one-half cycle for three motors of 424 cu. in. piston displacement representing the power impulses of a twin six in the center diagram, a twin four in the upper diagram and a single six in the lower

been bound to come in at some speed. You cannot make a crankshaft, within reason, and make it strong enough so that it won't spring a little; in other words, the larger you make it, the faster will be its periodic pendulum action, and the faster the motor will have to run before the pistons get into step with it.

Periodic Vibration

Now, in reference to the pistons getting into step with it, it is just like stepping up to someone, swinging and pushing them at the right time as they come back each time, and you keep them going. The minute that you hit them a little too quick, or too light, they will begin to slow up. The same thing with a crankshaft. The period of vibration ordinarily does not last over a range of more than 1½, 2 or 3 miles. If it comes in, say at 40 m.p.h., it would come in with increased intensity at 80 m.p.h., were it possible to get that high. In other words, double the motor speed. We, of course, had the choice of going to an unusually large crankshaft, but still having the possibility of having slight vibration or disturbance at extremely high speed; or putting on the vibration damper. By putting on the vibration damper, we damped out that period without making any larger crankshaft, and we were, therefore, enabled to retain the smaller crankshaft, with its lower bearing speeds, which makes for efficiency, and we simply chose the vibration damper.

What Vibration Damper Does

Just a word as to what the vibration damper does. It is simply a brake on the swing; that is, if you put a board on each side of the swing, and bear up against the ropes, you would give the swing a push, it would probably go to the other end, but it would not come back very fast, and when it came back to the center, it would stop. The crankshaft oscillation is exactly the same thing. The vibration damper does not prevent the shaft from springing slightly, but it does prevent it from oscillating and setting other parts into synchronized vibrations. I might state that it seems to smooth the motor throughout its entire range; and it is very effective so far as damping out periodicity is concerned.

Displacement-Car Weight Ratio

A. Ludlow Clayden, THE AUTOMOBILE: I would like to introduce to the discussion a line of thought touched upon by Mr. Vincent but not followed very far, this being the proper proportion of piston displacement to the total weight of the automobile. We gain ability of performance in proportion as we increase the total volume of gas swept by all the pistons during a yard of travel and we can always get more ability by lowering the gear ratio or by increasing the size of the engine. There must be some limit to this procedure. For instance it would be absurd to put a Packard twin six engine in a Scripps-Booth chassis as it looks at present, equally ridiculous to suggest that the Packard ability could be obtained from a six-cylinder 3 by 5 geared nine to one on high. Possibly in the fullness of time we shall discover that neither of these extremes is absurd, but it is interesting to examine the figures for displacement per foot of travel for a few well known cars. This means nothing, however, without consideration of the weight of the cars; wind resistance counts for little or nothing as ability is appreciated and desired most at speeds below those at which the atmospheric friction begins to count.

Taking the following list we have these figures:

	Cu. In.	Gear	Ft. Wheel Circ.	Cu. In. Per Ft.	Weight	Cu in. Per 1000 Lb. Ft.
Packard ..	424	4.4	9.7	192	4,500	43
Cadillac ..	315	4.4	9.4	147	4,300	34
Hudson ..	288	3.7	8.9	132	3,000	44
Scripps ...	104	4	7.8	53	1,750	30
Ford	177	3.6	7.8	82	1,500	55

This method of figuring is only a very rough and ready way of making comparison, but it serves to show that ability can be increased greatly by reducing weight. Of course the weight is not a true measure of the resistance to motion but it is obtainable easily while drawbar pull is not. Mr. McCain has shown me a different way of estimating ability, based upon the tractive effort at the tire at different speeds. calculating from the known horsepower of the engine at the corresponding rate of revolution and I hope he will quote some of his figures. It is hardly possible for an outsider like myself to obtain such data from a sufficiently large number of plants to enable proper comparison to be made.

Twelve the Limit

Now the question is whether the eights and twelves and light sixes we have to-day provide sufficient ability, too much ability or not enough ability. It seems that the present consensus of opinion is that the ability of the twelve represents about the limit that the public is ever likely to ask but that smaller and cheaper cars than the very large ones will have to approximate the same figure of merit.

Road Performance

Taking my table it is obvious that the figure of merit of fifty-five for the Ford does not truly represent its ability as compared with the lower figure of forty-three for the Packard, but we know that the horsepower of the Packard is vastly greater than that for the Ford. Thus to convert my figures of merit into others which would show a truer comparison it would be necessary to know the horsepower for each engine. I am going to ask Mr. Vincent and Mr. McCall White if they can give the power developed per cubic inch piston displacement at 1000 r.p.m. This multiplied by my figure of merit ought to show a true comparison between the conditions of the two cars which we know represent about the limit of ability that has yet been reached in practical manufacture. Suppose that the result of this multiplication gave a figure of 300, which would be the Packard case at a rating of 1 hp. per 7 cu. in. approximately, then it seems to me that 300 might be taken as a constant to which other engineers could work. I am afraid I have not made this very

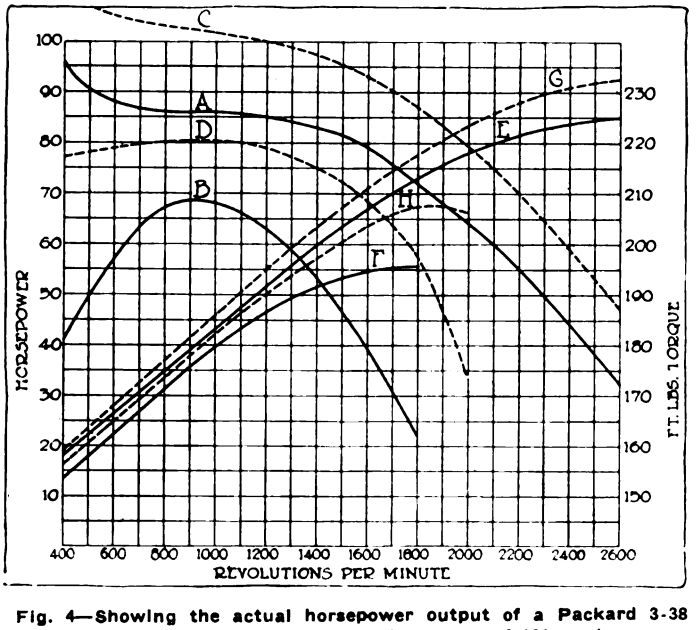

Fig. 4—Showing the actual horsepower output of a Packard 3-38 six of 415 cu. in. and a Packard twin six of 424 cu. in.

clear, but I mean that the ability, the road performance, of cars which can show the same figure of 300 say, ought always to be about the same. We see that the figure can be produced by weight reduction and is possible of attainment without phenomenally low gearing by a small four-cylinder automobile.

An Equation for Merit

I do not suggest that I have considered everything in this suggested equation, no doubt many holes can be picked in the argument, but I do think that it ought to be possible to develop an equation which would give us a true figure of merit and if this can be done it would be very useful to engineers.

Now I want to say a few words on the multi-cylindrical question. Mr. Vincent's paper is a splendid argument for the V motor principle and is almost equally favorable to eights as to twelves. The cheap eight is a better car by comparison with the expensive one than the cheap six of a couple of years ago was by comparison with the better class car. How small, then, is it going to pay to make a twelve?

Suppose we can find a possible ability equation and so design a car as to suit the desired figure of merit, what then is going to decide how we shall split up the necessary number of cubic inches per road wheel revolution? The choice offered is so immensely wide, ranging all the way from 2 to 1 down to 6 to 1 in gear ratio and from four to twelve cylinders.

Cylinder Size Main Factor

I have lately been told by many engineers that the cost of a motor of a given standard of workmanship is in proportion to its piston displacement and that the number of cylinders had little to do with it. The most remarkable statement is that the V twelve costs no more than a six of the same capacity. Thus it seems to me the ultimate deciding factor will be the individual size of cylinder that will give us the best horsepower. Mr. Vincent says that the volumetric efficiency increases as the cylinder size decreases, by virtue of increased compression which is possible with the smaller cylinder. With this view I am in accord within limits, but I am not convinced that the Packard twin has not cylinders that are already a little on the small side. There must be a comparatively narrow range of size which will give the highest horsepower combined with other qualities. If manufacturing conditions abroad were normal I would try to persuade the Sunbeam company to build an eight and a twelve of the same total size as their six and I sincerely trust that some live manufacturer will try what can be done with a 300 cu. in. racing car with eight and with twelve cylinders. Europe has always thought the four was the only possible racing engine and it will need a racing car with more cylinders to shake this view anywhere in the world. American genius has brought the multi-cylinder V engine into a position of such prominence that it is the absolute duty of American engineers to see this thing through to the limit, and the limiting test of an engine is the speedway. If a 300 cu. in. twelve can hold its own on the racing track the case for minute cylinders will be proved, but it seems impossible to prove it by any other method.

Ability Defined

C. T. Myers, engineer Timken-David Brown Co.: I would like to ask Mr. Vincent if he will give us the definition of "ability"; also the terms "smooth ability" and "range of ability."

J. G. Vincent: We, out at the Packard factory, use the term "ability" simply as a relative definition of a car. In other words, we take a car out, and test it for acceleration. The greater the range of speed that car will show on either drive, that is, from the lowest to the highest, is what we call that car's "range of ability." Now, supposing that the car would go from 1 or 2 m.p.h. to 70 m.p.h., on high gear, smoothly, and without vibration at any period, we would call that a large range of smooth ability. In other words, if you have two cars and start them off on high gear at the same speed, and one car pulls away from the other, we would say that the car that got away had the greatest ability. Now, it might not have the greatest ability over all ranges of speed, but it would have the greatest ability for that test. If it has the greatest ability all the way up the range, then it would have a larger range of ability than the other car.

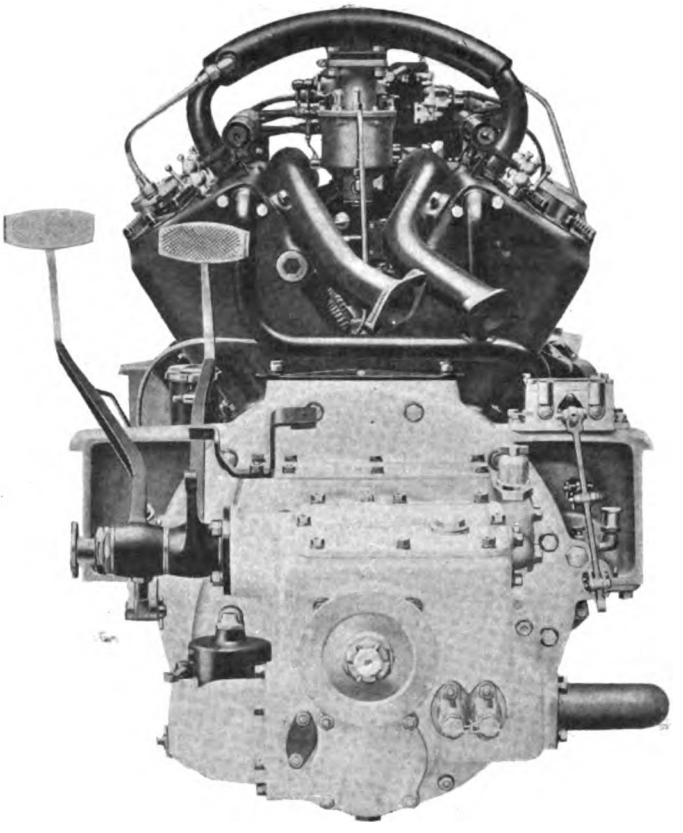

Fig. 5—End view of the Packard twin six motor

C. T. Myers: What is your definition of "ability" itself? What is the comparison?

J. G. Vincent: Generally speaking, acceleration—acceleration on a given gear ratio.

C. C. Hinkley: Is that a time element?

J. G. Vincent: Of course, acceleration would naturally mean a time element.

C. T. Myers: What would the acceleration be?

Testing the Car

J. G. Vincent: To make my point clear, I will try and do it this way. If we went to test a car for ability, we might take it out to-day, and if we are feeling pretty good, that car would feel about so to us. If we took it out next week, the car might feel better or worse to us; we might have changed, but the car might be just the same; so, in order not to fool ourselves, we adopted the scheme several years ago of using what we call acceleration curves. Later on, we have measured the ability with an accelerometer; but we still use the acceleration curves taken with a tested out speedometer, starting the car at a known speed, say, 5 m.p.h., and then taking a reading every 10 sec. up to 60 sec., and we get a very accurate acceleration picture of what that car's ability is. Now, we file that away. We will suppose that car accelerated from 5 to 30 m.p.h. in 10 sec., or from 5. Supposing we build a car next year that accelerates from 5 to 32 m.p.h. in the same time, then we would say we had increased the car's ability. Of course, we do some test work

for hill climbing, and so forth, but, generally speaking, acceleration curves are made on the level; and by the way, we take them in both directions and take the average, and it is a very good indication of what the car's hill climbing ability will be. In other words, to a certain extent the acceleration takes into account the weight of the car.

Smoothness of Motor

Smoothness, of course, the smooth part of the ability, simply refers to the action of the motor while it is performing that given work.

A. C. Woodbury, S. A. E. Standards Recorder: I have heard, in regard to the Packard Twin Six, the statement that carburetion trouble was very slight, and at very low speed. It has been the general experience that carburetion troubles have entered in at low speeds of engines, because of the gas speed in the inlet pipe being so small it would not carry the gasoline up the cylinder. I would like to inquire if there are any Packard secrets that we can learn in regard to that.

Carburetion Problem Easy

J. G. Vincent: I will admit that I was a little bit surprised myself, how very little trouble we had with the carburetion problem. We, of course, were very careful in designing the engine; very carefully proportioned capacities, to be as near right as our experience would dictate, and we very carefully took care of the heating of the gas. In other words, the individual header that goes into each cylinder block is surrounded by water on approximately three sides. Of course, as soon as the motor warms up, no condensation takes place. Then, of course, valve timing must be taken into consideration, and the inlet valve location with reference to the center of the opening into the block, and then the heating of the manifold above the carbureter. In designing that, we did not do anything more than use our information that we had gained through years of manufacturing six-cylinder motors. The carbureter used is exactly the same size as our last year's single six-cylinder. The carbureter and the parts are just the same, with the exception that the inside spring of the air valve which we found possible to make somewhat softer on account of the uniform suction of the motor. In other words, you all know, with an air valve carbureter, you get a certain amount of flooding on the four-cylinder motor, and you get less with a six, but still you get a little flooding, and the inside spring, commonly called a buffer spring, has to be made of strength that when you step on it quick, the flooding of the valve will not allow too much air in. In other words, to lean your mixture too much. We found the constant suction of the twin six motor allowed us to reduce the strength of that spring about one-third. That is absolutely the only change. Of course, the main part of the carbureter is not very high. It is 1¾ in. bore, same as for the single six, but where the manifold is divided, to go into each block, we naturally made it a little smaller and cut it to 1½ in., as I remember.

A Member: That is a single carbureter?

J. G. Vincent: That is a single carbureter; single jet. In other words, just exactly the same choke and jet that we use in the six-cylinder.

A Member: May I ask what acceleration test the Packard twin six gave in seconds, at, say, from 5 to 50 miles?

J. G. Vincent: From 5 to 50; of course, it varies, but under ideal conditions, I have done it in 24 sec.

William B. Stout, chief engineer, Scripps-Booth company: In the small bore multiple cylinder motor, and the ability to get the valves smaller, is there not an advantage worth going after in the overhead valve, in the multiple-cylinder type? I would like to get your opinion on that.

J. G. Vincent: That is the old story of a lot of considerations. I don't know. We do know the very wonderful all-around efficiency of the L-head motor, when well-built. You can throw the valves in and take them out pretty easily. Most anybody knows how to take care of them. Of course, within reasonable limits, you can get as much compression as you want with an L-head motor, anyway, and within reasonable limits, I agree with Mr. White, of the Cadillac, that you can get about all of the efficiency out of the L-head motor that you can out of the valve-in-the-head motor. You can get a little more out of the valve-in-the-head, I believe. Of course, at extreme speeds, I know you can get a whole lot more, but I have yet to see a valve-in-the-head motor that will really stay quiet over a long period of service, and there are usually some difficulties about grinding valves, and things of that kind. Of course, if I were going to design a racing motor, I would design a valve-in-the-head motor, naturally, because there is nothing but power which counts, but in building an automobile motor, you must take into consideration a lot of things; power is just one important item.

I don't expect any movement, or any great movement, toward valve-in-the-head motors, especially in the higher-priced cars.

The Aluminum Alloy Piston

Some Points of Superiority—Increasing Bearing Life—LesseningVibration—Preventing Injury to the Cylinder Under Overheating Conditions—Few Defective Pistons

By James E. Diamond*

A FEATURE of the meeting of the Indiana Section of the Society of Automobile Engineers, in Indianapolis, Thursday evening, Sept. 23 was the paper by James E. Diamond, engineer of the Aluminum Castings Co., which was scheduled to follow J. G. Vincent's paper on the twelve-cylinder motor. Mr. Diamond's paper is given herewith in full:

It seems altogether fitting in a discussion of the twelve-cylinder motor, a type which has immediately commended itself to the automobile public, that the aluminum alloy piston, certainly a factor in this motor's greater success, should not be neglected. It is a happy circumstance that almost coincident with the advent of the V-type, multi-cylinder motor, one in which the reduction of the reciprocating mass to a minimum is an all-important desideratum, was the development of a successful aluminum piston alloy, successful from the standpoint of both maker and user.

It is my intention to comment on some points of superiority of the aluminum alloy piston, even though this undoubtedly involves a repetition of facts which are more or less familiar to you since this type of piston has been the subject of much discussion in recent months. Certain phases of piston design will also be considered later. The advantages of aluminum alloy pistons generally will first be touched upon, and I then shall endeavor to make clear the decided superiority of pistons made by the Cothias process, more commonly known as permanent mold pistons, to those cast in sand.

Weight of the Alloy

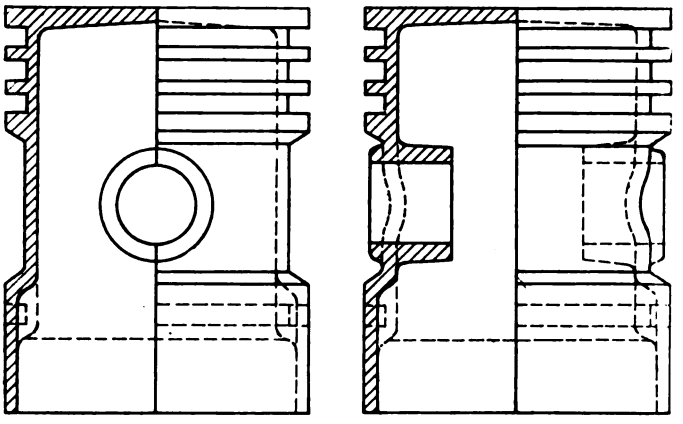
The weight of the aluminum alloy piston is, roughly speaking, but one-third that of an iron piston of the same design. It immediately follows that the inertia forces due to the purely reciprocating mass, that is, the piston itself, may be reduced approximately 67 per cent by its use. Again it follows that the vibration-producing forces attributable to inertia conditions are decreased to the same extent, by the vibratory force due to the lack of balance between opposed vertical forces present in vertical motors, or unbalanced horizontal forces, as in the V motor. Crosswise vibration is disagreeable if nothing more,—much more disagreeable than vertical vibration,—and the smaller these may be made, the more the likelihood the motor will be able to absorb this vibration within itself.

Increased Bearing Life

In reducing the inertia forces responsible for vibration, another very desirable object is being attained, namely the diminution of the bearing pressures, engendered by these self-same forces, this equivalent of course to increased bearing life—a consideration of no mean importance. It is easy to underestimate the magnitude of these forces, but with the present tendency toward the small bore, long-stroke, high-speed motor, more attention must be given this phase of motor design. It is quite safe to say that in some of the recent European racing products, these inertia forces are of greater magnitude than the working forces in the motor. Theoretically, this may be shown, and theory is supported by tangible evidence that this is so.

Incidental to these advantages it may be said for our own particular alloy, that its bearing qualities are excellent, its coefficient of friction being but approximately 50 per cent that of cast iron. A slight gain in mechanical efficiency should result, and possibly the reduced friction explains a decided decrease in the consumption of lubricating oil in several cases that have come under my observation at one time or another, where the iron pistons have been displaced by Lynite pistons. Doubtless, too, the much greater thermal

*Editor's Note—James E. Diamond is the engineer of the Aluminum Castings Co., Cleveland, O., manufacturer of Lynite pistons, and is an authority in this field.



Sectional drawings showing the construction of the hourglass type of piston

conductivity of the aluminum piston plays a part in this result. In any event, it seems reasonable to suppose that less friction would reflect itself in a smaller consumption of oil.

The greater thermal conductivity of this piston also explains why the carbon deposit on the head is so much less than experienced with iron pistons. As a rule the little carbon that collects is easily removed. In fact, under favorable lubricating conditions, no carbon is deposited.

In Case of Overheating

Another feature will commend this type of piston to you. Should a motor overheat and a piston seize, only in rare cases does harm to the latter result, and practically never is injury done the cylinder. On the other hand, if piston seizure occurs in an iron-pistoned motor reboring and regrinding are the usual order, frequently a new cylinder block being required.

Considering now the advantages that the piston made by the Cothias process has over the sand-cast one, we have found this permanent mold piston quite superior to the former in every respect. The point of superiority in which its pre-eminence is most marked and which has the greatest practical value is that its hardness is approximately 25 per cent greater, consequently its resistance to wear greater to the same degree. One of the troubles with aluminum pistons has been that they have been too soft. By this process pistons are being made that have a hardness not very much less than that of cast iron.

While the strength of the sand-cast piston is ordinarily sufficient for requirements, the increase of strength inherent to this Cothias process is, or should be, welcome, and the tensile strength will range between 25,000 and 30,000 lb. per square inch—quite a little higher than that of ordinary iron. As of passing interest, a case is recalled where some sand-cast pistons of scanty proportions failed a few hours after they had been put into a motor. Later pistons of identically the same design were produced by this process, and are running to-day, at last accounts, the mileage being considerably in excess of 10,000.

From the standpoint of manufacture, also, the permanent mold piston is a better and cheaper proposition. Usually pistons come from the molds with not more finish than may be ground off in one operation. The reference to grinding is made advisedly, for while it may be true that some aluminum alloy pistons cannot be satisfactorily ground, Lynite permanent mold pistons may be, and are being successfully ground in production.

Kerosene is a satisfactory grinding medium, and I also believe, turpentine will do very nicely.

The wristpin holes are cored and brought closely enough in size in some cases to require a reaming operation only.

An advantage also measured in dollars and cents is that the percentage of pistons found defective in the shop after machining operations have been performed upon them is very much less than that of sand-cast pistons found defective after a similar expenditure of time and labor. In this connection the superintendent of a plant manufacturing high grade motor cars,—the motors of which having had aluminum alloy pistons as standard equipment, for some time and Cothias process pistons for several months,—recently told me that their defective loss had dropped 90 per cent when this change was made. Foundry practice, respecting sand castings, it is doubtful, will ever be refined to a point where allowances for finish need not be as liberal as presently required. With the exercise of the greatest care piston sand castings will vary from one to another. This excess stock represents quite a bit of metal for which the foundry quite properly must be paid, and yet which not only usually represents a dead loss, but also in most cases represents an additional item of expense, in that additional operations for its removal are required.

The Use of Ribs

Relative to design, this may follow very closely that for the iron pistons. However, in my opinion it is advisable to rib the head, the better to carry away the heat from it, in this way eliminating the possibility even, that the continued subjection to high temperature result in a gradual deterioration of the metal. Whether one rib or two be employed if the rib in the plane of the bosses is dropped down to them, stiffness is given where stiffness is required and the ring-carrying portion of the piston more rigidly and strongly bound to the rest of the piston.

Oscillating the Pin in the Piston

There are as many advocates of the practice of oscillating the pin in the piston as there are of locking the pin in the piston and rocking the rod. While each has its advantages, the former construction is certainly the cheaper, and where used the results have been uniformly highly satisfactory. I have examined pistons of this type that have seen many thousands of miles service, in which the wear in the wristpin holes was not measurable.

Whenever it is possible, it is wise to increase the length of the piston, possibly 25 per cent. This of course, gives more bearing surface. It is also good practice to increase the width of the first land, also to fit the rings rather more tightly than is customary in fitting rings in iron pistons. The reason for this is self-evident.

The Question of Expansion

One question that invariably arises is relative to the greater expansion of aluminum, and the clearances required. No set rule can be laid down. The proper clearances must be determined by experiment for each particular type of motor. In many cases if the piston barrel is tapered, it is possible to eliminate entirely piston slap.

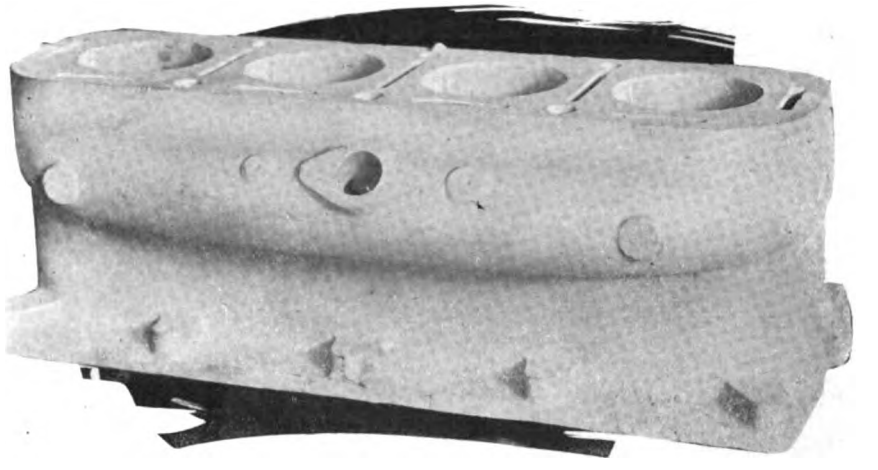
Hourglass Type Gains

At the present time, the manufacture by the Cothias process of pistons of a design providing for the employment of a so-called wiping ring at the bottom of the skirt is not a commercial proposition, where strict adherence to conventional design is insisted upon. However, as the process adapts itself to the manufacture of pistons of the "hour-glass" type, the same end may be attained. The prejudice against this type of piston is rapidly disappearing. Many who were skeptical six months ago are no longer so, and you will be interested to know that one of the largest manufacturers of motors in the country has standardized on Cothias process pistons of the general "hour-glass" type.

I believe it entirely proper to remark in conclusion that my company already has in hand orders aggregating a half-million pistons, pretty fair evidence that the aluminum alloy piston has arrived.

Lower Weight—Higher Efficiency

A. L. Clayden Answers F. R. Porter—Thinks Weight and Performance Will Be Sales Factors in Future



At the right is illustrated an aluminum casting for a Knight motor which will have no cylinder liners but will use cast iron valve sleeves and aluminum pistons. This is an experimental job, but if successful it is likely to be followed by regular production. The saving in weight is considerable. Aluminum cylinder heads have been used on Knight motors before with perfect results, but this is the first all-aluminum attempt

DETROIT, MICH.—Editor THE AUTOMOBILE:—In his letter published in THE AUTOMOBILE for Sept. 2, F. R. Porter states that he thinks the automobile of 1917 will have to carry seven passengers with a motor of not more than 200 cu. in. capacity and argues therefrom that every part of the engine will have to be made from the strongest possible material. Far be it from me to venture any prophecy in definite terms, for I know full well I should never have predicted the twin fours and sixes, and experience teaches that prediction in the automobile field is somewhat risky, but I am tempted to tilt a lance with Mr. Porter on this subject in the light of past experience.

Naturally, I am always a little liable to argue from European experience as a basis, but on the question of motor efficiency it is unobjectionable to do so because Europe has tried out engines with the maximum of volumetric efficiency possible to date. A year ago, when the British and French manufacturers were getting ready their 1915 designs that would have been seen last fall, had it not been for the war, it was quite noticeable that the tendency was distinctly toward a slight *reduction* in volumetric efficiency.

Efficiency Can Be Carried Too High

This was because the ultra high efficiency motor is ultra sensitive to any sort of derangement, is ultra costly to build and is ultra heavy for its power. In this connection it may be well to look at aeroplane engine development. It was thought in Europe in 1912 that the best possible engine for aeroplane work would be one following the ideas of the racing car motor, and I confess without shame to having supported this notion, finding myself in such good company as that of F. W. Lanchester and many other expert engineers. But actual trial showed that aeroplane engines of low volumetric efficiency gave better results in practice; that engines built with the sole idea of obtaining the most power from the least weight were altogether different from the high efficiency engines that the racing car had brought into being. Broadly, the explaining reason was that the racing car engine was so highly stressed that it had to be heavy if reasonable reliability was to be obtained.

Coming back to the car again, Mr. Porter has suggested 200 cu. in. as the ideal size. Now, in 1912 and 1913 one of the most popular sizes for European automobile engines for cars with a four- or five-passenger capacity was 3 liters or 183 cu. in. roughly, and many such motors developed a maximum power of from 45 hp. to 65 hp. at about 3000 r.p.m. which is 1 hp. for each 3 cu. in. approximately.

Use of these engines showed that poppet valves were troublesome, because the power fell off so fast if the tappet adjustment was a hairsbreadth out of true, if the ignition was not in perfect condition and if the carbureter was not highly tuned. With Knight motors the efficiency did not depend upon the valves, of course, but the very high-efficiency Knights had their troubles none the less.

As a consequence the 1914 engines were a trifle larger than the 1913. Several makers changed from a millimetric bore and stroke of 80 by 130 mm. to 80 by 150 mm. or even to 90 by 135 or 150 mm. Cars which had been regarded as wonders for their engine size were made better performers, between the 1913 and 1914 seasons, more by increased dimensions than by increased mean effective pressure or increased speed, and if the 1915 cars had appeared it would have been seen that this tendency had persisted.

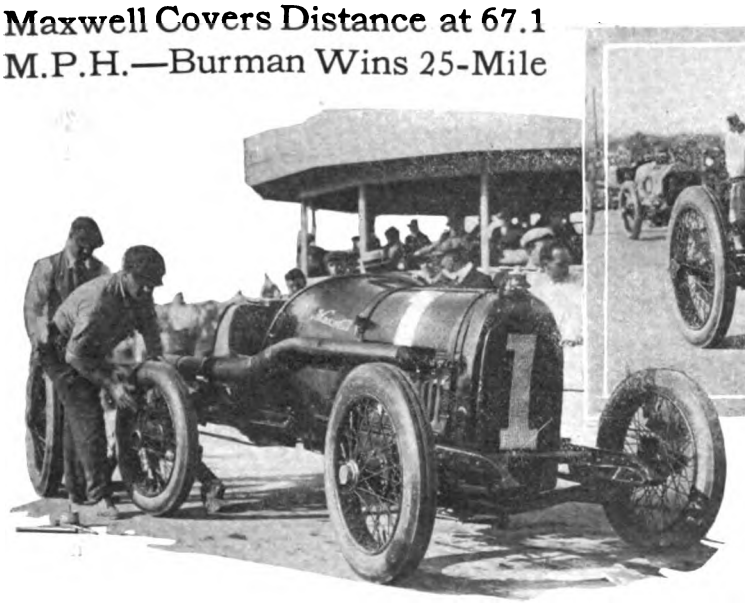
What Is Efficiency Limit?

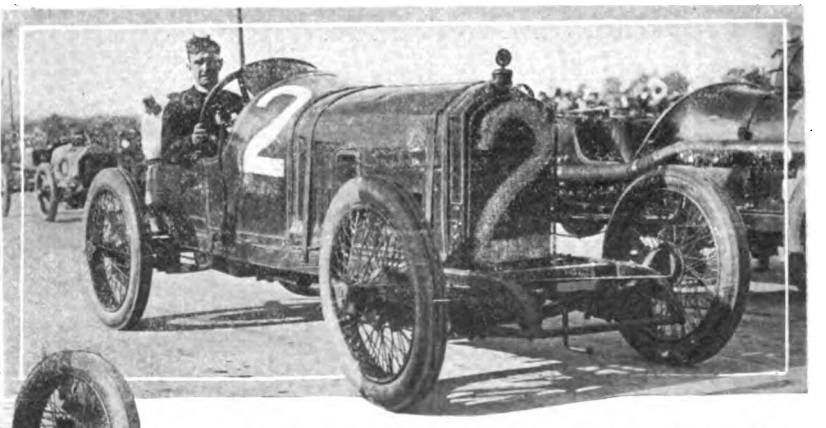
Whether we have reached the useful limit of horsepower yet remains to be seen, but it stands to reason that there must be a limit. There must be an explosion pressure beyond which it does not pay to go. The conditions of an automobile motor are so complicated, and an automobile engine has to do so many things no other kind of engine is asked to do. I do not for a moment say that higher mean effective pressures will not be used in the future, but I do think that we are near the limit unless the whole scheme of the motor undergoes some change. If there is a type of gasoline engine which has not yet been discovered, anything may happen, but with the present poppet valve or Knight motors I feel fairly confident that reliability will be difficult of attainment if we increase the pressures much above 1 hp. for each 3 cu. in. at maximum power, or if maximum power is developed at speeds much above 2800 r.p.m.

Again let me say that all sorts of things *may* happen, but confining attention to modern experience I think we have the limit of pressure for an internal combustion automobile engine well in sight—for commercial work that is, though perhaps not for racing. If this be agreed upon, then I think it is most probable that the free use of aluminum and the copying of aeroplane constructors' practice will help the automobile manufacturer and the motorist more than anything else. I think that we are nearing the day when nobody will care much how many cubic inches a motor has, but will regard only the weight and the ability. In other words, the performance on the road and the cost of that performance in fuel, oil and tires. It is emphatically the car that is light in weight by comparison with the passenger load it can carry which is going to come out on top.—A. LUDLOW CLAY[illegible]

Rickenbacher Wins Narragansett 100-Mile

Maxwell Covers Distance at 67.1 M.P.H.—Burman Wins 25-Mile





Above—Bob Burman in his Peugeot which won the 25-mile race on the Narragansett Park speedway last Saturday with an average speed of 69.76 m.p.h.

Left—Rickenbacher changing a tire on his Maxwell which won the 100-mile event at an average speed of 67.1 m.p.h.

By James T. Sullivan

PROVIDENCE, R. I., Sept. 18—Eddie Rickenbacher, in a Maxwell, won the most sensational automobile race ever seen in New England when he captured the 100-mile contest here to-day averaging 67.11 m.p.h. He came from behind and by sensational driving made up lost laps and then swept into the lead. His time for the 100 miles was 1 hr. 29 min., 24.75 sec., an average of 67.1 m.p.h. This is claimed to be a new record for the distance on a 1-mile track, the old record having been held by Tom Alley in a Duesenberg, made at Minneapolis in 1914 and which was 1 hr., 31 min. 30 sec., or 65.57 m.p.h. Another record claimed to have been made was that for 1 mile by Bob Burman before the race started when he circled the track in 45.73 sec., the 46.20 made by Louis Disbrow in St. Louis a year ago having been the best previous mile on a 1-mile track.

The races were staged on the new Narragansett Park speedway, an old horse track that has been asphalted. The curves are banked about 25 deg. and the track is 50 ft. wide. It was stated by F. E. Perkins, head of the Narragansett Park speedway organization, that there were 40,000 people present, there being 38,000 paid admissions.

The big race started shortly after 3.30 p. m. with fourteen cars lined up in two rows of five and one row of four, with about 10 yd. between each row. They were sent around for a flying start and they kept well together so that they got the flag on the first time around. Then the race was on in earnest. And from beginning to end of the 100 miles only four of the contestants did not stop, Burman, De Palma, Haupt and Jones. The asphalt seemed to wear the tires, particularly as they went around the banked curves where the cars bounded a bit, showing the track was somewhat rough. The weather was ideal for the race, cool and bracing, but it had been so hot previously during the tryouts of the previous days that the carbureters had to be adjusted.

Rickenbacher shot into the lead on the first lap, but was crowded back into third place before the second mile ended. There he held his place, watching the speed of the others and always within 50 ft. of the leader.

Rickenbacher Falls Behind

But he had to stop in the fifteenth lap with carbureter trouble. Before he got going the leaders had passed around three laps. Rickenbacher cut loose, however, and very soon it was apparent that the little car with 1 on its radiator was coming around very frequently. First it was noticed that it had regained the laps lost to the tailenders of the field. Then when 33 miles had been covered he had won back a lap, the leaders being 33 and Rickenbacher 31. Soon he was in third place. De Palma then started a spurt, whirling past Burman and trying to lengthen out the distance, but he could not get very far, for Burman was always within 10 yd. of him.

De Palma had the lead in the 37th mile and from that time to the 57th, or a distance of 30 miles, he kept in the van. But every time he and Burman made a mile in 54 or 55 sec., Rickenbacher did it about 50 or under. So he continued to cut down the lead. Before 50 miles had been reached he had circled all the others again and so they were then but 1 mile ahead of him.

Burman then began to show signs of speed, and to tear away from De Palma, having passed into first place on the 58th mile. And each mile while Burman was leaving De Palma behind, Rickenbacher was gaining on both. The spectators then began to sit up and shout. And the shouting encouraged Rickenbacher, for he smiled and let his car out a little faster.

When 60 miles had been reached he was swinging around the upper curve with an abandon that seemed reckless, for he appeared to be handling the car like a toy. It

would whirl around and the rear wheels would start for the sky or the upper edge of the track only to get yanked back like an unruly horse that shied at a street car.

Then it would roar down the track with the driver laughing and nodding to his pit attendants, who held up blackboards telling him how fast he was going, his position, etc. Having evened up matters it was then his plan to get the lead. De Palma was the first he went after and when he had swung over the line on the 72d mile and the cars tore around the first quarter, Rickenbacher went into second place.

It was now Burman only that separated him from first place. Then the real race began. One hardly realized that the Maxwell had passed when it was around again. It came so fast that people mistook it for some other and they asked where it was, not knowing it passed.

When the cars came whirling down for the 73d mile it was seen that Rickenbacher was closing up on Burman. The latter passed over the line 5 sec. ahead. There was no question then of the outcome, it seemed. On the next lap they tore down side by side and it seemed as if Rickenbacher was playing with Burman. On the next mile they crossed the line with Burman 4 ft. in the lead. For two more laps they swung around side by side and then entering the 77th mile Rickenbacher seemed to infuse new life into his car and shot into first place. When he went over the line on that mile he was 9 sec. ahead of Burman.

Meanwhile De Palma seemed to have lost heart and was slowing up. As they went around on the 80th mile Rickenbacher was close to De Palma and on the next mile had passed him, giving Rickenbacher a full lap lead, thereby making up four laps in about 65 miles.

Meanwhile his lead over Burman increased and at 85 miles he was 27 sec. ahead, which was equal to a little more than ½ mile. The spectators began to expect him to lap Burman then. But when he had gone 90 miles and was about ¾ mile ahead he began to slow down and drive safely. Burman was trying to make up the lost distance, but could not do it.

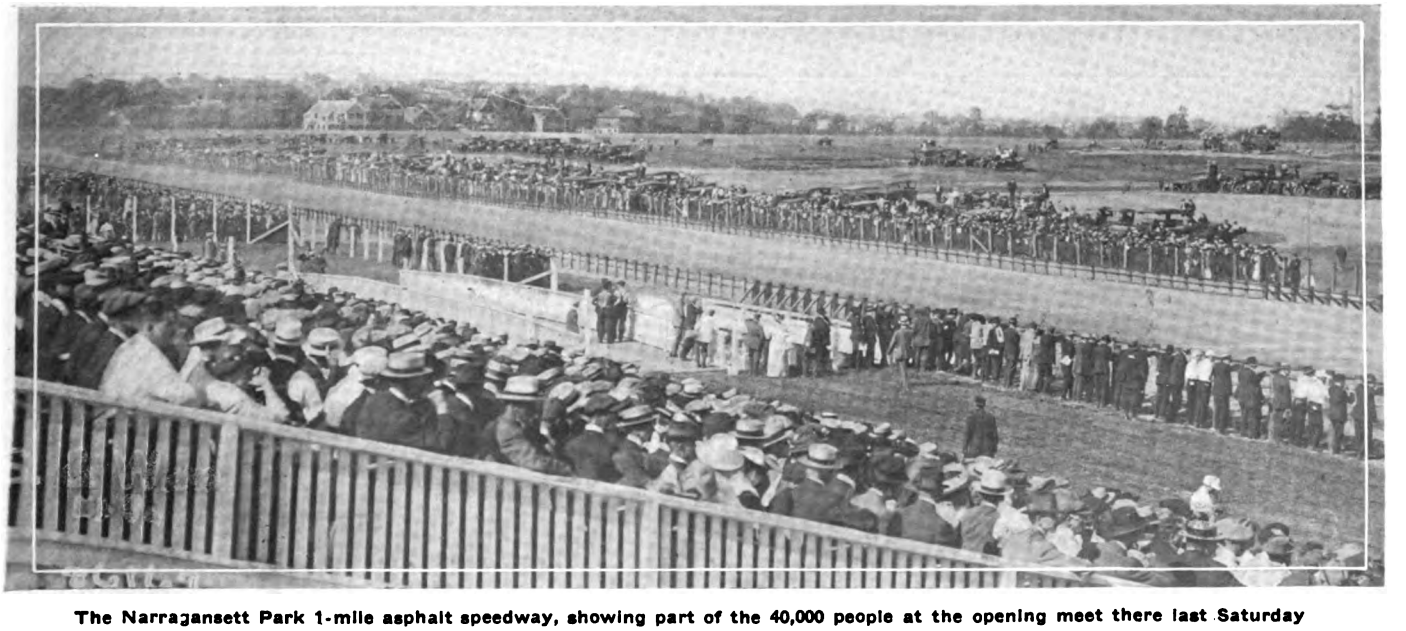
Willie Haupt then came along and passed De Palma. So as it neared the 100 miles everyone was resigned to Rickenbacher's win. And he crossed the line amid a great ovation, with 1 min. and 1 sec. to spare. Burman finished second, Haupt third and De Palma fourth.

Burman Wins 25-Mile Race

The 25-mile race was not very interesting. There were eight starters and it proved a jockeying match between Burman and De Palma, neither getting far in the lead at any time. Finally Burman shot over the line 50 ft. ahead of De Palma with Haupt third and Jones fourth. Burman's average was 69.76 m.p.h. for the race. Stops were unofficially given as follows:

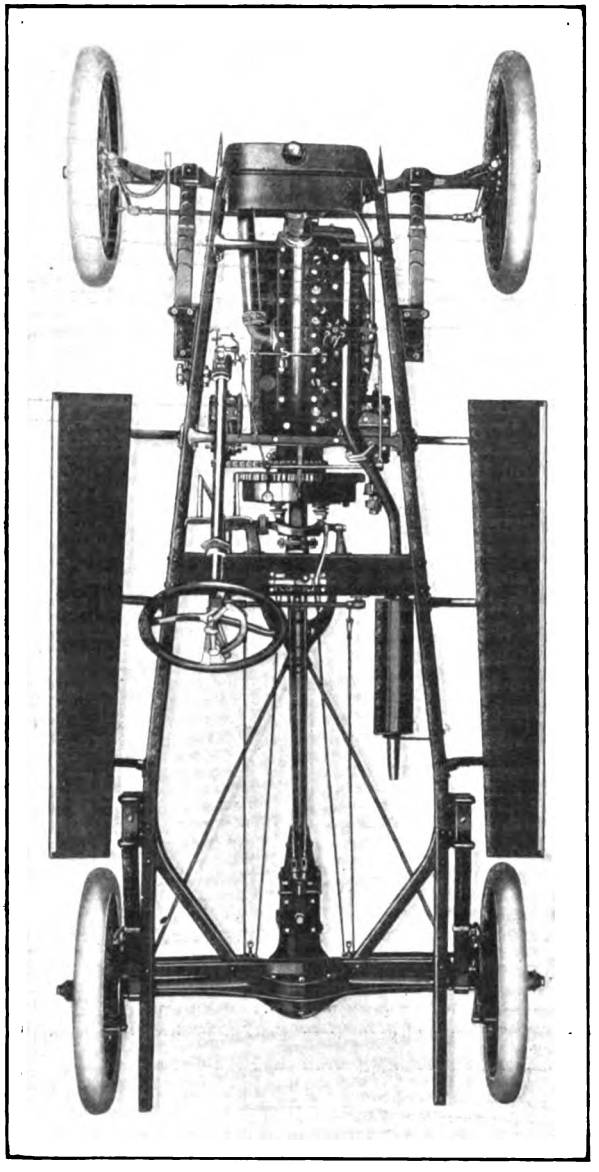
Richenbacher stopped in the 15th mile to adjust carbureter. Lost 2½ min.
Henderson, Duesenberg, 47th mile to change tires.
Vail, Mulford Spl, stopped on the 25th and 60 miles for tires.
LeCain, Pugh Bros. Spl, out in 15th mile with broken clutch.
Cleary, Bugatti, stopped in the 8th, 42, 50 and 75th miles for tires.
Dickenson, Stutz, stopped on 3d, 45th and 75th mile with steering gear trouble that finally put him out of race in last stop.
Myers, National, stopped in 25th and 45th mile for tires.
Stricker, Erwin, stopped in 32d mile for tires and 45th for carbureter trouble.
Grant, Sunbeam, stopped in 42d and 48th miles for spark plug trouble.
O'Donnell, Duesenberg, stopped on 4th and 13th miles for carbureter trouble that put him out of race on second stop.

Rickenbacher's winning Maxwell and Burman and Haupt's Peugeots used Oilzum throughout the race and practically all the cars except the Sunbeam used Boyce Motometers. Nearly all the cars were equipped with Goodrich Silvertown cord tires.



The Narragansett Park 1-mile asphalt speedway, showing part of the 40,000 people at the opening meet there last Saturday

Saxon Adds Roadster on Six Chassis



Plan view of the Saxon six chassis for 1916

Two-Unit Electric Starting and Lighting System Replaces Single-Unit Type on Six— Bodies of Both Four and Six Improved

THE new series Saxons of the Saxon Motor Car Co., Detroit, Mich., will cost the buyer just as much as they did before, but they have a number of improvements and refinements which really make the cars strikingly good values. The little Saxon roadster still commands a figure of $395, though it is fitted with a three-speed gearset instead of two speeds, and there are other differences such as a much more attractive body line which brings the cowl up to meet the windshield in neat fashion.

The six price is $785, and besides the touring car model, a very attractive roadster is fitted to the chassis at the same price. Perhaps the most important change in the six is the adoption of a new type of electric starting and lighting system of two-unit form which replaces the single-unit type of the previous series. Besides this, there are a number of body refinements and a few little changes in the mechanical end which lend to the greater efficiency of the vehicle.

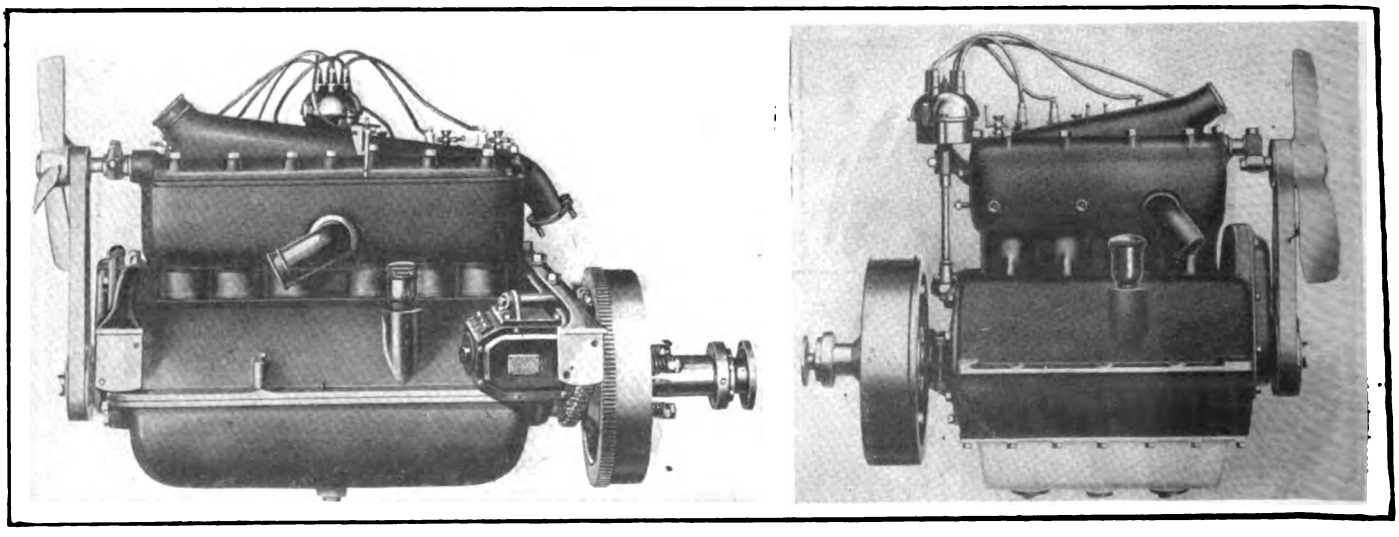
Briefly, the roadster specifications take in a 15-hp., 2¾ by 4-in. motor, a three-speed selective gearset in unit with the rear axle, dry-plate clutch, left steer with center control, wheelbase of 96 in., cantilever springs and 28 by 3 tires.

Reviewing the details of the six, one immediately sees that the characteristic appearance of the car is not changed. It still retains the high, narrow radiator and the nicely-shaped body. The motor has a bore of 2⅞ in. and a stroke of 4½ in., and the gearbox is also on the rear axle, which is a three-quarter floating construction. Cantilever springs, dry-disk clutch, wheelbase of 112 in. and 32 by 3½ tires are also among the specification features.

The Saxon Six

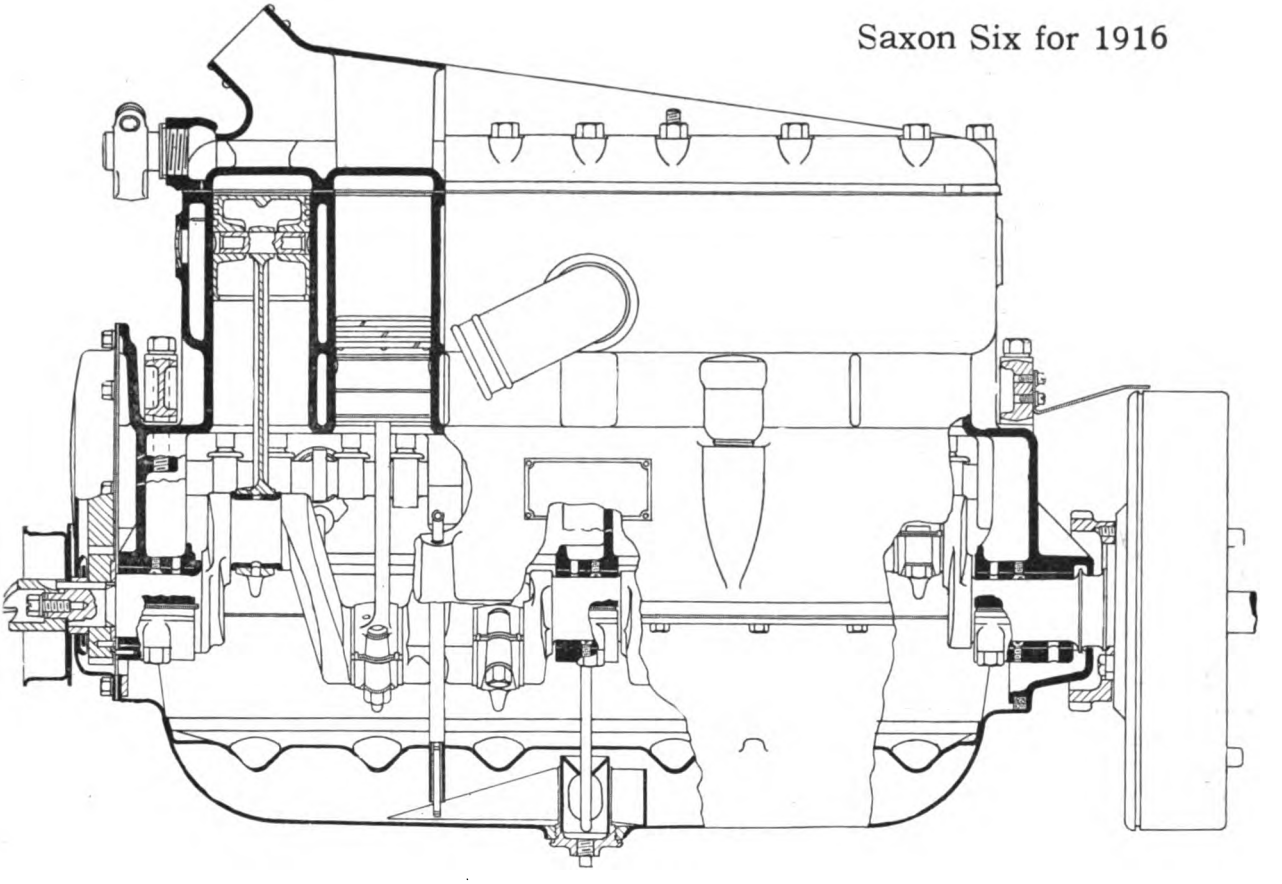
Taking up the six-cylinder car first, it should be said at the outset that the car enters its second year strikingly free from mechanical changes. This but reflects the soundness of the design in the first place, for it is not to be supposed that a company of the Saxon caliber would stand back for a minute if it were deemed advisable to make any constructional changes other than the minor ones that are to be mentioned in the new series.

In adding a roadster body to the six chassis, the Saxon company makes a wise move, for there is unquestionably a large field for roadsters of the lighter type, and the chassis adapts itself readily to this

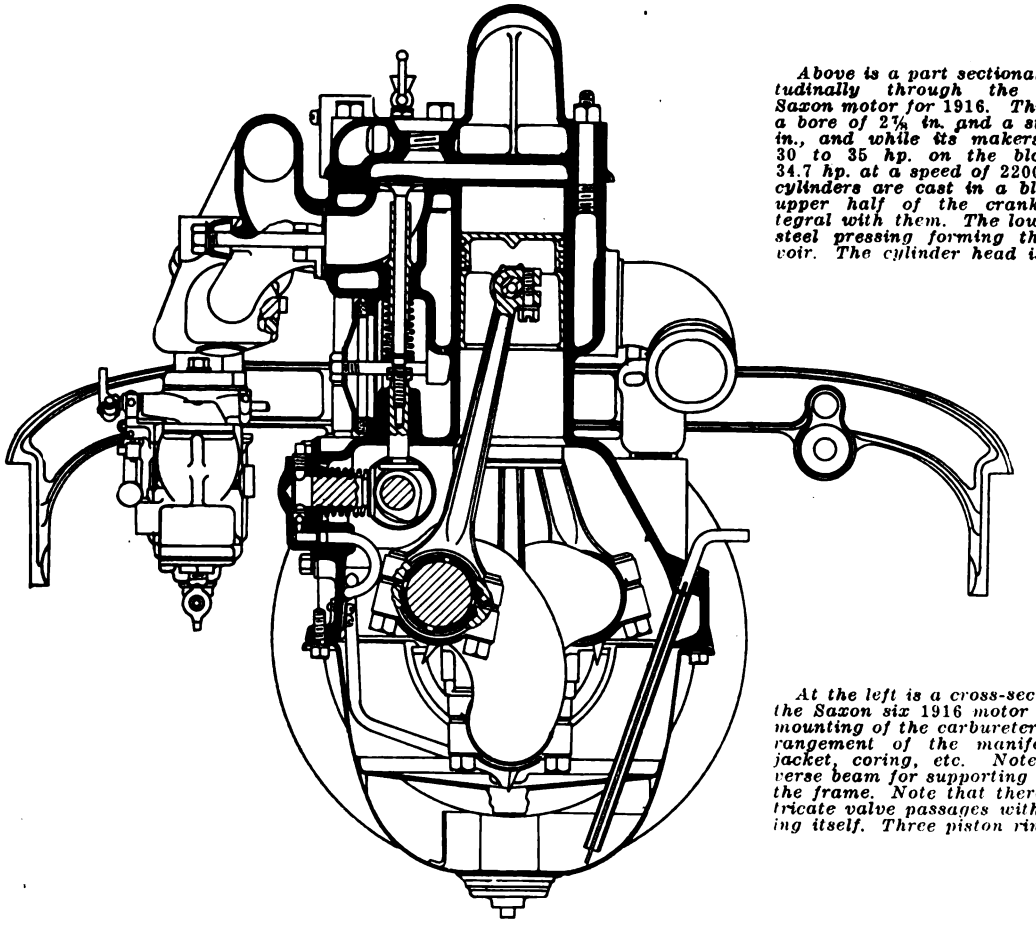


Left—Left side of Saxon six motor showing electric starter. Right—Right side of Saxon four motor

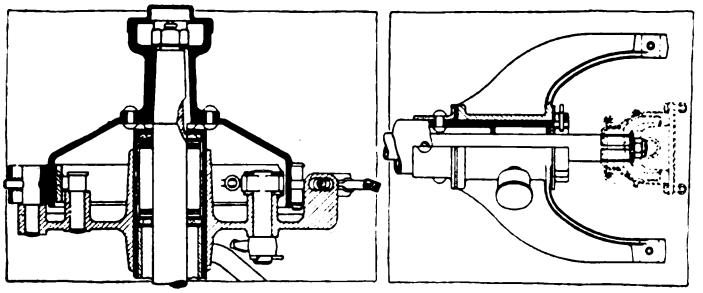
Saxon Six for 1916



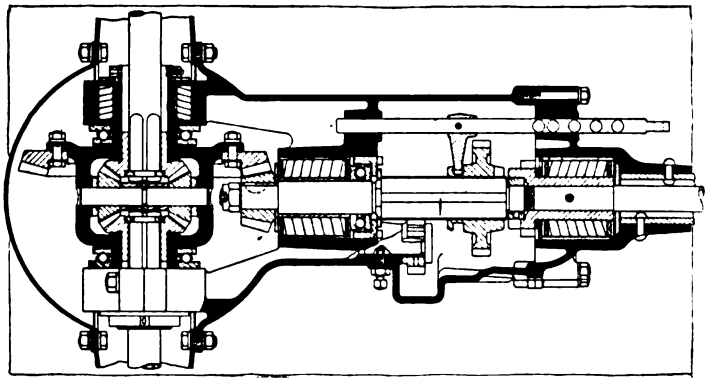
Above is a part sectional view longitudinally through the six-cylinder Saxon motor for 1916. This motor has a bore of 2⅞ in. and a stroke of 4½ in., and while its makers rate it at 30 to 35 hp. on the block it gives 34.7 hp. at a speed of 2200 r.p.m. The cylinders are cast in a block and the upper half of the crankcase is integral with them. The lower half is a steel pressing forming the oil reservoir. The cylinder head is detachable



At the left is a cross-section through the Saxon six 1916 motor showing the mounting of the carbureter and the arrangement of the manifolds, water-jacket, coring, etc. Note the transverse beam for supporting the motor in the frame. Note that there are no intricate valve passages within the casting itself. Three piston rings are used



Left—Characteristic hub of the 1916 Saxon. Right—Yoked front end of the driveshaft torsion tube which hinges to a frame cross member



Rear axle and gearbox in unit with it used on the Saxon four

body without change over the touring car type. A most attractive design of two seater has been evolved—one in which the rear deck is in good proportion to the hood, thus giving a well-balanced effect. Too often body designers make the mistake of dropping the rear deck too abruptly, giving the idea that they simply added a rear deck to cover the rear end of the frame. But Saxon has not made this mistake. The design, in fact, is such that the rear compartment will take a spare tire or two, so commodious is it.

Body sides of the touring car have been raised slightly by the addition of a piece of molding running all the way around the top edge of the body. This is known as a garnish strip, and it does much to add a finishing touch. Tonneau seats have come in for 1 in. of widening, this bringing them to 46½ in. and giving room for three reasonably large persons. To make riding more comfortable in the front seat, the seat back has been given a slightly less vertical position. It tilts to the rear 1 in. more than it did in the previous model. A point which adds to the general good looks is the use of plain upholstery without tufting. That is, the folds run straight instead of diverging to tufting buttons.

The new sixes will also appear in a different standard color. It is a very pleasing shade of olive green—a color known to the paint trade as Cadillac green. This seems to dress the six up in genteel style, and is a welcome relief to the somber deep blues and blacks that are all too prevalent in standard body colorings.

Two-Unit Electric System

The chief mechanical change, as already mentioned, is in the adoption of a two-unit electric system. This is the product of the Detroit Starter Co. and both motor and generator are compact and well mounted on the engine. The two units occupy positions on opposite sides at the rear. The starting motor is placed on the right and hangs from the rear motor supporting arm. It connects to the flywheel gear through the Bendix automatic shifting device. The reduction is 10 to 1 between engine and electric motor, and the latter is capable of turning a motor somewhere in the vicinity of 100 r.p.m.

Hung off the left rear motor supporting arm, the generator is chain driven from the crankshaft. This drive is just between the flywheel and the rear of the engine. To afford adjustment of the chain and to make a simple mounting of the electric unit, a trunnion construction is used. A plate on the top of the generator fits into a trunnion pin attached to the supporting arm, and the generator can be rocked closer to or away from the engine to give the required adjustment of the sprocket centers. Two set screws hold the generator in place. The generator runs at twice engine speed.

Charging regulation is obtained by the use of a Ward Leonard regulator which cuts in at 10 m.p.h., and holds the charging rate at a prescribed maximum regardless of the engine speed.

Saxon axle equipment is now made by the Timken company, and has been for several months. However, the present axles are of practically the same design as they were formerly, although a notable change made some time ago was the adoption of spiral-bevel gears in the rear axle. There is no longer any doubt of the efficiency or noise eliminating features of this very modern form of gearing, and further dilation upon it would be useless here.

34.7 Hp. at 2200 R.P.M.

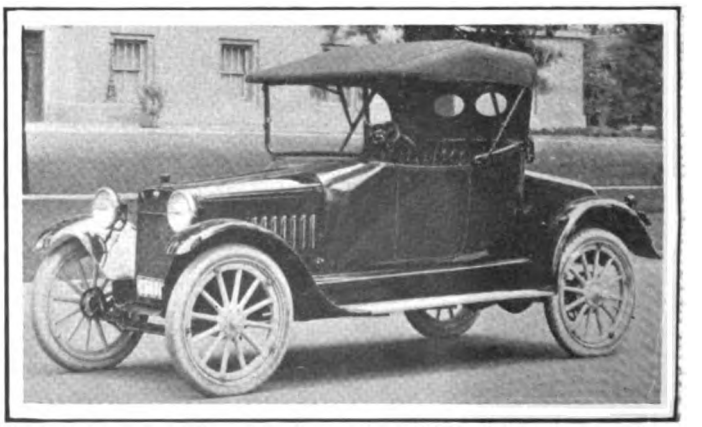
On the block the six-cylinder motor gives 34.7 hp. at a speed of 2200 r.p.m. Its advertised rating is from 30 to 35 hp., so that it does all that is claimed for it. At first glance, the most noticeable thing about this power unit is the compactness. The cylinders are cast in a block, and the upper half of the crankcase is integral with them. The lower half, which also forms the oil reservoir, is a steel pressing, which is light and smooth of form. The cylinder head is detachable, bolting by a number of heavy studs to the cylinders proper, and incorporating as an integral part the large water outlet connection to the radiator.

Valves are on the right, having the usual complete inclosure against dirt and noise. On this side are also both manifolds which are separate castings bolting to the block. A simple cylinder casting is therefore obtained, as there are no intricate valve passages within the casting itself. The Rayfield carbureter is positioned at about the center of this side of the engine so that it is readily accessible.

Interior features offer nothing out of the ordinary for good practice. Valves have nickel-steel heads welded to carbon steel stems. Pistons and rings are standard, and a slight change this year is the substitution of a Burd high-compression ring at the top of each piston for the former eccentric ring. The other two rings for each piston, however, remain of the eccentric type. Four bearings support the camshaft, the drive for which is by helical gearing, and there are three main bearings for the crankshaft. Bearing dimensions follow:

Front main	1 7-8 by 1 1-2
Center main	1 7-8 by 1 7-8
Rear main	1 7-8 by 3
Connecting-rod lower ends	1 7-8 by 1 1-2

(The first dimension is the diameter.)



New Saxon six roadster which lists at $785 with complete equipment

Atwater Kent distributer ignition is employed, and there is one slight change in connection with it. That is the moving of the spark plugs from over the exhaust valves and placing them over the intakes. This was done to give the plugs longer life and keep them cleaner. The exhaust gases sweeping by the plugs subject them to greater heat than they have to undergo over the intakes.

Splash lubrication finds good application in this motor. There are individual splash troughs under the rods, and circulation is maintained by a pump, with leads to the main bearings. Cooling is also very simple through the use of the thermo-syphon system in connection with a cellular-type radiator and belt-driven fan.

Rear-Axle Gearbox

Continuing back of the power unit, the car possesses a multiple dry-disk clutch, alternate disks being steel against Raybestos. This clutch is housed in the flywheel. There are two engagement springs, making for uniform action. Then, after passing through a universal, the drive shaft enters a torsion tube. This has the usual yoked front end, hinging to a substantial frame cross member. At its rear end the tube attaches to the front of the gearbox, and the latter in turn is a unit with the front part of the rear axle housing. Diagonal brace rods run from the outer ends of the axle housing to the front of the torsion tube.

In this design of attaching gearset to rear axle, a compact form of gearbox is used, this of the three-speed selective type. The shifting rods run along the top of the torsion tube from the gearshifting levers.

The Saxon company has been very successful with cantilever springs, these being used on both cars. They are constructed of vanadium steel, and are mounted outside of the frame rails on riveted brackets. These springs are 2 in. wide, 30 in. long in the rear and 27¾ in. in front on the six.

Of rather unusual form is the frame, which has a straight taper from a point a little forward of the rear axle. This is done to bring it to a narrow front and to offer a good support the entire length of the body.

The Saxon Four

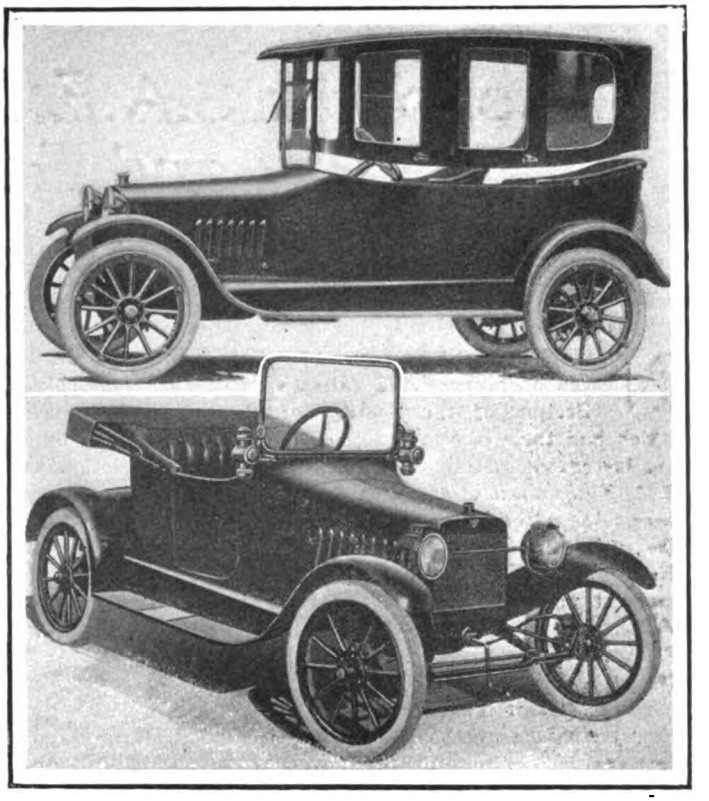
Flexibility of the little Saxon roadster and better ability for negotiating all sorts of going is given by the addition of the intermediate speed in the gearset. In the previous models, there was no speed between low and high, and the change will be appreciated.

The noticeable thing about the new roadster, however, is the change in the front part. The former windshield filler skirt has been entirely done away with. This was a piece of cloth used to bridge the gap between top of cowl and bottom of windshield. The new body cowl is brought up to meet the windshield without break, and it adds a nice touch. Along with this improvement, the windshield itself has been enlarged and made ventilating. That is, it is hinged to swing either way, and when the top is swung outward, there is some space below for air to sweep in.

Although electric starting and lighting are not standard on this car, the cost of equipping it with a single-unit Detroit Starter Co. system has been cut from $70 to $50 extra. This means that a full electric-equipped vehicle may be had for $445. However, instead of having only gas headlamps as the standard lighting equipment, oil side lamps have also been added, these in addition to the acetylene lights at the front of the radiator.

Another refinement is the fitting of adjustable clutch and brake pedals so that a driver of any height may be comfortably accommodated. The brakes have also been improved by making them 2 in. wide instead of 1½ in. This gives added braking power on the 8-in. drums.

As in the six, the axles are now made by Timken though of the same design as in the past, except that the front wheel spindles have been changed to a better steel. They are now a chrome-nickel steel, whereas they used to be constructed of 15-20 carbon steel.



Above—Saxon six touring car with detachable inclosed top which sells for $935, including the touring car top as well as the demountable type illustrated. This car sells for $785 without the demountable top. Below—The new Saxon four-cylinder roadster which, with three-speed transmission, larger body, adjustable pedals and other refinements, sells for $395

In the tire equipment, although the size remains the same as last year, the tires are really better for instead of using motorcycle tires, the Goodyear factory is furnishing a strictly automobile design of tire. The main difference between them is that the tread is heavier, this spelling longer wear.

Motor Similar to Six in Design

There are no motor changes other than the fitting of a Burd ring at the top of each piston instead of an eccentric ring, as is also done in the six. Though smaller, the motor is much the same in general design as the six. It is a block type with cylinders and upper crankcase in unit. The head is detachable and also carries a large water outlet for the thermo-syphon cooling system.

Ignition is by Atwater Kent, with the distributer vertically placed at the rear of the motor cylinders. A Mayer carbureter is used, the supply tank being in the cowl. Similar to the six, the engine is oiled by splash, with a pump supplying the troughs and the main bearings.

In the chassis, the design follows closely the recognized Saxon practice, with concentric torque tube inclosing the drive shaft, and with the gearset mounted as a unit with it and the rear axle. The latter is semi-floating, having a pressed steel housing.

Following the popular trend, Saxon has added detachable tops to its line. These are intended for fitting to either the four-cylinder roadster or the six-cylinder touring car. They virtually inclose the car against any kind of weather, and a good scheme of attachment by bolts and catches is employed. The front fits the side supports of the windshield snugly. For the touring car, this top costs $150 extra when bought with the car, and for the roadster the price is $60 additional.

Metropolitan S.A.E. Discusses Aeroplanes and Governors

Paper by Leon Goldmerstein Traces Development of Aeroplanes—Final Report of Research Committee on Governors

NEW YORK CITY, Sept. 17—Fine attendance marked the opening of the fall season of the Metropolitan Section of the Society of Automobile Engineers which had their meeting at the Engineering Society's building last night. More than 100 members of the section and S. A. E. members of the Metropolitan district were in attendance to hear the interesting program made up by a paper on the aeroplane by Leon Goldmerstein, M.A., M.E., and the final report of the Research Committee on Governors presented by chairman H. G. McComb, engineer of the General Vehicle Co. The other members of the committee are, C. W. Fletcher, vice-president Walter Motor Truck Co., and A. M. Wolf

The report of the Research Committee on Governors completely summed up the activities of this body and marked a very valuable study of the governor as applied to automobiles. The report completely classifies and discusses the various types and thoroughly covers the patent situation of this device. The paper on the aeroplane was one which was well calculated to interest the engineers as it completely treated of the development of this art up to its present stages.

Mr. Goldmerstein prefaced his lecture by pointing out the growing similarity in the aims and work of automobile and aeroplane engineers. He then gave figures to show the enormous progress of the aeroplane industry caused by the war in Europe. Up to the present time this progress had not been accompanied by as careful a study of aeronautics as a science as could be desired, especially in this country. In Europe, although the manufacturing resources are perhaps not so great as in America, much more laboratory work has been done. The war has shown that the most useful type of aeroplane was one capable of carrying a crew of two to six men and a large load of bombs for attack. The recently completed Canada aeroplane made by the Curtiss company for the Allied forces which carried a load of 1 ton and attained a speed of 95 m.p.h. was mentioned as a good example.

The theory of the aeroplane was then dealt with by Mr. Goldmerstein with the aid of diagrams and some mathematical formulae which the lecturer assured his audience were very simple. It was shown that a single flat plane is not stable owing to the non-coincidence of the center of gravity and the center of pressure, causing a turning moment which upsets the plane. In the aeroplane this is overcome by placing another plane, forming the tail plane, at some distance behind the front plane, the effect of which is to cause the machine as a whole to maintain a definite relation to the line of travel by providing a turning moment about the center of gravity of the aeroplane. If the tail tends to drop its lifting power is automatically increased and the resultant lift brings the main plane back into its most useful position, or angle of incidence.

Fig. 2—Below—Typical hydraulic governor

Report on Governors

The report of the Metropolitan Section Research Committee on Governors follows:

In considering the subject of governors for internal combustion engines, we might first mention the reason for their existence. Everyone to-day is familiar with characteristics of the internal combustion engine as applied to the automobile. One of these characteristics is that when the load is released from an engine the speed of the engine increases. This increase is limited practically by the size of the valves and other parts used in handling the fuel.

The governor reduces the maximum speed of the engine as limited by its valves and gas passages.

In the earlier days of the automobile the governor was much in vogue on pleasure car motors. To-day its use is ordinarily limited to the motor truck. This is, perhaps, due to two causes: the marked tendency to remove from the pleasure car every part that does not add to luxury, and the necessity, on account of maintenance costs, to limit the speed of the motor truck. It is also worthy of note that the pleasure car is usually driven by the owner, or in his presence, while the motor truck driver is usually outside of his direct control.

The governing of engines is an old art. Everyone is familiar with the flyball type of governor that limits the speed of the steam engine.

For the governing of the internal combustion engine various classes or types of governors have been employed. We may list these as follows:

(1) Hit or miss—Keeping inlet valve closed or exhaust open and so causing engine to miss one or more power strokes.
(2) Inlet valve control—Varying time of the opening or closing of the inlet valve.
(3) Ignition control—Omitting the ignition spark.
(4) Quality of fuel—Lean or rich charge.
(5) Quantity of fuel—Throttling the charge.

It is interesting to briefly consider the various types that are *not* used on automobile engines.

The hit or miss type probably came into existence on account of the low cost of construction of the governing mechanism. In this class the governor is usually nothing more than a pendulum provided with a trigger or catch that swings on the valve operating rod and hits or misses the end of the valve stem in accordance with engine speed.

The inlet valve control is a promising type but involves high cost and complication.

The ignition control type can be made cheaply but its use involves a waste of fuel in the unexploded charges, and the regulation, of course, is not close.

The quality of fuel control is too delicate a type for ordinary use.

This leaves us then only the quantity of fuel type for consideration in automobile practice. It should not be understood, however, that none of the other types are desirable, but simply that the quantity of fuel type has been the choice for development.

The quantity of fuel type controls by throttling the fuel supply after the fashion used on the cheaper steam engines in throttling the steam on its way to the engine. In the automobile this throttling is usually accomplished by a damper or other balanced valve placed in the intake pipe.

The function of the governor is to limit the motor to some determined and fixed speed.

Governor Limits

The governor may operate in relation either to
(1) The speed of the engine, or
(2) The speed of the vehicle.

In the engine speed limit type, racing of the engine is prevented. Its maximum speed is fixed. This naturally limits the horsepower output of the motor to that obtainable at the predetermined speed.

In the second type of governor where the speed of the vehicle determines the governed speed of the engine, the full output of horsepower of the engine may be obtained for low gear work when it is desirable, or even necessary, for the sake of expediency, that the engine be forced to do its utmost.

In one device on the market these two control methods have been combined.

In considering the variations of governors we come to a classification of types of quantity of fuel governors.

These governors may be subdivided into four classes, determined by the method of operation—these classes are:
(1) Centrifugal.
(2) Hydraulic.
(3) Inherent design.
(4) Gas velocity in intake.

The Centrifugal

The centrifugal governor, as generally used, consists of two oppositely disposed weights carried upon a revolving shaft, the speed of which bears a direct relation to the speed of the motor. These weights are mounted upon bell cranks, and, as the speed fluctuates, the bell cranks slide a splined sleeve axially along the revolving shaft against spring pressure. The motion of the splined sleeve is then communicated by suitable mechanism, to the throttle.

For the governor to be effective the throttle control mechanism must be arranged so that the driver is given only a limited control by means of the throttle lever, except in special cases where the governor is used only for holding the motor at *any* desired speed.

In all ordinary cases the governor has the master control, as it were. This is readily accomplished by a slotted link.

A typical flyball governor, with horizontal axis is shown in Fig. 3, while Fig. 7 shows the method of connecting the governor with the throttle. This is the governor used on the German Daimler truck.

The Hydraulic

In a modification of the typical centrifugal governor a steel ring, so supported that it can rock in relation to the shaft which drives it, is normally held at an angle with the shaft by a spring. As the shaft speeds up the governor ring tends to assume a position concentric with and at right angles to the axis of the shaft. Through the usual splined sleeve and trunnion the movement is conveyed to the throttle.

A typical governor of this kind is shown in Fig. 1, which is that used on the earlier Cadillacs.

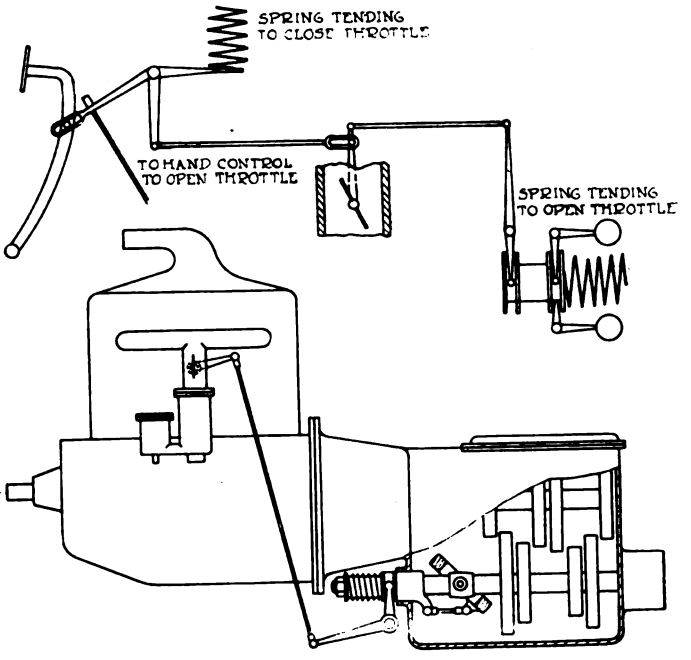

Fig. 3—Above—Flyball governor with horizontal axis
Fig. 4—Below—Governor drive from transmission shafting

The hydraulic type of governor utilizes fluid pressure from the water circulating or other system where the pressure is in relation to motor speed. The usual form consists of a large diaphragm, one side of which receives pressure from the pumped water of the cooling system, while a rod fixed in a washer or plate on the other side transmits the movement to the throttle. A typical hydraulic governor is shown in Fig. 2. This governor was, until recently, used by Packard, and has been a feature also of Panhard design.

Inherent Design

Since every motor has, from its inherent design, a limiting speed, it is apparent that this limiting speed can, by design, be made the governing speed desired. This is done, in its most simple form, by making the intake passages small.

As yet this means of motor control has not been utilized to any extent.

Gas Velocity

The kinetic energy of the gas in the inlet manifold is utilized to operate a type of governor that is extremely simple in its design and operation. An example of this type is marketed as the Kramer. In this governor a disk is placed in a funnel shaped section of the main gas passage. This disk is held in normal position by a spring. When the gas velocity reaches a predetermined speed the spring tension is such that the disk is drawn toward the small end of the funnel tube, and by suitable connections with the balanced throttle, the gas supply is limited.

Vehicle Speed Limit Type

We next shall pass to that type of governor where the motor speed limit is set by the speed of the vehicle. This method of control, as before mentioned, permits the engine to run at higher than the normally governed speed, when the vehicle is being operated on any of the gears but high. The reason for this is obvious; more power for the emergency pull on low gear. The governing means is essentially the same as designed for incorporating in the motor, but with the important difference that it receives its drive from the wheels or some part that runs in relation to car speed. In one form the governor drive is from the front wheels, Fig. 5, while in another the drive is from the transmission, Fig. 4.

It has been said that the governor might limit in proportion to engine speed or that it might limit in proportion to

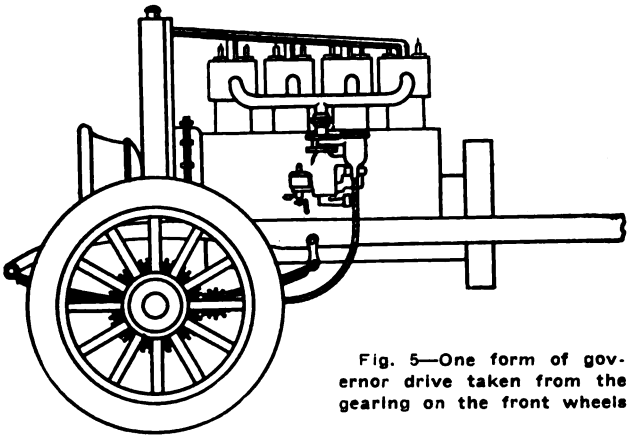

Fig. 5—One form of governor drive taken from the gearing on the front wheels

vehicle speed. One of the most interesting developments is the governor that limits in proportion to both.

In this ingeniously designed governor, shown in Fig. 8, there are two operating shafts. One of these shafts is driven by the motor and the other is driven from a part that rotates in proportion to vehicle speed, such, for example, as the propeller shaft. The shaft which is going at the higher speed, controls the motor, but the gear ratio between the engine and governor is so arranged that on direct drive the vehicle speed operates the governor connection from the motor. In other words, on direct drive, the ratio with the propeller shaft, for example, may be such that when the propeller shaft is going 800 r.p.m., the governor may be going 1000, and as it controls the motor at this point the motor is really governed to 800 r.p.m. However, the ratio between the motor and governor may be so arranged that the motor speed would have to be 1500 r.p.m. before the governor reached the critical speed of 1000 r.p.m.

It will be seen that through this method of governing, while the maximum speed of the car is limited on the top gear and the engine governed in proportion, should the driving become difficult on account of hills or heavy road resistance—in other words, should road conditions so change as to necessitate using some of the lower gears, the governed limit of the motor is raised so that the motor can be permitted to develop its full horsepower.

In this governor a grid type of throttle is used in which the openings are proportional to the angular movement of the throttle axis and in which only a small angular movement is necessary to completely close the throttle.

Another scheme to accomplish the same result forms the basis of a patent granted to H. Saurer. In this governor an auxiliary spring, operating in relation to the gear shift, augments the governor spring when the gear shift is in certain positions. This is shown very completely in the patent office drawing of the Saurer patent No. 13,348. The purpose of the Saurer scheme is to decrease the engine speed when the vehicle is traveling on its top gear, but to allow the engine speed to be increased when the lower gears are employed. This, it will be noted, is done by means of a cam fixed to the gear shift shaft. This cam also has provision for reducing the motor speed when gears are in neutral. This is one of the most interesting types of governing mechanism.

That the governor is, at present, deemed of importance for commercial vehicle work, is indicated by an examination of the Statistics of 1915 Commercial Cars, as issued in a booklet by *The Commercial Vehicle*. Here it is found that 74 per cent of the commercial vehicles are provided with governors, which leaves only 26 per cent ungoverned. Of 142 different makes of commercial cars, with 377 different models, 279 of these have governors as follows:

Of the centrifugal type	238
Of the hydraulic type	5
Of the inherent design type	5
Gas velocity in intake	34

Through the kind co-operation of the Institute of Automobile Engineers of England, information was secured relative to English practice. Here the proportion of non-governed to governed motors was more nearly even than in America. However, this is, perhaps, traceable to better disciplined truck drivers.

Without doubt, at the present, a consensus of opinion calls for governors on the engines of motor trucks.

Governor Drive, Etc.

In connection with this subject, it is interesting to note a few of the different types of drives that are used to communicate the movement of the rotating part to the governor mechanism. In some cases, particularly where the governor is to be applied to an engine made by the builders of vehicle units, but not applied as standard, the flexible cable is in vogue.

In those types of construction where the governor is built integral with the motor we find a sturdy and simple mechanism comprising suitable bell cranks, levers and rods connecting the sliding sleeve of the governor unit with the throttle.

The governor is usually so designed that it is impossible for the driver to tamper, in any way, with its operation.

An excellent example of sealed-in governor connections is the type used on the Packard.

If we refer again to Fig. 7, we will see how the governor is given the master control through the slotted link, which permits the driver to open up the motor without, however, taking it beyond the control of the governor, since it will be noted that the flying out of the governor weights exerts a positive control of the throttle lever, which is entirely beyond control by the driver, since the slot in the slotted link is made of sufficient length to give the governor full range and thereby full control.

Positions of Springs Interesting

In relation to other details, the position of governor springs is of interest. In some designs the governor spring is arranged so that it presses against the splined sleeve that operates the governor mechanism, the spring being arranged concentric with the shaft on which the splined sleeve is fitted. This is well illustrated in Fig. 3.

In other less used types of mechanism, the governor spring operates on the end of a lever connected with the trunnion carrying the governor weights. In the Kramer governor the spring is of the spiral or clock type.

In still another type the springs act directly on the governor weights. This is clearly shown in Fig. 6.

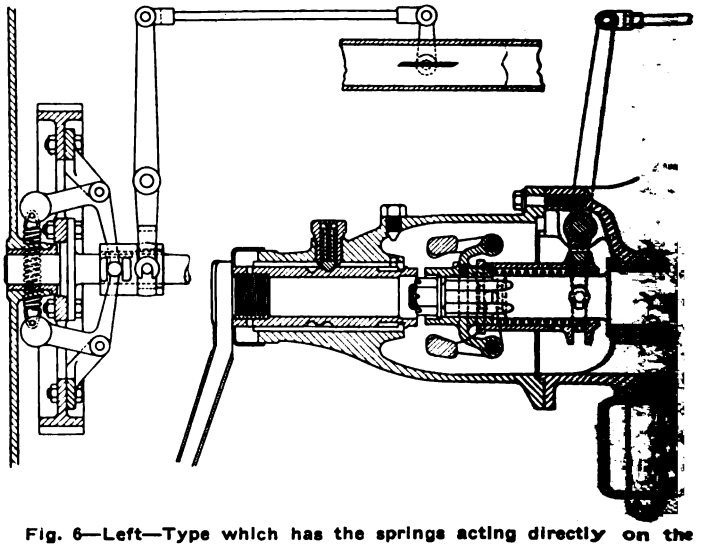

Fig. 6—Left—Type which has the springs acting directly on the governor weights

Fig. 7—Right—Method of connecting the governor with the throttle, as used on the German Daimler

In most of the commercial governers now on the market, the governor spring is made adjustable by means of a threaded sleeve and this sleeve is provided with a locking means, so that after the desired governor adjustment is obtained, the governor mechanism may be locked either by seal or padlock.

It is the usual practice to have the truck guarantee become void if governor seals have been tampered with.

In other forms of governors, like the German Daimler, the governor spring is housed in an extremely inaccessible box. To get the necessary adjustment, the governor spring is ground to length when the motor is tested. In this case the governed speed is fixed once and for all. Another interesting detail refers to various methods of connecting the governor and throttle. In automobile practice direct connections are used, but an examination of the patent art shows that besides the bell crank and rod methods of connection, or connections by flexible cable, electrical and pneumatic means may be used.

Patents

In connection with this report, a collection has been made of the United States Patents on the subject of governors. These patents will be found on file with this report.

Most of these, fortunately, do not touch the automobile.

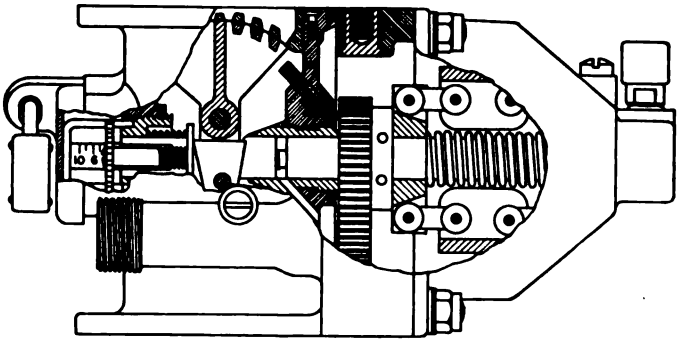

Fig. 8—Diagrammatic section of the governor with two operating shafts, one shaft being driven in proportion to the vehicle speed and the other by the motor

However, they are of interest in showing the work attempted on governor design. These patents are found under Class 123, in the United States Patent Office, and under this class we list various interesting patents under sub-classes.

In addition to United States patents, we have obtained, through the courtesy of August Riebe of the Riebe Ball Bearing Co. a list of German patents.

A complete list of United States and foreign patents then followed in the report.

Recent Court Decisions—Sale on Instalments

By George F. Kaiser

A MASSACHUSETTS contract to sell an automobile on instalments allowed title to the car to remain in the vendor. The seller also had the right to take possession of the car on default in any of the terms of the contract. A default was made, and 2 days afterwards a replevin action was started for possession of the car against a deputy sheriff, who had attached it.

The court decided that the seller was entitled to possession of the car as against the vendee creditors, who were claimants under the attachment, because the contract had been made, and was to be performed in Massachusetts, although the case was tried in Maine, and no Massachusetts statute had been put in evidence to show that in a case like this the seller was required to give notice to the attaching party before beginning suit, and one who relies on a foreign statute must prove it.

In this case on neglect to prove the Massachusetts statute, the common law rule applied, under which no notice was required.—*Franklin Motor Car Co. vs. Hamilton*, 92 *Atlantic* (*Maine*) 1001.

Allow Automobile to Pass

That an automobile, when overtaken from the rear, must allow the approaching automobile to pass, was recently decided in New York.

A suit was instituted for damages arising out of a collision between two automobiles. The party bringing the suit claiming that she had been driving her car on the extreme right of a public highway, 20 or 25 feet wide, at the rate of 15 miles per hour. That the left front hub of her car had been struck by the right rear wheel of another automobile coming up at the speed of 30 miles per hour without any warning. The other motorist claimed, however, that the first car was to the left of the center of the road; that for a considerable time he had been driving in its dust, and finally, desiring to go ahead, he sounded his horn when he was about 200 feet in the rear, and continued to sound it until he had overtaken the car in front; that there was barely room to pass even leaving the road and scraping the stone wall at the side.

That plaintiff, instead of yielding the road, edged over further beyond the center, and caused the collision.

The jury accepted the latter statement as regards the accident, and the court said that "if the position of the forward car in the center of the highway did not leave sufficient room for passage, upon request or equivalent notice, if practicable and safe, it should have been turned aside so as to leave sufficient room for passage. Relief was therefore denied the party bringing suit.—*Gautier vs. Lange*, 151 N. Y. *Supp.* (*N. Y.*) 902.

One Must Give Way

The decision in a recent New York case was that when each of two parties relies on the other's giving way both are guilty of contributory negligence and are barred from recovering for injuries resulting from a collision. Suit was brought by a motorist for damages claimed because of a collision between a trolley car and an automobile truck. The question of negligence and contributory negligence was emphasized by the court when it was found that neither the motorman nor the chauffeur attempted to stop his vehicle, the chauffeur and his helper testified that they had started the automobile truck on 133rd street, west of Madison avenue, and that they intended going south on the avenue. That when 7 or 8 yards from the crossing they saw a car approaching about 30 yards south of 134th street; that the helper put up his hand for the car to stop but the car struck the truck's front spring and scraped by in front of it; that they had blown their horn but did not slow down or stop until they saw that the motorman was not going to stop.

The court held that in view of the fact that neither party had right of way over the other, but that both had equal rights on the highway, it was as much the chauffeur's duty to avoid a collision as it was the duty of the man in charge of the trolley, and that therefore the trolley company was not responsible to the automobile truck owner for the damages.—*James Everard's Breweries vs. New York Railways Co.*, 151 *N. Y. Supp.* (*N. Y.*) 905.

Sheldon Makes Only Semi-Floating Axles

EDITOR THE AUTOMOBILE:—In your issue for September 9, beginning on page 472 was a story entitled Axle Design for Accessibility and Strength, in which illustrations were shown of various makes of axles including a panel of Sheldon rear axles. The illustrations of the Sheldon type of construction showed semi-floating, three-quarter floating and floating, giving the impression that the Sheldon Axle & Spring Co. is still producing three-quarter and floating types of axles.

The information concerning the Sheldon products and blueprints from which the illustrations were made were sent to you by the writer in answer to your request for information concerning typical methods of constructing these three types of axles and insofar as being illustrations of those three types is concerned the matter is accurate.

The illustrations of the three-quarter and floating types are illustrations purely of types that have not been manufactured in the Sheldon plant for some time. As you undoubtedly are aware, the Sheldon company is convinced of the unquestioned supremacy of the semi-floating type of axle as evidenced by the fact that no type other than the semi-floating is being manufactured by it. In view of the fact that we are convinced of the superiority of the semi-floating type and are true to our convictions to the extent of not manufacturing any other type we certainly will appreciate the publication of this communication so that there may be no confusion in the minds of your readers concerning our adherence exclusively to the semi-floating type of construction.

Wilkes-Barre, Pa. ARTHUR M. LAYCOCK,
Chief Engineer, Sheldon Axle & Spring Co.

—This article was in no way descriptive of the product of any manufacturer and must not be construed to mean that the axles shown are the present products of any of these. In fact, some of the illustrations were merely diagrammatic. The illustration showing the Timken, for instance, was of a diagrammatic nature and included a three-quarter floating type which this concern does not make.

Wants Owners' Fuel Consumption Tests

Editor THE AUTOMOBILE:—Some weeks ago you had an article in your magazine commenting on the unfair gasoline consumption tests as advertised by certain automobile manufacturing companies. You suggested some definite standard by which all tests might be made, but why not get actual road tests?

I have had my new Studebaker four-cylinder car now for some nine weeks, have traveled 2865 miles and consumed 148 gal. of gasoline. At 1408 miles I used 70 gal.; at 1800 miles just 90 gal. From that time on I began to go with a full car (five passengers) and consequently the average began to drop.

It seems to me such tests are of much more value to the average motorist than any track test by experts can possibly be.

The new 1916 cars are frequently reported as making certain mileages on special trips but no 3000-mile average can be staged by the average owner very often.

Would like to hear of tests similar to mine from different car owners.

Melrose, Mass. H. M.

Lost Motion in Pinion and Gear

Editor THE AUTOMOBILE:—Kindly explain by sketch and description the proper way to find out if there is any lost motion between the driving pinion and crown gear?

2—Between compensating gears and spider gears?

3—Kindly explain the proper way to find out if the driving pinion has sheered its key.

New York City. J. D.

—This can be explained better than illustrated. The best way is to remove the cover plate from the differential housing and clean off the gears so that the action in the assembly can be noted. Leave both wheels on the ground and place the gearshift lever in neutral. By means of a pipe wrench a firm hold should be taken on the propeller shaft and with the hand on the large crown gear, the propeller shaft moved backward and forward. Any lost motion between the shaft and the crown gear can then be readily noted.

2—Any play in the differential assembly at any point can be located by removing the assembly from the housing and examining the gears, by shaking them back and forth.

3—If the driving pinion has sheered its key this can be readily determined by the fact that with the gears in neutral, the propeller shaft can be rotated by means of a pipe wrench without moving the rear wheels or the differential.

Remedying Grinding in Differential

Editor THE AUTOMOBILE:—Kindly advise me how I can eliminate a grinding noise occurring in the differential on an Overland 1910 model 51.

Would like to know just how to adjust this so that I will not have to buy new gears.

Anna, Ohio. O. E. H.

—The grinding noise you speak of may be due to foreign matter which has accumulated in the differential gear housing. Before doing anything else, it would be well to flush this out with kerosene. The differential can then be packed with heavy grease and unless the noise is due to considerable wear, it should not bother you. The probabilities are that the wear occurs between the driving pinion and the crown gear. Any adjustments at this point should be made by a repairman who is expert in the work, as it is very delicate. On the Overland rear axle, the mesh between the bevel gear and drive pinion can be accomplished by removing the cover from the differential housing and taking off with a screwdriver the thrust bearing adjustment lock on the side toward which the differential is to be moved. The adjustment cup of the thrust bearing is then turned in the same direction. The two screws which hold the split differential adjusting collar are turned until the collar may be evenly moved in the desired direction. Moving the collar on one side of the differential makes it necessary to adjust the one on the opposite side accordingly. Both axle shaft ends have right threads.

When the proper mesh of the gears is obtained, both collars are tightened, and the thrust bearings brought close to the adjusting collars. All the screws are then tightened and the small locks which keep the cups from turning are replaced.

Carbureter Is Improperly Adjusted

Editor THE AUTOMOBILE:—What are some of the best carbureters for the Ford 1913? I have a Holley and am not geting sufficient power.

2—I would also like to know whether dry cells are practicable for lighting the Ford? I hesitate about running the lights from the magneto.

3—My motor runs well until I strike a steep hill and have to open the throttle wide, then the engine seems to choke, and skipping follows. The throttle is situated so that the engine idles smoothly when the throttle is closed. It is not a question of mixture, at least when the throttle is not opened much, for I have tried different adjustments of the mixture needle.

Hartford, Conn. H. H. B.

—The Holley carbureter should give you perfect satisfaction on the Ford car and if you are not getting sufficient power it is because the adjustment is not correct or because some part of the carbureter or motor is out of order. It is suggested that you have the carbon cleaned out and the valves ground if this has not been done for some time.

2—Dry cells are not practicable for lighting a Ford car as they would have to be renewed every time the current was consumed.

3—You are not getting enough air at full throttle opening and you should change the carbureter adjustment to correct this fault.

Forcing Apart Split Demountable Rims

Editor THE AUTOMOBILE:—I have found a jack and convenient rock a most efficient device for forcing the ends of a split demountable apart so that the retaining lock could be dropped over the pins. Anyone who has tried to put a tire on this type of rim when rust under the bead has increased the diameter will, I believe, appreciate the idea. See Fig. 1.

Manila, P. I. R. N. C.

A Device for Detecting Loose Bearings

Editor THE AUTOMOBILE:—The following is a description of a device, Fig. 2, which ought to interest all automobile repair men. Its purpose is to detect a loose crank bearing or piston pin bearing of a connecting-rod without removing the oil pan. It is also used for testing leaky piston rings. Take a foot pump and add a cup washer the reverse of the regular one so that one will act in each direction. Make a brass fitting to take the place of the base of the pump, the end of which is threaded to fit the spark plug hole. With the piston on upper center, screw the tool into the spark plug hole and by working the plunger up and down, the piston will be alternately raised and depressed and any slack in bearings detected, also by listening at breather hole, any leak by rings will be heard.

Detroit, Mich. C. R. S.

Advantages of Auxiliary Air Control

Editor THE AUTOMOBILE:—Would it be an advantage to have some hand control device attached to the intake manifold above the carbureter to make it possible to add an extra supply of air to the mixture when operating an automobile?

2—Could it be made to act as a scavenger and cylinder cooling agent?

3—Could it be used to increase the engine power?

4—Could it be used as an air brake?

5—Would it be useful to cut down gasoline consumption?

6—Would there be any other advantages that could be gained by applying such a device for controlling the air to a car, if any?

Easton, Pa. W. F. B.

—Many drivers are using such an attachment to great advantage. These extra air devices are open when running at fairly high rates of speed and cut down the fuel consumption.

2—They probably are not of great assistance in scavaging, but as a cylinder cooling agent when coasting down a hill with the ignition cut out, the clutch in and the device open wide, they might be of some slight assistance.

3—The engine power is probably not increased so much as the economy unless the mixture given by the carbureter is given incorrectly in the first place.

4—Not much more than the carbureter alone. The cylinders will probably be filled just as completely without the extra device.

5—Yes, it would probably be an aid in this direction.

6—The main advantage is in flexibility of control of the mixture.

Sign Your Letters For the Rostrum

The editor of the Rostrum is in receipt of several inquiries and communications which do not bear the signatures of the senders but instead are signed Reader, Subscriber, by initials or other noms des plume. While only the initials are published in THE AUTOMOBILE, *unless it is otherwise expressly desired, it is necessary that the letters bear the signature of the sender as an evidence of good faith.*

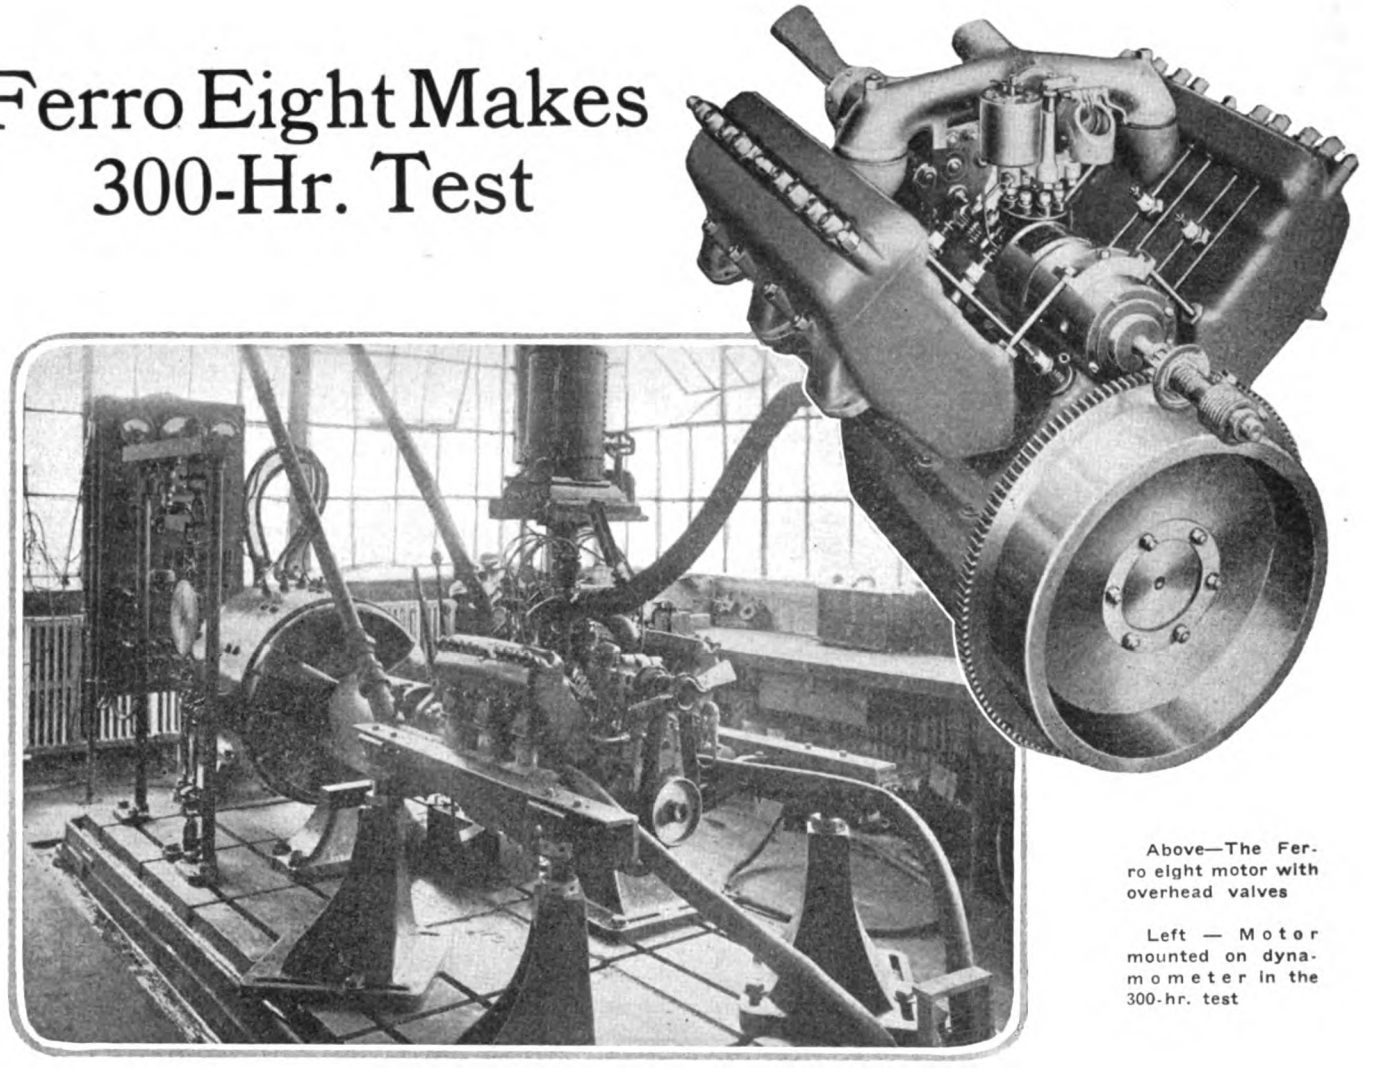
Ferro Eight Makes 300-Hr. Test



Above—The Ferro eight motor with overhead valves

Left — Motor mounted on dynamometer in the 300-hr. test

FINAL reports on the 300-hr. endurance test of the Ferro eight-cylinder motor which extended from June 23 to July 7 this year, have just been made public. This test, which was reported briefly in THE AUTOMOBILE for July 15, was held under traveling conditions, making it approximately equivalent to the service done by a car traveling at a speed of 35 m.p.h. with a motor speed of 1500 r.p.m. for 11,000 miles. At the horsepower developed, namely 34.93, the work done equals that of climbing a grade of 8.5 per cent with a car weighing 3300 lb. Engineers will be interested in the final reports of this test due to the fact that the motor involved several features of construction which are unique in eight-cylinder practice. Among other elements of design found in the Ferro may be mentioned the overhead valves, the unit casting comprising the cylinders and upper half of the crankcase which is cored for valve passages, seats, etc., the sixteen camshaft and the firing order which proceeds directly from one side of the V block to the other, that is; the firing order is 1-1, 3-3, 4-4, 2-2.

Only Eleven Stops

While this test has not been officially conducted under the supervision of any of the automobile clubs, engineering societies or universities, it was a carefully-made factory test and is stated by the Ferro company to be authentic and supported by records on file at the Ferro offices which are open for inspection. The test was continued for 324½ hr. Of this time 12½ hr. were consumed in eleven different stops giving a total actual running time of 312 hr. The stops made were for various causes, all but three of which were due to troubles with accessories and had nothing to do with the design and construction of the Ferro motor itself. The other three were in each case due to broken valve springs and this, the Ferro concern states, is one of the most valuable points brought out by the test, inasmuch as the springs were purchased in the open market and should not have failed if they had been of proper quality for their strength and size. A repetition of this trouble can now be readily guarded against.

59 Hp. at 2250 R.p.m.

The tabulations appended herewith show the results of the test. These are numbered and by referring to numbers 1, 2 and 3 it will be noted that the maximum brake horsepower obtained before the run was 59 at 2250 r.p.m. The horsepower per cubic inch piston displacement and the maximum speeds are both of interest and both high as would be expected in a high efficiency, multi-cylinder motor. It will be noted that the average horsepower developed, the average horsepower per cubic inch of piston displacement and the average revolution per minute were all in excess of what would be expected by the S. A. E. rating. The gasoline and oil consumption, which figures are also given, are quite low.

Wear Very Slight

After the test the motor was torn down and an examination was made for wear on all the stressed parts. In every case the Ferro organization states that it was inappreciable and in no case enough to produce noise. This performance which more than equals the continuous run of 11,000 miles with a fairly heavy car is noteworthy. Clearance figures are also checked as well as possible. For example, refer-

ring to the name, bearing, the diameter of the shaft and the thickness of the shelves of the babbitt bearing was measured by a ball micrometer. The connecting-rod bearings were in excellent condition, the increase in clearance being 0.0008 on the inner as well as on the outer bearings. The main bearings showed an increase of but half that quantity, 0.0004 in.

Bearings Stand Up Well

The construction of these bearings has thus been shown to be reliable and is indicative of the soundness of general practice. The bearings are babbitt against the crankshaft; for the connecting-rod bearings and a hardened steel connecting-rod against phosphor bronze for the upper bearing of the connecting-rod. The smooth polished surface of the rod bearings indicated ample bearing surface and lubrication. The condition of the seats of the valves in the cylinder would seem to bear out the claim made for the overhead valve type of construction. There was no carbon that prevented the proper seating of the valves nor any pitting to cause leakage. The importance of this was demonstrated by the fact that the horsepower at the end of the run was greater than at the beginning.

No carbon deposit could be noted on the piston heads and this was probably due to the fact that the temperature at all times in the endurance run was quite high and prevented the collection of anything more than a small quantity of hard baked carbon. The combustion chambers were slightly carboned and no signs of scoring were noted in the cylinder barrels.

Overhead Valves Wear Well

Regarding the overhead valve operating mechanism, but little wear could be noted here. The spherical fulcrum of the valve rocker arm evidently helped to eliminate wear and noise and proved itself easy to lubricate while the unequal lengths of the rocker arm seem to bear out the prediction that the inertia would be reduced and consequently noise and wear. Little or no indication of any wear at the points of contact with the valve stem and pushrod was noted. The other parts of the valve operating mechanism such as the cam faces, valve tappets, guides and pushrods were also subjected to an examination and shown to be in good condition.

Some Ignition Troubles

Some ignition troubles were experienced during the run due to spark plugs and a worn distributer head and in the subsequent horsepower tests the condition of the distributer had some effect upon the performance of the motor at low speed. This disappeared at higher speeds.

Table No. 3 in the illustrations herewith showed the condition of the Ferro eight after the tests. The higher horsepower after the run, namely 61 at 2250 r.p.m. in spite of the worn distributer very clearly brings this out. The tabulations follow:

Specifications of Model 2 Ferro Eight in 300-Hr. Test

Number of cylinders	8
Bore and Stroke, in inches	3 1-4 x 4
S. A. E., Hp. Rating	33.8
R.p.m. at S. A. E. Rating	1500
Piston Displacement in Cu. In.	265.6
Weight of Motor in Pounds	585
Type of Cylinder	V Block
Type of Valve	Overhead
Lubrication	Pressure Feed
Carbureter	1-In. Double Zenith
Cooling	Thermo-syphon
Ignition	Delco
Spark Plugs	Bosch

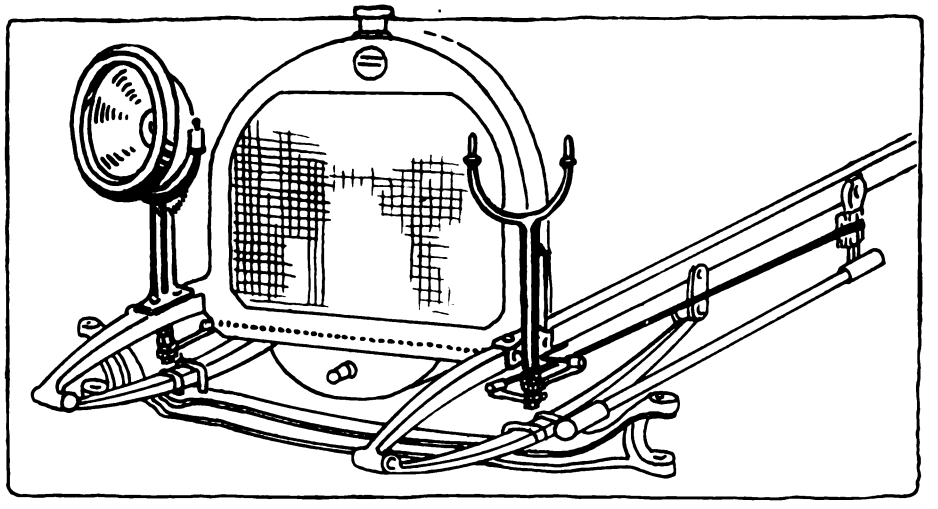
NOTE—No work done on motor before test. The valves were not ground.

ACCESSORIES



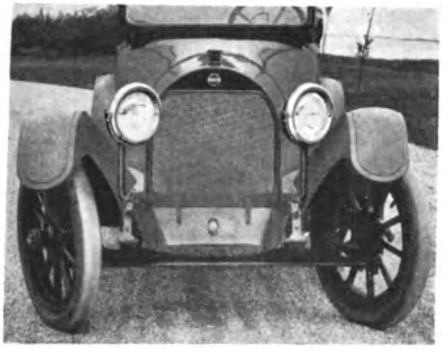
Sketch illustrating the operation of the Steer-Lite headlight bracket which automatically turns the headlights in the direction in which the front wheels are carrying the car

Steer-Lite Headlight Bracket

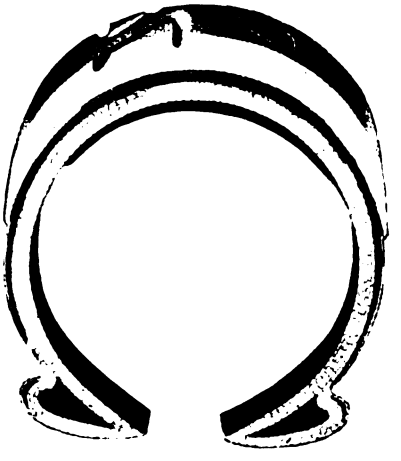
THE need for an arrangement whereby the headlights are turned in the direction of motion of the car has frequently been felt. The Steer-Lite device provides such an arrangement whereby the steering motion is duplicated and the headlights in all circumstances throw the light in the direction in which the front wheels are carrying the car. Due to the fact that the linkage for operating the movable brackets is connected directly to the steering drop arm, the amount that the headlights are turned from the center line is directly proportional to the amount that the wheels are turned. The result is that for a given deflection from a straight course in the direction of travel of the vehicle, there is a corresponding deflection of the headlights which will throw the light directly along the path of the vehicle.

With the powerful electric headlights now in use, the driver of a car is forced to turn his vehicle into an area which is practically cut off from all illuminations by the strong wall light thrown out by the parabolic reflectors. With the Steer-Lite bracket the roadway into which the vehicle is turning is illuminated before the turn is made, allowing the driver plenty of time to determine the safety of the intended course.

The construction of the device is shown in the accompanying illustration. The brackets for the lamps fit into two sleeves and rest on cone nuts, which take the load and hold the brackets rigid. The cone nuts are held in place by lock nuts providing a rigid bearing surface. There is a ball-jointed lever which is screwed to the base of each bracket and tie rods connect the two bell-crank levers on the bases of the brackets and also connect the steering arm to the base of one of the brackets so that when the steering arm is operated the motion is imparted to both brackets. Careful workmanship and good materials make this a rigid device which can be used for either gas or electric lamps. A special set for Ford cars sells for $12 and for other cars for $15.—Motor Products, Inc., Stamford, Conn.



How the Steer-Lite device acts on a car



Section through the Woodworth puncture-proof tire

Allwon goggles with two-color lenses

Woodworth Tire

A new puncture-proof tire called the Woodworth Puncture-Proof embodies the novel principle of employing a strip of chrome leather in place of the metal or other materials usually used in this type of tire. The leather is firmly incorporated in the structure of the tire, forming the innermost layer beneath the tread. The makers guarantee the tire against puncture for 5,000 miles, and to back up their guarantee offer to pay the cost in repairing tires in case they are punctured.

The tires are manufactured from combed Sea Island cotton, the chrome tanned leather being on the inside of the casing. The leather is light, therefore adding very little to the weight of the tire, and its flexibility is great enough to not materially stiffen the wall of the tire. It is stated that the leather is non-heating.—Leather Tire Goods Co., Niagara Falls, N. Y.

Allwon Motor Goggles

Motor goggles which have two-color lenses have been brought out for the purpose of—in the language of the manufacturer—absorbing optical shocks on the road. The two-color lens is not made of two pieces joined, but of a solid lens of one piece of glass. One is colored darkly enough for the brightest lights, and the other part is left light enough for ordinary use. The color is introduced into the glass, becoming part of it, although the surface of the lens is not disturbed and every part is clearly transparent. The prices for the two-color motor glasses are, for the medium size, $12; for the large size, $13.50 per doz. With side shields the regulation size sells for $13.50, and a larger size at $15 per doz.—Strauss & Buegeleisen, New York City.

Lawco Products for Fords

Pressed steel is used for the Lawco muffler for Fords, a number of perforated cups being nested and the aggregate area of the perforations is so large that back pressure is small. The makers state that tests made at the laboratory of the University of Michigan indicated an ability to carry heavy loads with no indication of capacity limit, and that the exhaust is silenced better than with the

regular type of muffler. Price, $2 each.

Lawco fenders are crowned and of attractive design and are made of twenty-gage steel and finished with hard baked enamel. They are interchangeable with the regulation fenders on model T roadsters and touring cars, but are not adaptable to the 1915 Ford sedan. The hood is of the same quality of material and is finished in the same way; it tapers back to the dash, where it is attached by means of a special head ledge. The fenders sell for $14 per set of four.—F. H. Lawson Co., Cincinnati, Ohio.

Weiss Disappearing Step

A folding step is attached to the under side of the running board and is operated by a pedal or lever manipulated by the driver. When extended the step provides an easy means of access to the car and prevents pulling on the door. When folded, the device is out of sight, and the makers state it cannot rattle. Price, $12. —The Weiss Co., Indianapolis, Ind.

Eclipse Steering Gear Bolt

The arms on the knuckles of the Ford front hubs are connected together by a rod, the joints being held by cylindrical bolts which in time become loose through wear. The Eclipse bolt replaces the originals and is adjustable. A split sleeve has a cylindrical exterior and a tapered interior and through it passes a correspondingly tapered bolt which can be inserted as far as is necessary to expand the sleeve until the hole is snugly fitted and locked in place by lock-nuts. Wear is taken up by inserting the tapered bolt further. The bolt is drilled and fitted with an oil cup. Only a wrench is required for application. Price, $1 per pair.—Eclipse Machine Co., Elmira, N. Y.

Triplexd Gasoline Hose

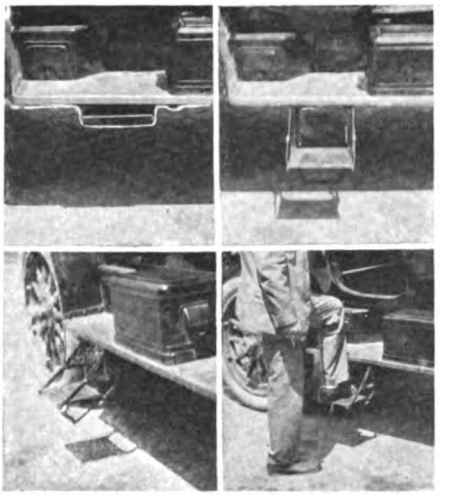
Triplexd hose is made in all sizes. The inner tube is of flexible metal construction, the second layer is of composition and the outer cover of loom woven jacketing. The makers state that it is more flexible than rubber-covered gasoline hose. Special types are made for steam, oil and air. Price ¾-in. size, 80 cents per foot. Couplings $1.50 per pair.—Metal Hose & Tubing Co., Brooklyn, N. Y.

Cushion Wheel

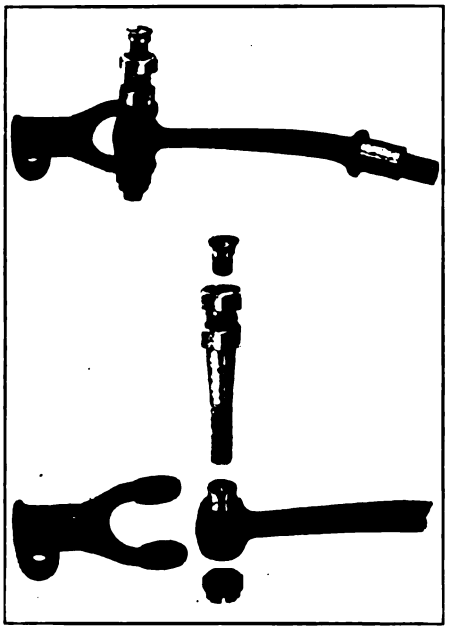
Sewell cushion wheels for motor trucks and passenger cars are made in two types, the single and the dual. In either type the inside wheel is carried on a series of trusses of rubber which occupy the space between the wheel and the outer felloe. Rubber side flanges encircle the wheel on both sides and connect the inner and outer felloes, making the space containing the rubber cushion proof against air, dust and grease.

These rubber flanges expand and contract between the inner and outer felloes as the cushion acts. There are two steel bands on each side of the wheel and they are bolted through, holding the side rubber flanges and the two wooden felloes in place. These bands expand partially over the rubber cushion from above and below, thus preventing lateral or side motions.

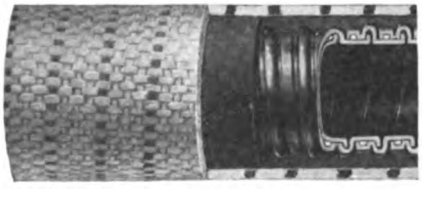
It can be noticed from the construction of these wheels that no connection occurs between wood and wood or wood and iron. The manufacturer claims that by using these cushion wheels the tire mileage is greatly increased and maintenance cost reduced. The axles are protected from shock and it is pointed out that the operating speeds may be increased without injury. —Sewell Cushion Wheel Co., Detroit, Mich.



Four views of the Weiss auxiliary step



Eclipse steering gear bolt for Fords



Triplexd gasoline hose, showing construction

Serco Horn Buttons

The Serco is a steering wheel rim in which are eight buttons for sounding the electric horn, the buttons being spaced around the wheel so that there is always one within easy reach, even if but one hand is being used for steering. Spring contact buttons are used, in composition casings, and the wire is sunk in a slot, 3/16 in. deep, in the rim, the slot being filled with wood over the wire, making a neat finish. The advantage claimed for the device is that the horn can be sounded at any time, even if one hand is engaged in shifting gears or other service; the hand that is on the wheel can always reach a button without difficulty. Price, $5 and $6.—Safety Electric Rim Co., Middletown, Ohio.

Kamlee Running-Board Trunk

A new type of running-board trunk has been put on the market which is just wide enough to utilize the full width of the board without protruding over the edge and low enough not to interfere with door operation. Two suit cases fit into the trunk, the lid of which is hinged at the edge so that it may be dropped over the edge of the running-board. This style trunk is made for any car. It is 49 in. long, 12 in. wide and 9 in. high and sells for $45.—The Kamlee Co., Milwaukee, Wis.

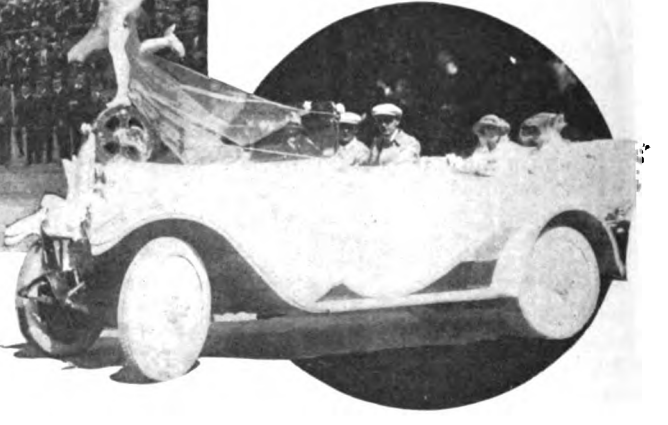
Christen Sheepshead Bay Speedway

Resta Breaks 10-Mile Record

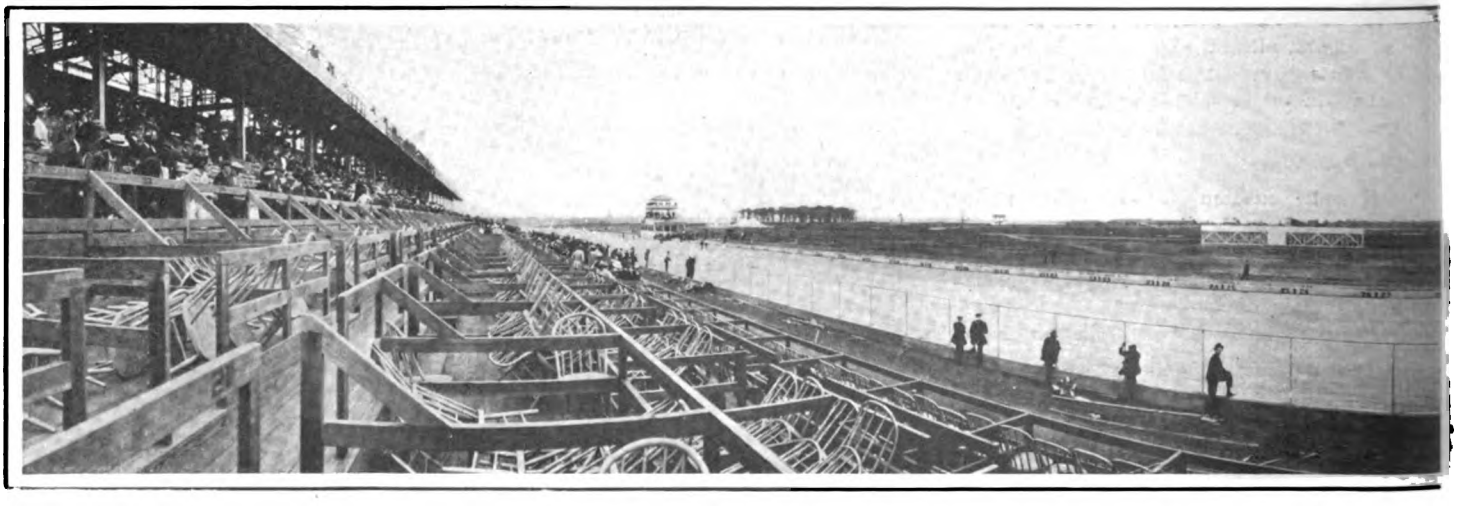
Above—At the right is Mrs. Orson Kilborn, daughter-in-law of Horace M. Kilborn of the speedway, christening the Sheepshead Bay motor speedway.

At the upper left is Resta getting the checkered flag at the finish of his recordbreaking 10-mi. time trial, which he made at 108.04 m.p.h.



Above at the left is a scene at the Sheepshead Bay motor speedway track during the opening ceremonies last Saturday. Over 12,000 people were in attendance

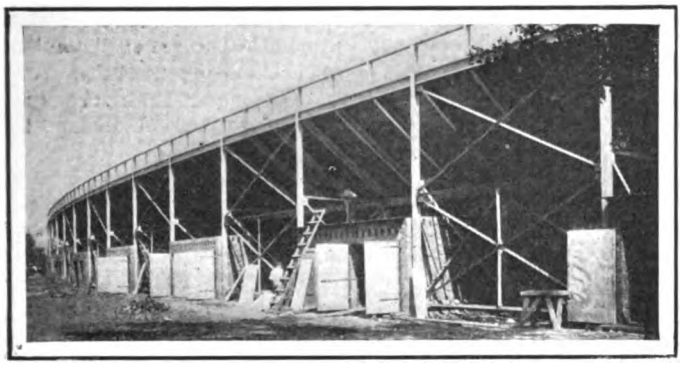
At the right is the Oldsmobile prize winner typifying speed in the parade of 2247 cars in celebration of the opening of the Sheepshead track

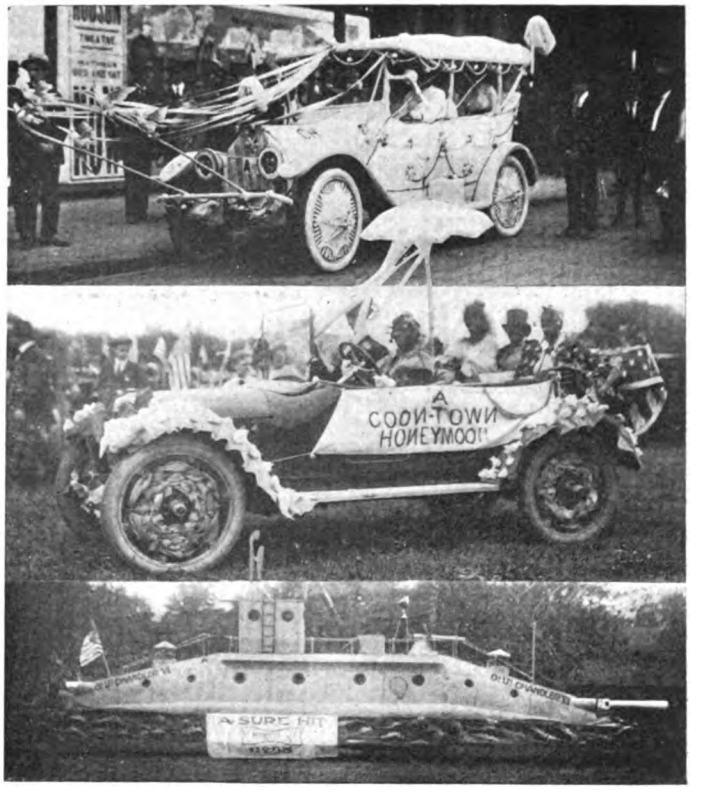


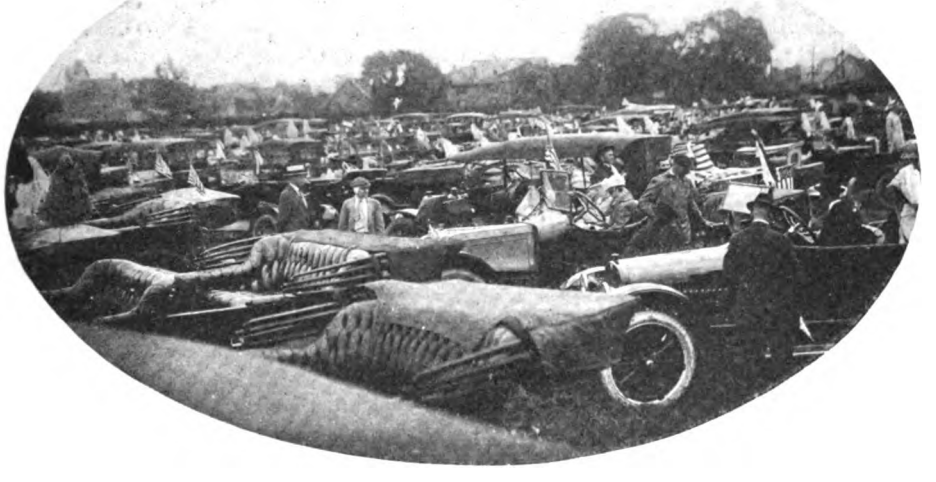
Panorama of the Sheepshead Bay motor speedway showing the completed course, judges' stand and the banking on the turns. Note the large that all previous speed

SOME idea of the merits of the paraboloid banked turns of the Sheepshead Bay Speedway as compared with the flat bank of the Chicago board track was revealed on Saturday when Dario Resta at the wheel of a Peugeot drove 10 miles in 5:32 4/5, a rate of 108.04 m.p.h.

Resta thus has succeeded in driving faster than anyone else for 10 miles, the best previous American record being held by George Robertson, who drove a much larger Simplex 10 miles on the Los Angeles Speedway on April 9, 1910, in 6:35.62. This is a speedway record regardless of class. The speedway record for cars in the same class as Resta's—231-300 cu. in—is held by De Palma, who drove the 10 miles in a Mercer at Los Angeles, May 5, 1912, in 7:27.33.







Above at the right are shown three of the prize winners in the parade comprising 2247 decorated and undecorated cars. That at the top is a Marathon, the middle is an Oldsmobile and the bottom one a Chandler

number of boxes in front of the covered grandstands. Over this course will be held the 350-mile race on Saturday, Oct. 2, and it is expected records will be broken

Model W-5 Sheldon worm-gear axle for 5-ton trucks

5-Ton Sheldon Axle with Ball Bearing Worm

Rear Wheel Brakes a Feature

A NEW worm-gear axle for trucks of 5-ton capacity has been brought out by the Sheldon Axle & Spring Co., Wilkes-Barre, Pa., under the model number W-50. After putting this new model through tests for several months, it is now ready for delivery. The new W-50 worm axle has been designed and tested for a tire load of 18,000 lb., including the weight of the chassis, body and pay-load and like all other Sheldons is a semi-floating design arranged to secure the greatest possible capacity with low weight and few parts.

A feature of Sheldon axle practice which is carried out in the new design is the use of ball bearings to take both the radial and thrust loads in the worm-gear carrier. The thrust is taken by a self-contained double-acting thrust bearing and the radial load is taken by two single row annulars. The differential is mounted on single row annular bearings while the side thrust, differential and axle shaft are taken by separate thrust bearings. Either double row annular ball bearings or straight roller bearings may be used at the wheels.

Brakes on Rear Wheels

Sheldon practice has also been followed in the construction of the brakes. As in all other Sheldon worm gears, this is done at the rear wheel rather than on the propeller shaft as the driving strain is taken through the springs thereby eliminating strut rods and torsion tubes. The track is 74½ in. with maximum spring center distances of 49 in. with 4-in. springs. The housing and brake spiders are hydraulically pressed on nickel-steel tubing and then riveted. The axle shafts are tapered to give a structure of uniform strength at all sections of the shaft. The shaft diameter is 3¾ in. at the outer bearing and the taper runs from the bearing collars to the differential. This provides the best possible distribution of the material while the material itself for the shaft is drop-forged 3½ per cent chrome-nickel steel heat treated to give it the designed physical properties.

For hardness, every driveshaft is given a Brinnell test before going to the machine shop, and any shaft not coming up to the proper standard, is eliminated.

Double internal band brakes of what are known as the self-intensifying type are employed and are 3 in. in width and lined with Raybestos. They act on 24-in. cast steel drums, the bearing surface of which is machined to eliminate any high or wavy spots in the drums and thereby assure a perfect braking contact at all points.

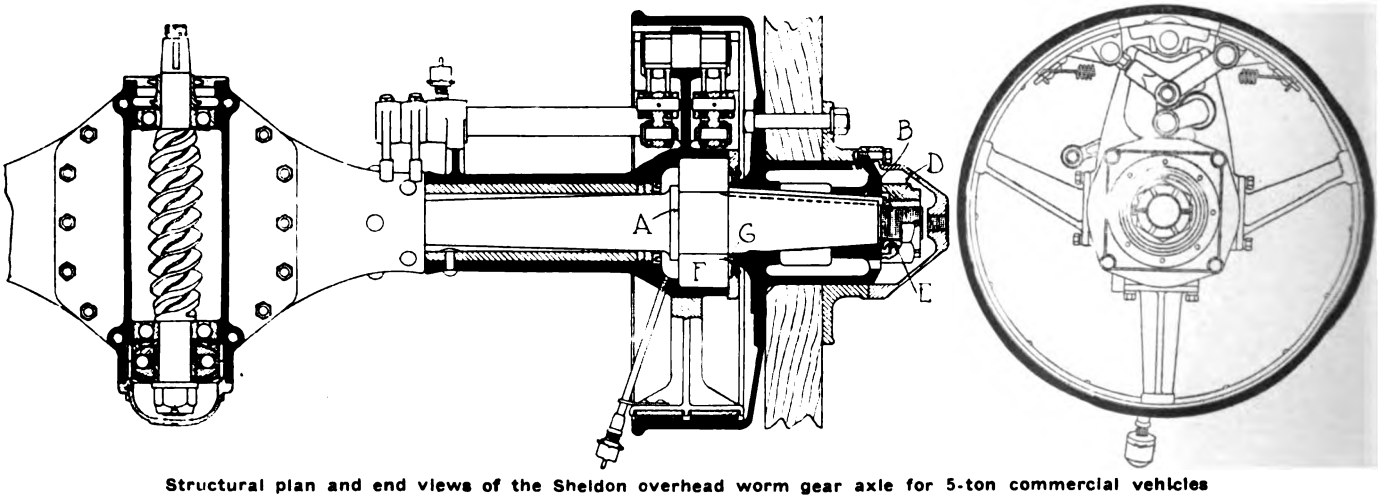
Steel against bronze, both metals being of the Sheldon private formulæ are used for the worm and wheel. This part of the axle receives the most minute inspection as regards accuracy. Every individual worm and wheel being tested in a precision measuring machine to 0.0001-in. for accuracy. These tests are made so complete that absolute interchangeability of all worms and wheels is assured.

The axle housing ends are bell-mouthed to resist distortion due to the hydraulic pressure when mounting the tube. Another safety precaution is in the flanging of the outer ends of the wheels where ribbing is placed to prevent damage in case the clutch is driven against the curb stone.

Bearings in Box Sections

A special feature which is noteworthy is in the construction of the wheel bearing housings which are made in box sections. Referring to the illustration, it will be noted that *D* and *E* are double nuts. The function of *E* is to take the key *B* against the bearing *F* and tighten it against the shoulder on the driveshaft *A*. This prevents the possibility of the bearing moving laterally on the driveshaft and producing a pounding action on rounding corners. The nut *D* is merely to tighten the hub on the conical part of the shaft. Both of these nuts are afterwards locked with cotter pins. The inside nut *E* which tightens the key is slotted and sometimes serves the purpose of a lock nut. This device eliminates any necessity for clearance between the bearing and hub as shown at *G*. This clearance is often allowed to permit the bearing *F* to float on the shaft. Repeated blows are apt to enlarge this clearance.

The W-50 model is also provided with a wheel puller attachment as indicated in the drawings herewith. The operation of demounting a wheel from this 5-ton axle consists simply in removing the hub cap, taking off the wheel retaining nut, replacing the hub cap, and giving a few turns to the wheel removing stud which accompanies the axle. The axle ends are so designed that when the wheel has been removed, the bearings remain undisturbed and protected in their housing upon the axle shaft. Tie rods and ribs are eliminated entirely in Sheldon construction, this concern maintaining that from experience they are satisfied that if the tie rod is tight enough to perform any function it tends to buckle the axle and if it is loose, enough so as not to endanger buckling it lets the axle down.



Structural plan and end views of the Sheldon overhead worm gear axle for 5-ton commercial vehicles

Research Committees

ONE of the most valuable works which a section of the Society of Automobile Engineers can perform is to appoint a committee on some pertinent topic and have them pursue this to its end, drawing up a report which covers the state of the art at the present time and thoroughly goes into the patent situation, thereby making up a record which cannot help but be of value to those who intend going further on the same subject.

The report of the Metropolitan Section Research Committee on governors is published in this week's issue. This report is a good example of what can be done in the way of setting down in concrete form the progress of development of a certain line of work. It cannot be doubted but that in the future any one who is carrying on research work in governors will take advantage of this report to familiarize himself with what has been done in the past and also on the status of the patent situation. Were it not for this report, those investigating the subject in the future would have to go through the many hours of labor spent by the committee which, owing to its official connection, has been enabled to secure co-operation not always possible for an individual.

Furthermore, the work of the committee becomes a matter of public record, while that of an individual is only private property and is valueless as regards the general advancement of exact information.

Aluminum Alloys

ONE of the things to be considered in the use of aluminum alloys is that rigidity is not only gained by the physical properties of the material, but also by its disposition. Hence, the question of ribbing, which is nothing more than placing the material as far from the neutral axis as possible in order to increase the section modulus, becomes of the highest importance.

With aluminum pistons, the ribs not only add to the stiffness of the design, but also act as a means of removing the heat from the piston head. Thus, the piston is preserved against disintegration in two ways by these ribs, first, by stiffening it and then by carrying the heat away so that the high temperature will not cause deterioration of the metal in the head.

With these objects in view, it is essential that designers of aluminum pistons carefully arrange disposition of material so as to provide a means of carrying away the heat of the piston head and also to give stiffness and rigidity to the castings.

Fall Duties

AUTUMN means either one of two things for the automobilist. It either brings a period of renewed activity or, on the other hand, it may mean the shelving of the faithful vehicle until the next summer season. In either case there are several duties that should be performed by the car owner if he wishes to do himself justice and secure the full return from the money he invested when the vehicle was purchased.

Old oil is often allowed to collect in the crankcase; the fall is the time to take it out. Storage batteries may have been somewhat neglected during the unpleasantly hot days; the fall is the time to bring out the hydrometer and see that the electrolyte is in good condition. The supply of air-tight inner tubes may have dropped so low that the driver is wondering what he should do in case he had a puncture on the road. Now is the time to go over the old tubes and bring them back into such condition that in case the season-old tires should be punctured it would not necessitate a hasty and most likely unsatisfactory repair on the road.

In a word the hundred and one duties that every automobilist knows should be done to put the car back into first class condition should now be performed. Deterioration is the worm that gnaws at the value of a car, and the fall cleaning and repairing will minimize the effects of the deterioration. If the car is to be put away for the fall and winter season it would be far better for the car and for the peace of mind of the owner if the car were put away in such condition that when the next summer comes it will only be necessary to dust it off and bring it out, ready for use.

If the car is to be stored, full direction for the proper method of procedure can be secured from the battery manufacturer, and these should be followed to the letter.

Packard Prices $150 to $200 Higher

Increased Wholesale Costs of Aluminum, Steel, Leather and Other Materials Responsible

DETROIT, MICH., Sept. 21—*Special Telegram*—The prices on all Packard twin six models have been increased $150 to $200. The 1-25 models, which are on the short wheelbase chassis, have all been raised $150, while the 1-35 types, on the long wheelbase chassis, are all increased uniformly $200. These increases will bring the prices of the 1-25 with open body to $2,750 and the 1-35 open models to $3,150.

The increases apply also to the closed car types, those mounted on the short wheelbase going up $150 and the others $200.

The price increases are ascribed to the increased cost of materials and the company states that it can show where every dollar of the rise comes from greater wholesale costs of aluminum, steel and leather, which, among other raw materials, have been largely responsible.

W. H. Gray Resigns from Gray & Davis

BOSTON, Sept. 21—W. H. Gray, general manager for Gray & Davis, has resigned from that company to take effect Oct. 15. A rumor to the effect that Alexander Churchward also had resigned has been officially denied by officers of the company. The W. H. Gray who has resigned is not William Gray, president and treasurer of the company. Gray & Davis have accepted a contract for war ammunition and while the company does not subscribe to the policy of accepting orders for war munitions to the detriment of its other business interests, changes in manufacturing processes have released much machinery which will be used in executing a large order for high explosive shells. A large heat-treating plant has recently been erected which adds to present facilities and this, with other improved manufacturing facilities and constructional alterations in its product, will permit of a considerably increased production of starting-lighting systems for the 1916 trade.

Edison Exhibits New Battery

WEST ORANGE, N. J., Sept. 20—Thomas A. Edison exhibited to-day the storage battery at which he has been at work for the last three years. At the same time he announced that arrangements have been completed to market the new battery in light delivery wagons which might be rented by merchants.

The new wagon which was displayed in the laboratory yard at the Edison has a carrying capacity of 750 lb. and a range of travel of 45 miles without recharging. The speed is 10 m.p.h. and is designed to be very simply operated by a single pedal.

Mr. Edison said the object of the car is to replace the horse-drawn delivery wagon of the small merchant. He claims that the cost of upkeep of delivery wagons, including current and storage, will equal only half the cost of feeding and stabling one horse, while the cost of tires would be less than shoeing one horse. Mr. Edison remarked that while the price of feed is increasing the price of electric current is decreasing so that the saving of money by the use of the small battery vehicle would increase proportionately.

L. P. C. Motor Co. Makes Voluntary Assignment

RACINE, WIS., Sept. 17—A voluntary assignment was made on Sept. 16 by the L. P. C. Motor Co., Racine, Wis., to F. Lee Norton, who represents the company's creditors as assignee. The action was taken as a means of conserving the assets and reorganizing the concern on a sound financial basis, operations continuing as usual in the meantime. In a statement issued by Capt. William Mitchell Lewis, president and chief stockholder, the voluntary assignment was made for the benefit of creditors and to enable the assignee to continue the business and thus avoid disposition of the assets at a great sacrifice. Inability to obtain funds in time to meet obligations maturing this month made such action necessary. Captain Lewis said further:

"There is a prospect of obtaining a large order which will make it necessary to operate the factory at its utmost capacity for the next twenty-four months. If this order is placed, the company will probably be able to obtain sufficient funds to continue the business at a large profit."

The L. P. C. Motor Co. was organized early in 1913 to manufacture the Lewis VI. Captain Lewis retired as president and general manager of the Mitchell-Lewis Motor Co. in the fall of 1912. Associated with him in the L. P. C. are Capt. Rene Petard, chief engineer, now at the front with the French army, and James M. Cram, formerly New York branch manager for the Mitchell. The name of the corporation is derived from the first letters of the names of the three principals.

F. Lee Norton, assignee, retired as vice-president and general manager of the J. I. Case T. M. Co., Racine, two weeks ago, as reported in THE AUTOMOBILE for Sept. 16.

Uniform Time for New Models

N. A. C. C. Committee to Meet Sept. 28 to Recommend Time for Announcements

NEW YORK CITY, Sept. 20—The committee of the National Automobile Chamber of Commerce, Inc., on a uniform time for announcing new models, will probably meet in Detroit either on Tuesday, Sept. 28, or Wednesday, Sept. 29. The committee has collected a large amount of data from manufacturers and dealers and it is said that its verdict will be in favor of announcing new models some time after September, in order not to disrupt the selling season as is now frequently the case.

The committee, of which Hugh Chalmers is chairman, consists of C. W. Nash, Buick; Alvan Macauley, Packard; A. L. Riker, Locomobile; John N. Willys, Willys-Overland; C. C. Hanch, Studebaker; and W. C. Leland, Cadillac.

Schmidt Pullman Pres.

YORK, PA., Sept. 20—J. C. Schmidt, of York, has been elected president of the Pullman Motor Car Co. Mr. Schmidt succeeds Edward Fox, who became the head of the Pullman company less than a year ago. Mr. Fox has been made the assistant secretary and assistant treasurer of the company. The new president is one of York's prominent business men, being the president of the Standard Chain Co., with headquarters in Pittsburgh.

Harris Mutual Motors V.-P.

JACKSON, MICH., Sept. 18—F. A. Harris of Detroit, who resigned as commercial manager of the Hupp Motor Car Co., has acquired a financial interest in the Mutual Motors Co., Jackson, Mich. At a meeting of the directors of the Mutual Motors Co. to-day, Mr. Harris was elected vice-president.

Chalfant Detroit Electric Eastern Sales Division Manager

DETROIT, MICH., Sept. 17—The Anderson Electric Car Co. has appointed E. P. Chalfant manager of the company's Eastern sales division, with headquarters in New York.

Draper, of Champion Plug, Dies

NEW YORK CITY, Sept. 20—C. F. Draper, who has represented the Champion Spark Plug Co., Toledo, Ohio, during the past year, died at his home in Brooklyn last week, following an illness which necessitated an operation performed in Dallas, Tex.

S. O. Raises Prices in St. Louis

Increase, Which Independents Have Been Waiting for, Amounts to 1 Cent

ST. LOUIS, MO., Sept. 17—Almost simultaneous with the announcement that independent dealers had complained to President Woodrow Wilson of alleged unfair tactics of the Standard Oil Co. of Indiana in its competition with smaller Missouri dealers comes the announcement from the local branch of the Standard that Red Crown gasoline would sell in Missouri for 9.9 cents a gal.—an increase of 1 cent per gal.

The independents had been waiting for this announcement ever since they raised the price of their No. 3 gasoline from 8.9 cents to 10 cents a gal. It was the Standard's failure to fall in with the independents' increase that evoked the protest to President Wilson.

Then a few hours after the Standard's announcement, the independents again raised the price of their product 1 cent, bringing the cost to the consumer to 11 cents a gal., if bought at the filling stations. On the other hand, the price of the same grade of gasoline when bought from the independents' tank wagons was cut one-tenth of a cent, bringing it down to 9.9 cents—the present Standard Oil price.

A. P. Robinson, manager of the Standard Oil branch here, at the time of the independents' first raise, said his company would ignore the independents. The independents now are waiting to meet their second boost in the price of gasoline and intimate that as soon as this happens the price of the independent product will go up again.

Flushed with what they term their "first victory" over the Standard, the independents are even predicting 20-cent gasoline for St. Louis. At the opening of the independents' office in the so-called war between them and the Standard the smaller men announced they would try to bring the price back to 17 cents, from which figure the Standard by 1-cent cuts had reduced the price to 8.9 cents. Now the independents see no reason why they should not get as much for gasoline as New York and other Eastern dealers.

—

St. Louis Independent Files Complaint Against S. O.

ST. LOUIS, MO., Sept. 17—A protest against the methods of the Standard Oil Co. in Missouri was filed with President Woodrow Wilson this week by F. C. Bretsnyder, president of the Bell Oil Co. of St. Louis, one of the largest independent dealers.

In a letter addressed to the President Mr. Bretsnyder charges that the Standard Oil Co. "appears to be making an unprecedented effort to crush competition in Missouri by cutting the price of gasoline while it is advancing the price in states where competition is not so strong." This was done, he said, while the price of the crude product was rising steadily.

"In the Eastern states where there is but little competition," he wrote the President, "the Standard has advanced its price to correspond with advances in the crude oil. Even in our neighboring State of Nebraska these advances have been made while the Missouri price was forced down."

He points out that while gasoline is selling in New England, Kentucky and Texas for 13, 14 and 15 cents a gal. and in New York for 20 cents the Standard Oil is selling No. 3—the grade most used by motorists—for 8.9 cents a gal. in Missouri. He says that in the last few years strong competition against the Standard has developed in Missouri and that is why the Standard is making its greatest fight in this State.

—

Pittsburgh Gasoline Price Raised

PITTSBURGH, PA., Sept. 20—The Atlantic Refining Co. has advanced the price of all grades of gasoline 1 cent a gallon, making bulk quotations as follows: Motor, 16 cents; 68-70, 18 cents, and 73-78, 20 cents.

—

Denver Gasoline Up 1 Cent

DENVER, COL., Sept. 16—Gasoline took another jump of one cent to-day, and is now selling at 15 cents at all the filling stations. Some of the garages are selling at higher prices ranging as high as 18 cents. This increase is regarded as chiefly a part of the general advance throughout the country, and the price is still lower than it had been in this territory the greater part of the last four or five years. This has been the second advance of 1 cent in the last two weeks. The 13-cent price in force a few weeks recently was the lowest on record for this territory during the last fifteen years.

—

Minneapolis Gasoline Price Advanced

MINNEAPOLIS, MINN., Sept. 20—Both Standard Oil and independent companies announce an advance in the price of gasoline of 1 cent. The advance to 11½ cents was made Sept. 15. This price has prevailed since June 11, 1915. Even at the present price gasoline is much lower than October, 1913, when the figure was set at 16½ cents. A reduction of 4½ cents followed in December, 1914, which continued until June this year. Lessened crude oil production in the mid-continent fields is the reason for the advance.

Five Owen Cars on Four-Day Tour

Makers of Electrically-Controlled Machines Give Successful Demonstration

GREAT BARRINGTON, MASS., Sept. 22—*Special Telegram*—Touring by the manufacturers received an invigorating stimulus this week when the Owen Magnetic Car Co., New York, conducted a four-day tour of 750 miles which went North through Albany, Lake George and Plattsburg and returned to New York City by way of Burlington, Manchester, Pittsfield and Poughkeepsie, the tour being entirely an invitation one for the technical and trade press of New York and Brooklyn for the purpose of demonstrating the Owen Magnetic car in which an electric magnetic system of transmission replaces the conventional gearset and clutch system.

Five Cars on Tour

Five Owen cars made up the tour, which embraced a trip through the heaviest grades of the Adirondacks, Green Mountains and Berkshires, the cars averaging over 200 miles per day with traveling averages well up to 25 m.p.h. in the mountain sections. All five cars behaved admirably in the hands of the newspaper men, several of whom drove them for 100-mile stretches. The Magnetic car has publicly demonstrated that it is not an experimental machine but a well tried out proven design that possesses several merits peculiar to itself. The performance of all five cars on the long mountain grades was a surprising feature to all and the effectiveness of the electric brake which holds the car at 15 m.p.h. on the longest and steepest grades adds a new pleasure to mountain touring.

Entz on the Run

Justus B. Entz, inventor of the electric transmission system used, was present on the run. One car was driven by its owner who has already driven it 7000 miles. Ray M. Owen, president of the Owen company, was host for the party of sixteen. The tour was not restricted by any schedules but was primarily to demonstrate the electric transmission system. One of the new features in driving the magnetic car is that when coasting, the car automatically overruns the engine and when the engine is speeded up at the foot of the decline it takes up the load automatically. The major control rests with a small controller lever on the steering wheel which gives the seven forward speed positions, in another position serves as electric starter and at still another position operates an effective electric brake.

Trade Review of the Week

Lack of Cars for Immediate Delivery Handicaps Dealers —Factories Are Busy

DETROIT, MICH., Sept. 21—The industry here showed little change last week over the previous period. Factories are rushed, and activity is everywhere, just as it has been right along.

In dealer quarters they are still feeling the effects of the Michigan State Fair which closed last week. This exposition brought in a good line of prospects which are now keeping the sales forces busy. There seems to be one drawback to the dealer activities, however. That is the lack of cars. It is becoming harder and harder to hold customers to deliveries which in many cases cannot be made for several months. The good days are rapidly going, and buyers want their cars to enjoy as long as they can before winter sets in. Thus they will sometimes go elsewhere when a dealer cannot get them a car within a reasonable time. This is all the more aggravated since many of the cars are about on a par as to value and many prospects do not care which of several that suit their pocketbook they take. Of course, this gets right back to the factories, which say that the trouble in supplying dealers' demands is not alone in Detroit but almost everywhere.

To Boom Export Trade

To stir up export trade, several of the big companies have already, or soon will, send representatives to foreign countries. Among these are Dodge, Hudson and Hupp. This does not mean Europe, but South America, Australia, etc.

In factory circles, last week's developments included the securing by the King Motor Car Co. of an additional four-story plant of 70,000 sq. ft. floorspace to take care of business growth. This is close to the main plant. The Hyatt Roller Bearing Co. also made Detroit its distribution point, and will have a new warehouse here. At the present time a carload of bearings is being received here daily from the plant at Newark, N. J.

On Sept. 16, Chalmers had the biggest shipping day in its history, 133 automobiles being shipped. Packard began delivery of its twin sixes also, and is working with utmost speed. It is expected that the Packard working force will soon be increased from its present total of 8800 to 10,000.

The Detroit Board of Commerce, always a very active institution, has taken another step which will help the manufacturers. It has opened a co-operative branch of its bureau of domestic and foreign commerce, the duty of which will be to work with the manufacturers to secure outside business, both domestic and foreign.

—

New York Sales Normal

NEW YORK CITY, Sept. 22—Sales conditions during the last two weeks in the automobile trade were normal. The dealers are making many deliveries, and shipments from the factories are coming in regularly.

Now that the vacation period is over, and thousands of those who bought cars to tour in during the summer, are back in town, inquiries from that class of buyers, have fallen off. The dealers, however, are now busy preparing for the fall demand by getting in special bodies. At present there is a considerable demand for closed bodies for winter use. The high-priced cars, especially, are getting in many inquiries for them.

—

Three New Dart Truck Models

WATERLOO, IOWA, Sept. 16—The annual meeting of the stockholders of the Dart Motor Truck Co., this city, was held Sept. 10. A 7 per cent cash dividend was declared on the preferred. An increase of about 30 per cent in business over last year, was reported.

The company also announced three new models. One was a small model of 750 lb. capacity, having a 1¼ by 4-in. motor, unit power plant, Disco electric starting and lighting system, 30 by 3½-in. pneumatic tires mounted on demountable rims, 106-in. wheelbase, selling with express body for $675. Also a ¾-ton worm-drive, using a Buda motor, 3½ by 5⅛-in. with unit power plant, 124-in. wheelbase, 36 by 3-in. front and 36 by 3½-in. rear solid tires or 36 by 4-in. front and 36 by 4½-in. rear pneumatic tires on demountable rims, optionally, at the same price, $1,300 for chassis alone. Also a 2 to 2½-ton worm-drive, 4⅛ by 5½-in. motor, unit power plant, 150-in. wheelbase, 36 by 4-in. front and 36 by 4-in. dual rear wheels and tires, using steel wheels, price $2,100.

A board of directors was elected, which in turn elected the following officers for the ensuing year: C. W. Hellen, president and general manager; W. A. Baxter, vice-president and sales manager; E. L. Stover, secretary, and C. C. Wolf, treasurer.

—

17,523 Reo Cars and Trucks

LANSING, MICH., Sept. 18—The combined output of the Reo Motor Car Co. and the Reo Motor Truck Co. during the business year ending Sept. 15, was 17,523 passenger cars and trucks of which 16,023 were of the former class.

Texas Crops Promote Good Trade

Farmers Buy Many Cars—Trucks in Demand—Good Roads Influence Sales

AUSTIN, TEX., Sept 20—Several highly favorable factors are contributing largely to the unprecedented activity of the automobile trade in Texas at this time. Overshadowing all other incentives are the splendid crops and the good prices that have been and are being obtained for the different products. While it is true that the State's cotton yield will probably fall a few hundred thousand bales short of what it was last year it is bringing 3 or 4 cents a pound more than it was 12 months ago, while cotton-seed is selling for $10 to $15 per ton more than it was a year ago. The wheat yield of Texas was approximately 10,000,000 bushels more than it was in 1914. This season's corn crop was considerably larger than last year, notwithstanding the poor outlook for a good yield earlier in the growing period. The forage crops are by far the biggest ever known. Much of it is being placed in silos and converted into ensilage. Oats and other small grains were produced in abundance.

Dealers Behind Orders

The first beneficial effects of the splendid crop prospects began to be felt by automobile dealers several weeks ago. Following the increased demand for cars that came from farmers orders for cars began to pour in from merchants and other members of the business element of the different cities and towns. It is stated that there is hardly a dealer in the State that is not far behind in filling orders that he has received for cars.

It is also undoubtedly true that the summer car tourist season has had a great deal to do with the flourishing fall trade of cars. Many people learned for the first time the manifold enjoyments of automobile touring. Others discovered the big business benefits that were to be derived from the use of a car. There was more traveling over Texas in motor cars during the past summer by home people than ever before. Scores of people made tours of thousands of miles in this manner.

Another thing that serves as encouragement to automobile travel in this State is the wonderful improvement that has been made during the last year or two to the public highways. The good roads systems of the different counties have been greatly extended and extensive plans are on foot for further improvements of this character.

The truck and delivery vehicle trade

is keeping pace with that of pleasure cars, according to the reports of dealers of Austin, San Antonio, Houston, Fort Worth and other cities and towns of the State. More sales of trucks are now being made than at any time in the history of that branch of the trade. The motor delivery vehicles have almost entirely superseded the old horse-drawn type of wagons and carts.

One of the interesting features connected with the automobile trade in Texas is the improved appearance of sales rooms, garages and other adjuncts of the business over what they formerly were. Much attention to making these places attractive, convenient and comfortable for the employees as well as to visitors is now being given.

—

Dann Self-Lubricating Bearing

CHICAGO, ILL., Sept. 20—A statement issued by the Dann Spring Insert Co., of this city, brings to light the fact that a bearing which will run without oil and a bushing which will lubricate without grease will soon be marketed. The name of the substance from which these bearings and bushings are manufactured is said to be Amalgamite and the company claims that with its use, a radical change in manufacture should take place due to the elimination of grease cups and even the oil reservoir in the crankcase.

Some of the claims made for Amalgamite are that it is indestructible, is unaffected by temperature conditions and shocks, and that with it scoring of cylinders is impossible because the piston rings can be made permanent lubricators while at the same time they are unbreakable.

—

Jelley Master Carbureter Manager

DETROIT, MICH., Sept. 20—A. L. Jelley for a long time connected with the automobile industry of Kansas City, recently connected with the Master Carbureter Corp., as general manager. W. E. Burk, who formerly was vice-president and general manager, has returned to California.

The officers now in charge of the Detroit organization are as follows: A. L. Jelley, general manager; A. B. Walton, sales manager; E. T. Daniels, secretary and Jesse Cook, engineer.

—

Leon Jaffess Assigns

NEW YORK CITY, Sept. 21—Leon Jaffess, dealer in second-hand rubber, tires, tubes, etc., at 252 West Fifty-sixth Street, this city, 902 North Avenue, Plainfield, N. J., 400 North Fifth Street, Harrison, N. J., 973 Woodward Avenue, Detroit, Mich., and 5019 Euclid Avenue, Cleveland, Ohio, has assigned for the benefit of creditors to Max Bieber.

He began business in 1909. In July last he bought a plant at Plainfield, N. J., for about $29,000.

18,771 Fords Sold in Canada

—

Output for 1916 Expected to Be 30,000—Large Stock Dividend Expected

DETROIT, MICH., Sept. 21—In financial circles here the rumor has been current during the last two months that the Ford Motor Co. of Canada, Ltd., will declare before the end of the year an exceptional large stock dividend in addition to its regular cash dividend which amounts to 40 per cent annually.

Officials of the Canadian concern are not willing to say anything regarding the proposed dividend, but local brokers say that this stock dividend will be from 500 to 600 per cent. The par value of the shares of the company is $100; the most recent sale of the stock was made at $1,535 a share.

The business of the Canadian company has been very satisfactory since the beginning of the 1916 fiscal year, that is since Aug. 1, 1915. During that month sales made were 206 per cent ahead of those made in August, 1914. September thus far is also greatly ahead of last year in sales. Production is at the rate of over 100 cars per day.

The foreign business or export end of the general business which has always been a most important part of the Canadian company's affairs, is again increasing rapidly, and indications are, so said an official of the company, that it will keep up growing.

Sales in 1915 totaled 18,771 cars; in 1914 the cars sold totaled 15,657. In 1913 a total of 11,584 cars were disposed of while sales in 1912 numbered 6,388 cars.

The output for 1916 is expected to be 30,000 or more.

—

21,456 Fords in Canada

FORD, ONT., Sept. 20—More than one-third of the total number of automobiles in all the Dominion of Canada are Ford cars, according to the complete registration figures for the year 1914. The exact figures are 21,456 Fords or 38.08 per cent of the total number of cars of all makes. These figures, however, have been materially increased in the present year, for since then 13,155 more Fords have been sold in Canada, and undoubtedly the proportion to other machines is still as great, if not greater.

—

One of Timken's Additions Completed

DETROIT, MICH., Sept. 20—Of the several new buildings which will eventually double the present size of the Timken-Detroit Axle Co.'s plant, one of the biggest was recently completed and is now in full operation. This is the four-story structure on Clark Avenue, which is now entirely used as an assembly plant for worm drive commercial car axles.

The first floor is used for incoming stock and as general receiving room; the second and third floors are given over to machining axle parts, while the fourth floor is used for assembling the complete axle. The basement is used for stock.

The total floorspace of the building is about 100,000 sq. ft. and with its equipment of machines and machinery cost about $500,000.

Work is well under way on the new drop forge plant. All departments are working to their full capacity.

—

S. A. August Imports $96,822

NEW YORK CITY, Sept. 20—Automobile exports from New York City to South America during August amounted to $96,822. Argentine led the other countries with $27,330. Venezuela was a close second with $25,901. Chile was third with $24,831 and Brazil fourth with $11,535. Colombia imported $1,044 worth of cars and the rest of the countries imported only $1,709 in cars.

—

Burdick with New Era Co.

JOLIET, ILL., Sept. 20—W. J. Burdick has resigned as Western sales manager of the Sears-Cross Co., and hereafter will be connected with the New Era Engineering Co., this city, as secretary and purchasing agent.

—

C. A. Gilbert, Gibney Sales Mgr.

CONSHOHOCKEN, PA., Sept. 20—C. A. Gilbert has been made general sales manager of the Gibney Tire & Rubber Co., this city. Formerly he was Pacific Coast general sales manager for the United States Rubber Co.

—

McKee with Russel M. Seeds

INDIANAPOLIS, IND., Sept. 20—Homer McKee, formerly advertising manager of the Cole Motor Car Co., this city, and since that time Indianapolis representative of the Mahin Advertising Co., has become vice-president of the Russel M. Seeds Co., of Indianapolis.

—

Bethlehem Plug Foreign Orders

NEW YORK CITY, Sept. 20—During the past 2 weeks, more than 100,000 Bethlehem five-point spark plugs have been shipped to the war departments of three of the European countries now at war.

—

Halifax Man Wins Houck Contest

CHICAGO, Sept. 15—J. Mullane, Halifax, N. S., has been declared winner by the judges of the contest promoted by the Houk company, which contest consisted in describing a picture showing an automobile stopped to change a wheel when carrying dispatches in war.

Milwaukee Dealers Make Big Success of Fall Fair Show

Proper Methods Prove That When Well Conducted the Fair Show Means More Real Business Than Indoor Exhibition—30,000 See Cars in Week—Gate Receipts Alone $3,000—Cost $4,500

MILWAUKEE, WIS., Sept. 18—It has fallen to the lot of the Milwaukee Automobile dealers to tell the entire country how to conduct an automobile show at a fall fair. This has been fall fair week in Milwaukee, the State fair being held here all week. During the week the dealers of this city have staged one of the best shows ever held in the State from a business point and tonight the dealers instead of being dissatisfied with the fall fair as they were a year ago are happy, and so pleased with the fall fair as a place for a proper automobile show that if it were put to a vote whether to do without the January automobile show in the Auditorium in the city or the show at the fair grounds there would be a majority vote in favor of the fall fair show.

Show Well Conducted

And this is merely because the motor show at the fair grounds this week has been properly conducted. For nearly seven years the dealers have been exhibiting cars at the fall fair in a half-hearted manner, not very pleased and only exhibiting because, leaving out the city of Milwaukee, 85 per cent of the cars sold in the State of Wisconsin are sold to farmers. Farmers make up the majority of the attendance at the fall fair; then as the Milwaukee dealers reasoned, this fall fair should be the real place to exhibit 1916 cars, but it must be done properly. This was how it was done.

The fair grounds in Milwaukee are typical ones, located well outside of the limits of the city, so that if you go by trolley you pay 7 cents; if by jitney 25 cents, and by taxi, anything from $1 up. The Milwaukee dealers under the leadership of George W. Browne, chairman of the show committee, and Overland distributor for the State, made up their minds they would not have a show like previous ones of automobiles, in which they were under a cement roof about 20 ft. from the ground, with a manure spreader at one side of them, a traction engine in front of them and a hit-and-miss gasoline engine at their left, making it impossible to sensibly talk sales and cars to customers.

To get matters right Chairman Browne and the other members of the dealers, including President Edwards, Kissel and Dodge agent, went before the State Board of Agriculture and told them what had to be done for the motor exhibit at the fair.

What Was Needed

The cement roof, already referred to, covered a vacant floor 150 by 350 ft. If sides were added to this floor and the roof there would be an ideal inclosed building 150 by 350, offering over 50,000 sq. ft. of floorspace, the best in the state fair grounds, for an automobile show. The State Board of Agriculture agreed to erect the cement and glass walls at a cost of $6,000 and turn the building over entirely to the Milwaukee car dealers for $3,000, with the provision that the dealers should have absolute control over all automobile and accessory exhibits in the fair and further that they could charge the nominal fee of 10 cents to get into the motor car show, all other exhibit buildings in the fair grounds to be open to all. This was agreed upon, contracts were signed and dealers started to boost for a real motor car show.

Real Attraction of Fair

That they succeeded has been more than demonstrated by the interest in the show all week. Every day more than 40 per cent of those who paid to get into the show grounds have paid the extra 10 cents to get into the automobile show. The motor car show has been the real attraction of the fall fair. It has by long odds been the only real exhibit. Charging 10 cents for admission has been a success. It has kept the riff-raff out. Those really interested in motor cars, motor trucks and accessories have entered. The show has been as orderly and high-class as any winter show. There have been over sixty makes of gasoline and electric passenger cars; three or four makes of gasoline trucks and over twenty accessory exhibitors. Only 1916 gasoline passenger car models have been shown, and the decorations erected by the dealers, the music provided by two bands and all show regulations are on a par with those of the January show in this city customarily held in the big auditorium.

This week's show has been a real business show. Cars have been sold, many prospects have been discovered, and the business done in closed cars has been exceptional. Car sales have been made to scores of small towns throughout the State. Milwaukee distributors who have the control of the entire State have had from 50 to 100 dealers in. There have been dealers' dinners and dealers' talks. Many new dealers have been appointed, and best of all, these dealers have contracted for cars which are for immediate delivery. It has not been a case of the new dealers putting off the placing of actual orders for a month or two, as is the case in the January show. Now is a good time for the dealers throughout the State to make sales and deliveries. The farmers have finished harvesting. Some have sold their crops and got the money in the bank. They know how much they have to spend. There are three good months ahead of them in which they can use the new car. The slack season of the year is ahead of them. It is a good time to buy a car. In the spring they are very busy sowing the crops. The dealer has a much better chance with the farmer and small-town buyer in September and October than in February and March and April. If the dealer waits until spring the farmer will have spent a good part of his money in farm machinery, etc. To-day the dealer has an even chance with all of the farm implement agents and others who are looking for some of the crop money.

30,000 See Show in Week

And the Milwaukee dealers have made a little money out of the show. Members of the dealers' association will perhaps get the money returned that they paid for exhibit space. They charged 25 cents a square foot for space, the average dealer paying $110 for his space, those taking double space paying $220 and a few paying over $300 for large spaces in which a dozen cars were shown. Before the show opened the dealers had taken in over $1,600 for exhibit space. On Wednesday 6500 paid admission to the motor car exhibit, giving a revenue of $650 for the day, which

was 42 per cent of the paid attendance into the grounds of the fair. Thursday was Milwaukee day and the attendance went much higher. Approximately 30,000 visited the motor show during the week, giving a revenue of $3,000.

The total cost of staging the show was about $4,500. This was made up of $3,000 paid the fair association, and other money spent for advertising throughout the entire State and also to pay for the helpers in the building, such as ticket sellers, door men, sweepers, electrician, carpenter, etc.

The Advertising Tour

The advertising scheme of the dealers was a motor tour through the State which was carried out several weeks ago. In this tour over forty-two towns and cities were passed through and the dealers distributed literature on the fair and also on the motor show. They took a brass band on the tour. It played in every city, town and village. It was a grand advertising scheme. In addition the dealers had 300 bill boards advertising the fair and the automobile show. These were in every city, town and village. They cost $1,050, but proved a good investment.

With such a preparation and such a show is it any wonder that new life was injected into the show and is it any wonder that the dealers are smiling tonight, happy after a week of real good business in spite of the rainy weather that marred the attendance on several days? Organization and co-operation did it all.

What the Dealers Say

Hear what a few of the dealers think of the fall fair motor car show.

F. Edwards, Kissel and Dodge dealer and president of Milwaukee Dealers' Association—It is the best business proposition I have ever bumped into at a show. I did more business during the first two days of the show than in the whole week of the winter show. We are selling cars and getting prospects for the city and also for the entire State. Now is the best time of the year to catch the farmer. He is through with the crops and has plenty of money. Farmers and business men from small towns and cities around the State are buying now and want immediate deliveries. The demand for closed cars and those with detachable tops is heavier than ever before. Outside of Milwaukee 50 per cent of our business is to farmers. If it came to vote as to whether we dropped the winter show in January or the fall fair show I would vote with both hands to continue the fall fair show. The attendance this year is good. Next year it will be better. It has been an experiment this year, but show visitors will go home and tell about the motor show and will come back in considerably greater numbers a year hence.

N. E. Osmond, Jeffery—There are sixty-four Jeffery dealers from the State attending the show and many of them have brought prospects with them.

Demand for Winter Tops

Edgar Sanger, Hupmobile and Stearns—This show is away ahead of the January one in the Auditorium. We are getting prospects who want cars right now. The farmers all want quick deliveries and that will cause a little trouble with some concerns that cannot make them. The demand for closed cars is growing, in fact, the demand for the detachable top is unprecedented. A car without a winter top is to-day much the same as a person wearing an overcoat but without gloves. Seventy-five per cent of my retail sales are cars with detachable bodies. This is a much better season to place dealers than in January.

Farmers Buy in Fall

W. H. Hathaway, district representative, Cadillac—The fall is the best season of the year to sell the Wisconsin farmer. In the spring he is too busy sowing the grain and tilling the soil. This has been a particularly good year with the Wisconsin farmer as all crops excepting corn have been good. This is the best season of the year to sell closed cars, and the January show is entirely too late for closed car sales. October to January are the months for selling closed cars, and this year the closed car business is being worked in small towns around the State. We sell one-third of our cars in the State to farmers. One dealer in a town of 1500 has taken seven cars for 1916.

H. W. Bonnell, Mitchell—At present the country business around the State is ahead of the city business and the fall fair is the best place to round up this country trade. Over forty dealers from the State are at the show with prospects.

Mr. Crafter, Winton—Crops conditions have been good throughout the State and bankers and business men in towns of 1500 and over are in good humor and are buying better than ever before. There is a perceptible demand for cars with special colors, there being many evidences that brighter colors are going to replace the sombre black of the past few years. More limousines are being sold than ever before.

Many Truck Prospects

Mr. Millman, Stegeman Truck—We get three or four times more prospects at the fall fair than we do at the January show. We do not expect to sell trucks at this show, but we do get prospects. We are going to exhibit at one or two of the best county fairs in the State. The city markets are overcrowded and there is better business with the out-of-town people in the smaller places, when you meet at the fall fairs. Our sales throughout the State are three times what they were last year.

George W. Browne, Overland—We have a 600 per cent increase inclosed car business over last year and the fall fair comes at a time when this closed car business can be properly presented to the buyers. Our State dealers are all at the show, many of them with many prospects.

—

Delaware Non-Reciprocal Law May Be Repealed

WILMINGTON, DEL., Sept. 20—An enactment of the last Legislature affecting motorists of other States is proving so obnoxious that the police of Wilmington have voluntarily stopped enforcing it.

Originally the Delaware law was wholly reciprocal, but because some business concerns in Pennsylvania were operating trucks in Delaware without paying a Delaware license, the last Legislature amended the law so as to prohibit motor vehicles owned by non-resident corporations being operated in Delaware without a Delaware license. As little was known of this change outside of the State, non-resident drivers were constantly falling into the trap, and the courts had no alternative but to fine them.

One result of this was to drive business away from Wilmington, though many concerns took out Delaware licenses in order to continue doing business here. For a time the traffic police were making arrests by the wholesale, but there was such a protest that now, instead of arresting a violator they take him to the nearest license agent and if he takes out a Delaware license he is allowed to proceed, but if he refuses he is prosecuted.

It is altogether probable that the next Legislature will repeal the obnoxious law early in the session. This amendment does not apply to cars owned by individuals, who can operate in Delaware with a license of their own State.

—

Proposed New York Law Requires All Drivers Licensed

NEW YORK CITY, Sept. 20—The next Legislature will be asked to enact a law requiring that all automobile drivers be licensed after a qualifying examination. It is stated that more than one-half of the fatal automobile accidents in this city are probably due to the inefficiency of owners or members of the families of owners and in many cases the inefficiency is due to incurable physical defects or to practically unalterable psychological disqualifications.

G. M. C. 50 Per Cent Dividend

Company Earned $14,926,322 in Fiscal Year—Seventeen Directors on New Board

NEW YORK CITY, Sept. 18—The directors of the General Motors Co., at their meeting concluded Thursday night, declared a dividend of 50 per cent in cash, being $50 a share, on the $16,506,783 in common stock, payable Oct. 15 to shareholders of record on Sept. 30. The board recommended the inauguration of regular quarterly common dividends, the rate to be determined by the incoming board.

The regular semi-annual dividend of 3½ per cent has been declared on the preferred stock, payable Nov. 1 to stockholders of record Sept. 30.

During the 1915 fiscal year which ended July 31, the General Motors Co. earned 81.2 on the common stock outstanding, compared with 37.6 per cent in 1914.

The surplus available for the common stock amounted to $13,408,839, compared with $6,201,055 in the previous fiscal period.

The net income, after deducting manufacturing, selling and administration expenses and maintenance and depreciation amounted to $14,926,322 as compared with $7,947,412 in 1914. The total cash on hand July 31, of this year was $14,526,124 and the funded debt amounted to only $2,328,000, being the balance on the 6 per cent notes which mature Oct. 1. This will be paid off.

Gross Sales, $94,424,841

During its business year just ended, the company's gross sales totaled $94,424,841, the total number of automobiles sold being 76,068. In 1914 the company sold 58,987 and the gross sales amounted to $85,373,302.

From Aug. 1 to Sept. 14 of the 1916 fiscal year the value of the sales as compared with the same period of 1915 more than doubled, the amount being $16,176,761 as compared with $7,585,739 last year.

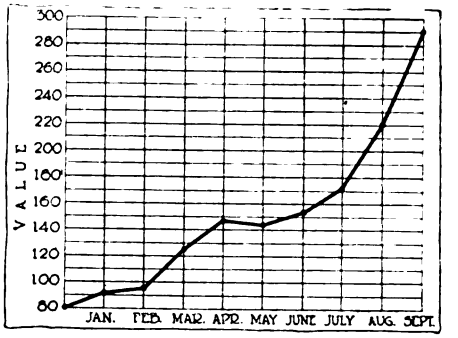
In view of the expiration of the voting trust on Oct. 1, the following proxy committee was agreed upon for the annual meeting Nov. 16; P. S. DuPont, W. C. Durant, L. G. Kaufman, C. W. Nash and J. J. Storrow, to vote for the following directors: Lammont Belin, director of the Aetna Explosives Co.; L. G. Kaufman, president of the Chatham & Phoenix National Bank; Pierre du Pont, S. F. Prior of the Union Metallic Cartridge and Remington Arms Co.; A. H. Wiggin, C. H. Sabin, J. A. Haskell, A. G. Bishop, E. W. Clark, W. C. Durant, H. J. McClement, C. S. Mott, C. W. Nash, Thomas Neal, J. J. Roskob, Albert Strauss and J. J. Storrow.

The new board of General Motors will consist of seventeen against fourteen in expiring board. The two boards are compared in the following list, the first eight names in each being identical:

NEW BOARD	OLD BOARD
E. W. Clark	E. W. Clark
J. H. McClement	J. H. McClement
Thomas Neal	Thomas Neal
C. S. Mott	C. S. Mott
C. W. Nash	C. W. Nash
J. J. Storrow	J. J. Storrow
Albert Strauss	Albert Strauss
W. C. Durant	W. C. Durant
Lammot Belin	Joseph Boyer
L. G. Kaufman	R. F. Herrick
Pierre du Pont	E. D. Metcalf
S. F. Prior	M. J. Murphy
A. H. Wiggin	M. L. Tilney
C. S. Sabin	Jacob Wertheim
J. A. Haskell	
A. G. Bishop	
J. J. Roskob	

Among the assets carried the past year are $1,001,000 in municipal securities, a post which was not carried on the balance sheet in former years.

In his statement to the stockholders of the company, President Charles W. Nash, says: "The common stock has never received a cash dividend since the company was organized Sept. 16, 1908. Your directors have followed the policy of building up the cash assets and the credit of the company and so have accumulated and held large cash balances



Showing phenomenal rise in value of General Motors common from first of year to Sept. 18, based on highest value reached each month

pending the maturity of the 6 per cent notes, the original issue of which was $15,000,000, and the last of which will be paid Oct. 1 next. During the past year, for the first time, it has not been necessary for the company to borrow money.

"Further marked improvements in manufacturing methods will be continued, but can hardly be expected in future to yield such large gains in output with such moderate expenditures on new buildings and machinery as have characterized the last five years. It is also true, in the opinion of your directors, in view of the strong financial posi-

tion your company now occupies, that the time is near when larger additions to plant, made necessary by the growth of the business should be made. Your board does not believe in running into debt, and it was partly because of these probable extensions, a portion of which have now been authorized, that your board voted to set aside the $1,000,000 referred elsewhere as invested in short time securities."

How General Motors common stock has ascended since the first of this year is shown in the accompanying table and illustration, which give the bid and asked prices at the beginning and the end of each month.

	Bid	Asked
January 5	81	82
January 26	90	91½
February 2	93	95
February 24	94	95
March 3	92	93½
March 31	124	125
April 6	126	128¾
April 26	145	147
May 1	143	145
May 31	135	136¼
June 7	151	153
June 28	152	154
July 5	156	157
July 27	179½	181
August 3	177	179
August 30	219	220½
Sept. 7	241	243
Sept. 18	280	288

In July, 1912, the stock was quoted at 32-33, while in July, 1913, at certain times there were bids at 26 to 32 asked. In September, 1913, the stock quoted 35-37 and at the end of December there was 36½ bid and 38 asked.

At the time of the start of the European war in 1914 the common was quoted at 82-84. Early in December of that year the stock was down to 68-72 but on Dec. 29 the records show that the quotations had again gone up, bid being at 76¼ and asked at 77½.

—

New Ajax Tire Plant

TRENTON, N. J., Sept. 20—The annual meeting of the stockholders of the Ajax-Grieb Rubber Co., this city, was held last week, and a dividend of 7 per cent on the preferred and 24 per cent on the common was declared.

A new plant is to be built immediately which will be 200 by 35 ft., three stories, and adding 210,000 sq. ft. of floorspace. Foundations are to be capable of carrying three additional stories which will be added later. The extensions include a new power house, engine, dynamo and boiler units.

—

500 Ross Eights for England

DETROIT, MICH., Sept. 20—The Ross Automobile Co., this city, has closed a contract for 500 cars for delivery this year, with Mann-Overton's Ltd., London, England. Arrangements have also been made for renewal contracts to cover three years and the exclusive representation in the United Kingdom, the Colonies and France.

Studebaker School for Employees

—

Three-Year Commercial, Mechanical and Technical Courses with Savings

SOUTH BEND, IND., Sept. 20—The Studebaker Corp., of this city, has made announcement of the establishment of a training school for the purpose of assisting the young men employees of the corporation to avail themselves of an opportunity of taking a commercial, technical or mechanical course, extending over a period of three years. The conditions as set forth in the announcement are as follows: Regular students must be under seventeen years of age for the preparatory office course and under twenty for the apprentice training course. They must be physically sound and of good moral character. The course will be carried on for three years and will not interfere with the regular work of the student. The student will contribute 50 cents a week of his wages as a guarantee of good faith in continuing in one of the courses until same is finished, which sum will be forfeited to the corporation in case the student should be dismissed for incompetency, irregularity, or any reason other than sickness, or leaves of his own free will. This weekly contribution will be deposited in a savings bank to the credit of the student, the total sum with interest to be returned to the student when he has satisfactorily completed his course. The corporation will in recognition of this effort for self-development pay the student's membership in the Y. M. C. A., and arrange for the course under the supervision of the Y. M. C. A. and pay all expenses. In addition to the foregoing a bonus of $100, $50 and $25 for each student completing the course with an average percentage of 95, 90 and 85, respectively will be given.

—

8-Hr. Day in Studebaker Plants

DETROIT, MICH., Sept. 20—The Studebaker Corp. announces an 8-hr. working day, effective Nov. 1.

—

Detroit Makers Benefited by New Local Department

DETROIT, MICH., Sept. 17—Hereafter, Michigan manufacturers and exporters wishing information will not have to write to the Department of Commerce in Washington. The Detroit Board of Commerce has now completed arrangements for the opening of a co-operative branch of the bureau of foreign and domestic commerce and will thus be able to furnish those interested with reports made by the special agents from the department as well as other information the manufacturers may desire. With the growing domestic and export trade in the Detroit district it has been found advisable to give the manufacturers quicker service and the new branch will greatly facilitate and help in this connection.

—

British Makers Meet to Offset American Invasion

LONDON, ENGLAND, Sept. 1—Representatives of a number of leading British automobile manufacturers held a meeting in this city lately, Edward Manville, chairman of the Daimler Motor Co., presiding. The meeting was private, but in an official statement issued after the conclusion of the proceeding, it was stated that "these manufacturers contemplate taking steps to approach the government concerning the complete engagement of the great majority of British motor manufacturers on government work, and their inability, owing to the fact, to meet foreign competition on fair terms, so far as normal trade is concerned."

It was stated that there was still a considerable trade in private and commercial cars, which was being captured mainly by American makers.

—

Transmission Ball Bearing Co. Formed

BUFFALO, N. Y., Sept. 16—The Transmission Ball Bearing Co., this city, has been incorporated with a capital of $100,000 to manufacture ball bearings for motors and trucks. The directors of the new company, which is the United States branch of the Chapman Double Ball Bearing Co. of Toronto, are W. J. Murray and J. P. Beatty of Toronto and W. M. Wilson of Buffalo. The office of the company is at 1407 West Avenue, this city.

—

Mitchell Co. After Confiscated Cars

RACINE, WIS., Sept. 20—The Mitchell-Lewis Motor Co., Racine, Wis., has taken steps to recover from the Imperial German Government the value of a cargo of Mitchell cars confiscated by the Germans at the siege of Antwerp more than a year ago. Shortly before the war broke out several carloads of cars were shipped to the Mitchell-Lewis branch at Antwerp. The cars arrived at destination safely, but when Antwerp was taken the Germans commandeered them as spoils of war. The Mitchell company has obtained a certificate from the secretary of state of Wisconsin to prove that it is a duly authorized corporation of Wisconsin, U. S. A., and not a company licensed by a country at war with Germany.

—

100 New Cars a Day

MINNEAPOLIS, MINN., Sept. 16—During the past eighteen days, 1857 new automobiles were registered in Minnesota, or more than 100 a day.

Billings & Spencer May Increase Stock

Directors Vote in Favor of New Organization with $500,000 Capital

HARTFORD, CONN., Sept. 20—In order that the new factory may be financed, the Billings & Spencer Co. proposes an increase in capital to $500,000. The directors of the company at a meeting late last week so voted and on Oct. 26, a meeting of the stockholders is scheduled to be held. It is the intention to have a new corporation, which will carry the same name as the old one, take over the business. It is explained by the directors that the capitalization of the company is small in comparison to its business and its assets. The Billings & Spencer Co. has almost completed removal to the remodeled plant at the corner of Park and Laurel Streets, formerly occupied by the Columbia Motor Car Co., and the scene of the earliest experiments in the United States on a commercial scale. The company has completely renovated the original quarters at great expense. The location is ideal. New buildings have been erected which include a power house on the bank of the Park River. The old plant on Lawrence, Russ and Broad Streets, will probably be on the market about Nov. 1.

—

Inter-State Adds

MUNCIE, IND., Sept. 18—The Inter-State Motor Co., this city, has broken ground for a new addition three stories high to building No. 2 of the plant. This addition will be 80 by 150 ft., constructed of brick and steel, giving 36,000 additional square feet of floor space. This will make a total of approximately over 200,000 sq. ft. of floorspace available for production. It is expected that the plant will be completed within 45 days after the material has been placed on the ground.

Changes are being made inside the present plant to increase each department. A large addition is being built in the form of a building inside of a building. The main bulding in which this new part will be housed is the largest single unit of the plant all on one floor, being 160 by 440 ft. The new building will be 34 by 230 ft., situated in the center of the main building.

—

King to Add 70,000 Ft.

DETROIT, MICH., Sept. 18—The long contemplated enlargement of the King Motor Car Co. is now a fact, the company having secured a four-story plant with nearly 70,000 sq. ft. of floorspace at 1045 East Jefferson Avenue or only a few blocks from its main plant. The latter will become plant No. 1 and will house the chassis assembly, motor manufacturing department, dynamometer test, technical department, stock and shipping departments, while plant No. 2 will have the final assembly, inspection and shipping departments, also the road test department.

—

Employees in Ohio Car and Tire Plants Paid $36,709,472

COLUMBUS, OHIO, Sept. 18—According to a report issued by the Ohio Industrial Commission the payroll of all automobile factories in the Buckeye State for the year 1914 amounted to $18,629,571. This included bodies and parts as well as automobile building proper.

The payrolls of all of the rubber goods factories in the State including automobile tire manufacturing amounted to $18,079,901.

—

Few Market Changes

NEW YORK CITY, Sept. 21—Markets this week were dull with few changes. Steel markets made no changes. Copper markets showed little increase in price. The producers report that the 18-cent price asked for is being rigidly maintained and that a number of good sales have been made to foreign account. Several good sized sales were also made to the domestic consumers. The copper situation appears to be playing into the hands of producers, for each day indicates that the situation is turning to the seller's favor. The aluminum market is much firmer, with demand continually increasing. The antimony market shows further weakness, holders offering spot at 27½ to 28½ cents. No new developments of importance occurred in the crude rubber situation last week either here or abroad. Locally a somewhat better inquiry was noted, but the demand was generally limited to small parcels for prompt use. The closing price for Up-River Para fine was 55½ cents, this being maintained throughout the week. The oil and lubricants markets this week were steady, no changes taking place. There were a number of good sales recorded on Tuesday of oils but this selling did not continue.

Fire in American High-Speed Chain Plant

INDIANAPOLIS, IND., Sept. 20—The factory of the American High Speed Chain Co., Indianapolis, Ind., caught fire early Wednesday morning, and damage estimated at about $50,000 was sustained. The fire, however, was confined principally to one floor, and arrangements have been completed whereby manufacturing will continue without interruption.

The company has been for years manufacturing noiseless chains, designed to drive small working parts of automobile motors. The business has grown so rapidly that they have been occupying all the space in the large building at the southeast corner of Illinois and South Streets.

—

Automobile Plant for New Orleans

NEW ORLEANS, LA., Sept. 16—This city is to get its first automobile plant. A tract of land twenty acres square, 7 miles from Canal Street, in St. Barnard parish, has been purchased by the Mohawk Motor Corp. of Delaware, whose local directorate is J. B. Davis, John Merkle and W. A. Francis. Work on the plant is to start within two months. The company is capitalized at $100,000 and plans to make two types of Mohawks, a five- and a seven-passenger.

in Milwaukee Sept. 16 and 17. The meeting was called to discuss ways and means for stimulating the lumber trade, which has been in a state of lethargy for many months and shows a need for stimulation. It was decided to make a canvass of all makers of bodies and vehicles who have adopted sheet metal and aluminum for body-making, with a view to resuming the use of wood. The growing use of metal instead of wood has become a serious matter to lumbermen and they intend to use every means within their power to bring about a change in conditions.

Manhattan Rubber Raises Wages

PASSAIC, N. J., Sept. 16—The Manhattan Rubber Mfg. Co., this city, maker of automobile tires and other accessories, will give all employees with the concern from six months to two years a 3 per cent increase in wages. Those who had worked from two to five years would receive 5 per cent increases, and all over five years a 7 per cent increase. The company employs about 750 hands.

—

Dividends Declared

Yale & Towne Mfg. Co., New York City: 1¾ per cent for quarter out of past earnings, ending Sept. 30, to stockholders of record at close of business Sept. 25, and payable Oct. 1.

Vacuum Oil Co., Rochester, N. Y. 3 per cent, payable Oct. 30 to holders of record Oct. 14.

Electric Storage Battery Co., Philadelphia, Pa.: 1 per cent on common and preferred, payable Oct. 1 to stockholders of record Sept. 21.

General Motors Features Market

—

Other Stocks Rise in Sympathy —General Trade Conditions Have Influencing Effect

NEW YORK CITY, Sept. 20—Automobile securities closed on Saturday with large gains, in sympathy with the General Motors dividend announcement. Conditions in the business world last week also had an influencing effect on industrial stocks. Certain barometers, such as the rise of sterling exchange, which is now quoted around $4.70, commercial paper rates and the New York bank surplus, and a better aspect of diplomatic affairs, were a stimulus for a very active market.

Markets Active

At the opening on Saturday, General Motors made a further extensive advance which it maintained throughout the day, closing at 286, a gain of 31 points for the week. Studebaker common was more active than ever before, and by closing at 128½, the price made a new high record. The Maxwell stocks also showed an increase of activity, and their prices increased moderately.

The automobile stocks' response to the General Motors dividend announcement was instantaneous, with a consequent large selling activity. Goodrich, especially, showed considerable buying strength last week. The directors of this company, it is said will take up the matter of common dividends at the next regular meeting of the board, which is scheduled within the next six weeks.

The majority of the stocks last week showed substantial gains, ranging from 1 to 31 points. Drops were few and small, ranging from 1 to 7 points.

In the automobile securities, General Motors and Studebaker were the feature and in the tire market, Goodrich, Goodyear and Portage, showed the best gains. Vacuum Oil rose 10 points.

Firestone common went down 5 points while that of the Peerless company dropped 7 points. Willys-Overland preferred dropped 2 points.

New Edition of Used-Car Market Report Published

CHICAGO, ILL., Sept. 20—Following the publication of the revised edition of the pocket edition of the Chicago Automobile Trade Association National Used-Car Market Report, covering Zone 7, which centers in Chicago, an edition of the pocket book has been brought out for Zone 9, which centers in Minneapolis. This is in every respect the same as the pocket edition for Zone 7 except that it gives the appraised value for Zone 9. This zone includes Montana, North Dakota, South Dakota, Minnesota, Wisconsin and part of Michigan.

Ford Tractor Plows 5 to 10 Acres Per Day at a Cost of $3.10—Life 2 Years

Tests and Experiments Still Under Way to Determine Form in Which Vehicle Will Be Put on the Market in About a Year

DETROIT, MICH., Sept. 20—The Ford tractor, which made its initial public appearance at the Michigan State Fair here recently, is now in a fairly advanced state of development, although the officials state that it is not likely that it will be placed upon the market for about a year, as it is intended to prove it absolutely before going ahead with it. Each day during the Fair the tractor was demonstrated to the visitors, and its ability for plowing and hauling shown.

Many Tests

Tests are being made with the vehicle repeatedly by the Ford company, and the experimenters will not say whether or not the present form of the tractor will be the final form, although it has worked out very well to date. To demonstrate the haulage ability of the vehicle, it was recently driven to Cleveland from Detroit over roads that are fairly good, making the 150-mile trip, pulling a 5-ton trailer, at the rate of 16 m.p.h. It has also made this trip with a 7-ton tow.

Plows 5 to 10 Acres Daily

As to its ability as a farm vehicle, the tractor is capable of doing from 5 to 10 acres of plowing a day, depending upon the depth of the furrow and the texture of the soil. It can pull either one plowshare 16 in. wide or two shares 12 in. wide. Equipped with the Holley kerosene carbureter, the tractor uses 10 gal. kerosene for 10 hr. work.

Cost $3.10 a Day

To figure the cost of operating, then, it should be considered that kerosene, in this locality, costs 6 cents a gal. in barrel lots, or 8 cents in small lots. This means a fuel cost of 60 cents per 10 hr. day. If the cost of the vehicle is to be $250, then on the basis that the tractor would last one year, which is very low, and also considering that the farm work for a year would not be over 100 days, the cost for amortization would be $2.50 per day. Adding this to the daily fuel cost, the vehicle figures to cost $3.10 per day, doing a minimum of 5 acres of plowing.

Low Fuel Cost

Now it costs at least $3 per acre to plow with two horses. A team cannot do more than 1½ to 1¾ acres per day, so that we arrive at the following comparison:

TRACTOR	TWO HORSES
Work per 10 hr. day—5 to 10 acres.	Work per 10 hr. day—1½ to 1¾ acres.
Cost per day—$3.10, figuring that the life of the tractor is only 100 days, which is very low.	Cost per day—$3.

The above is on the assumption that the farmer would need a new one each year. Even if he did, he would do the work in one-third the time, or save two-thirds for the same amount of work. It would probably be fairer to consider that the tractor would last at least two years. Supposing it was good for 250 days, the amortization cost per day would be $1.00. Then the daily cost, including fuel would not run over $1.60 to $1.75. Then the comparison with horses becomes more one-sided. Probably a tractor having good care would last much more than two years.

Uses Standard Ford Engine

The Ford tractor in its present form uses the Standard Ford engine as used in the passenger cars, and this is coupled up to a worm-driven rear axle. Instead of the regular Ford planetary transmission, the transmission is changed to have only one speed, and the band brake is enlarged. But there are two sets of spur gears back of the regular housing for the planetary gearing, which housing is a part of the crankcase and has the regular Ford engine form. These gears give two speeds.

The worm is over the worm wheel, and within a substantial housing which is also the housing of the rear axle unit. By the use of worm drive in connection with the planetary transmission and the two gears back of the latter, an enormous reduction between engine and wheels is obtained. On the highest speed, the reduction between engine and wheels is 32 to 1, while in second speed it is 77 to 1.

Two Sets of Wheels

Two sets of wheels are used with the tractor. One set is of the regular truck type. The rear pair are used with solid block rubber tires, and the fronts use solid continuous rubber tires, of artillery form. For plowing and field work where greater traction is required, tractor wheels are arranged to fit the same axles in place of the truck-type wheels. The tractor wheels are steel, the rear set having steel blocks around their circumference.

In its present form, the vehicle uses no form of body, having only a single seat for the driver on the left. The engine is inclosed under a hood, however.

At either side of the hood on brackets from the frame are large 10-gal. tanks. The one on the right carries the kerosene, while 10 gal. auxiliary water is held in the right tank. For tractor work, the cooling system must be adequate for the pulling is long and steady with heavy working of the engine—conditions which would heat the engine unduly without the auxiliary water circulation through the 10-gal. tank. It is stated that the cooling is held within reasonable limits by this added water supply method.

On the models shown the public, a stiff frame was used—not the regular Ford car frame.

Not in Final Form

Probably before the vehicle is finally ready for the market, other changes will be made, although the present construction may prove entirely satisfactory as it is. The Ford concern is experimenting with the vehicle right along and making it prove its ability under all kinds of severe conditions. The aim is to have a vehicle that will serve the farmer well, and until it has advanced to such a state of development that they are sure it will do its work, it will not be put on the market. From information that can be gained, it seems likely that the rural population will have to wait at least another twelve months before the Ford tractor will be a commercial reality.

—

Jitney War on in Terre Haute

INDIANAPOLIS, IND., Sept. 15—War on the jitney bus at Terre Haute, Ind., was begun late last evening when suit was filed in the district court by the Fidelity Trust Co. of New York, bondholders for the T. H. I and E railway, who, in turn, are owners and operators of the street railway lines in Terre Haute.

Sixty defendants are named in the notice of the suit, the trust company stating the jitney bus in Terre Haute is being operated by individuals instead of organized companies. The suit is in the shape of a bill of equity, asking for a restraining order against the operators of such lines.

It is cited in the appeal for injunction, that the jitney bus drivers have organized what is known as the Jitney Bus Drivers' Union, No. 168, which is a trades union, recognized by the Central Labor Union of that city. Stress is laid on the contention that Central Labor Union started a boycott against the street car lines in January, 1915, and that since that time the decreases in the income of the street car line in the way of fares have been as follows:

February, $4,152.53; March, $4,916.99; April, $9,255.91; May, $11,777.62; June, $10,341.86; July, $16,834.54; August, $10,508.83.

It is cited that the railway company has already lost more than $75,000 on account of the boycott, whereas previous to January, 1915, the average monthly receipts were $37,000.

—

N. E. Chalmers Dealers Meet in Boston

BOSTON, MASS., Sept. 18—More than 100 dealers who handle the Chalmers line in New England were guests of Harry Pyke, manager of the Boston Chalmers company on Sept. 17 on an outing at the Breaden Cheese Inn, Cohasset. During the meal addresses were made by factory representatives. Vice-President C. A. Pfeffer told of the sales being made during the present time, and how the production had jumped up to more than 120 shipments of cars a day. W. J. Drumplemann, eastern district representative, spoke about infringements and how the factory would protect dealers. J. M. Cuhelan spoke about advertising and publicity.

—

Portland Jitneys Hurt by Decision

PORTLAND, ORE., Sept. 15—For the second time a Portland jitney ordinance has been given a body blow by the courts. Circuit Judge Bagley enjoined yesterday the enforcement of the second measure. He held the council exceeded its authority in affixing an emergency clause preventing the invocation of a referendum. He also declared illegal a provision requiring applicants for operators' licenses to get certificates from the commissioner of utilities.

The first ordinance was declared a violation of the initiative election law because it was prepared by the council itself before submission to the voters.

—

$6,178,213 in Washington Cars

OLYMPIA, WASH., Sept. 15—Automobile salesmen are doing a big selling business, according to the personal property returns of the county assessors.

There were 15,223 automobiles in the State of Washington in 1914. There are 21,713 listed this year. The total value of the machines in 1914 reached $4,924,263, according to the assessors, and $6,178,213 in 1915.

—

Newark Jitney Ordinance Vetoed

NEWARK, N. J., Sept. 16—Mayor T. L. Raymond to-day sent to the Board of Works his disapproval of the ordinance drawn by that body regulating jitney buses. The mayor said it contained features which may be unjust to the jitney owners.

P. O. Authorizes 500 Rural Routes

—

288 in Operation—Finds Cost Per Mile Is 34 Cents on a 29-Mile Route

WASHINGTON, D. C., Sept. 18—The Post Office Department has announced that more than 500 automobile rural routes have been authorized and of these 288 are in operation. Their preliminary experience has convinced postal authorities that the new service will greatly improve the farmer's mail and express facilities. Time schedules are better maintained and routes more regularly served in all weather conditions by automobile than by horse-drawn vehicle. Forecasts, department officials say, that the automobiles could not do 50 to 60 miles a day upon regular schedule are not borne out.

A Kansas Carrier's Cost

A Kansas carrier gives his experience as to cost, as follows:

Set of tires (Average life 6000 miles)	$60
Gasoline—(1 gal. to 15 miles at 15 cents a gallon, though he is now paying 11 cents)	60
Oil—(1 gal. to every 150 miles at 45 cents a gal.)	18
Depreciation—(Based on 72,000 miles as the life of his car)	40
Repairs per 6000 miles	30
Cost of operation per 6000 miles	$208

$0 3466 per Mile

From the above, the cost of operation per mile comes to $0.3466. Applying this figure to his 29½-mile route, this carrier found this to be his outgo for running expenses:

To serve route 250 days by automobile at $1.02 per day	$255
To hire horse and conveyance at $1.50 a day for 57 days, or during the period in which he could not use the machine	85.50
Cost to serve route	$340.50

For a 55-Mile Route

Deducting $340.50 from his $1,200 salary, the carrier's net income now is $859.50. Applied to a 55-mile route, it works out thus:

To serve route 250 days	$477.50
To hire substitute at $3.33 a day to cover that part of route which the regular carrier could not do by horse-drawn conveyance during the period in which he could not use his machine, and to hire horse and conveyance at $1.50 a day to do the remaining half of the route for period of 57 days	270.50
Total cost of serving the long route	$758.00

Hence, this carrier, if he received $1,800 a year for covering 55 miles six days a week, figures that his net income would be $1,042—or $200 more than he is now getting.

—

$64,000 for Postal Cars in St Louis

ST. LOUIS, MO., Sept. 18—Government-owned motor vehicles of a special design soon are to be installed in St. Louis to supplant the present system of wagon and street car delivery and collection of all mail, including parcel post. Similar service has been ordered installed in Chicago, it was learned here. In both these cities the mail is now being handled by conveyances operating under private contracts. It is said the excessive compensation demanded by these contractors has compelled the government to operate its own machines. The government has been experimenting with motor vehicles in Washington and Detroit and the order for their installation in St. Louis and Chicago is taken as acknowledgement of the success of the innovation.

It is planned to spend $64,000 for motor cars to handle the St. Louis mails. Their operation, it is estimated, will cost $112,000 a year. At that the government counts on saving $3,000 the first year as at present the government is paying $179,600 for the transportation of mail under the contract system in St. Louis. The motor service will be institutied here Jan. 1, 1916—it is announced in advices from Washington, D. C.

—

Hudson Files Complaint Against Michigan Central Railroad

WASHINGTON, D. C., Sept. 18—The Hudson Motor Car Co., Detroit, has filed a complaint with the Interstate Commerce Commission against the Michigan Central railroad, for a refund of $527.50 being the freight charges on two automobiles which were shipped over that road to be delivered in Monterey, Mexico, but which were returned to Detroit.

The shipment was made, so the complainant claims, at a time there was an embargo on shipments by way of Laredo. The Hudson company claims that the shipment could and should have been made by way of Brownsville, Tex., but the road refused to divert the shipment promptly and an embargo was placed when it arrived in that city, from where the two cars were ordered returned to Detroit. It is the opinion of the Hudson company that the railroad company is at fault and should be compelled to refund the freight charges.

Two Racing Co.s Formed

Indianapolis Speedway Will Race 2 Peugeots—May Enter Other Fields

INDIANAPOLIS, IND., Sept. 15—The Indianapolis Motor Speedway and the Prest-O-Lite Co., this city, are to be represented with racing teams in all the important automobile races of the country. To this end the Indianapolis Speedway Racing Team Co. and the Prest-O-Lite Racing Team Co. filed articles of incorporation yesterday with the Secretary of State. Each company is incorporated at $20,000.

F. H. Wheeler, Carl G. Fisher, T. E. Myers, A. C. Newby and J. A. Allison are the incorporators of the Speedway Racing Team Co. and Carl G. Fisher, J. A. Allison and F. E. Sweet comprise the Prest-O-Lite Racing Team Co.

It was announced last evening that the Speedway Co. has purchased two Peugeot cars, which arrived in Indianapolis Saturday and that the Prest-O-Lite Co. will use Maxwell cars.

Howard Wilcox and John Aitken, two popular Indianapolis drivers, will comprise the racing team representing the Speedway. Their Peugeot cars probably will be shipped to New York for their first race Oct. 2. It was said last night that the drivers for the two Maxwell cars to represent the Prest-O-Lite have not been selected, but arrangements have been made for Eddie Rickenbacher to captain the team. The two companies, under their charter, may also enter airships and balloons in speed events, though their activities for the present will be confined to automobile racing.

—

Syracuse Dealers Want Larger Show in 1917

SYRACUSE, N. Y., Sept. 18—The dealers of this city want a real automobile show in connection with the New York State fair which is held here every year. As yet they have not had one though they hope to have one in 1917 provided plans at present in embryo mature. The show this year is a small one and the results which have come from it to date are not all that the dealers could desire. About a dozen dealers exhibited in tents in various parts of the great fair grounds and two dealers, Buick and Overland, had spaces in one of the big buildings.

The feature of the show was an exhibit of used cars staged by secretary Harry Gardiner of the Syracuse Automobile Dealers' Assn. For his exhibit, Gardiner rented a tent 40 by 70, divided it into seventeen spaces and then divided the cost of the whole venture, including rent of the tent, cost of the space at 1 cent a square foot, which was the regular rate for space in the fair grounds, cost of advertising, etc., by the number of spaces. This brought the cost per space in the tent to $17. Members of the association were offered these spaces at this figure for the exhibition of used cars and every space was taken.

With regard to the value of an exhibit at any State fair, most of the dealers were agreed that it was good from an advertising point of view but that not a great deal of business results. The impression prevails that the value of such an exhibit to a dealer is almost directly proportional to the size of his territory; that a dealer with a large territory will benefit to a greater extent than a dealer with a small territory for the reason that the show draws from the whole State and therefore brings in many prospects which do not rightfully belong to the dealer with a small territory.

The following dealers exhibited: Reo Sales Co., Reo; Palmer-Moore Co., Palmer-Moore trucks; Brockway Motor Truck Co., Brockway trucks; Sanford Motor Truck Co., Sanford truck; Erie Trailer Mfg. Co., Erie trailer; Bartlett & Smith Motor Co., Studebaker; H. A. Gardner Stowell Motor Car Co., Packard, Hudson, Dodge; Chalmers-Syracuse Co., Chalmers; Overland-Syracuse Co., Overland; Buick-Syracuse Sales Co., Buick.

Speedway Presidents to Meet Oct. 1

NEW YORK CITY, Sept. 20—Nine presidents of automobile speedways and dirt track courses throughout the country have been asked to attend a meeting in New York City, Oct. 1, to formulate a working agreement for the 1916 season.

At the meeting, called by Chairman Kennerdell of the contest board of the American Automobile Association, a schedule will be drafted so there will be no conflicting dates. The tracks that will be represented are: Chicago, Indianapolis, Sheepshead Bay Speedway, Minneapolis, Omaha, Sioux City, Des Moines, Providence and Tacoma.

—

Overland Wins Philadelphia Sociability

PHILADELPHIA, PA., Sept. 18—One hundred and fifteen cars participated in the fifth annual run of the Lu Lu Temple Automobile Club to Atlantic City, N. J. The time of each car for the trip was taken at the finish and the total of all the times was divided by the number of cars checking in, to arrive at an official time. The result was 3 hr. 48 min. 58 sec. for the approximately 70 miles, and F. G. Roth, in an Overland, who finished in 3 hr. 48 min. 40 sec., captured first prize being but 18 sec. off.

Fords May Race at Indianapolis

$1,000 Prize Race Planned—Only Stock Models Eligible —50 Cars Required

INDIANAPOLIS, IND., Sept. 15—An exclusive Ford contest, for a cash purse of $1,000, is contemplated by the Indianapolis motor speedway management, as a preliminary event to the $10,000 invitational 100-mile match race at the speedway, Saturday, Oct. 9. Whether the contest will be held or not depends entirely upon the reception at the hands of Ford owners. If less than fifty cars are entered the race will not be run.

The terms of the contest, as outlined at present, are none but stock Ford roadsters or touring models fully equipped shall be eligible. All cars must be at least six months old. The race will run in five heats of 5 miles each and a final over the same distance. Ten cars will be entered in each heat, the winner of first and second of each heat being eligible for the final.

Winners of the first place in the heats will get $50 each, or $250 in all, the remainder of the purse, or $750, being reserved for the finals as follows: First $300; second $200; third $100; fourth $75; fifth $50; sixth $25.

The speedway management is launching the Ford contest to stimulate interest in small car performances. The Ford was selected to start over other makes of cars, because of its greater distribution. Should the race prove a success it is planned to hold meets for other cars as well.

Drawbacks Granted by Treasury Department

WASHINGTON, D. C., Sept. 18—The regulations of the Treasury Department of March 4, 1915, providing for the payment of drawback on motor cars and parts of same, manufactured by the Buick Motor Co., Weston-Mott Co., Cadillac Motor Car Co., Northway Motor Mfg. Co., Oakland Motor Car Co., Cartercar Co., General Motors Truck Co. and the Olds Motor Works, have been amended to provide for the filing of supplemental sworn statements and schedules covering other styles and kinds of motor vehicles or parts of same, or showing changes in the quantities and kinds of imported materials manufactured with the use of imported materials, used. Upon verification of such supplemental statements and schedules, drawback may be allowed on articles covered thereby.

The Treasury Department has granted the Ericsson Mfg. Co., Buffalo, N. Y., a drawback of duties on magnetos manu-

factured by that company with the use of imported ball bearings or with the use of ball bearings manufactured by the Norma Co. of America, with the use of imported steel inner and outer rings, cages and balls.

The department has also granted the Driggs-Seabury Ordnance Corp., Sharon, Pa., a drawback of trucks and parts exported.

—

Automobile Shipments to Denver Slow

DENVER, COL., Sept. 17—Automobile car sales in the Rocky Mountain territory are ahead of last year at this time, but many dealers declare that the general condition of the trade is quiet and considerably below what it ought to be. The blame is placed principally upon failure of the majority of manufacturers to supply cars fast enough to keep the trade in a healthy condition. General business conditions are only fair, but crops are good and the favorable reports on agriculture, stock-raising and mining, Colorado's leading industries, are favorable enough to justify the dealers in expecting better business, even at this season of the year. Dealers able to get cars feel that their orders are coming in too slowly, and believe that prospective buyers are holding back to see what develops in the trade in general.

—

Eleven Cars Shown at Louisville

LOUISVILLE, KY., Sept. 17—One of the most interesting exhibits at the Kentucky State fair held here this week was the display of automobiles. This is the first time the farmers in this section of the country have had an opportunity to compare the new models collectively.

The automobile exhibits included the White, Velie, Saxon, Ford, Studebaker, Dodge, Hudson, Overland and the Indiana, Commerce and I. H. C. trucks.

—

Galesburg Holds Show on Street

GALESBURG, ILL., Sept. 20—This city decided to experiment with the fall show proposition, the automobile dealers giving a public exhibition on Main Street from Seminary to the public square in connection with the annual style show, arranged by the dry goods merchants last Tuesday, Sept. 21. Traffic was prohibited on the street set aside for the exhibition.

—

Victor Top in New Plant

ST. LOUIS, MO., Sept. 18—The Victor Buggy & Auto Top Co. formerly at 1545 North Broadway, St. Louis, Mo., is now installed in its new plant at 2215 Pestalozzi Street and has double the capacity of its old plant.

29 Sheepshead Entries

—

Nine Foreign Cars and Four Countries Represented—Trials Begin Sept. 25

NEW YORK CITY, Sept. 21—Twenty-nine entries have been made to date for the 350-mile race at the Sheepshead Bay Speedway on Oct. 2. Of these, nine are foreign. According to the conditions the candidates must take part in eliminating trials on the speedway next Saturday and the following two days. To be eligible to start they must show in a one lap trial of 2 miles, an average speed of at least 85 m.p.h. The entries received are:

De Palma	Mercedes
Oldfield	Delage
H. S. Harkness	Delage
Earl Cooper	Stutz
Anderson	Stutz
Driver not named	Stutz
Driver not named	Stutz
Resta	Peugeot
Burman	Peugeot
Mulford	Peugeot
Aitken	Peugeot
Wilcox	Peugeot
Moore	Sunbeam
Pullen	Mercer
Ruckstell	Mercer
Rickenbacher	Maxwell
Driver not named	Maxwell
Porporato	F.R.P.
Driver not named	F.R.P.
Chevrolet	Car not named
O'Donnell	Duesenberg
Henderson	Duesenberg
Driver not named	Duesenberg
Vail	Mulford Special
Alley	Ogren
Ora Haibe	Sebring
Bergdoll	Erwin Special
Driver not named	Erwin Special
Le Cain	Pugh Special

Buick Six Goes 27.5 M. P. G. with Stromberg Carbureter

CHICAGO, Sept. 16—An economy of 27.5 miles per gallon with the same carbureter setting that gave 56.2 m.p.h. is the showing made by a Buick small six fitted with Stromberg carbureter. The test was made by the Stromberg Motor Devices Co. on a car owned by a private user and was under sanction by the American Automobile Association and supervised by Chairman F. E. Edwards of the Chicago Automobile Club technical committee.

The car was a Buick five-passenger model D 45 which has a six-cylinder 3¼ by 5-in. motor with overhead valves, Delco ignition, lighting and starting. A Stromberg model H-1 1-in. carbureter was fitted with an exhaust air heater. The dash adjustment was disconnected so it could not be changed without lifting the hood. Silvertown tires 32 by 4 in. were used. The top and windshield were down and four passengers were carried. The economy run was over the Chicago boulevard system with the route arranged so the car went about an equal distance in all four directions. A strong wind and frequent showers probably cut down the mileage slightly. One gallon of gasoline was poured into a special tank attached to the windshield and which fed directly into the carbureter. The amount was determined by a gallon measure stamped by the city sealer. After running 27.5 miles on the measured gallon the car was taken to the speedway where tests for speed and acceleration were made. An officially timed test for one lap of the 2-mile speedway with the same load in the car and the same carbureter adjustment as during the economy run gave 2 min. 8 2/5 sec. for a lap, an average of 56.2 m.p.h. In the acceleration test under similar conditions the car accelerated from a standstill to 30 m.p.h. through all the gears in 11 1/5 sec. On high it accelerated from 5 miles to 25 m.p.h. in 12 2/5 sec. The car weighed with its load 3590 lb. and empty 2918 lb.

—

New York and Chicago Show Plans Under Way

NEW YORK CITY, Sept. 20—Definite plans are well under way for the Sixteenth Annual National Automobile Show in New York next January, also the Sixteenth National Show in Chicago the same month. Application blanks and diagrams for these shows of 1916 have been sent by the National Automobile Chamber of Commerce to those manufacturers who have been invited to participate, with the announcement that those desiring space must apply not later than Oct. 2 to be considered in the first allotment, which will be made on Oct. 7. It is planned to stage the shows on an even greater scale than former efforts.

S. A. Miles, manager of the shows, has adopted a new rule this season which will afford protection against those companies that have been in the habit of applying for space in past years and then failing to exhibit. The new rule provides that applicants for space must make a deposit of 25 per cent on the value of the maximum quantity of space applied for. Under this plan companies will be protected against concerns which apply, doubtless with the intention of exhibiting, but which fail to comply with the contract requirements, thereby forcing other applicants into less desirable allotments and leading to confusion and changes which cannot always be made with perfect fairness. The change simply means that the deposit is payable 2 weeks earlier than it has been in the past.

—

Bosch Prizes for Sheepshead

NEW YORK CITY, Sept. 20—The Bosch Magneto Co. is offering the following prizes for the Sheepshead Bay race on Oct. 2: First, $500 in gold; second, $300 in gold; third, $200 in gold. In addition to the above prizes, there will be an additional bonus of $100 for each place,

providing the winner makes a better average than the best time made in an American long distance contest, i.e., an average of 101.86 m.p.h., provided the second driver makes a better average than the best time made by a second place car, an average of 100.56 m.p.h., and provided the third driver makes a better average than 97.78 m.p.h. These drivers must employ Bosch magneto ignition during the entire race.

—

Denver Distributors Divided on Exhibiting at State Fair

DENVER, COL., Sept. 17—Denver distributors seem about equally divided regarding the value of State fair and county fair exhibits for aiding automobile sales. Some dealers are assisting their sub-dealers financially in making such exhibits, and are also placing a salesman at the disposal of the sub-dealer and furnishing a demonstrating car for use outside the fair ground, even when the fair is many miles from Denver. Other distributors claim that they do not see enough good in these fair exhibits to justify giving their sub-dealers any financial aid, but nevertheless they are willing to furnish a salesman as an encouragement to sub-dealers eager to place exhibits at their local fairs.

The Arguments

Those favoring the fair exhibits urge that these events afford an excellent opportunity to show cars and stimulate trade, even if direct orders are not noticeable. Those holding that there is no benefit in such exhibits argue that the farmer attends the fair solely for enjoyment, and while he may be interested in cars even to the extent of being a prospective buyer, he is more interested in the displays of farm products, livestock and implements, and particularly in having a good time.

Along with all this diversity of opinion regarding different features of the fair exhibit question, however, the dealers practically all agree that a large share of these fair "prospects" are very likely live prospects before the show is held and would become buyers soon without the need of any extra expense to arouse their interest through a fair exhibit. Also, the attitude taken by the distributors is largely in accordance with the policy outlined by their respective manufacturers.

—

Steenstrup Sails for S. A.

DETROIT, MICH., Sept. 18—Peter S. Steenstrup, South American representative for the Hupp Motor Car, Co. has sailed on an extensive business trip in the interest of the company. He will go to Panama, Peru, Chili, Argentina and Brazil and probably be away for three or four months.

Races Feature of Spokane Fair

—

Two Track Records for Local Drivers Broken — Over 10,000 in Attendance

SPOKANE, WASH., Sept 17—The automobile races at the opening of the Spokane Interstate fair proved the big attraction, and upward of 10,000 were present.

Track records for local drivers twice went by the board when Harry Bohr headed the Plummer Special around the ½-mile dirt course making the 5 miles in 6:16 3/5 in the preliminary heat of the Inland Empire Class D race, and then drove the same car to victory in the finals of the same race in 6:09 2/5.

The 5-mile record for the track for local drivers has been 6:23, made by Herbert Alderson in 1911. The Plummer Special is a Stutz stock car.

Eleven cars entered the qualification test, a mile against time, four to qualify. In this test the Schneider Special of North Yakima (Kocher), the Parsons Special (Parsons), and the National (Mattison) turned in the three fastest miles in order. The Ford and Stutz Special tied for fourth place in 1:12. In the run-off the Stutz recorded a mile in 1:08¾, while the Ford could not equal its first time.

The Parsons, Schneider, National and Stutz entered the pursuit race, the cars being stationed 220 yd. apart at the four-eighth poles about the track. The Stutz was eliminated after a few laps, being challenged by Parsons. The National was unable to stand the pace. At the beginning of the eleventh lap Parsons held the lead, hotly pursued by the Schneider Special. At the thirteenth lap Parsons led by but 50 yd. and on the next Kocher cut this to about ten. On the twenty-fourth lap the Schneider car got its nose in front to the great delight of the crowd, but Kocher momentarily lost control of his steering gear, veering wildly, again giving Parsons the lead, but the plucky North Yakima lad came back strong and finished in the lead on the twenty-fifth.

Harry Hahn was a deeply disappointed lad when, 200 yd. in the lead in the Class D championship race, his engine froze, with the race half over and victory in sight.

Parsons and Stutz Duel

In the final race the Stutz Special had the pole with the National and Parsons Special and Schneider lining up as named. The Schneider was practically left with the fall of the starter's flag, Kocher having killed his engine. The early part of the race developed into a brisk contest between the Parsons and the Stutz. Parsons tried twice to slip inside the white Stutz at the turn. At the sixeenth lap both cars lapped the National and a moment later the Stutz rocketed through the fence at the south end. Mechanician R. L. Williams suffered the fracture of his skull and Oral Palmer, driver, escaped unhurt. This Stutz is the old No. 8, driven by Cooper in 1913, with which he won the Montamarathon at Tacoma.

The Parsons car was out of commission shortly afterward with a broken connecting-rod and the 15-mile race settled down into an easy victory for Kocher in the Schneider, with McGoldrick, National, taking second. The time was 17:28.

McGoldrick drew down four seconds during the racing and $280 in prize money. The 15-mile race was run at an average of 51.5 miles an hour. Two half miles were driven in 0.33.

Event No. 1—Qualifying heats for event No. 2, mile against time; flying start, four to qualify. Summary:

Car and Driver	Time	Fastest Lap
Schneider Spl. (Kocher)	1:07¼	.33
Parsons Spl. (Parsons)	1:08	.33
National (Mattison)	1:10	.35
Ford (Hahn)	1:12	.36
Stutz (Palmer)	1:12	.36
Stutz Spl. (Bohr)	1:13¼	.36½
National Spl. (McGoldrick)	1:14¾	.37
Lozier (Paulsen)	1:16 2/5	.38
Oakland (Carlton)	1:19½	.39
Croxton-Keeton (Penticoast)	1:20	.40

In run off of the tie, National 1:08¾ fastest lap .33¾ Ford 1:12¼.

Event No. 2 Australian pursuit race: won by Schneider Spl. (E. Kocher), which lapped last rival, Parsons Spl., in 25th lap. No time.

Event No. 3, five miles, local cars: Preliminary heat won by Plummer Special (H. Bohr), National Spl. (Ed. McGoldrick) second, Lozier (Ray Paulson) third. Time 6.16 3/5; Ford out fifth lap, oiling trouble.

Event No. 4, five miles, local cars: Won by Plummer Spl. (Harry Bohr), National Spl. (Ed. McGoldrick) second, Croxton-Keeton (Penticoast) third. Time 6:09 2/5. McGoldrick's time 6:10 (breaks track record).

Event No. 5, five miles, qualifying heat, two fastest in finals won by Stutz (Palmer), National Spl. (Ed. McGoldrick) second, Plummer Spl. (Alderson) third. Time 6:57.

Event No. 6, free for all, fifteen miles: won by Schneider Spl. (E. Kocher), National Spl. (Ed. McGoldrick) second. Only these two finished. Stutz (Palmer) through fence. Parsons Spl. (Parsons) did not finish.

—

Farmers at Spokane Show

SPOKANE, WASH., Sept. 15—While the automobile dealers held a successful show in the Davenport Hotel, Spokane in May, they deemed it wise to avail themselves of the opportunity to show their 1916 models at the twenty-second annual Interstate fair Sept. 13 to 20. While fine results were obtained by the dealers from the spring show, the fall show at the fair grounds brought them into closer touch with the great majority of the farmers in the Inland Empire.

While but few cars were sold direct to the farmers, Spokane distributors have appointed many sub-agents recently and these new dealers were on hand to learn all they could of the new models, introduce their prospects to them, and many sales resulted.

D'Arcy Spring Adds—The D'Arcy Spring Co., Kalamazoo, Mich., manufacturer of automobile springs, will erect an addition to its plant.

Kalamazoo Co. Builds—Fuller & Son, Pitcher Street, Kalamazoo, Mich., are building a factory, four stories, 61 by 101 ft., for the manufacture of automobile parts.

Automobile Hardware Co. to Build—Crandal, Stone & Co., Binghamton, N. Y., manufacturers of automobile hardware, etc., have awarded contract for the erection of a four-story brick and steel factory, 40 by 100 ft., to cost about $20,000.

Colorado Tire's New Addition—The Colorado Tire & Leather Co., 999 South Broadway, Denver, is planning a $75,000 addition to its plant. The new building will have 25,000 sq. ft. of floor space, and will be equipped with a rubber mill.

Hayes Wheel Adds—In order to do away with night work the Hayes Wheel Co. in Albion, Mich., will put up an addition, 70 by 100 ft., to its plant which will enable it to increase its output about two-thirds. A total of 150 men will be employed.

Merrill Spring to Add—The E. R. Merrill Spring Co., 526 West Twenty-eighth Street, New York City, manufacturer of automobile and truck springs, is having plans prepared for alterations to two buildings and the erection of two other buildings.

Vacuum Oil Adds—The Vacuum Oil Co., Rochester, N. Y., will build another addition to the local plant. It will be a filter building and will cost $17,000. This will bring the company's expenditures for improvements this year up to $210,000. It plans to spend $500,000 in improvements in the next year.

Hyatt to Build Warehouse—The Hyatt Roller Bearing Co. will begin the erection of a large warehouse on the Michigan Central railroad, having decided to make Detroit, Mich., its distribution center, not only for the automobile end of the business but also for the tractor department. At the present time a carload of Hyatt bearings is received in Detroit daily, according to the officials of the company.

Seattle Ford to Extend—Extensions to the plant and equipment of the Ford Motor Co.'s assembling factory in Seattle are to be made within the next few months entailing the expenditure of approximately $100,000. An average of thirty-two cars is being turned out each day. When the contemplated addition is finished the production will be between sixty and sixty-five machines a day.

Winnipeg Ford Nearing Completion—Provided that favorable conditions prevail the new Ford building in Winnipeg, Man., will have its roof on by Nov. 20. The excavating work is rapidly being completed and already the supplies for the construction operations are being received at the site, corner of Portage Avenue and Wall Street. Business at the local Ford establishment continues brisk. From Aug. 1 to Sept. 2 deliveries of 259 cars were made in Manitoba.

To Make Starter—The Rock-Way Starter Co., Jonesville, Mich., is the name of the new concern which will start manufacturing the new starter invented by G. L Rock, proprietor of the Jonesville Garage. With him there will be associated his brothers, Alonzo and Darrell, the latter having been at one time superintendent of the service department of the Cadillac Motor Car Co. It is said that local people are interested financially and will provide the capital.

F. W. D. May Start Oct. 1—The Four-Wheel Drive Truck Co., Battle Creek, Mich., which is to make the truck designed by Maurice Bollstrom, a pioneer in this type of vehicle, will very likely be ready to start operation by Oct. 1. An option has been secured on a local plant and the organization work is said to have progressed in such a way that actual manufacturing will be started in October. One type chassis of ½-ton capacity will be made and will be furnished with a dozen types of bodies, such as express wagon, ambulance, hearse wagon, ordinary truck, U. S. mail wagon, etc.

Wayne Tank to Enlarge—Work will be started in a short time on two new factory buildings for the Wayne Oil Tank & Pump Works of Fort Wayne. The cost of the improvement will be about $40,000. The buildings will be constructed of steel and concrete and will be absolutely fireproof. A large amount of new machinery will be purchased for the buildings, which will be completed about the middle of December. The Wayne Oil Tank & Pump Works have been turning out more orders this year than ever before in their history, and the capacity of the present factory has been reached.

The Automobile Calendar

Sept. 18-25.....Los Angeles, Cal., Show, Shrine Auditorium.
Sept. 20-25.....San Francisco, Cal., International Engineering Congress.
Sept. 22-25.....Rockford, Ill., Show.
Sept. 24.....Indianapolis, Ind., S. A. E. First Section Meeting.

Feb. 19.....Newark, N. J., Show.
March 4-11.....Boston, Mass., Truck Show, Mechanics Bldg.

The Week in  the Industry

Spalding St. Louis Packard Mgr.—H. W. Spalding has been appointed general manager of the Missouri Packard Co., St. Louis, Mo.

Bingham Promoted — B. S. Bingham has been appointed assistant general sales manager for the Reliance Automobile Co., San Francisco.

New Gotham Trailer Man — C. H. Quereaux has succeeded F. H. Greaney as manager of the New York City branch of the Troy Wagon Works Co., maker of Troy trailers. The New York office is at 30 Church Street.

Wells Moon's City Sales Mgr.—P. H. Wells has been appointed city sales manager of the Moon Motor Car Co.'s St. Louis branch, 2227 Locust Street, while E. J. Moon is in the East. Mr. Wells has been with the Moon company seven years.

Dealer

Gibney Tire in Louisville—The Dixie Auto Supply Co., 444 South Third Street, Louisville, Ky., has taken the agency for the Gibney tire.

Recent Canadian Studebaker Appointments—The Breen Motor Co. has appointed Clark & Cuthbert, Portage la Prairie; B. J. Thompson, Pense, Sask.; the Jackson Auto Agency, Saskatoon; U. R. Gordon, of Wilcox, Sask., and Morden & Graham, Pilot, as Studebaker agents.

J. M. Shock Absorber Moves Office—The main office of the J. M. Shock Absorber Co., 210 South Seventeenth Street, Philadelphia, Pa., has been moved to New York City to 250 West Fifty-first Street. The service station and sales office will be maintained at the original office in Philadelphia.

St. Paul Maxwell Moves—The Martin Motor Sales Co., distributer of Maxwell cars in the Twin Cities, has moved its St. Paul office from 344 North Exchange Street to the Kissel-Kar Building, 237 West Ninth Stret, under the management of W. F. Frei. A service station will be opened.

Recent Philadelphia Items—The Standard Eight, the product of the Standard Steel Car Co., Pittsburgh, Pa., has been introduced in Philadelphia, Pa., the Eastern Motors Corp. being special representative. Showrooms have been opened at 1634 Chestnut Street.

The Allen car is represented in Philadelphia by the Allen Motor Philadelphia Co., 150 North Broad Street.

Motor Men in New Roles

Reynolds Heads St. Louis Goodyear Department—The Goodyear Tire & Rubber Co., 1909 Locust Street, St. Louis, Mo., has inaugurated a mechanical-goods department. The department will be under the supervision of W. A. Reynolds.

Elliott Cadillac Sales Mgr.—R. S. Elliott, one of the veteran salesmen of the Don Lee organization in San Francisco and winner of the first prize for the number of Cadillac sales last season, has been made Cadillac sales manager for that territory.

Mooney Joins Advertising Co.—F. J. Mooney, formerly sales and advertising manager of the Hupp Motor Car Co., has joined the Taylor-Critchfield-Clague Co., Detroit, Mich., advertising agent, and will act as counsel in connection with automobile selling and copy plans.

Wells Takes on Stearns in Des Moines—H. R. Wells has taken on the Stearns Silent Knight for Des Moines, Iowa, and twenty-six Iowa counties. He will have headquarters here and is appointing many sub-agents. Business is opening up well for the Stearns car in Iowa, he states.

Hohenphal Joins Simms—E. H. Hohenphal has been appointed assistant sales manager and advertising manager of the Simms Magneto Co., East Orange, N. J. Mr. Hohenphal was formerly with the Bosch company and was manager of the automobile-supply department of Rubel & Co., Washington, D. C.

Kesler a Manager—S. W. Kesler, who recently resigned from the I. S. Remson Mfg. Co., Brooklyn, N. Y., Abbott-Detroit and Westcott dealer, to become affiliated with the Brooklyn branch of the Packard Motor Car Co., has been made manager of sales of a Brooklyn branch of the Kent Motors Co. His headquarters are at 1251 Bedford Avenue.

Schneider Heads Elco Agency — The Elco agency in the St. Louis district has been given by the Bimel Buggy Co., Sidney, Ohio, to the Motor Car Repair & Supply Co. at Missouri Avenue and Pestalozzi Street, St. Louis. This is the first time the Elco line has been sold in St. Louis. The local district includes eastern Missouri and southern Illinois. Officers of the local agency are Frank Schneider, president; Max Gapinski, manager, and William Hoag, secretary.

Sharpe Russian Transportation Mgr.—O. C. Sharpe, superintendent of the Stewart Taxi-Service Co., Baltimore, Md., is on his way to Russia, where he will have charge of the movement of the big American-built motor-truck fleet that the Czar's government has purchased for use in the war.

Mr. Sharpe's position will be that of transportation manager and it will be his duty to direct the movement of the cars and to see that repair stations are established and to also see that the machines are always in serviceable condition.

According to information Petrograd will be his base and he will have the handling and supervision of the drivers between the hospital and battle lines.

He started Sept. 15 for Montreal and will make his trip to Russia from Canada.

Dealer

To Make Tractors—The Reed Foundry & Machine Co., Kalamazoo, Mich., is one of the latest entries into the field of tractor manufacturers. The company has completed the building of a tractor which was tried out on a farm near Richland. The tractor easily pulled four 14-in. plows through the heavy soil.

De Kalb May Take McIntyre Plant—The De Kalb Mfg. Co., with headquarters at Auburn, Ind., if the proper negotiations can be made, will take over the property of W. H. McIntyre, automobile manufacturer of Auburn. A new organization will be formed. The De Kalb company has been incorporated for $150,000.

Grossman Opens Chicago Branch—The Emil Grossman Mfg. Co., Inc., New York City, has leased the top floor of the building formerly occupied by the Winton Motor Car Co., at the northeast corner of Michigan Avenue and Thirteenth Street, Chicago. Here will be located their western manufacturing and distributing branch. The space occupied is 6000 sq. ft. Rudolph Cory was appointed manager of the Chicago branch.

Almond Branch in Detroit—A branch office of the T. R. Almond Mfg. Co., Ashburnham, Mass., has been established at 1257 David Whitney Bldg., Detroit, from which point Don F. Kennedy, who has been appointed Michigan representative, will take care of its Michigan business which consists chiefly of flexible steel tubing for use on automobiles and trucks, and its line of drill chucks. Mr. Kennedy will also handle the business of the Sawyer Tool Mfg. Co., which is under the same management as the Almond Co., on its line of machinists' fine tools.

Recent Incorporations in the Automobile Field

Arkansas

LITTLE ROCK—Davenport Safety Tire Co.; $100,000. J. R. Alexander, W. H. McLaughlin.

Connecticut

STAMFORD—Motor Products Co.; $100,000. Allen Sheldon, R. K. Green, P. D. Whitton, F. B. Bertram, Elliott Savage.

Illinois

DANVILLE—Holmes Garage Co.; $21,000. W. C. Holmes, D. W. Beckwith, B. N. Custer.

Indiana

INDIANAPOLIS—Durnell Motor Sales Co.; $10,000. C. E. Durnell, E. E. Voyles, C. F. Voyles.

INDIANAPOLIS—Meridian Mfg. Co.; $75,000; automobiles. Elmer Hinshaw, E. W. Hughey, H. M. Callahan.

Maryland

FREDERICK—Mountain City Garage Co.; $25,000. M. E. Kefauver, J. H. Grove, D. P. Buckey.

New York City

NEW YORK CITY—Adams-Williams Mfg. Corp.; $100,000; top manufacturer. V. J. Stahl, K. G. Osborn, F. G. Schwab, 323 W. Seventy-seventh Street.

NEW YORK CITY—Bergen Carbureter Co.; $2,000; manufacturer. M. E. Harby, 31 Nassau Street; William A. Watson, A. S. Bergen.

NEW YORK CITY—Eastern Motor Sales Corp.; $10,000. F. S. Hannah, A. G. Keinath, C. M. Fleming, 540 Manhattan Avenue.

NEW YORK CITY—E. H. & F. Co.; $100,000; motor manufacturer. F. C. Royce, W. N. Frazer, T. P. Hyatt, 1169 Eighty-third Street, Brooklyn.

NEW YORK CITY—Empire State Sight-Seeing & Trucking Co.; $1,000; trucking and sight-seeing. C. F. Fuchs, Rudolph Pick, Walter Latzer, 989 Simpson Street.

NEW YORK CITY—Lewis Roller Bearing Co.; $10,000; manufacturer. Emil Auerbach, S. B. Levy, I. A. Cohen, 39 W. Thirty-fourth Street.

NEW YORK CITY—Lombard Auto Tractor-Truck Corp.; $25,000; manufacturer. J. S. Barron, 320 W. Seventy-seventh Street; J. T. Crowley, R. O. Eggleston.

NEW YORK CITY—Perfect Service Taxicab Co.; $500. A. H. Schweizer, R. G. Schweizer, Sam Klein.

NEW YORK CITY—Peugeot Automobile Racing Co.; $500. Leon Mintz, A. J. Hill, William Thierfelder, 433 E. Fifth Street.

NEW YORK CITY—Pullman Motor Car Co. Export Dept.; $10,000. J. C. Cameron, Albert Frankel, C. A. Doyle, 132 Ash Street, Flushing.

NEW YORK CITY—P. E. Remington; $500,000; automobile business. P. E. Remington, N. M. Kaplan, T. P. Wadleigh, 1790 Broadway.

NEW YORK CITY—Safety Steering Device Co.; $15,000. H. C. Miller, L. H. Tasker, Charles Blauvelt, 233 Broadway.

NEW YORK CITY—Standard Auto-Bus Corp.; $3,000. William Goldsmith, Louis Muschel, William Muschel, 519 W. 150th Street.

NEW YORK CITY—Standard Truck Corp. of N. Y.; $10,000. Florence Boldman, E. D. Boldman, H. W. Johnson.

NEW YORK CITY—Sterling Automobile Mfg. Co.; $100,000; manufacturer. Charles Chambers, 2 Rector Street; William Adelson, Adolph Hayman.

NEW YORK CITY—St. Paul Garage; $10,000. C. J. Brennan, J. J. Duffy, A. F. Moons.

New York

BROOKLYN—Bell Rubber Co.; $20,000; tires. W. O. Geisman, Anna Geisman, S. F. Schroeder.

BROOKLYN—Liberty Garage; $15,000. George Way, Fred. Smith, A. A. Russell.

BROOKLYN—J. J. Snyder & Son; $50,000; garage. J. J. Snyder, L. R. Snyder, P. A. Snyder.

BROOKLYN—Surplus Motor Parts Co.; $1,000; automobile machinery. S. S. Waldman, Harold Obst, Joseph Sokoloff.

BROOKLYN—Windsor Mahnud Co.; $10,000; garage. A. G. Welsh, William Gegenheimer, R. C. Corlett, 1500 E. Third Street.

BRONX—Intervale Garage and Auto Service; $5,000. A. B. Goodwin, F. J. Goodwin, A. J. Goodwin.

BRONX—Sundries Co.; $5,000. Charles Weishaupt, Hugo Liedtke, E. P. Butler, 533 Union Avenue.

BRONX—Uneeda Garage; $1,000. Pauline Feiner, N. E. Harcombe, S. B. Steinmetz.

BUFFALO—Nicholson & Stoll; $1,800; garage. Lance Nicholson, Amy Nicholson, Thomas Stoll.

BUFFALO—Transmission Ball Bearing Co.; $100,000; manufacturer. W. J. Murray, J. P. Beatty, W. M. Wilson, 35 Pearl Street.

ELMIRA—Interstate Pneumatic Valve Corp.; $5,000; manufacturer. C. H. Thayer, Fred Peck, H. B. Peck, 131 Cedar Street.

GLEN COVE—Pressed Bearing Co.; $3,000; bearing, tools, etc. Mortimer Schwager, F. S. King, A. M. Schmidt, 556 McDonough Street, Brooklyn.

HEMPSTEAD—Great Neck Garage & Repair Co.; $2,000. Henry Allendorf, F. L. Place, Erwin Giesman.

HUDSON FALLS—Adirondack Garage Co.; $50,000. F. C. Sherman, E. V. Bulow, G. N. Nay.

LAKE PLACID—McElroy-Prime Motor Co.; $50,000. J. H. McElroy, S. G. Prime, P. J. Hennessey.

OSSINING—Simplex Rubber Co. of America; $300,000; rubber goods of all kinds. N. A. Campbell, 31 Pine Street, New York City; E. Gwynne-Evans, A. C. Travis.

RICHMOND BOROUGH—Pegasus Garage Corp.; $3,000. C. P. Siemers, Arthur Wood, L. E. Manning.

SYRACUSE—Auto Supply and Tire Co.; $2,000. F. A. Samon, S. G. Schlachter, A. A. Schlachter.

Ohio

AKRON—McCrea Auto Service and Supply Co.; $5,000. George McCrea, E. A. McCrea, G. E. McCrea, R. T. Walsh, L. J. Myers.

CANTON—Auto Garage and Sales Co.; $10,000. J. M. Roose, E. C. Scheffler, F. N. Sweitzer, G. E. Halliwell, A. M. Hurst, H. J. Reeder.

CINCINNATI—Struebing Truck Co.; $5,000. W. J. Struebing and others.

CLEVELAND—Hudson-Stuyvesant Motor Co.; $25,000 to $50,000.

OTTAWA—Auto Products Co.; $250,000; automobiles. R. D. Bray, W. J. Halpin, P. J. Daly.

CLEVELAND—Victor Motor Car Co.; $12,000. A. F. Reed, C. M. White, V. C. Snyder, J. M. Lee, R. B. Curtiss.

DAYTON—Two-In-One Tire Co.; $10,000. George Inman, D. W. Marsh, T. J. Curran, W. B. Schaeffer, A. P. Smith.

RAVENNA—Mohawk Motor Truck Co.; $25,000. H. C. Bradley, E. J. Smith.

ST. CLAIRSVILLE—St. Clairsville Garage Co.; $5,000. J. E. Anderson, E. A. Caldwell, W. H. Caldwell, T. J. McNamee, Otto Rothmeier.

TOLEDO—Universal Motor Co.; $100,000. Howard Lewis, H. J. Keho, F. S. Lewis, H. Emery, P. W. Alexander, Frederick Gaines.

XENIA—Xenia Garage Co.; $2,500. J. B. Bice, F. Bice, C. W. Craig, M. H. Schmidt and Mrs. M. H. Schmidt.

Pennsylvania

HAZLETON—Power City Motor Car Co.; $5,000. H. M. Benjamin, W. C. M. Butler, C. J. Kirchman.

PHILADELPHIA—Speedwell Motor Service Co.; $5,000. W. P. Vees, F. W. Vees, S. K. Cissel.

SHAMOKIN—Stief Motor Co.; $10,000. M. C. Stief, J. W. Timmes, M. L. Conneon.

South Carolina

GAFFNEY—Gaffney Motor Co.; $5,000. E. M. DuPre, C. S. Monteith.

Texas

DALLAS—Dallas Hupmobile Co.; $5,000. F. A. Wynne, W. R. Wynne, E. O. Thackston.

SAN ANTONIO—Blumberg Motor Mfg. Co.; $25,000. H. G. Blumberg, H. D. Hierholzer, Joseph Hierholzer, Robert Butler.

Virginia

ASHLAND—Hanover Garage and Repair Co.; $10,000. Boxley Vaughan, F. W. Tucker.

GALAX—Twin County Auto Sales Corp.; $20,000. J. G. Davis, C. A. Collier.

Washington

SEATTLE—Jaquemin Auto Steel Wire Tire Co.; $100,000. Evan Gough, Eugene Jaquemin, J. R. Cabanne, H. M. Hill.

SEATTLE—Seattle Tire & Rubber Co.; $2,500. Arthur W. Hoppock, Harry H. Hazeltine and Mary C. Hoppock.

SEATTLE—The Washington Garage; $10,000. Walter T. Douglas, N. E. Felt, E. H. Sennolt.

SPOKANE—Northwest Auto Supply Co.; $5,000. Maurice Oppenheimer, Charles D. Bibbins.

SPOKANE—Washington Motor Car Finance Co.; $250,000. C. A. Plackett, M. L. Moe, Edw. V. Carter.

West Virginia

PARKERSBURG—Central Garage Co.; $5,000. O. D. Strader, H. D. Little, H. N. Kinler.

Wisconsin

CEDARBURG—Automatic Jack Co.; $25,000. J. R. Thill, E. J. Groth, M. N. Green.

In the Dealers' Field

New Duluth Garage—Formal opening has been made of the new John E. Ford garage and service station at 208 East Superior Street, Duluth. Mr. Ford will have a service station night and day for owners of Chevrolet and Winton cars and others. He represents the Firestone tire and will give service in that line in the second floor shop. The show and sales rooms occupy the ground floor.

Recent Seattle Changes—J. C. C. Morris, distributor of Moon automobiles in the Pacific Northwest has moved into new quarters at 907 East Pike Street, Seattle. G. G. Gunderson has been named city sales manager.

Pacific Auto Supply Co., Seattle, has enlarged its quarters at 801-3 Union Street. This concern is distributor for Waverly motor oils, Knight and Ajax tires.

Winnipeg Cadillac Moves—The Winnipeg, Man., branch of the Cadillac Motor Sales Co. will move at the beginning of October to the large building at 310 Carleton Street, which was formerly occupied by the Detroit Electric Service Station. In its new quarters it will have three floors at its disposal and practically three times the amount of room which is available in its present building. Both the Cadillac and Dodge cars will be handled from the new quarters.

New Tire Agencies in Wash.—The Child, Day & Churchill Co., Spokane, has secured the agency for the Norwalk tires in the Inland Empire territory.

The W. J. Ball Motors Co., Spokane, has moved into its new garage at 1116-18 Sprague Avenue, where it handles the Studebaker. Ajax tires will also be handled.

Kelly-Springfield tires are now being distributed in Tacoma by the Griffith Motor Company, which has put the Dodge car to the front in Southwest Washington.

New Automobile Row for Portland—Portland, Ore., has now practically a new automobile row at what is known as the Custom-house corner. The Oregon Motor Car Co., Studebaker representative, and the Pacific Kissel-Kar branch have announced the construction of two new homes near the Custom House corner on lower Broadway.

Recently the Overland distributer, J. W. Leavitt & Co., settled in a new home directly south of the Custom House, and the Fisk Rubber Co. of New York is completing a building on the southeast corner. Just one block north, at Couch and Broadway, the Oldsmobile has opened handsome new quarters. This gives a total of five automobile concerns in this new center.

Among the pioneer firms already located along Broadway are the H. L. Keats Co., the Northwest Auto Co., the wholesale accessory house of Ballou & Wright, the White Co., and the B. F. Goodrich Co.

VOL. XXXIII. NEW YORK—THURSDAY, SEPTEMBER 30, 1915—CHICAGO No. 14

The AUTOMOBILE

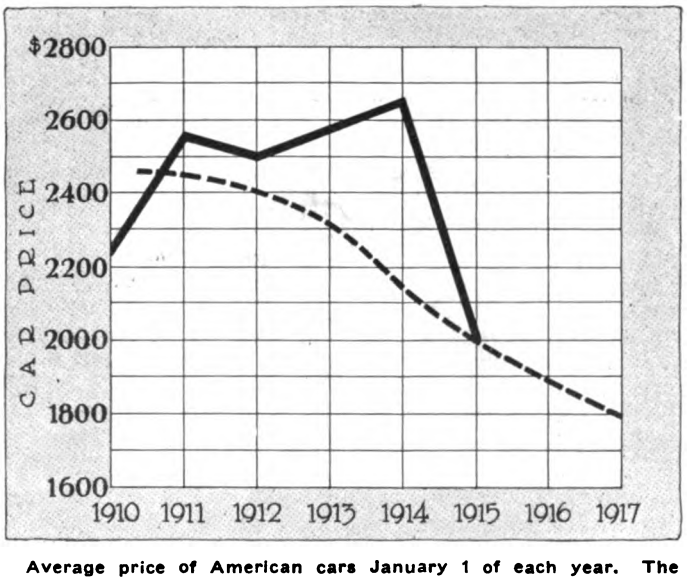
Why the 1916 Cars Are Cheaper

New Models Better Than Old Despite Price Reductions—Cleaner Design, Better Manufacturing and Lower Labor Costs Offset Rising Price of Materials

By A. Ludlow Clayden

MANY a motorist noticing the 1916 prices and specifications for automobiles is prone to wonder how it is done. Is the new car at a 20 per cent lower price as good as the old one? Has the quality been cut? These are the questions that naturally arise in the mind of a close observer of the 1916 trend.

It is possible to answer that never before has the value for money offered to the motorist approached the pinnacle upon which it now rests. The reason why is that the automobile industry has only just reached maturity. To make a human analogy, the youthful trade has passed through childhood, through school and college, has made its first essays in the world of trade. It has just, and only just, completed its period of probation; after twenty years of preparation it has commenced in business for itself and proved its right to take a man's place in world commerce. Now, just as the father has to pay for the education and the capitalization of his son's first essay in life, so has the the public had to father the young automobile industry. Of the money paid for automobiles by the users thereof, much went to the education of the industry and much more to the equipment; to the building of factories, the buying of tools.



Average price of American cars January 1 of each year. The full line shows actual averages from 1910 till 1915 and the dotted line represents an even downward progress from January, 1911. It cuts out the starter period with its accompanying price changes

Expenses Decrease

Of course in every trade something of the price paid by the consumer goes to the maintenance of equipment, to its expansion and improvement, but a new trade that is coming into being demands far more of its supporters than does an old business. The automobile industry is just shaking off the shackles of development that have bound it and is settling down into a form which it will probably retain for many years. Its future expansion will be less rapid than that of the past ten years, and thus we find the *expenses* of the industry as a whole are decreasing as the output increases and so the load the consumer has to carry is lessening every year.

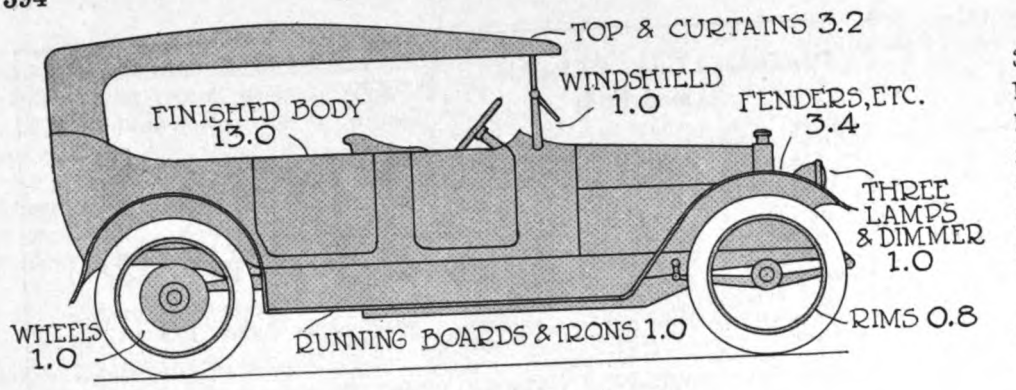
Examination in Detail

It is possible to explain the cheapening of automobiles much more accurately by a detail study of conditions although it is rarely possible to quote actual figures. First it should be explained that in splitting up the cost of a car into items it makes no difference whether the car be made throughout in one plant or assembled from parts made by specialists. The effect of the latter system is to spread overhead charges over several separate firms instead of over several departments of the same firm, but the general effect insofar as it concerns the consumer is the same in either case.

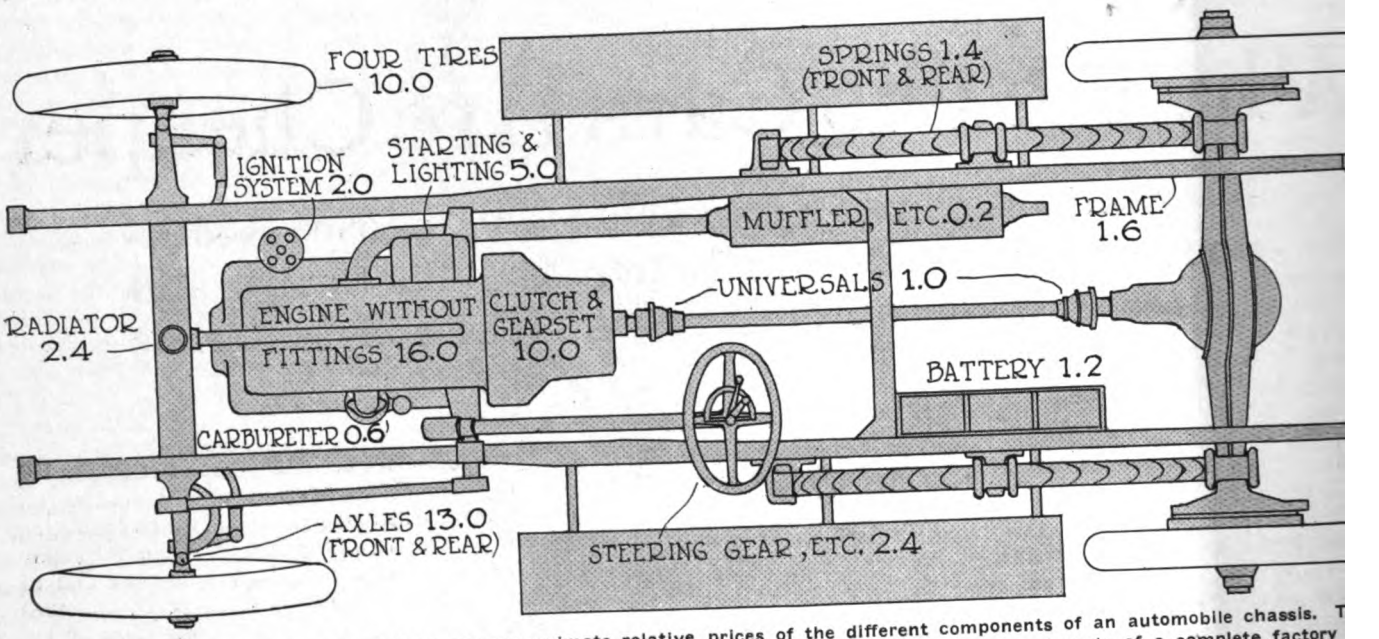
Cost of an automobile is made up from:

Material, including steel, other metals, wood, leather, rubber, paint, etc.

Labor, machinists, assemblers, tool makers, body builders, coppersmiths, etc., and the labor of the factory organization such as cost department, stockroom clerks, etc.



OTHER PARTS	
SPEEDOMETER	1.0
MATS & CARPET	0.4
FORGINGS, RODS, ETC.	1.0
STEEL CASTINGS	1.6
TOOLS & JACK	0.4
HORN & BUTTON	0.2
OTHER SUNDRIES	0.2
LABOR	
PAINTING CHASSIS	1.0
ASSEMBLING & FITTING	3.0



This drawing shows in graphical form the approximate relative prices of the different components of an automobile chassis. T represent the percentage costs of the components purchased by an assembly firm, or the department costs of a complete factory the overhead split up. The prices do not include anything for overhead on the assembling plant or the assembling portio the factory. Necessarily the figures represent broad averages only and are not derived from one special job

Overhead Labor. Engineers, salesmen, managers of departments, etc.

Capital investment in plant, machinery, etc.

Net Profit. The difference between all the above added up and the selling price.

Materials Cheaper and Dearer

The materials used in an automobile of 1916 cost less than before on the average, despite the fact that nearly all materials are more expensive. This apparently contradictory condition of affairs has been brought about by various causes, the main things being that materials are better chosen and better proportioned. Taking the case of steel, the price of common qualities from which the better qualities are made fluctuates all the time and whether it is up or down just now depends upon how far back one goes for the comparison. Steel is cheaper for many automobile parts because of the work of the Society of Automobile Engineers, and because of advances in design.

Not so long ago the steel used for automobile parts was largely a mystery, it was sold under fancy names like soaps or patent medicines. Each maker cried his special brand and a tremendous jargon of largely meaningless words was built up, shrouding the alloy steel business with a cloak of mystery. The S. A. E. steel standardization has made free to all the world the knowledge that steels made to definite formulæ have definite properties and that there is no mystery about it. The S. A. E. specifications enable a manufacturer to get competitive quotations for *the same steel* from all s of sources. He no longer has to worry with the *name* fancy brands.

The effect is that steels are being used for many a mobile parts which are just as good as those of four or years ago and cost anything up to 5 cents a pound less. is competition alone the cause of this for the simpler steels have been found to be not so terribly hard to m Some steels which used to be considered a crucible job been produced by the open hearth process in excellent qu More electrical refinement has enabled economies to be m so that the rise in price of pig that has occurred in the year has not been enough to offset the economies of the three or four years. Of course, this cannot last forever there are indications that next year may see a real shortage which will boost prices on all qualities, but if this does happen it will be but temporary. It is the ward tendency of price due to better steel making and usage that has enabled the 1916 automobile to be bu cheaply.

Design Economizes Material

As an example of the way in which design is helpin crankshaft may be taken. Not long ago it was though to make this of expensive steel which was hard and d to machine, but now we have found that vibration c eliminated only by the use of much larger shafts th demanded by consideration of strength only. So crank

of 1916 are made of cheaper qualities that are easy to handle in heat treatment and in machine shop and still make a better job. To use high tensile alloy steel for a modern 2½ in. crankshaft is rather like employing a steam hammer to break eggs; quite efficient but rather absurd.

Look, too, at what has disappeared. Look at the clean and simple chassis of to-day and think of the rods, tubes, pressings, links and brackets, castings, forgings, rollings, etc., that have vanished from the automobile and you see not only saved material but saved work. Before leaving materials, however, it should be added that three important metals are now high in price, these being aluminum, zinc and copper. Lead and tin, too, are up in price, so that brass parts have become costly. Very well, go carefully over an automobile of 1916 and see how much brass is to be discovered. Take off the switch from the dashboard and you will find the flange plate is enameled steel, just as strong and many times as cheap as the brass that would have been used till lately. No quality worth having is missing but off come several cents from the price. Look at the motor, where are the brass and copper water pipes, the heavy brass nuts and levers and handles. All gone and replaced by lighter, better steel forgings and stampings, all much lower in price.

Percentage Cost of Chassis Parts and Body

NOTE—All figures are expressed in percentage of factory cost less selling cost, etc. They apply well to cars costing retail from $650 to $1,250, but the proportional cost of motor and body rises a little as the price increases. The figures given are a broad average.

Part of Car	Per Cent Total Car Cost
Radiator	2.4
Engine Without Fittings	16.0
Clutch and Gearset	10.0
Carbureter	0.6
Ignition System	2.0
Starting and Lighting	5.0
Battery	1.2
Front and Rear Axles	13.0
Wheels	1.0
Rims with Spare	0.8
Four Tires	10.0
Springs	1.4
Finished Body	13.0
Top and Curtains	3.2
Windshield	1.0
Speedometer	1.0
Fenders, Etc.	3.4
Running Boards and Irons	1.0
Three Lamps and Dimmer	1.0
Mats and Carpet	0.4
Steering Gear, Etc.	2.4
Frame	1.6
Forgings, Rods, Etc	1.0
Steel Castings	1.6
Muffler, Etc.	0.2
Tools and Jack	0.4
Horn and Button	0.2
Universals	1.0
Other Sundries	0.2
Labor	Per Cent
Painting Chassis	1.0
Assembling and Testing	3.0
TOTAL	100.0

Come to the body. Comment on the better appearance of the smooth side includes the improvement caused partly by the absence of the big brass handles that used to decorate each door. Somewhere inside the door is a simpler, neater and more efficient little catch of a quarter the weight and twentieth the cost. Try the hub caps. They have become a light stamped part instead of a massive casting, just as effective for keeping in oil and excluding dirt and cheaper in material and in labor, all being factors which make for a lower manufacturing cost.

Take the radiator. Brass is very expensive, but this did not cause the one-piece construction to be dropped in favor of the enameled steel shell with the brass or copper radiator proper suspended within it. The steel shell makes the radiator a better appearing job, and a more durable and stronger part, while it saves brass, the expensive labor of the coppersmith and some time also in the chassis assembly and paint shops.

Summing up, there is *less* metal in the 1916 automobile. It is used in *simpler* forms. In a word there is less *waste*.

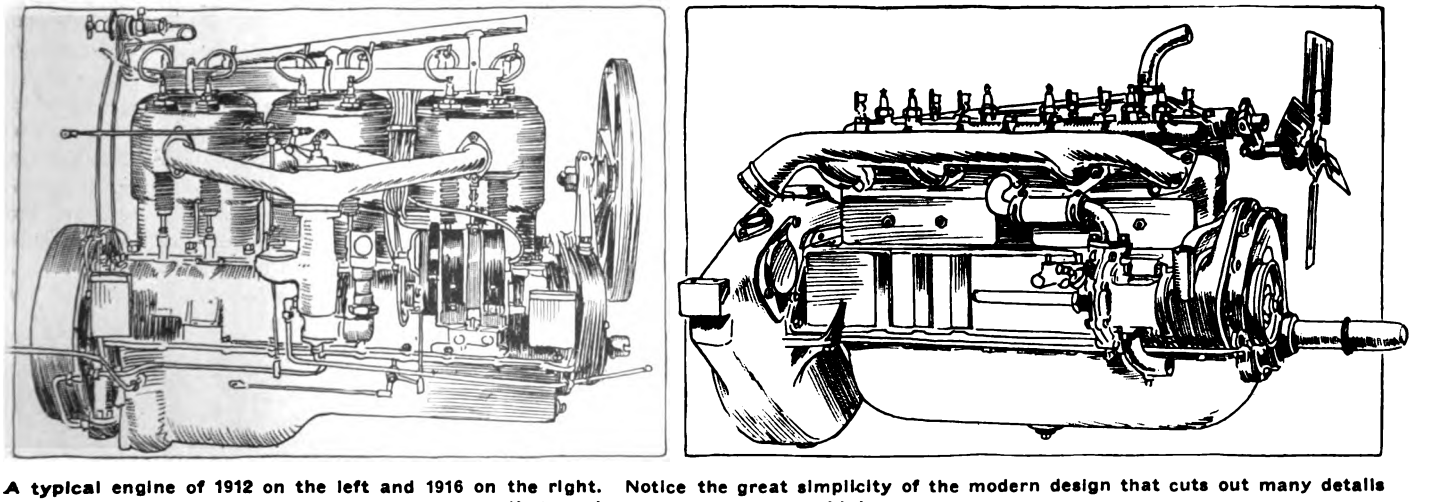
Cutting the Labor Cost

Better manufacturing has been the cry for three years past in almost every automobile plant. The automobile trade was just getting down to production when the self-starter upset everything. Having recovered from that disruption, having made the once troublesome accessory an integral part of the car, evolution has resumed a normal progress. Naturally manufacturers will not give definite figures for definite parts, the matter is too vital to the business, but it is safe to say that the average cost of producing a motor, an axle or some such unit assembly has dropped anything from 20 to 50 per cent *on labor alone.*

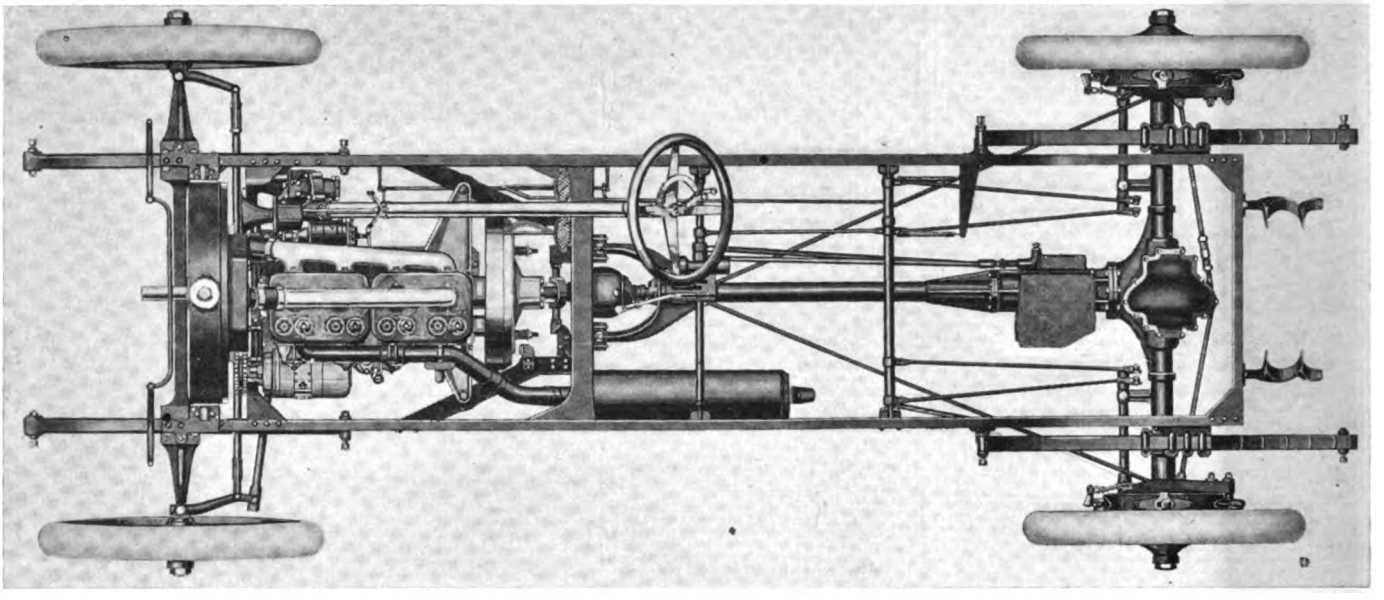
Why? Well, look at a motor of 1913 and a motor of 1916 side by side. Which looks as though there was most to do on it? A block motor eliminates the making of manifolds for gas and water, of casting, machining and fitting those manifolds. It eliminates two or three holding-down bolts and the manipulation thereof. Oilways cast integrally with the crankcase save copper pipe, the cutting, nipple fitting, testing and attaching of the pipes. The detachable cylinder head simplifies the casting, the machining, the valve fitting. It dispenses with valve caps, their machining and fitting and renders the motor assembly easier, in addition to rendering it much more accessible, thus benefiting the car owner.

The Simple Power Plant

Go to something bigger and take the unit power plant. Here we have, no lining up of one part with another, three points of frame attachment instead of six or eight, no clutch coupling shaft, one part to be handled instead of three, and



A typical engine of 1912 on the left and 1916 on the right. Notice the great simplicity of the modern design that cuts out many details that used to need separate machining



A typical chassis of 1912. Compare it with the chassis illustrated on the opposite page, one of the 1916 low-priced sixes

usually the elimination of two or three frame members, their making and attaching. Take the rear axle, spiral bevels eliminate the noise trouble to a great extent, they allow the axle to be brought to perfection with less time on adjustment. The axle case is commonly simpler in design with fewer parts. Take the brakes, having the pedal and the emergency lever on the power plant has done away with several frame attachments, has eliminated another lining up job. Finally look at the fenders and running boards; they look better, the domed fender is handsome, the graceful curve pleases the eye and also helps to make the fender more effective as a mud catcher, but look closer and you may notice that one piece of sheet steel, formed at one squeeze of a giant die has replaced a dozen strips of metal with bolts and rivets and screws which enabled the old style fender to be built up by one hand process after another. Bump comes the die, obedient to the hand of one man and as much work is done in a couple of seconds as was previously performed by half a dozen skilled men in an hour. Again a *better* article for a fraction of the cost.

There is no need to elaborate the picture further, enough has been said to indicate a line of thought that any man can follow for himself, but it is things like this that make up better manufacturing.

Capital and Labor Compromises

Now to look at another aspect of the labor question: We are led to that of capital investment. Too hurried an expenditure on plant piles up a debt that the efficient working of the machines cannot pay off within a reasonable time, but every time one machine is used that could be replaced by another to do better work there is waste going on. Suppose $3,000 will buy a fairly efficient machine for making some special part, and the best possible machine costs $9,000, as may easily happen. Then it becomes a point to decide whether the saving on the work of the more expensive tool will be enough to compensate for the heavy capital charge. Very often indeed the poorer tool is the better, figuring on a schedule of a couple of years output. This is simple horse sense and most automobile manufacturing concerns have gone slowly in the purchase of costly tools, starting in business with fairly good equipment and improving it as earned money gave them funds to spend. This is especially true of the big firms which form the backbone of the trade.

Economical, Efficient Painting

To give an example, many of these firms have installed during the summer, a new body finishing scheme. Here the body is passed through a sort of tunnel which is so heated that the paint dries in a much shorter time, so clearing the floor space more rapidly and easing the handling, as it reduces the number of half-finished bodies in the various operating rooms. This saves time, which is money, produces just as good work, even better some say, but the equipment is costly and it is only lately that the steadiness of large demand has made the outlay allowable.

Another thing of vast importance is the air brush painting system which does better painting in vastly less time and with less waste of paint. Mounted on a revolving stand six four-cylinder block castings can be air brush painted in 2 min. by one operator working carefully. Try looking at a cylinder block and think out how long it would take to paint it with a brush so as to give a perfectly even surface. Modern bodies have few beadings and few angles, which makes painting and rubbing down much easier and quicker. Upholstery does not roll over the edges of the panels but stops flush. So much the easier for the workman, for a metal bead and a leather strap vanish, the upper edge of the body is finished by the die that presses the panel instead of by the hand of the tack-hammer wielder.

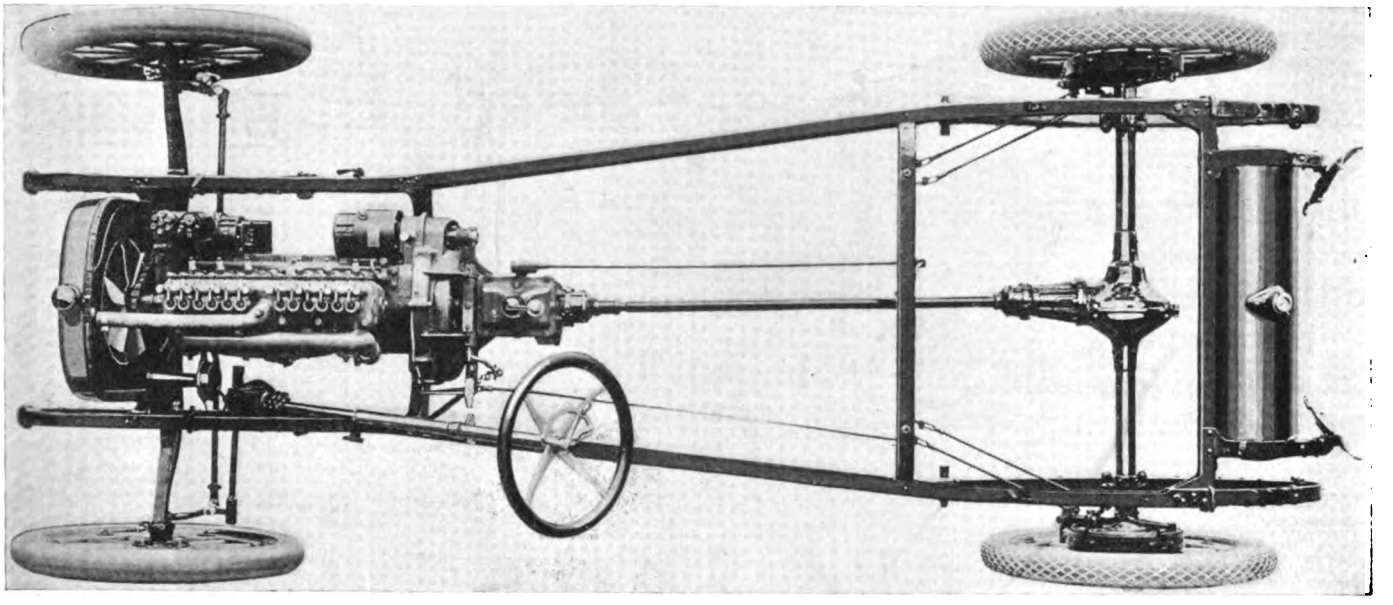
Saving the Profits

Big machine tools, new process equipment, such as the paint shop outfits just described, factory rail tracks and chain conveyors, all sorts of things to lessen labor in making and labor in handling are the things the automobile firms have spent a large part of their profits on during the past few years. Suppose the profit in 1913 were $200 per car, very likely half or more went to but equipment that would cut the factory cost, but we have now reached a stage where much of this equipment is bought and paid for. It is no longer a charge on the profits of the company, so in making at the old price they would be making double profit. Having the better plant, having the facilities for larger scale manufacture, it is better commercially to drop the price to the user, to take a smaller gross profit per car, sell a few more cars and have at least as much net profit at the year's end. In other words, the user is getting the benefit of the tools and equipment he has helped to pay for during years past.

Per Cent Cost of Components

The table of costs of different parts of an automobile figured in percentages and shown on page 595 is an interesting subject for analysis. Taking the items there given we find the following:

Radiator—Price about the same as improved methods of



Typical 1916 chassis. Note the simplicity of this design as compared with the 1912 chassis on the opposite page. Note how many parts have been eliminated

design and construction offset increased cost of materials. Labor especially is cut by use of loose steel shell so that the radiator actually fitted to the chassis may sometimes be a few per cent cheaper.

Power Plant—Materials are iron which is dearer, steel which is cheaper, aluminum and brass which are dearer. Labor is down anything up to 50 per cent on new designs by virtue of improved manufacturing. Thus motor and gearset cost anything from the same as last year to 40 per cent less according to how much the design and the making have been improved.

Ignition, Starting and Lighting—All material a little more expensive, but improved design gets the same effect with less wire and can save a few per cent on total cost. Elimination of waste material, especially brass, increased use of stampings and decrease of total weight have caused a considerable economy, probably up to 30 per cent.

Battery—This is one of the few parts of a car that have sometimes been cut in quality a little, but it is cheaper mainly by virtue of the fact that the battery makers have got into shape to meet the demands of a new field for their wares.

Axles, Springs and Wheels—Very slightly cheaper, from 0 to about 5 per cent. Mostly accounted for by increased quantities coming from each plant.

Tires—Approximately 15 per cent cheaper because of larger quantities, fewer sizes and better manufacturing.

Body—From 0 to 50 per cent cheaper. Savings made by simplified design, cheaper upholstery material instead of leather, cheaper quality of leather, more springs, less hair in stuffing. Greatest saving obtained by new finishing systems now in process of development, that save large proportion of labor.

Body Fittings—Cheaper by elimination of heavy brass parts, etc. Saving impossible to estimate accurately as this tendency has spread over several years.

Accessories—From 5 to 25 per cent cheaper by virtue of simplified construction and elimination of such parts as side lamps.

Steering Gear—Cheaper from 0 to about 5 per cent on account of larger orders. By comparison with several years ago, cheaper by simplified design perhaps nearly 50 per cent in some instances.

Frame, Forgings, Castings and Raw or Semi-Raw Materials—Mostly slightly more expensive than last year. These are common steels and feel fluctuations of steel market.

Of course these percentages do not represent the truth concerning every car. They are simply broad averages and the figures are deduced from confidential information gathered from all sorts of sources. Some cars which have had their price cut are costing just as much to make now as ever they did and the cut represents nothing but less profit for the manufacturer; but these instances are rare.

Normal Price Reduction 13 Per Cent

After all, has the cutting of price been so very large? Remember that a cut is only a true cut when the car as a whole remains much the same. A new design like the Oakland little six for example is not a cut for it is a new Oakland in every respect.

Take twenty cars and examine what has happened to them.

Car	1915 Price	1916 Price	Per Cent Cut
1. Briscoe 4	$785	$750	4.5
2. Buick Big 6	1,650	1,450	12.0
3. Cadillac 8	1,975	2,080	*plus* 4.8
4. Chalmers 6-40	1,400	1,275	9.0
5. Franklin 6	2,150	1,900	11.6
6. Hupp 4	1,200	1,085	9.6
7. Hudson Light 6	1,550	1,350	13.0
8. Imperial 4	1,085	995	8.3
9. Interstate 4	1,000	850	6.6
10. Jeffery 4	1,550	1,000	35.0*
11. Marmon 6	3,250	3,250	0.0
12. Maxwell 4	725	635	12.4
13. Mitchell 6	1,555	1,250	19.6
14. National 6	2,375	1,690	29.0
15. Oldsmobile 4	1,285	1,095	14.8
16. Oakland 4	1,150	1,050	8.7
17. Overland 4	1,075	725	32.5
18. Regal 4	1,085	985	9.2
19. Stearns 4	1,750	1,395	22.0
20. Studebaker 4	985	850	13.7

*This car is a new design to a greater extent than most of the others.

The average decrease in price for these twenty cars selected at random, is 13.3 per cent.

Now a drop of 13 per cent is perfectly explainable on the basis of better design and better manufacture. As enlarged upon in the previous pages, it is nothing to cause either question or alarm and it is merely a natural manufacturing development. In 1914 the average price of an automobile reached its zenith and there is no doubt that the price was forced up by the coming of the starter which was then hardly the integral part of the car it has since become. The starter cost a good deal to buy and much more by reason of the disorganization of design and assembly methods which were just settling down in 1912. The automobile would have come to its maturity sooner had the upheaval of the electrical equipment not come along quite so soon. Take the curve

Sebring	Haibe	1:19.29	91
Duesenberg	Haupt	1:20.05	90

*Qualified by Rickenbacher.

NEW YORK CITY, Sept. 28—Sixteen cars will start in the 350-mile race on the Sheepshead Bay Speedway on Saturday, Oct. 2, the original entry of thirty being reduced to this figure by some not being in running condition, others withdrawn for lack of drivers, and others eliminated due to accidents. The latest of these was the Maxwell, driven by Harry Grant, which took fire in Monday's practise when Grant was severely although not fatally burned, and the car badly damaged. The Mercers are out on account of lubrication trouble. The Peugeot which Ralph Mulford was to have driven is not ready. It will be impossible to get the Delage, entered by Harry S. Harkness, president of the speedway, ready in time. Other withdrawals are Bugatti, Sunbeam and one of the Stutz entries. It is uncertain whether the Erwin specials, generally known as the Bergdolls, will appear or not. Of course, there are a number of drivers who have not yet made their elimination trials so that the final list cannot be determined.

Hold Speed in Reserve

Elimination trials to determine the order of starting in Saturday's race are progressing slowly, thirteen cars having taken their trials the first two days. The trials will be continued to-day and to-morrow. So far none of the cars have had difficulty in setting an average of over 85 m.p.h. Resta's Peugeot holds the track record in these trials at 106 m.p.h. Higher speeds are possible but all drivers are holding themselves more or less in reserve.

Curved Bank Increases Distance

It is not certain whether elimination trials will be as fast as on the Chicago speedway, due to the fact that with the parabola banking, the drivers are forced to drive wider and higher on the track than they did at Chicago, where the straight banking is used. It has been calculated that in a lap of the 2-mile speedway here, a car travels 197 ft. further when averaging 100 m.p.h. This is equivalent to 1 3/5 sec. per lap, which equals about 4 m.p.h. On the Chicago track with its straight banking it was possible to make as high speeds close to the inner edge of the track as high on the banking.

Easy on Tires

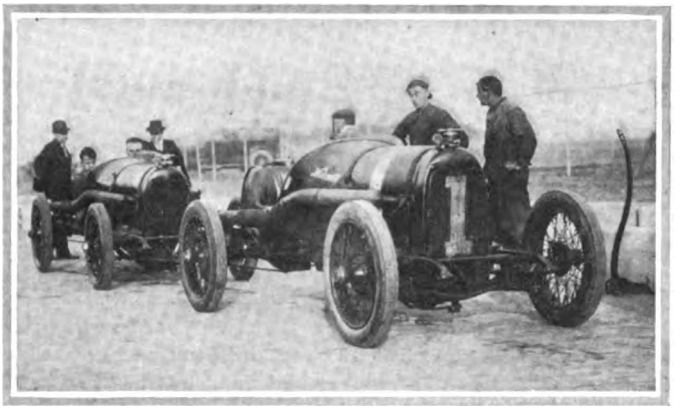
In practise the cars are running high on the steepest part of the curves at each end of the speedway, these curves being well banked on the surface. With the cars traveling at approximately 100 m.p.h. there is no tendency to skid but

rather the rear wheels tend to slide toward the inside of the track, indicating that the track is intended for considerably higher speeds than the cars are able to make. Because of this situation, the drivers believe that the track will be easier on tires than the Chicago one, where there is a tendency for the rear wheels to skid toward the outside of the track at speeds of 102 m.p.h. and over. It is estimated that on the New York track this skidding outward will not take place until speeds of 120 m.p.h. or higher are made and perhaps not then.

The track surface is quite black, the wood having been creosoted. This does not make it slippery but has just changed the color. Inside of the track is a broad safety apron which is brick along the homestretch but hard dirt around the rest of the track. Inside of this safety zone is a cement wall nearly 2 ft. high. Within the wall is a safety zone or neutral space, after which comes the fencing inclosing the infield, where the cars park.

William Schimpf, ex-chairman of the Contest Board of the American Automobile Association, has been chosen referee. The entire speedway is practically completed, the grandstand seating 39,000 was completed in time for Saturday's trials and the bleachers are now completed. The main entrance, at which fourteen rows of automobiles can enter abreast, is finished, the high wire fencing inclosing the reserved parking spaces inside the track is in place, in fact all details with a few minor exceptions are ready.

The Mercer and F. R. P. cars have not yet been on the track except for a few laps, and no gage of their speed possibilities has been obtained. The F. R. P. motor has been redesigned so that there is now a waterjacket between the piston and the inner sleeve, this jacket extending upwards from the base of the cylinder casting. This should result in getting the heat well away from the piston. There still remains a waterjacket outside of the outer sleeve so that the sleeves reciprocate between waterjackets. The cylinders are 3.88 by 6.125 in. Other details of the car are as they were at Indianapolis.



Two Maxwell cars at the side of the track at the elimination trials for the 350-mile race. Note jack at the right of the illustration, one of the greatest of time-savers in tire changing

Complete List of Possible Starters

Car	Driver
Mercedes	Ralph De Palma
Delage	Barney Oldfield
Stutz	Earle Cooper
Stutz	Gil Anderson
Stutz	Rooney
Peugeot	Dario Resta
Peugeot	Bob Burman
Peugeot	John Aitken
Peugeot	Howard Wilcox
Maxwell	E. Rickenbacher
F. R. P.	Jean Porporato
Duesenberg	E. O'Donnell
Duesenberg	Pete Henderson
Duesenberg	Haupt
Mulford Special	Ira Vail
Ogren	Tom Alley
Sebring	Ora Haibe
Pugh Special	Jack LeCain

Record Attendance Expected

The sale of tickets promises to reach $100,000 before the opening day of the race. If the grandstand is entirely sold out it will bring approximately $198,000. With good September weather prevailing, it is safe to assume that the attendance will be greater than at any other speedway race ever held in America.

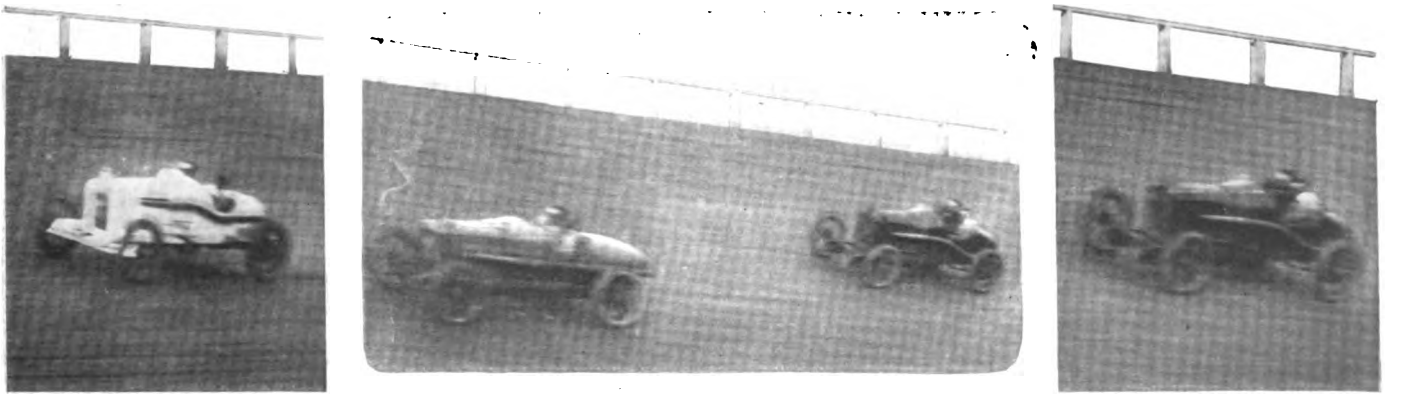
The accident to Harry F. Grant, twice winner of the Vanderbilt Cup race, occurred at the end of the elimination trials Monday, when he was practising on the track with Rickenbacher in the other Maxwell. Grant was traveling at high speed and soon after he passed the grandstand, flames were noticed under the car. By the time he reached the curve the rear end was enshrouded in flames. Grant tried to stop as quickly as possible and skidded fully 200 yd. on the track before he came to a standstill. Fortunately, workmen were at hand and soon extinguished the blaze but not before Grant was very severely burned from the waist downward. It will be several weeks before he will be out of the hospital.

Predict 100 M.P.H.

With good weather conditions prevailing on Saturday it is expected that an average speed of close to 100 m.p.h. will be maintained for the 350 miles. The race starts at 12 o'clock noon, this hour being selected to give out-of-town spectators a good opportunity of reaching the track without having to start before sunrise.

In the practise to-day Burman made a circuit of the 2-mile track at 103 m.p.h., this being the fastest for the day.

A simple way to time the cars is by figuring that it takes exactly 1 min., 12 sec. to circle the track at 100 m.p.h.



Left—Cooper in a Stutz during the elimination trials. Center—Oldfield in a Delage and Aitken in a Peugeot at high speed. Burman is at the left. Right—Grant in the Maxwell

Indiana S. A. E. Talks Twelves and Aluminum

Vigorous Discussion Follows Reading of Papers by J. G. Vincent and James E. Diamond at Opening Session

INDIANAPOLIS, IND., Sept. 25—Last night a crowded meeting of over 350 members and visitors attended the reading of the two papers scheduled for the opening meeting of the winter season of the Indiana section of the Society of Automobile Engineers. The papers presented by J. G. Vincent on the twelve-cylinder engine, and by James E. Diamond on the aluminum piston were published in THE AUTOMOBILE last week, Mr. Vincent's paper being identical with that read by him in Detroit on Sept. 16. At the previous meeting O. E. Hunt, chief engineer of the Packard Motor Car Co., read the paper for the author so as to leave him with an untired voice when discussion commenced, and this idea working out well it was repeated at Indianapolis.

A novel detail of procedure was the reading of Mr. Diamond's paper immediately after Mr. Hunt had finished, thus opening the discussion on both papers at once. The scheme worked out extremely well.

Business Report Is Good

The business report was read first and showed the section to be in excellent condition financially, many local manufacturers having given substantial donations to its funds. F. E. Moskovics was in the chair and spoke briefly on the section. He said that J. G. Vincent deserved the greatest possible credit for the way in which his tests on the Indianapolis speedway had been conducted with the utmost freedom and publicity. At Mr. Vincent's invitation other engineers had handled the Packard cars which had been tried out on the track for many days previous. These visitors had returned the compliment with their experimental chassis and it was an honor to belong to a section and to a society that could boast men so broad gaged as these engineers.

Coker F. Clarkson, general manager of the S. A. E., came from New York to attend the meeting and he spoke in similar strain, congratulating the section on its activity and good feeling. He also mentioned the automobile reserve which has been suggested as a matter of vital interest to the army authorities and a fit subject for the S. A. E. to consider. The society has no official action in immediate contemplation, but considers the subject one that ought to be discussed so that various schemes may be thought out. On the suggestion of W. G. Wall it was decided to appoint a small committee to consider the matter.

W. G. Wall Opens Discussion

After the papers had been read the discussion was immediately opened by W. G. Wall, who said:

W. G. Wall, vice-president and chief engineer, National Motor Vehicle Co.:—"I have heard with a great deal of interest Mr. Vincent's paper and also heard him discuss his very remarkable motor. I have seen this motor run and have seen what it will do. I can only say it will accomplish everything and probably more than is advertised for it by his company. I agree with most of the things Mr. Vincent has said. There are a few things, however, with which I differ slightly. I believe I am a little more liberal toward the eight than Mr. Vincent is.

"When we decided to build something which we thought was a more perfect motor than the six-cylinder motor, we went into the matter rather thoroughly and looked over the eight and saw that it had some advantages. We also saw that it had a number of disadvantages. We saw that the twelve had what we considered a great many more advantages than the eight so our idea was, which we endeavored to do, to extract the virtues of the eight and incorporate them with the many advantages of the twelve.

"We considered one of the troubles and one of the drawbacks of the eight, aside from the fact that the torque could never be the same as the twelve or that the vibration could never be reduced to the same extent as on the twelve, that one of the greatest disadvantages of the eight was the inaccessibility.

"The one trouble was getting to the valves. We found, however, that the eight did have some advantages and one of the principal advantages was the fact that the accessories were located in the center, between the cylinders, in what Mr. Vincent refers to in his paper as the 'valve-alley,' where they were entirely out of harm's way, and where weather and road conditions could not affect them, and in fact, you could go through deep water if necessary without any effect upon your accessories. Therefore, we decided it would be better if we built a twelve to locate the valves on the outside instead of on the inside. We did this and found there were other advantages besides accessibility. One of the things that has come up is the fact that even though aluminum pistons have very little carbon deposit, when you locate the valves on the outside, then loose bits of carbon can escape so that we have a practically carbonless engine.

The Friction Factor

"There are several things I wish to ask Mr. Vincent, as he is certainly an authority on twelve-cylinder engines. One of these is his ratio of connecting-rod length to stroke, and another is whether he found any difference in the amount of water and therefore the temperature of the water in the two cylinder blocks, by using the double pump arrangement he has and putting water through the cylinders in multiple. In other words, whether the friction causes any difference. One more point, which is really more technical than of any great interest to the user—what is the horsepower required in driving twelve-cylinder camshafts? Is the horsepower necessary to turn this camshaft increased very materially with the weight of the springs? In other words, you can readily see that in a twelve-cylinder, as one valve lifter goes up the side of the cam, there is always another valve lifter coming down the side of another cam, so that the power required to run a camshaft is really decreased as you increase the number of the cylinders.

"There is a question I would like to ask Mr. Diamond also, and that is what he finds the difference in the co-efficient of friction between die cast and sand cast pistons."

J. G. Vincent replied that there were certainly advantages in favor of the eight and that he thought all types of engine had their place. All his paper was concerned with was the quite large engine of approximately 424 cu. in. As regards the location of valves, he had considered several types and had wooden patterns made of several designs. The wood pattern is a very useful method of comparison between sug-

PACKARD

gested designs because it is cheap and easy to make in a rough and ready way and gives a real idea of how a motor will look in the chassis. He found the Packard twin six with the valves outside would work out too wide and sit too low in the frame. Also for a motor of the dimensions under consideration the drive layout for the two camshafts, etc., became awkward.

He regretted he could not give the power required to drive the camshaft, but it was easy and light on the chain; he found the chain front end to stand up much better on the twelve than it did on the experimental six of the same total cylinder capacity. The springs used were 60 lb. as compared with 85 lb. on the six. Water temperature varied little, if at all, between the two cylinder blocks and the motor seemed easy to keep cool. Connecting-rod length used on the twin six was 12 in., giving a ratio of 12 to 5 but the length was chosen not so much on account of this proportion as to obtain a good length of valve and valve spring and plenty of bearing on the tappets. He considered the rod to be longer than necessary from the angularity viewpoint.

J. E. Diamond said in reply to W. G. Wall that he could not give comparative coefficients of friction between sand and permanent mold castings but thought the difference would be extremely small.

C. P. Grimes, experimental engineer for Wheeler & Schebler, asked if Mr. Diamond could explain the fact that an aluminum dashpot piston used in a trial carbureter seemed to swell and needed periodical turning down.

J. E. Diamond answered the only possible explanation was that some stress on the aluminum exceeded the elastic limit and so created a permanent set. The only time he had encountered similar trouble was in an aeroplane engine piston and it proved to be owing to the use of too high a compression, causing actual melting to take place.

C. S. Crawford, chief engineer of the Cole Motor Car Co., remarked he has observed several cars standing with the motors idling in the streets of Detroit and the Cadillac eight seemed to run more quietly in this condition than the Packard twin sixes.

Curbstone Quietness Vs. Efficiency

Mr. Vincent: "In this connection there is no question that any type motor can be made to run more quietly when made from an accurate set of tools. The only Packards we have had on the road have been made by hand until recently, when we have been making a few deliveries, and I think any engineer here this evening will bear me out when I say that when boring all new crankcases in a boring mill and depending upon a lathe hand to turn up all pistons and make all parts in this manner, you cannot get the quietness you would get from machine tools.

"It has been my experience that I have never been able to make a motor quiet enough in all its parts to make it absolutely quiet, but in building these experimental cars by hand, I was able to get more quiet results than ever before. There is nothing in absolute quietness. For a long time I have I have been an advocate of what I call commercial quietness. That is the motor which will go out and give you a ride every day in the week, which will not make the motor evident to the passengers, and not the motor that will give the most quiet demonstration at the curb. I can make any Packard six-cylinder motor absolutely quiet for curbstone idling but it is not practical for anything else, and that is the reason I have set the valve clearances and every other clearance so it can go out and give proper smoothness and the greatest range of ability on the road. The engineering department too many times allows the sales department to get them into trouble by making a motor "curbstone" quiet. It is only a question of the clearances the engineer sets. There is no question but what smaller valves, lighter springs and quiet cams can make the motor quiet. There is no question, either, about piston clearances. It depends altogether on what results you want to obtain. I have had some experience with eight-cylinder motors. They can give absolute quietness, but they make better motors if they are set to give a little more life at the expense of a little quietness in curbstone idling."

At the request of Mr. Vincent, C. P. Grimes then gave some figures relating to the acceleration of the Packard twin six tending to show that the results obtained on the speedway had been identical with magneto and battery ignition. With a gear ratio of an amount giving 25 m.p.h. at 900 r.p.m. of the engine the Packard accelerated from 10 to 50 m.p.h. in 22.4 sec., this result being the average of several tests made by Howard Marmon.

With magneto ignition the result was the same figure within 0.28, the acceleration shown being from 10 to 50 m.p.h. in 22.68 sec. The maximum speed shown was about 74 m.p.h. in both cases.

Two Carbureters or One?

C. P. Grimes then said: "It just occurs to me that Mr. Vincent has developed a very fine twelve-cylinder motor and has been using a single carbureter, which seemed to work first rate. I would like to bring up a question at this time. A number of people are using two carbureters on a smaller number of cylinders than twelve. A few years ago, when the six first came out, it had many carbureters, and I believe the twelve is going to give excellent results with a single carbureter, but just at the present time I am not satisfied in my mind whether it is due to the range of the carbureter in general or whether it is the lack of a well to accelerate from, that so many single carbureters do not give very good results on multiple cylinder motors.

"Some of our men have been experimenting with an eight-cylinder Knight motor and have found two carbureters on that car would go over a certain hill at probably 30 per cent better speed and with more life to the motor than with a single carbureter.

"Another question I would like to ask is the mileage Mr. Vincent obtained. He speaks of increased compression in the motor and I am very much interested in finding out the compression pressure he uses and the mileage per gallon of gasoline he obtains with his cars and his idea on the carbureter end of it."

Mr. Vincent replied as follows: "We found that at any ordinary speed, a single carbureter is adequate. There is no question in my mind, however, but that you can get more power at extremely high speeds with a double carbureter. An interesting thing in this connection is that the valve timing is more important and more variable than it is ordinarily given credit for. Setting the valve timing at a point where the exhaust opens at 50 deg. early and the intake closes at 50 deg. late, which is more or less conventional L-head racing timing, we found we did not get any increased horsepower from a single carbureter, at the high speeds, over the horsepower obtained with the timing set for touring, but by putting on a double type carbureter (in this case I think we used a Zenith), we got quite an increase. That is we got 117 hp. at 3200 r.p.m. I do not believe the extra horsepower that was obtained is of any particular advantage in touring car practice but it might be at some future time.

Economy Vs. Maximum Power

"As to economy, running the motors with the conventional valve timing, we made a test the same day with a double carbureter which had been adjusted to an economy setting rather than the highest horsepower setting and the double carbureter did not show nearly so well, in fact, it gave, if I remember correctly, 8 miles to the gallon as compared to 11, which is entirely too large an item to be neglected. I believe

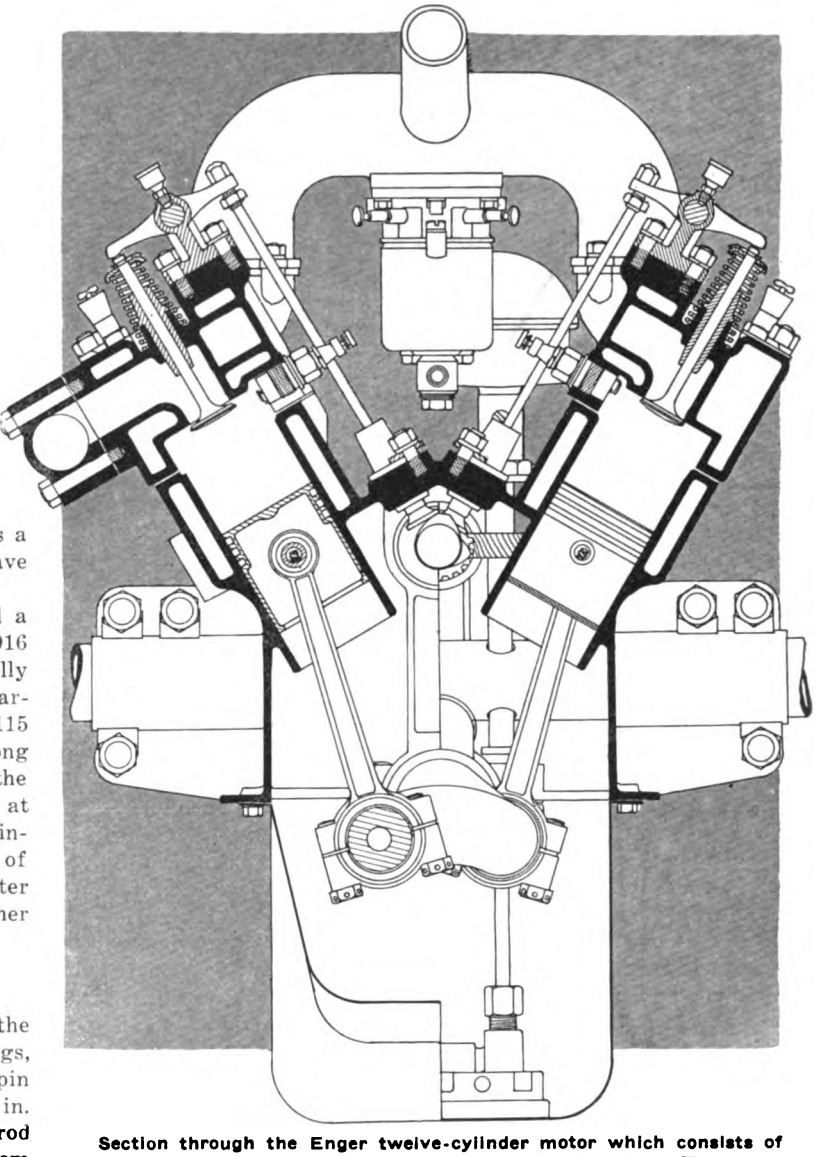
Individual Valve Cams in Enger Twelve

Oil Is Fed Through Chain-Driven Hollow Camshaft with Twenty-Four Cams— 60 Deg. V Motor 2⅝ by 3½— Lists at $1,095

THE Enger Motor Car Co., Cincinnati, Ohio, has placed on the market a twelve-cylinder car to sell for $1,095. Demonstrators have already been shipped and the factory in Cincinnati, Ohio, has now busily turned their attention to the production of this car which is the lowest price attained by a twelve-cylinder model and marks a step in the industry which two years ago would have been considered unbelievable.

The Enger company in the 1915 season marketed a six-cylinder car. This has given place for the 1916 season to the twin six, which will be built practically entirely in the Cincinnati factory. In general appearance the car is low and long, having a wheelbase of 115 in. and a straight-line body design which gives a long appearance. The small bore and stroke have given the designers an opportunity to keep the parts light and at the same time produce a compact engine. The cylinders, which are 2⅝ by 3½, are cast in two blocks of six and placed at an angle of 60 deg. from the center line of one-cylinder block to the center line of the other in the planes of the axes.



Section through the Enger twelve-cylinder motor which consists of two blocks of six cylinders each set at an angle of 60 deg. There is a separate cam for each of the overhead valves, or twenty-four cams in all, mounted on a single hollow chain-driven camshaft in the center of the V, where are also mounted the carbureter and the ignition unit. Note the mounting of spark plugs on inner sides of cylinder block and the large water outlet manifold

Light Reciprocating Parts

Light weight reciprocating parts are a feature of the motor, the pistons reciprocating weight including rings, bushings, upper half of connecting-rod and wristpin total but 25.9 oz. The length of the piston is 2⅞ in. and the number of rings, three. The connecting-rod length is 7½ in., and the rods are drop-forged from carbon steel. These light weights should provide the motor with smooth running qualities at high speed and the bearing areas are ample to take care of the small unit pressures existing in a power plant of this kind. The connecting-rod bearings are 1⅛ in. in length and 1⅝ in. diameter and the crankshaft bearings are 1¾ in. diameter and 2¼ in. length. The material of the crankshaft is 0.40 carbon steel. This is a heat-treated drop forging.

Although following the dictates of twelve-cylinder design the lessons learned of motors of four cylinders have not been forgotten. Following the practice which is rapidly becoming general throughout the entire field the cylinder heads are removable, making the motor readily accessible for inspection and cleaning. In the particular overhead valve construction used in the Enger the detachable cylinder head also provides an easy adjustment for the valve tappets, a point which is quite necessary to consider in a twelve-cylinder motor which has twenty-four of these tappets requiring attention if the full efficiency of the motor is to be secured at all times and under all conditions.

One of the interesting features of this design is the arrangement for valve drive. Each valve is operated by an independent cam, giving twenty-four cams in all. The camshaft is hollow, providing rigidity which is naturally essential in a unit of this nature. With the material massed at a distance from the neutral axis of the camshaft this rigidity is secured, while at the same time the bearing speeds, due to the increased diameter, are not high enough to be detrimental to the bushings. At the same time the hollow camshaft provides a method of lubrication which is very efficient for motors of this type as it allows the oil to be fed under pressure through the camshaft.

Chain drive is employed for the camshaft which is not of constant section throughout its length. It is carried on three bearings which have respectively diameters of 1¼, 2 and 2 1/16 in. respectively. This design is worked out to give practically a constant strength throughout the entire length of the shaft allowing sufficient material to take the stresses developed at any point along the length of the shaft.

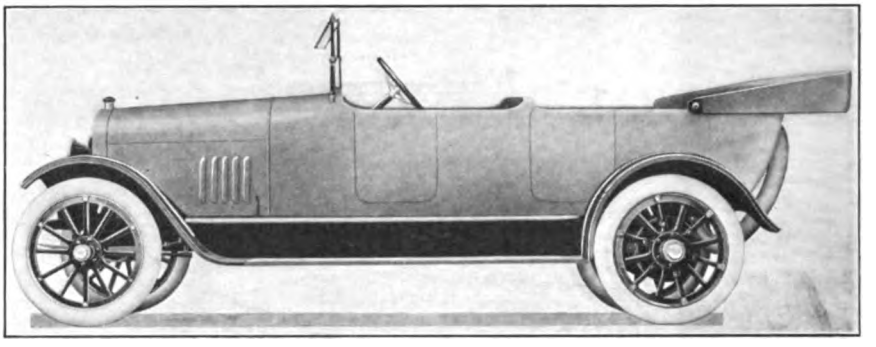
With practically the entire valve mechanism exposed and practically under the eye of the operator no fear for the possibility of weak explosions in one of the units of the twelve-cylinder assembly need be felt. The rocker arms are carried as shown in the illustration along a common axis provided with grease cups between each pair of arms, all of this being accessible by merely lifting the hood.

The water cooling arrangement is interesting, there being two outlets from the radiator to the waterjacket intake. The water enters the cylinders on the outside of the V at about half the length and from this point is carried and baffled so as to thoroughly cool the jackets for the full length of the motor. The water outlet from the cylinders is carried upward at the center through a common header and thence by rubber hose connections to the radiator. This arrangement provides a single inlet and a double outlet and thus allows the water to utilize all the available area of the radiator without danger of having two separate streams with a pocket in the center.

The ignition drive is directly from the camshaft and provides either automatic or hand advance as desired. It operates in connection with a battery system and a timer distributer is mounted at the rear of the engine with the wires carried through hose leads which prevent chafing against the water connections or the tops of the cylinders.

An interesting point in the design, and showing the characteristic rigidity, is the mounting of the fan bracket. This is carried on a platform at the forward end of the motor with the fan shaft projecting through the housing giving a firm support on both sides of the camshaft in taking the drive.

One of the places in which weight is saved on a motor of this type is in the flywheel. This has a diameter of 14 in. and a weight of 40 lb. The clutch is mounted in the flywheel and the bell housing is continued back from the crankcase. This gives a rigid support for the forward end of the gearbox. Three speeds are provided by the gearset which is made up of 3½ per cent nickel steel gears. The center control lever is mounted on the cover of the gearbox and, as will be noted from the illustration, this is a compact unit of small size.



The Enger twelve-cylinder five-passenger touring car for 1916 which sells for $1,095. Note the smooth body lines and long appearance

The drive is through two universals of the Hartford type to a Hess rear axle. The differential gears are spiral bevel and are carried on Gurney ball bearings. The hubs are provided with Bower roller bearings and the torque is taken care of by a torque arm mounted on the axle housing and carried to the rear cross member. The propulsive thrust is transmitted through the cantilever rear springs to the frame side members. The cantilever rear springs are long, extending forward to a point well up along the frame and giving a frame which should have an easy action on rebounds.

Two Independent Mufflers

Other features about the chassis which should be mentioned include the mounting of the twin exhaust line with two independent mufflers which are swung between cross members and which provide independent outlets for the exhaust gases of each set of six cylinders. The frame is bottlenecked, allowing a narrow turning radius. The starting and lighting systems are accessibly mounted, the starting motor meshing directly with the flywheel and the generator being directly driven by chain at the forward end of the motor.

Standard equipment includes a five-passenger body with slanting windshield, Gemmer steering gear, gasoline tank in the cowl, Atwater Kent ignition and a full line of accessories and tools. In its finished condition the car gives a handsome appearance, being provided with real leather upholstery over hair cushions. The body is roomy and attractive, being thoroughly up-to-date in design and providing all the seating capacity necessary.

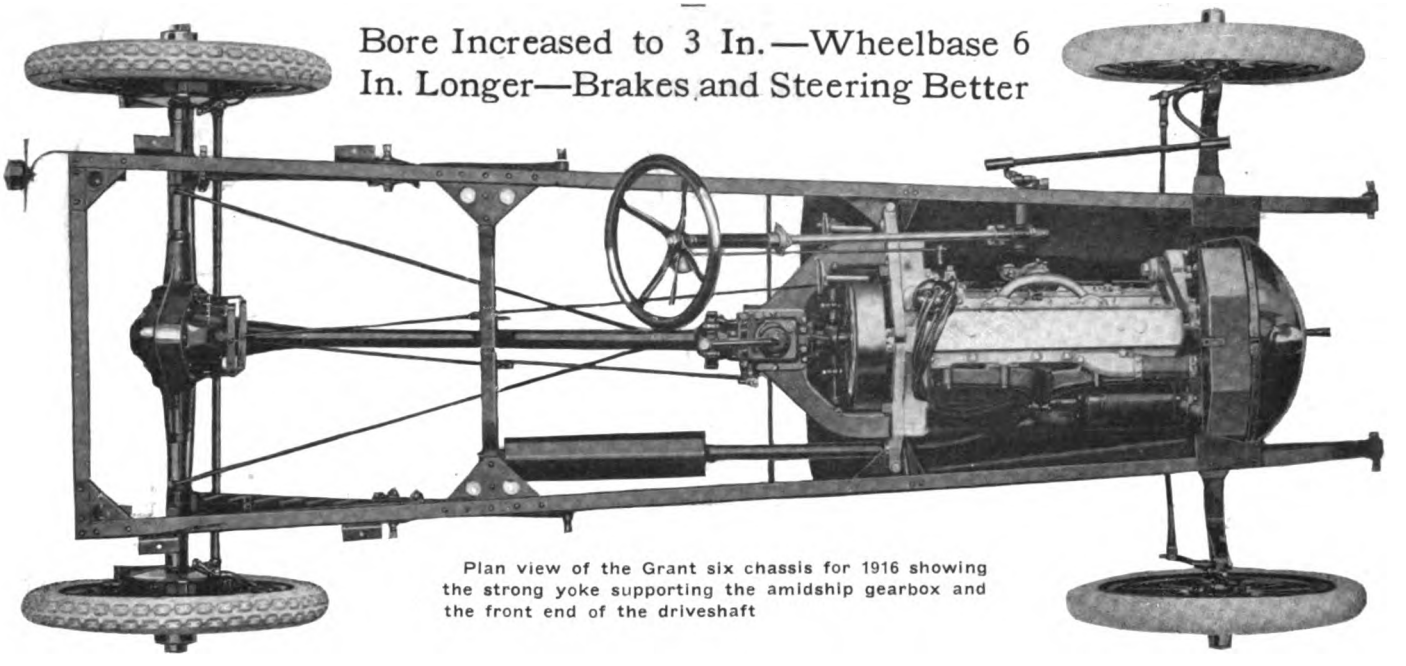
Larger Motor in 1916 Grant Six

Bore Increased to 3 In.—Wheelbase 6 In. Longer—Brakes and Steering Better



Plan view of the Grant six chassis for 1916 showing the strong yoke supporting the amidship gearbox and the front end of the driveshaft

NOW entering its second year, the Grant six, product of the Grant Motor Co., Findlay, Ohio, is a larger car with a motor of increased power due to enlargement of the cylinder diameter from 2⅞ to 3 in. The wheelbase has been lengthened a full 6 in., making it now 112 in., and this has permitted of much lengthening of the body and a better proportioning throughout. Coupled with these more important differences, the new Grant has also been considerably refined in a number of details which, though they do not show on the surface, help to make the car a better vehicle mechanically. For instance, the brake size has been enlarged to give greater ability to stop in a short distance; there has been a steering gear improvement, a slight added feature to the clutch, and the front axle has been increased in size. Though from these facts it is quite evident that the 1916 Grant is a bigger value than it was before, the price has been retained at $795 with complete equipment, this being possible, it is said, due to greater factory economies, and better manufacturing prices made possible by greatly increased production.

New Body Lines

The new body lines are the first thing to be noticed when inspecting the car. The popular trend has been carried out, and a modification of what is known as the boat-line design is used. The sides of the body have been somewhat raised, and the cowl is also brought up higher, with very little difference between the slope of hood and front of car. The hood is also higher to conform, and though the radiator retains the characteristic Grant round form, it is larger and more smoothly built.

In the rear, full three passenger seating capacity is attained by the length of the seat. To accomplish this, the body extends out over the wheels somewhat, and the fenders are set into the wheel houses. This not only gives a substantial construction, but adds to appearance.

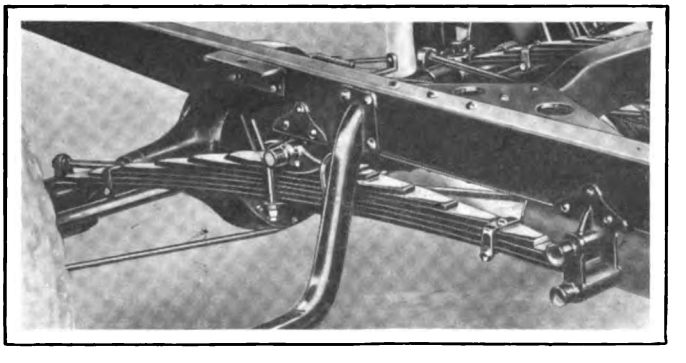
Mechanically, the Grant six employs the design wherein the power plant unit takes in clutch and gearset, and the rear axle unit incorporates a torsion tube surrounding the driveshaft. The engine is now 3 by 4¼, the gearset has three selective speeds, and the clutch is a cone type. Other specifications include Atwater Kent ignition, Allis-Chalmers lighting and starting, floating rear axle, and cantilever rear springs.

In increasing the motor bore from 2⅞ to 3 in., the Grant concern steps up the S. A. E. horsepower rating from 20 to 21.6, and increases the piston displacement from 165.5 cu. in. to 180.2. Thus, while the increase in horsepower does not show up materially in the rating, the displacement gives some idea of what the bore increase means. The engine, in fact, ought to give fully 10 per cent more power.

Overhead Valves

The Grant motor is an overhead valve design, with the valve rods running up from the left side. The valve rocker mechanism is completely housed by a cover plate at the top of the motor, so that when it is in position all that is visible of the valve mechanism is a portion of the rods. The head, carrying valves and rockers, water outlet connection and manifolds, is detachable from the main cylinder block, which is in unit with the upper part of the crankcase. The exhaust manifold is a separate casting bolting to the right side of the headpiece, but on the right there are two openings running to a two-branch manifold to take care of the incoming gases. The distribution passages are cored within the head casting.

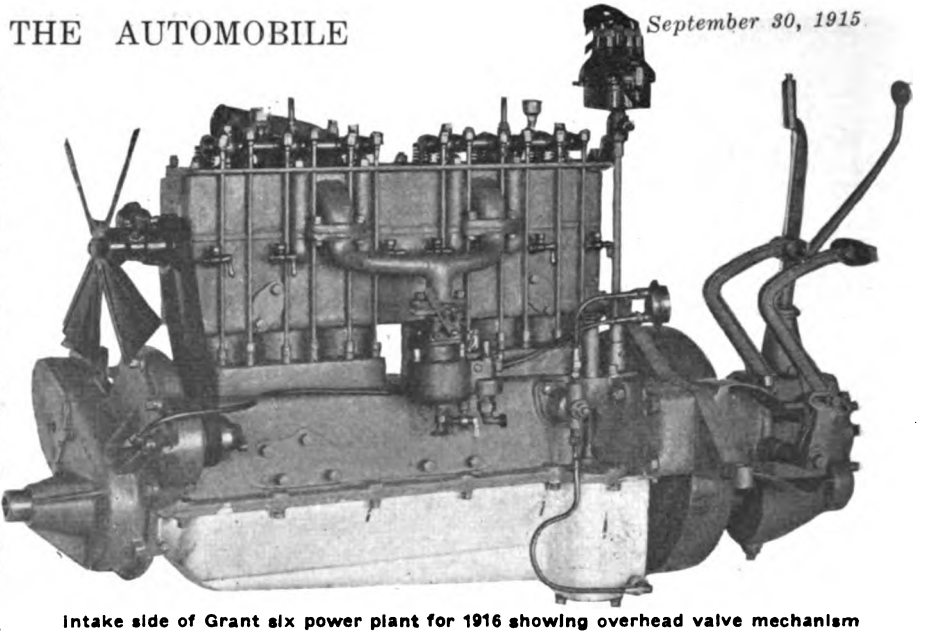
Instead of using the former mushroom type of valve tappets, the new form is of the roller design. The cams



Ingenious method of pivoting rear cantilevers under the frame

now come in contact with the rollers and thus the side thrust component is eliminated, this making for less wear and also tending to reduce noise. Then the method of assembling the tappets into the crankcase has been changed so that they can now be removed without disturbing the camshaft—a feature which will be appreciated if the owner ever has to take one of them out. The tappets have also been bushed, and there is no chance for oil leakage past them.

Standard practice prevails throughout the internal mechanism of the motor, and notable smoothness is attained through a good running balance to the reciprocating parts, coupled with rigidity of the crankshaft. This may partly be ascribed to the proportions of the three-bearing shaft and partially to the casting of the upper part of the crankcase in unit with the cylinders.



Intake side of Grant six power plant for 1916 showing overhead valve mechanism

In its application of the Allis-Chalmers single-unit starting and lighting system, Grant places the motor-generator on the right forward side of the engine base, bolting the head to the housing of the silent chain that drives it, and supporting the rear end on a bracket. This makes a very substantial mounting, which is one of the essentials of electric units of this kind. Between the head of the starter and the housing there is interposed an eccentric, drilled with a number of holes. Shifting of this eccentric, after the cap screws have been loosened, takes care of the chain adjustment. The storage battery is an 80 amp.-hr. type, and it is carried in a special steel basket concealed under the front of the right running board splasher. The electric system operates on 6 volts and is of the single-wire type with grounded return.

In the thermo-syphon cooling system the radiator is the only change. This is of an entirely new design for Grant, having a double construction. The outer shell attaches to the frame of the car and supports the inner core. Thus any weaving of the frame or other stresses to which the radiator might be subjected are absorbed by the shell and are not communicated to the core, which is thus made more efficient because there is less chance for seams to be sprung or leaks otherwise to develop.

Two gallons have been added to the capacity of the gasoline tank under the cowl, this feeding by gravity to the Rayfield carbureter which is fairly high on the left, and which is fitted with a waterjacketed manifold. No change has been made in the oiling, which is by a splash system with circulating pump feed and gage on the cowl board.

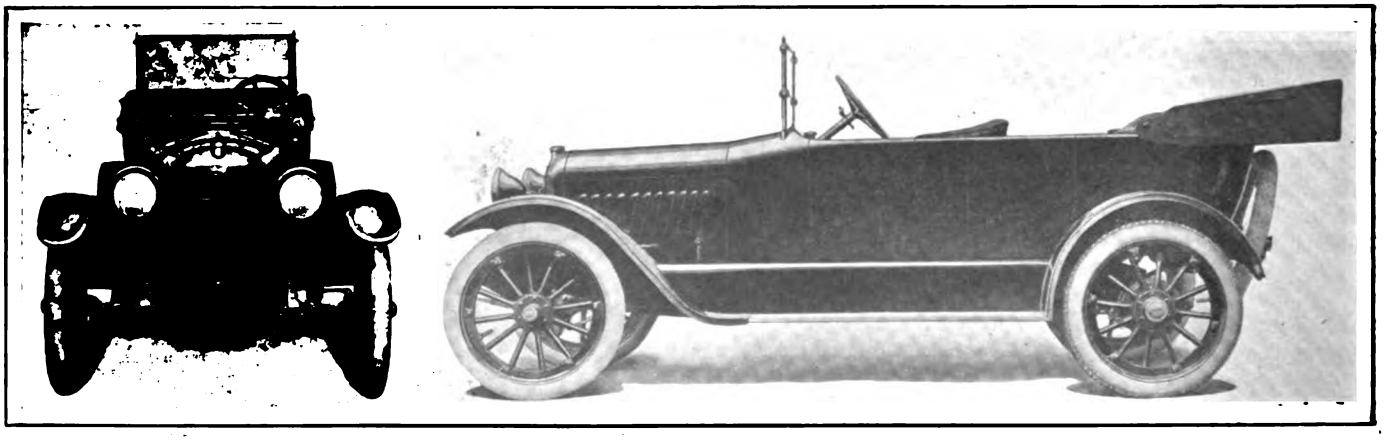
The Atwater Kent ignition distributer device now has a polarity switch, so called. This serves to prevent the fusing or corroding of the timer, and should tend to make the ignition even more reliable and permanent. The distributer unit is at the left rear side of the engine, driven by a vertical shaft which is itself operated by gear connection with the end of the camshaft.

The Transmission System

Construction of the driving mechanism back of the engine is quite conventional. The gearbox is bolted to the rear of the crankcase by a yoke construction. The flywheel is uninclosed, and the arms of the yoke pass around it to bolt to the rear of the supporting portion of the back end of the power plant. The yoke leaves plenty of room for the cone clutch and its operating mechanism. There is a refinement in the clutch to the extent of putting in a ball-bearing design of throw-out mechanism, making it easier to operate and at the same time lessening wear and reducing the problem of properly lubricating the bearing surfaces. Adjustment for the amount of tension of the engagement springs is quite simple.

Annular ball bearings carry the gearset shafting, which is very compactly arranged. Center control with a swivel lever is used, and the shifting mechanism is all assembled with the top plate that covers the gears. The torsion tube which incloses the propeller shaft finds a good front end mounting back of the universal joint, and has brace rods running diagonally back to the outer ends of the axle tubes.

In the back axle there is no change. It is a floating type, adjustable, and having differential and pinions on one carrier as is common practice. Ball and roller bearings carry the shafting, and there is an unusually large plate at the rear to get at the differential. With a gear ratio of 4½ to



Left—Front view of Grant six for 1916 which sells for $795. Right—Side view, showing smooth lines of Grant five-passenger body

1, this axle is well fitted to take care of the power it receives. In the braking system there has been a widening of the bands to give increased braking surface. The brake equalizers are mounted on the forward side of the axle housing at the middle, this method of positioning them calling for the use of but one brake rod forward to each brake control.

Cantilever Rear Springs

The rear cantilever spring suspension is nicely laid out for free action. The springs are of the full cantilever form, with the center trunnioned to the under side of the frame rail and the front end shackled to it. A considerable taper is given the frame from rear to front in order to make an easy turning radius and to offer good support to the sloping body along its entire extent. This construction of the frame is commendable, for while roominess of body has been accomplished, it nevertheless is not done by sacrificing the strength of the car as a whole. Frame cross bracing is also ample, for there is an intermediate member gusseted to the side rails in addition to the front and rear cross arms.

There have been some additions to equipment, each making for greater general satisfaction of the driver. The windshield, for instance, is of a new type with curved base and attached directly to the cowl with no filler board. On the rear wheels, non-skid tires are now fitted instead of plain treads, and besides this, Firestone demountable rims are now used. The tires are still 32 by 3½. Dimmers have been fitted to the lights, which will add to the comforts of city driving. On the cowl board, the electric instruments have been nicely grouped and a dash lamp added to illuminate them. In this electric unit group there are the polarity switch, ammeter, the electric regulator and the fuses. Bringing all the electric apparatus to one central point is a feature of the construction of the modern car's electric system which has developed along with greater reliability and general efficiency of the outfit.

An outward noticeable alteration in the new Grant is the standard body color. This has been changed from black to a Brewster green for the body. The fenders, hood and running gear are still black, however.

Why the 1916 Cars Are Cheaper

(*Continued from page* 597)

of price and cut off the peak of 1914 and then the decline to 1916 does not look so alarming.

What really has caused the excitement is not so much the cuts in the prices of known cars, but the advent of so many new ones. We have long been accustomed to cars selling at prices from $500 to $800 and we know about what to expect in the way of body comfort, appearance and finish as well as in road performance and chassis durability.

The fact that a good many more manufacturers have entered the field with cars in the $750 class does not affect the class of the $750 cars. Just like their more expensive brethren they are better cars for the money than we have had before, and for the same reasons precisely, but it is absurd to pretend that a little six at $750 or thereabouts is as good an automobile as the average of the $1,000 sixes of last season. Of course they cannot possibly be. Size has a good deal to do with it as a motor costs more or less according to its total piston displacement rather than according to the number of cylinders. When all the cylinder machining operations are done simultaneously on one block of cast iron a small six of 250 cu. in. size will be actually cheaper to machine than a larger four also of 250 cu. in., since all six bores are cut together more rapidly than all four of the larger size could be.

Considering new jobs which appear to be wonderfully low priced, one outstanding example has a six-cylinder motor of 249 cu. in., which model replaces a 165 cu. in. four made last year. The engine design of the new six is simplified by comparison with the old four and the new motor actually costs a little less than the four did. The rest of the chassis has been altered but little, because any transmission and chassis strong enough for a 165 cu. in. four is plenty strong enough for a 249 cu. in. six with its more even torque. Thus the new six is really no more costly to make than the old four.

Another instance is the appearance of a six bearing the name of a medium class manufacturer of good repute at less than $800. In this case examination shows a new motor for which the engine manufacturing concern has equipped, in conjunction with the class of gearset and axle components used in previous years for $800 to $950 fours. There is a considerable falling off in the body quality by comparison with the $1,200 job the same concern was making last season, but cheapness is secured by the use of a simpler outline as well as by cheaper fittings and cheaper upholstery.

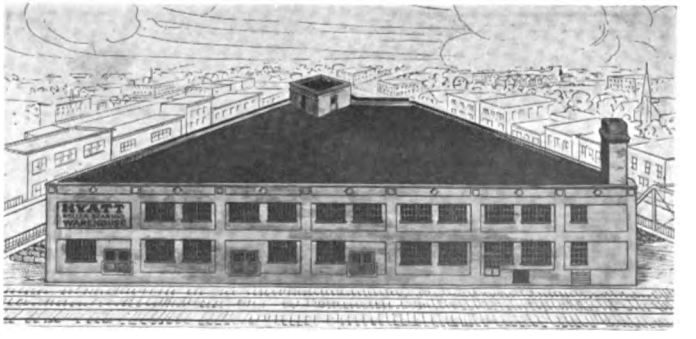
Another important body feature is the space, though there is some reason to think that this is being overdone on some of the light sixes. Some idea of this is obtained by wheelbase comparisons which are found to show only a very few inches increase, and where a new light six replaces a four, the added length is seldom much more than that accounted for by the extra pair of cylinders. Many of the new bodies appear much greater in length than they are in actual fact, by virtue of the straight lines of the design.

In the absence of any proper record of weights it is difficult to compare tire equipment, but as most of the new designs are lighter than those cars which they replace it appears that the 1916 automobile is rather better supplied with tire section than the car of 1915; certainly there is no falling off in this respect.

Conclusion Is Better Value Everywhere

It is instructive to observe, by the report of the N. A. C. C. given out recently that during the past year the total number of cars made by members of the association has increased 36 per cent, while the value of the total has increased only 10 per cent, and these figures give a fairly good idea of the real truth of the price drop; it is not so enormous. The outstanding fact remains that more car for less dollars can be bought to-day than ever before and more car service also. Take any price car from $500 to $5,000 and it will be a better one than could be had for the same sum last year.

Hyatt Bearing's Detroit Warehouse



The warehouse to be built by the Hyatt Roller Bearing Company on the Michigan Central R. R. in Detroit, Mich., will have a frontage of 225 ft. and will contain 20,000 sq. ft. in its two stories. The first floor will be on a level with the floors of the freight cars and the second floor will be on the street level. Freight will move in only one direction, Detroit freight going to the second floor while that for other points remains on the first

The Engineers' Forum

Art in High-Speed Motor Design—Quietness, Absence of Vibration and Power at Low Speeds Imperative

By W. B. Stout
Chief Engineer, Scripps-Booth Co.

DETROIT, MICH.—Editor THE AUTOMOBILE:—Mr. Gerster's series on the design of high-speed motors appearing in several issues of THE AUTOMOBILE last spring very thoroughly covered those technical engineering problems which are related to a motor's performance as a machine, and, as such, are not to be criticised.

A large part of modern automobile engineering, however, consists of the fitting of this technical engineering to the mind of the public in such a way as to make this engineering commercial, and a proposition of the least sales resistance. In this psychological branch of engineering, there are rules just as definite and mental formulas just as important as are the relation of valve lift to diameter, or heat-treatment to crankshaft material.

It is the ignoring of these items which very often condemns otherwise masterly engineering so that before laying down the high-speed motor for an actual production and sales proposition, these psychological items must be taken as part of the business and profession of the modern engineer.

Performance and Appearance

In order to sell, a motor must satisfy the mind of the buyer in appearance and performance. It must satisfy in appearance before he will give it an open mind on the standpoint of performance. In other words, it must satisfy his eye first. This makes the design—after the technical engineering is taken care of—a problem of art, and art rules which are just as definite as mathematical-engineering rules may be applied to the exterior of the motor even outside of its finish, which will gain the favor of the buyer through his eye, and thus instill in his mind the desire to see it work. A beautiful machine is beautiful because of its following of art principles, but a beautiful machine is always more attractive when performing the function for which it is designed. Hence, a motor in action is the next desired step to a prospective purchaser.

Lack of Vibration

The eye satisfied, the ear is the next mental stage to be appealed to. This is where the greatest problem of the high-speed motor comes to the designer of this type of American use, for quietness and lack of vibration is the first requisite in a really high class car.

The motor must sound right and must not give an impression of laboring nor of shaking itself out of the frame. This means abnormally light reciprocating parts on a gear ratio not abnormally low, and if the gear ratio is not abnormally low, where is the value of the high-speed motor?

The reason for the high-speed motor I have indicated in Fig. 1, showing a car with a 300-in. motor on a 2 to 1 gear ratio. This car will give a certain performance of pulling power and speed, but its greatest necessity is power at low speeds. An electric automobile of 2500 or 3000 lb. weight is generally fitted with a motor of 4 or 5 hp. This motor, however, delivers this 4 or 5 hp. at practically any speed, and with a 100 per cent overload possibility for continued periods. The gasoline motor to give an equal performance on a car of equal weight, must develop this 4 hp. at the slower speeds, and from this, must be able to carry the car up to a maximum of say 45 m.p.h. Forty-five miles per hour is all that the average public requires of speed.

Power at Low Speeds

Practically every owner makes this statement, but at the same time while boasting that his car will do 60 m.p.h., and saying that he never uses it, makes the statement "but I want that power at low speeds."

This power at low speeds—which is the most necessary power of all—is a question of gear ratio. The average owner in his touring, driving and his city work runs between 20 and 30 m.p.h., rarely exceeding this and very often running under it in average. This being the case, it is only reasonable that the motor of a car should develop its best power at these speeds.

If a high-speed motor is designed to run at 2500 r.p.m. normally with a maximum of say 3500 and the speed at the 2500 mark is 30 m.p.h., this would require a gear ratio of about 8 to 1 on 32-in. wheels. On a gear ratio of 4 to 1 on 32-in. wheels, this car would be doing about 38 m.p.h. at the best speed of the motor—2500 r.p.m.

Maximum Torque at Low Speeds

This is figuring from the horsepower standpoint, but the torque curve is the one which counts in this power item. An engine should show its maximum torque or twist at a fairly low speed and carry this along a straight line clear up to its highest revolution per minute. A motor showing its greatest horsepower or peak at 2500 may show its maximum torque at around 800. Figuring from this speed, on a 3½ to 1 gear ratio on 32-in. wheels, the car would be doing about 21 m.p.h. The problem in the high-speed motor however, is to have a torque curve which is at a maximum at as low a revolution per minute as is necessary, as many high-speed motors of the racing type do not show this torque maximum below 1000 r.p.m., which means on a 4 to 1 gear ratio about 32 m.p.h. in the average car.

Going back to Fig. 1, one can see why a high-speed motor on a low gear ratio is a wonderful advantage, for in Fig. 2 is shown a 100-in. motor on the same dimension chassis as in Fig. 1 with a 6 to 1 gear ratio at the rear. This arrangement will give every performance of the 300-in. motor except maximum speed, but the 100-in. motor will give well within the range of 45 m.p.h., and show below that point every power advantage of the 300-in. motor, and at some points even better performance. The 100-in. car can be made of one half the weight of the 300-in. car or even less, while the motor should weigh less than one fourth what the 300-in. motor weighs. This gives the 100-in. car every advantage in soft road, for the ability to pull through sand and mud depends on road resistance related to torque, and the resistance

on soft roads varies as the square of the weight. This is why a light car will go through mud and sand where the heavy car sinks in and fails, even with more horsepower per pound.

Fig. 2 thus gives the reason for the high-speed motor giving more power per pound of chassis weight, with the same motor car performance in half the motor car weight.

The limitation of the high-speed motor at present in America is not so much the engineering difficulty of building the motor, but rather of making a low gear rear axle which will be quiet and cheap enough for production. This is from the engineering standpoint.

From the psychological standpoint, the problem is to so balance the high-speed motor that the one riding in the car may not get the impression of a car always on second gear—a thing which the average driver will not like until he gets used to it, and in a sales period one cannot get used to these things. A high speed motor must therefore be wonderfully balanced and made with minimum weight in the reciprocating parts—an indication of the eventual arrival of multi-cylinder motors for all high-speed types.

Americans Dislike Gearshifting

One brings up the point that the Europeans do not gear their high-speed motors much higher than their lower speed motors, using the difference for speed alone. This is very true in most cases, but remember that the foreigner is allowed on these roads unlimited speeds, both by law and by road surface. Also, the foreigner likes to shift gears. When his motor runs to 1000 r.p.m. he shifts to second and takes pleasure in doing so. The American is annoyed if he has to shift gears to go up the side of a mountain, feeling that by racing his motor on second gear, he must make up for the speed he has lost in shifting from high. On this account, if the high-speed motor is to give the same performance below the American's maximum touring speed, a lower gear ratio must be fitted. The problem of the high-speed motor in America, therefore, first resolves itself not into a technical problem alone, for this practice is very well understood by now in America, but the difficulty lies in fitting high speed practice to those more or less distorted ideas which have been put into the minds of the American public, concerning motor performance on high gear. The engineer who can build a car with a high-speed motor on a low gear ratio, having the business-like appearance and the psychological sound and feel of right construction the first time you ride in it will first make a success of high-speed motor car construction in America.

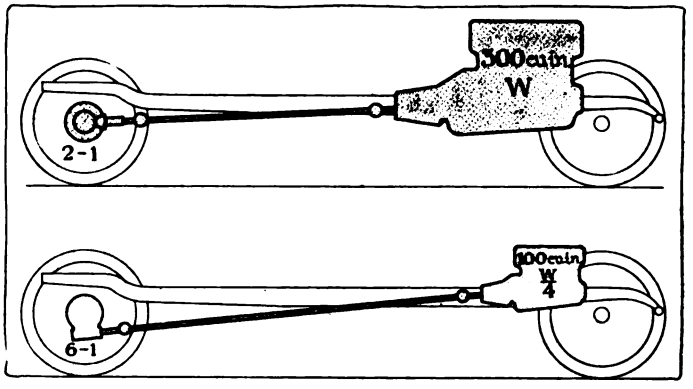


Fig. 1—300-in. motor, 2 to 1 ratio, car weight W. 1200 r.p.m. at 60 m.p.h. Maximum torque at about 40 m.p.h.

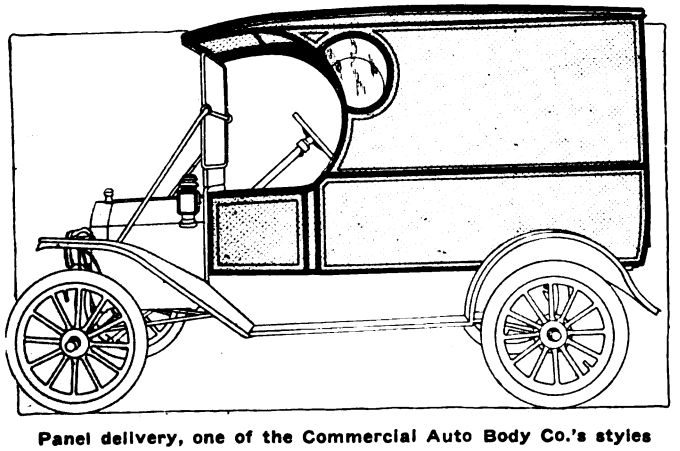
Fig. 2—100-in. motor, 6 to 1 ratio, car weight about $\frac{W}{4}$, 45 m.p.h. maximum at 3000 r.p.m. Maximum torque at 17 m.p.h.

An Eventual Type

As efficiency is always the basis of growth and development, and as better things are always an advantage to everyone connected, we have an indication that the high-speed ultra-refined motor is an eventual type, and it would be well if salesmen as well as engineers would follow the new development that they may make no mistakes in statements concerning their big motors which cannot be substantiated by the authoritative analytical engineering of Mr. Gerster's article.—W. B. Stout, Chief Engineer, Scripps-Booth Co.

Commercial Line of Delivery Bodies

The Commercial Auto Body Co., St. Louis, Mo., is putting out a complete line of bodies for delivery service and kindred commercial purposes which can be fitted to any chassis. These bodies are built with seasoned ash sills, ash frames with floors running lengthwise, reinforced hardwood floors with strips of steel, and durable trimming material. Leatherette is used in the cushions instead of cheap enameled drill, the cushions being one piece, open bottom spring design, locked in position so as to prevent them from springing forward and backward. All the roofs are full slatted, covered with heavy oil duck and on express bodies the curtains are of the same material.

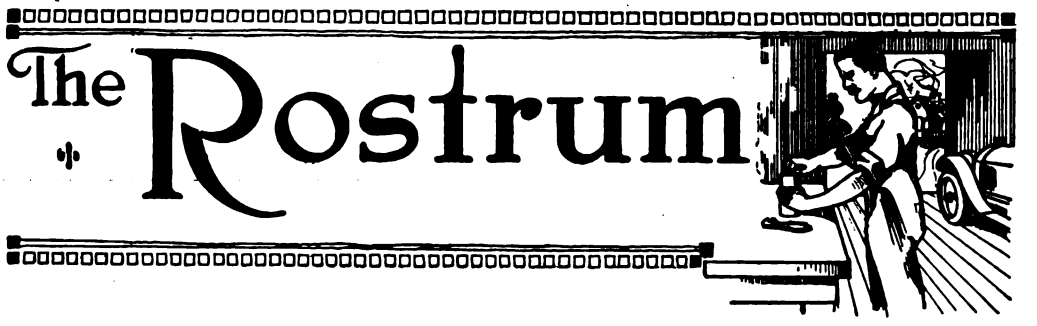


Panel delivery, one of the Commercial Auto Body Co.'s styles

Among the bodies which are made by this concern to fit any chassis, are the open express, full panel delivery, light-weight express top with screen sides, light-weight canopy style top with flareboards, suburban canopy style for station work, flareboard delivery, demountable flareboard box and general utility box inclosed with double doors.

These bodies sell complete for $100 with the exception of the light-weight canopy design with flareboards which is $90 and the flareboard delivery which is $60. The demountable flareboard box which fits on the back platform of a Ford roadster, or other type of roadster, is $14.50 for the Ford, and $19.75 for others. The general utility box is $25 complete, and can be made to fit snugly on the platform of a Ford roadster.

A special line of delivery bodies for Ford cars made to be placed either on the Model T roadster or touring chassis, is of special interest. This includes the following types: A panel side delivery body, 56-in. long and 53-in. wide with double doors, for $110; a panel delivery body of the same dimensions, with double doors having oval glass in the upper panels and drop sash windows at the side of the seats for $115, an all steel panel body for $120, an all steel delivery for $100, duck curtain delivery for $75, light panel side delivery for $82.50, and demountable slip on body for $95. In addition to these there are other bodies at corresponding prices.



Correct Slot-Size for Piston Rings

EDITOR THE AUTOMOBILE:—What is the proper width, or opening of the slot in a diagonally cut piston ring? Does it vary with the size or is it standard for different cylinder diameters?

2—Can a magneto, without disassembling, be tested on a shop bench to ascertain if magnets are weak without using special equipment? If so, how?

3—What clearance is allowed aluminum pistons in relation to the bore of the cylinders?

4—What is the factory rating of cylinder compression in pounds of the White 30, 45 and 60 hp. cars?

San Francisco, Cal. C. S.

—The size of the slot in a diagonally cut eccentric ring does not only vary with the diameter of the ring but also varies with the different manufacturers. Some only take out the width of the cutter, which will be approximately 0.015 in. Others make a practice of taking out as much as ¼ in. in all sizes. The latter is true especially for two-cycle motors of the marine type.

2—The magneto can be removed from the car and driven by belt at various speeds. If the magnets are weak, it can be detected by the weakness of the spark at low speed. If you will write the manufacturer of the magneto he will tell you the width of the gap that the magneto spark should jump under atmospheric pressure at different speeds.

3—This is a quantity which has not as yet been worked down to standard practice and varies in the different alloys and also varies for different manufacturers.

4—Compression in the cylinders of the White motor is 90 lb. for all the models mentioned.

Valve Diagram for a Model 19 Buick

Editor THE AUTOMOBILE:—Kindly give me a valve diagram for a Buick model 19 and also the gear ratio of this car in the three speeds.

Barberton, Ohio. F. S.

—The valve diagram for the Buick 19 is given in Fig. 2. The timing of this model is: Exhaust closes 1/16 in. after upper dead center and the inlet opens 3/32 in. after the upper dead center. The back lash is .005-in.

The gear ratios on the first, second, third and reverse speeds and also on the rear axle are as follows:

Speed	Reduction	Speed	Reduction
First	3.36 to 1	Reverse	4.32 to 1
Second	1.5 to 1	Rear axle	3.5 to 1
Third	Direct		

Valve Lifts of Various Motors

Editor THE AUTOMOBILE:—Do the valves of the Model T Ford open ¼ in.?

2—What is the diameter of the valves used on the Pierce-Arrow, Packard and four-cylinder Stutz?

3—Do the valves of the above named cars open an inch?

New York City. T. K.

—The valve opening is 1¼ in. and the lift 3/16 in.

2—The diameter of the valves on the Packard twin six is 1½ in. and the lift 5/16 in. On the Pierce there have been slight changes from time to time, but these points have not been varied to any great extent. The present models which this concern is building began to appear in June, 1914, and will continue until Jan. 1, 1916. They are known as the series 3 cars and the approximate valve diameters are 1 15/16 in. for the 38 hp., 2⅛ in. for the 48 hp. and 2½ for the 66 hp. The dimensions given are those for the smallest diameter of the valve as shown at *C*, Fig. 1. These are practically the same as the diameter at *A*, which is the passage immediately below the seat. The lift of the valve is measured by the distance *d* which is the eccentricity of the cam and is very closely 11/32-in. for the 38 hp., ⅜ in. for the 48 hp. and 7/16 in. for the 66 hp. on the exhaust side and a trifle less than this on the inlet.

On the Stutz the valve diameter is 3 in. and the lift 5/16.

3—This is answered under question 2.

Trouble Not Due to Magneto Setting

Editor THE AUTOMOBILE:—Would you please tell us how we could get at the gears of the National K-4 magneto on the Reo car so that we may set them because the spark is too late?

Manitau Beach, Mich. C. M. R.

—It seems quite certain that your trouble is not in your magneto. If the spark is late as you state, it is no doubt due to an improper adjustment of the breaker points, or it may be possible that the magneto has shifted slightly from its original position, which would have a tendency to affect the accuracy of the timing.

The instructions for the care and adjustment of National magnetos as issued by the National Coil Co., state that in setting the timing No. 1 cylinder should be placed in firing position at full retard and then the magneto should be set so that the traveling arrow on the timing dial is opposite to line No. 1. The coupling is fastened in this position and the magneto is then timed. The plug wires are then connected to the distributer terminals to correspond with the numbers on the timing dial.

Displacement Not Only Motor Criterion

Editor THE AUTOMOBILE:—On page 466 of THE AUTOMOBILE for Sept. 9 the following statement is made: "Another argument which is frequently advanced in favor of the long stroke motor is that for a given displacement per minute the piston speed is less." This is true only when the bores of the short stroke and long stroke motors are the same or nearly so. Then the long stroke motor has a greater piston displacement than the short stroke. Then most certainly the long stroke motor would pull better on hills. It is a bigger motor. It would then have a slower piston speed for a given displacement per minute.

Do you realize how absolutely absurd it is to compare long

and short stroke motors when they are not of the same piston displacements? Do you suppose that a 3 by 6 motor is more powerful than a 3 by 3 motor merely because the former is a long stroke motor? It is entirely impossible to make any fair comparison of the performance or qualities of long versus short stroke motors unless, first of all, they have the same piston displacements.

For several years, unscrupulous advertising managers and salesmen have been talking long-stroke nonsense. THE AUTOMOBILE is no place for such. A 3¾ by 5¾ single cylinder has 63.51 cu. in. piston displacement and not 97.5 as stated in the first column at the bottom of page 467. Why was it not stated that the compression pressure of 60 lb., 75 lb. and 90 lb. per square inch are the absolute pressures? How was F. E. B. to know from the answer given him that the pressures were absolute and not gage pressures?

Chicago, Ill. R. E. C.

—Very probably a good part of the discussion on long stroke motors has been due to the fact that there has been no absolute definition of long stroke. The average stroke bore ratio of American cars has been rising steadily since 1911. At that time the average motor was practically square with the ratio 1.01 to 1. The average stroke bore ratio of the 1915 car was very close to 1.33 to 1. Whether or not a motor with a 1.33 to 1 ratio can be called a long stroke motor is only a matter of opinion.

Regarding the matter of piston speed, it is of course a self-evident fact that piston speed is a direct function of length of stroke and with any two motors having the same displacement, the motor with the longer stroke has the higher piston speed for a given revolutions per minute since the piston must travel further in the same length of time. It is quite possible, however, to compare the efficiencies of motors which have not the same piston displacement because revolutions per minute is as much of a factor in calculating horsepower as is piston displacement. We may have two motors capable of developing the same horsepower with widely different displacements. The case you cite of a 3 by 3 as compared with a 3 by 6 is of course an extreme one and hardly likely to be other than self-evident, but on the other hand, consider the two motors as cited in the paper by J. G. Vincent on twelve-cylinder motors. In a part of this paper read before the Detroit section of the Society of Automobile Engineers, Mr. Vincent remarks that before bringing out the twin six a single six-cylinder motor known as the 28 was developed which contained practically 100 cu. in. less piston displacement than the 3-38 while it developed a horsepower practically equal to the latter. In line with this, he says, "I became more and more convinced that the small bore high-speed motor is going to be the final answer in this country as it has been in Europe."

While no direct reference is made to the length of stroke it is quite certain that a motor which had a ratio approximately equal to that in the twelve was meant. This motor has a bore of 3 in. and a stroke of 5 in., a ratio of 1.66.

The engine characteristics in other words, have had as much to do with the problem as mere displacement. If this were not true, the 300-in. cars could not have held their own with those of almost double the piston displacement on the race course.

The displacement you give is the correct figure and the compression pressures as you state are in absolute reading and not gage.

Dimensions of Buick Light Six

Editor THE AUTOMOBILE:—Kindly answer the following questions:

1—What is the bore and stroke of the new Buick light six, and what is the official record of miles per gallon of gasoline and the speed limit?

2—What is the speed limit of a stock Ford?

3—What is the highest speed ever obtained from a National stock car?

4—What car manufacturing company, if any, has adopted the new Weidely twelve-cylinder motor, announced in THE AUTOMOBILE for Aug. 19.

5—Is the fourth speed of 1911 four-cylinder White direct drive, or above, and if possible give illustration of how these gears shift. I do not know the exact factory model of this car but it is about 40 hp. and about 114 in. wheelbase, five-passenger car.

6—Is it still possible to secure a Shanhouse motor suit from the firm of this name of Rockford, Ill.? This is a one-piece garment used by motorists instead of an overall suit.

Norfolk, Va. I. A. S.

—The new Buick small six has a 3¼ by 5 motor. On page 587 of THE AUTOMOBILE for Sept. 23 appears an account of an official fuel and speed test made with this model in Chicago.

2—Speed limit of the Ford is between 45 and 50 m.p.h.

3—The National stock car won the Indianapolis Race with Joe Dawson driving in 1912, the average speed for the 500 miles being 78.7 m.p.h. Whether this is the highest speed ever obtained from a National stock car or not cannot be stated. This however, is an official record and represents the time over a 500-mile course.

4—The Weidely twelve motor has only recently been announced, and up to the present time THE AUTOMOBILE has no record of any one having adopted it as stock equipment.

5—The fourth speed is above direct and should only be used when the car has obtained a speed of 20 m.p.h. or better. Shifting is shown in Fig. 3.

6—Yes. This concern is still actively engaged.

The Car That Stays Young

By M. C. K.

(*Continued from September 16, page 519*)

MUCH like a complicated character in fiction, the idea of The Car That Stays Young does not crystallize perfectly until it has been viewed from many different angles. The car is not the same when it can be expensive as when it must be cheap. No definition fits it exactly. It is not the car with minimum depreciation, because that quality may have been secured at a cost of production which is too high for what is gained or at the expense of efficiency or economy in service. It is not necessarily the same for one owner as for another, since city and country, mountains and plains, rough high-speed service and easy low-speed service require different construction features to afford equal values. Even the term "value," meaning the sum of desirability divided by the total cost, does not represent an idea which is quite parallel, since value may be found to exist through a lucky chance, as where radical construction features turn out well though insufficiently tried. A judicious conservatism marks The Car That Stays Young, but there is evidently a point where it must be more satisfactory to accept the risk of a promising innovation rather than the admitted and proved shortcomings of that whose place it takes, and in such cases the criterion may be: Whether it is quite clear that the innovation cannot react detrimentally in some unexpected manner upon other features in the car's construction or operation, and whether a mistake might be corrected inexpensively. Left side drive was, for example, at one time an innovation which had to be accepted cautiously, as it affected motor arrangements and, once adopted, could not be changed. Whatever influence it had on durability and the continuance of attractive appearance was not obvious, but such an effect might be traced to a better chance for avoiding side swipes in the traffic and to a certain simplification in style due to the removal of levers and quadrant from the outside of the vehicle. The elegance of The Car That Stays Young must usually depend on simplicity in lines.

Data Kept in Obscurity

Some current phrases throw a rather illuminative sidelight on the true character of The Car That Stays Young, as when the manufacturer frequently summarizes his claim for having done the utmost that his selling price allows him to do for his customers in the way of value and durability under the blanket guarantee of "careful attention to details," while it may be perfectly understood, and even agreed upon, that he first of all "gives the public what the public wants." All important progress in the durability of cars and in reducing the cost of car values has come by the opposite process of producing what the public ought to want and marketing it as fast as the public can be persuaded to want it.

In the gap between the car which the public is supposed to demand at some given price—presumably judging its desires from its past purchases—and The Car That Stays Young and can be sold at the same price, in each instance, there must be a considerable mass of data receiving scarcely any publicity, as they relate to those things which the public according to the evidence of the market does not expect or demand and among which each manufacturer cannot afford to champion more than one, if it is conspicuous, or two or three, if they are of a minor sort and can be slipped into the ensemble of an otherwise orthodox vehicle without too brazenly braving the public's supposed preferences. Where durability is the main point in the issue the publicity needed for making the public perceive its own best interests suffers further from the unexciting nature of this property which can be demonstrated only in the tamest terms and figures and rarely can be illustrated except by showing the lack of durability of something else—which would be "knocking" and is justly tabooed as an ungracious method of conveying information outside of confidential communications.

Although the subject is somewhat elusive when referred to in generalities, it may perhaps have been made clear that "careful attention to details" mainly concerned in "what the public wants" produces a deadlock against substantial progress and in favor of appearances; that is, in favor of making a $1,000 car look like a $1,500 car, a $1,500 car like a $2,000 car and so on throughout the scale of prices, with the inevitable result of forcing into relative obscurity the efforts and improvements which the public would appreciate if it knew or studied the facts but which under the circumstances can be made only piecemeal here and there and must make their way to recognition against the resistance of the industrial trend at large. Masters in the arts of publicity manage, to be sure, to demolish some of the fortifications of *status quo* where important innovations in engineering are concerned, as one such can justify an expensive publicity campaign and confers a profitable prestige if it "gets over", but with regard to the minor things whose importance lies in their aggregate and which are not aggregated in any one car but scattered among many, it does not seem possible to doubt that they must suffer where the tendency to "give the public what the public wants" prevails, and that there is occasion, therefore, to coddle them by gathering them in one fold as the attributes of The Car That Stays Young and according them a special publicity in one place. From this viewpoint The Car That Stays Young is revealed as the car which no manufacturer can afford to build in all its eventual completeness and variety—until it has become better known.

In the midst of a gigantic but unorganized industrial and commercial activity for producing and selling motor vehicles of all sorts, there should be room for one co-operative effort in favor of all the inconspicuous, and therefore neglected, virtues which it may be found possible to instil into a car, independently of the supposed momentary expectations of the public. It might also be found that these expectations are now usually diagnosed too cynically and that both home and export trade would respond heartily to a special cult of The Car That Stays Young—a cult which depends upon publicity collected in one place and the volunteering of detailed information to build up the Technology of Durability in Motor Vehicles.

A page will be kept open in THE AUTOMOBILE specially for data of this nature, under the caption: The Car That Stays Young, and contributions to these studies of durability are invited.

Remarks made in the two previous instalments with regard to fenders and running-boards, radiators and the means for their protection, mufflers, exhaust pipes and running-

board aprons, motor hoods and the positions of wheels have indicated some of the more important features with regard to which the public's expectations seem to clash with the substantial interests of everybody. For the present there remain only to be mentioned briefly a number of features in which early aging is often observed, while fairly numerous exceptions seem to prove that there are ways to avoid this result without sacrificing style or efficiency or increasing the cost of production perceptibly or at all.

Footboards and Pedals

Rusty pedals and pedal slots bear witness of thinly galvanized cast iron in the pedals and slot linings, and footboards showing wear from the foot soles in spots indicate the error of using a mere surface coating for the boards in a place where wear is unavoidable. Even linoleum is not as a rule of uniform texture and coloration all through, and the wear is therefore plainly visible. In taxicabs the boards are often only painted black and the slots are unlined, but there can be little objection to this economy for public cabs, as the systematic maintenance provides a new coat of paint when needed. For private cars the very general practice of employing single-color fiber sheets with brass fastenings and slot linings leaves perhaps little to be desired for cars with front doors and with cowls over the dash, in which the more or less tarnished brass trimmings are not conspicuous, but bronze suggests itself as more tasty and suitable under other circumstances and for higher-priced cars, and probably something better than galvanized iron could be devised for cheap ones. Rusty pedals, as well as crumpled fenders and running-board aprons cracked wide open in their front and rear seams, must eventually get into the same category as frayed trousers in the popular estimation and will then be held as evidence of sloth in people who can afford automobiles.

Public opinion has moved faster in Europe, in this respect, than here and even begins to hold dusty highways of the old kind against the counties which still tolerate them, especially in England. The automobile is no longer in itself an acceptable excuse for neglected appearances, and competition in providing the means for maintaining them is getting correspondingly keener—or was showing this tendency before the war interrupted the flow of minor industrial ideas in the European countries.

Motors and Their Mounting

With reference to types of motors, the inclosing of their organs, their relations to the clutch and gears and to the fan and radiator, their suspension in the frame, the material of the crankcasing, the drip pan or its omission, the type of clutch and a host of detail features in the whole power plant, it is evident that the questions of durability and of noises and troubles due to wear are too numerous and complicated to be considered under the caption of The Car That Stays Young, since most of them are still subject to technical discussion and inseparable from the motor design in connection with which they arise. On the other hand, while the motor organization in its decisive features must be worked out by the manufacturer on purely technical grounds, the public taking it or leaving it mainly upon faith and reputation, it is noticed that recently questions of durability and silence of the power plant have been publicly discussed on an equality with efficiency and power—as advantages, for example, in worm gears and valveless motors—but that little is yet done to explain those relatively simple and untechnical expedients by which one power plant is made to give more lasting and regular service to the car owner than another which from all the principal engineering viewpoints is of the same kind.

Taking the motor, clutch, gear and driving system for granted, with brief characterization of it in each case, what has been done to make the repairs simple and inexpensive and to have the whole plant work as well five years hence as to-day? An answer to this question separated from all considerations of efficiency, power, strength and convenience in operation would throw light on The Car That Stays Young if repeated with reference to a number of different power plants of each general type. The public cannot tell if a part is made of alloy steel or a bearing member has been casehardened or how well it has been hardened and polished. Assurances on these points count for little. But it can appreciate if bearings are bushed and if the bushings can be easily replaced. It cannot judge safely as to whether a multiple oilduct system, supposed to take care of a number of bearings, is really dependable, but it can be induced to look for an oil filter and other protection against dust and grit (without which safeguards a shaft running in a bushed bearing might be worn down more rapidly than the bushing), and it can appreciate having only a few oiling places to watch and keep time on. It may not be able to see trouble ahead where shearing strains on rivets are aggravated by frame weaving—as they may be through the manner of mounting a motor—but it can be made to guess the value of visible precautions in this respect if they are pointed out; the public being always understood as including the sales agents who in most cases act somewhat as the guardians of their patrons.

It seems probable to the writer that a great many valuable data on the durability of the power plant and its organs—from the radiator to the brakes—could be brought to the surface for public appreciation, if those most closely associated with designing and testing would present their experiences and information on this subject with a minimum of reference to the engineering data which are usually in the foreground and occupy the space but with distinct relation to cost of production. No doubt, some surprises might crop out in the way of showing the simpler, cheaper and perhaps lighter construction more durable than a more pretentious one, but more often the data would probably tend to demonstrate that The Car That Stays Young in its power plant must be designed with a large number of special and more or less costly provisions against wear and deterioration. The most interesting point of all is in reality that nobody can tell in advance what such data will show, as they have never been separately gathered and compared, and they might furnish strong clues to improvements. It may be found true that the power plant by virtue of replacements of parts is the most durable portion of a cheap car in one sense of the word and must be so, because no marked deterioration can be tolerated, and there may be suggested ways to extend the replacement system to those portions of a car which are now usually permitted to go on aging to the end like a suit of clothes.

Wire and Wood Wheels

If there is a decisive difference in the merits of wire and wood wheels it probably depends on climate, type of car and construction details in both the wire wheel and the wood wheel. A moist and hot climate and a fast car used roughly seem to predicate the wire wheel, while for other conditions the choice at present becomes mostly a matter of taste and style—with the questions of manufacturing facilities and finality in construction looming up large in the background as determining for car producers. The wire wheel has not yet been back in the American market long enough to establish a comparison on an equal footing, but the department of The Car That Stays Young will afford an opportunity for illustrating the public's experience with it, so far as durability, economy and appearances are concerned. Some very interesting data and opinions should be forthcoming bearing on the competition between demountable wire wheels and wood wheels with demountable rims. With reference to a

durability choice at the present moment, it can scarcely be in the first line of importance, as the writer has not for a number of years seen a car in operation that was disgraced by its wood wheels or one that was disabled by its wire wheels. A wobble is practically always in the spindle or axle or in the steering.

Steering Linkage

According to generally accepted practice the joints in the steering linkage should be as few as possible, to reduce the aggregate wear and play with the resulting noise and wobbling, each of them should be lubricated, those of the steering rod should be cushioned and held tight with buffer springs whose size and tension should correspond to the weight and speed of the car, those at the ends of the tie rod should be arranged so as never to give any perceptible play, either by means of adjustment or strong buffer springs, the tie rod should be capable of yielding enough—when wheels get wedged between ruts, for example—to avoid buckling the rod. Formerly tubular steering rod and tie rod of ample diameter and gage were considered indispensable for combining rigidity and light weight, and tube stock is still preferred for the steering rod, but now tie rods are usually solid and shaped with bends that permit a yield, especially when located behind the axle.

The durability of steering linkage varies notoriously and, as the above mentioned forms of practice leave room for a number of variations, it may be found possible by comparing notes to account for shortcomings without theorizing about the causes.

Seats, Seat Springs and Upholstering

A very large factor in the average car owner's satisfaction or dissatisfaction with his vehicle after its first six months of service comes under the head of seats, seat springs and upholstering, and no other features depend so completely on the public's common sense in adjusting their demands to the price which they are willing to pay. In a general way, the more movement and conforming are demanded of a seat the more rapidly it will become shabby and uncomfortable and the more art and money's worth will be required in its construction to make it last. And the more the movements of springs, stuffing and covers are localized the smaller is the chance for durability. Seat makers have not yet been accustomed to give technical consideration to specific pressures—pressures per square inch—elastic limits, permanent sets and fatigue or stretch of the materials with which they operate. They build to price with the old data of their art which were mainly based on stationary seats rather than seats required to work hard most of the time while in use. Recourse to real leather and real horsehair is neither sufficient nor economically available, and near-leather fabrics, being much improved here and much cheapened there, are uncertain materials so far as the public can tell. Discriminating engineering in co-ordinating the spring elements, if it exists in notable degree at all, needs a public airing, not only for the sake of developing it but to make clear the reasons for variations in the cost.

In front seats which are reclining and high under the knees, yet 12 inches deep in upholstery, the springs at the rear which support almost the entire weight of the driver, or his companion, are nearly always broken down, which is so much more natural as they are even required to work obliquely, and front seats of this description are not for The Car That Stays Young. The remedies are mostly obvious, however, awaiting only the public's insistence on having them applied. Probably almost any style of seat could be produced by rational compromises in the matters of economy, durability and permanent appearance. But for this purpose the free and public exchange of data seems again to be what is mostly wanted. For example, does anybody know of a deeply upholstered seat in a $700 car that remains presentable and comfortable after one year of average service? A description of its construction and materials with approximate cost of production would be valuable.

Doors and Hinges

Something about doors and the way they are hung proclaims class, but the subject is passed up here as too subtle. Still, the old and common solution consisting in making low-priced cars slab-sided and the doors flat does not seem final for a pleasure vehicle in which some grace of lines is expected. To make a car homely to have it Stay Young is soon found too much of a sacrifice when the eye gets tired of the homeliness.

Paints and Colors

To pick out of the intricate technical subject dealing with paints, enamels and varnishes something which we can all fully understand and apply in the purchase of a car or in estimating its probable durability, is probably beyond the possibilities as well as unnecessary. The chemistry of paints is advancing; the micro-physics likewise and it is possible to "cover" a metallic surface now in any one of several different tints and have the coating exceedingly thin, adherent, hard and attractive, so that baked enameling can be more and more dispensed with. Chemical coloration, including gun metal finish (which is scarcely rustproof, however) is also being industrialized for large-scale work. Expensive cars are seen in ever growing number on which there is no baked enamel or varnished paint in many slow-drying layers and which can be groomed without the caretaker going to school first with the old-time coachmakers. The art is developing satisfactorily, in other words, for car owners and for The Car That Stays Young. Only in the finish of close cars are the traditions still dominant though gradually giving way to the practical needs for a vehicle that is much more exposed to hard usage, dust and mud than were even the stage coaches of old—and they were simply painted.

What seems mostly to be required in the data on paints and colors for The Car That Stays Young, whose equipment or finish cannot be of speculative value, is a separation between the actual and the supposed requirements, between the actual means at command for producing a suitable, durable and renewable finish and those still frequently employed solely to "please the public." The public is already showing its willingness to do the rest.

Leather and Its Substitutes; Cloths

When material is tufted which is not adapted for tufting, and which is not recommended for tufted upholstery by its makers, one must expect to find the folds worn threadbare in short order, and of all the avoidable features which make a car prematurely old in value as a luxury a threadbare leather substitute is among the commonest. In some foreign markets, such as those of South America, it is reputed to be fatal to the continuance of trade.

Cloths, being by nature flexible and showing little difference in texture and colors whether new or worn, would probably be uniformly preferred were not the question of waterproofing in the way. This one problem, for which a number of more or less satisfactory solutions can be imagined offhand, may be singled out for the attention of the best informed, in the belief that it already HAS BEEN SOLVED in a manner more acceptable than the use of materials can possibly be which get old and grimy by a few months of exposure to wear, dust and sunshine. For the completion of The Car That Stays Young though not expensive, data on this point seem indispensable.

Lines of Wear

When a car has been handled much in public garages, and perhaps under other circumstances not so easily traced,

certain lines of wear make their gradual appearance, not always in the same places in different cars but apparently according to the chances for receiving bumps or abrasions or the imposition of oily hands. The question seems to be one of maximum exposure for certain portions of the car. If there is a remedy and it is simple it ought to be known.

With this mere outline of obvious ideas for The Car That Stays Young the writer hands over the subject to all those who are in possession of useful detailed data on Durability and Its Relation to Cost and Style.

Weak Spots Brought Out in German Trucks

DURING the German campaign in Russia last spring not only the soft roads were found impassable for heavy loads but highways which were apparently macadamized were revealed as merely thick layers of broken stone in many places laid on a miry foundation which the thaw released from its frozen bondage. The war trucks constantly broke through this undulating stone carpet, and their construction was sorely tried. A German engineer who made it a point to look up the troubles arising from this cause reports on the subject in *Automobil-Rundschau* for July with the avowed object of enabling the manufacturers to correct the weaknesses discovered. Mentioning firm names only if their records were found especially favorable, he makes in substance the following statements:

It was soon proved that the wagons of each and every firm have a special weakness. The commonest effect of the Russian roads was spring fractures. Practically none but front springs were broken, however, and these only in two characteristic places; namely, close to the front pivot exactly at the end of the first leaf adjacent to the single or double main leaf and, secondly, a few centimeters in front of the clip—rarely at the hole between the clips. Notably few fractures occurred in Daimler springs, which appear to be ground with unusual care. It happened that the spring forging at the front end of the frame was forced deeply into the road when a fracture took place.

Solid rubber tires of the most reputable makes gave out rapidly, but this was expected, being ascribed to the rubber famine.

Fractures of front axles occurred only with bent axles and only at the bends.

The manner of securing spring pivots and shackles to the frame was not always found substantial. In the case of one firm the lug carrying the rear spring shackle came loose regularly. It was joined to the lower frame flange by six rivets, and the rivet heads came off.

Ball bearings gave little trouble, excepting that neglected lubrication frequently caused abrasions in the ball bearings of front wheels in personal cars. In a few instances ball bearings in the gearbox were broken and caused great damage. A seized ball in a rear-axle gear ground pretty concentric rings into both bevel wheels.

Damage to radiators by collision is largely warded off by a fender rod in front of it. Nevertheless the radiators received innumerable injuries from diverse causes, including bullets and shrapnel of course. The field repair consists in soldering with tin, but pounds of tin are sometimes needed for reaching a small hole. In Büssing trucks flat brass tubes, vertical, take the place of the cellular system, and they have considerable strength and can be easily replaced when damaged. Only a few firms use similar construction.

Long-stroke motors were generally found preferable. One firm has placed the upper piston ring too close to the top of the piston, and the edge of the piston was often broken. Melting of crankshaft and connecting-rod bushings was too frequent; also ovalizing of crankshafts in their bearings. The melting of bushings was ascribed by some technicians to lack of viscosity in the lubricating oils, whose quality has suffered under the war conditions for lack of the usual supplies. But another explanation lies in the strong vibrations of the shaft which occur with long-stroke motors of high speed unless each crankpin is balanced by counterweights in its own transverse plane. This is too seldom done.

In motors with valves controlled from the top, which were found desirable in general, a considerable advantage was noted if the valves were vertical, as those operating at an angle frequently had to be taken out and cleaned.

Complaints of drivers had seldom any other object than the carbureter. One repair unit met them by ordering one hundred Pallas carbureters and regularly installing them in the place of those found faulty. These were uniformly designed and made by the car manufacturer. The specialists do better. The aviators, whose lives are staked upon the correct functioning of the carbureter, show marked aversion to one aeroplane in which this accessory is unreliable.

A truck whose rear-suspended fuel tank has no dents is a rarity. Many of them have a road clearance of only 25 to 30 centimeters. A strike against a stone frequently finishes them. The reduction valve is often clogged, and the need of keeping the tank and its tubular connections airtight, coupled with the introduction of impurities in the fuel from the exhaust gases, does not increase the popularity of the pressure-feed system.

An improvement in new two-wheel trailers, each for the transportation of three wounded where the roads permit, consists in replacing the ordinary hook-and-eye coupling, which allows too much lost motion and therefore too many sharp jerks, by a ball-joint device supplemented by a hinged brace.

Two views, showing part of one shipment of American trucks sold to Great Britain for war purposes. The trucks are of three makes, Locomobile, Packard and Peerless. The photographs were taken "Somewhere in England"

Demonstrating the

Five Cars Make 800-Mile Ru

Three of the Owen cars on the run traversing one of the typical mountain roads in Massachusetts

THE first public long-distance demonstration of the Owen magnetic car was made last week when the company made a tour of over 800 miles from New York City north through Albany, Lake George and Plattsburg, around the northern end of Lake Champlain, and back to New York by way of Burlington, Rutland, Manchester and Pittsfield. Five cars made the trip, these carrying press representatives from New York City. The tour was expressly for the purpose of showing what the Owen car, with its electric transmission instead of the conventional clutch and gearset, will do on all kinds of roads.

Typical Touring Route

The trip was over a typical route which led through the heart of the Adirondack mountains and also through the Green mountains and the Berkshires. There were long, steep mountain grades, and long descents. One day of heavy rains was encountered. The trip incorporated typical touring conditions so far as weather and roads were concerned.

The five Owen cars gave as good a demonstration as could be wished; in fact, there was nothing that savored of unfavorable performance in the entire 4000 miles total covered by the five cars. The cars were driven nearly half of the distance by press representatives in order that they might get a correct gage on their performance. These representatives invariably handled them through the mountain sections where difficulties would be most likely to arise if such were to occur.

Circle—Steep climb over a creek bank, the road through the field being overgrown with grass. This gives an idea of the kind of going to which the cars on the run were subjected

Below—Instrument board on Owen magnetic car. The two center dials are ammeters, the left showing the rate of battery charge and the right the torque of the gasoline engine of the car in amperes

Features of Driving

In driving a magnetic car there are many entirely different conditions met with, all of which are highly favorable to the electric type of transmission. Foremost come the pleasant coasting qualities. When descending a hill the car can over-run the motor at will, the same as in a conventional car with a gearset when the clutch is released; but in the magnetic this coasting occurs automatically, the driver not having to do anything. When the driver wishes to bring the motor again into use when the coasting is nearly finished there is nothing to do but press the accelerator and the car moves on without the slightest jerking.

Another pleasant feature of driving is the electric brake in which the braking is accomplished by the electric motor on the propeller shaft, this motor being converted into an electric generator which produces electric current when the brake is applied. This brake is applied by the small controller handle above the steering wheel which gives the different speed ratios of the electric transmission system. It is only necessary to move this lever, which is little larger than the throttle or spark lever on the conventional car, to what is called the neutral position, to apply the electric brake, which very rapidly reduces the speed of the car to 15 m.p.h. on the steepest grade and holds it there. In one descent over a mile long in the Adirondacks this brake demonstrated its effectiveness perfectly. An excellent feature in connection with using it is that when it is applied the power of the engine is automatically cut off and immediately the brake is taken off the controller lever cuts into the forward

Oval—One of the cars at meal time showing the electric cooking range set up on the running board

speeds as needed. This gives a smooth, uniform change to acceleration.

Seven Forward Speeds

The car is provided with seven forward speeds through the electric transmission, all of these being obtained through the small controller lever referred to. There is no neutral position between these speeds, but you pass along from one to the other progressively. What is known as high speed is used for all ordinary running, and it is only on steep grades that lower speeds are used. In the lower speeds an electric motor on the propeller shaft assists in driving the car, this motor receiving its electric current direct from the generator which corresponds with the clutch, a storage battery not being necessary to supply the current. There is a direct drive on all speeds, the only difference between the high and lower speeds being that there is greater slippage between the fields and armature of the electric motor on lower gears than on high. On high the slippage is approximately 40 r.p.m. when the gasoline engine is operating at 1000 r.p.m. In other words, on a level road the gasoline engine works at 1000 r.p.m., let us say, and the propeller shaft is revolving at 950 r.p.m. In this speed the electric motor on the propeller shaft is not assisting in driving the car. On the lower speeds there is greater slippage between the gasoline engine and the propeller shaft, but on these speeds the electric motor is assisting the gasoline engine in driving. These changes are all taken care of automatically, the only work the driver has to do is to merely move the controller handle and regulate the throttle of the gasoline engine.

Emergency Low-Gear Ratio

The cars are provided with an emergency low-gear ratio between the gasoline engine and the rear axle, which is controlled by a lever. This lower ratio was not needed on the entire trip, which demonstrated that it is practically unnecessary for ordinary touring, although there might be conditions, such as long stretches of deep mud or heavy sand, where this would be used. It is not necessary for hill-climbing. On the tour there were long detours in the mountain sections of the Berkshires which led over the worst roads ordinarily encountered on touring, and on these the emergency gear was not necessary for the steepest grades.

Acceleration of the Owen car is particularly rapid, and is accomplished without the noise of going through gears. The controller lever is merely moved through an arc of slightly over 90 deg. There is no pause between adjacent speeds, excepting when high is reached, there is a slight forward impulse.

Most Hills Climbed on High

Nearly all of the hills were climbed on high, the driver only having to give a wider opening of the throttle. When lower speed ratios are used, the greater slippage in the generator corresponding with the clutch and flywheel generates electric current which is consumed by the electric motor on the propeller shaft, this motor then aiding in driving the car.

When driving the magnetic car more or less attention is given to one of the two ammeters shown on the instrument board on the opposite page, namely, that one immediately left of the speedometer dial. The reading of this ammeter is a good indication of the engine torque used in driving a car. When coasting down grade the ammeter dial stands at zero; when pulling on the level road at speeds of 30 or 40 m.p.h. it indicates between 50 and 70 amp., and when the engine is pulling its hardest on long hills on high ratio, it reads at 125 to 150. This ammeter is a fair indication of whether the engine is pulling its maximum. With a missing cylinder the ammeter may not show over 100 amp., which is immediate notification to the driver that everything is not working properly with the gasoline engine.

The ability of the Owen car to operate without a useful battery of any capacity was well demonstrated on the run when old Betsy, the second car built by the company, did not have sufficient battery to crank the motor, yet there was no difference in the operation of the car, the electric system working as if the battery were in a complete state of charge. This demonstrated the company's contention that the battery is only necessary for starting and lighting and not an essential in the electric transmission system.

ACCESSORIES

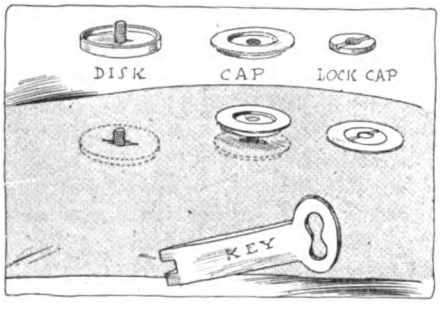
Warner Electric Clock

A CLOCK with a seven-jeweled movement is made electrically self-winding, current being supplied by one dry cell or, if so desired, by the electric lighting system of the car. When a dry cell is used it will keep the clock going for six months, and can be changed without handling any wires, the cell making its own connections when pushed into place. The dial is 3 in. in diameter and the figures, which are white on a black ground, are etched in metal. Setting and regulating can be effected without removing the clock from its place. Two models are made, one being of the flush type for dashboard installation and the other for mounting anywhere on the car, but not flush. Both sell for the same price, $15.—Stewart-Warner Speedometer Corp., Chicago, Ill.

Warner electric clock, showing dry cell attached

Spitler Puncture Plug

This device is designed to effect a permanent repair of punctures and small blowouts without the use of cement, or patches and without vulcanizing or soiling the hands. They consist of a disk with a threaded projection which is slipped into the puncture or blowout on its edge and which covers the under side of the tube or shoe where the puncture or blowout occurs; then, a cap is placed over the threaded projection of the disk so that it covers the outside of the tube or shoe; a lock cap then screws onto the threaded projection, holding the cap in place and being tightened by a key so that it is impossible for the tube to leak. The manufacturers claim that there is no friction between the plugs and the shoe, and that they cannot injure the fabric of the shoe nor the inner tube on this account. There is no pressure on the edges of the plug, they claim, so the latter cannot cut the inner tube. The plugs are made of brass and sell for $1 per set of four.—Spitler Puncture Plug Co., Inc., New York City.



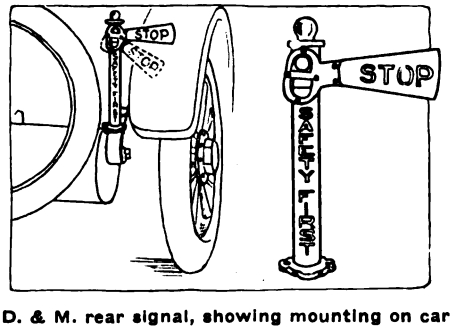
Illustrating use of Spitler puncture plugs

Wonder-Mist for Polishing

To replace harmful soaps, water or anything containing lye, lime, soda or potash which when dried carries with it the moisture of the varnish, Wonder-Mist has been put on the market. This is a transparent liquid containing no acid, gum or alkali. The oil which it contains is free from fats and is blended by a private process which, according to the makers, is a food for varnish and keeps it elastic.

This fluid is supplied with a sprayer and is distributed evenly over the surface in a fine mist, the process being to have this oily mist come directly in contact with the dirt loosening it and absorbing it so that where it is removed with dry cheese cloth it leaves the finish clean. About 10 sq. ft. can be cleaned and polished with one teaspoonful of the liquid. The makers claim that this is a large gain since when the polish is poured on the cloth about two-thirds is lost by absorption. Also they state that variations in the amount of moisture in the cloth give unequal distribution of the liquid.

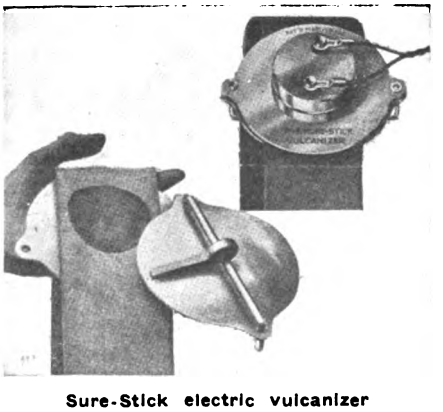
In removing the dirt it is claimed that the fluid introduces a film of oil between the dirt and the finish, allowing it to be readily removed without destroying the polish. It is claimed that transmission grease or engine oil to ¼-in. thickness can be removed, and road tar is also said to succumb to the Wonder-Mist. The price is $3 a gal., $2 for ½ gal., and $1.25 per qt., with sprayer free. —Wonder-Mist Co., New York City.



D. & M. rear signal, showing mounting on car

D. & M. Rear Signal

This signal is designed to render unnecessary signaling by hand the driver's intention to stop, being a simple mechanical device automatically acting on the semaphore principle when the brake is applied, through connection with the brake pedal. The signal clamps on the rear spring, no drilling of holes being required. Working parts are all inclosed and at night the device is electrically lighted. The makers fully guarantee its operation. The signal sells for $7.50.—Drabold & Mott Mfg. Co., Detroit, Mich.



Sure-Stick electric vulcanizer

Sure-Stick Electric Vulcanizer

The Sure-stick vulcanizer is heated by current from any 6-volt storage battery, a special clip and cable being supplied for making the connection quickly. It will vulcanize tube patches and small casing cuts; the makers state that it can be used on tube work while the car is running, saving time in putting spare tubes in order. The clamp can be released and the patch inspected while being vulcanized, and the vulcanizer replaced if the work is not sufficiently cured. Weight, 2 lb. The outfit includes the usual vulcanizing materials, and sells for $3.—Sackett & Ogden, Columbus, Ohio.

United Camp Cooking Outfit

This camp cooking outfit is especially for the use of automobile parties, the special features of which are the compactness with which the various utensils can be stowed away and the grid on which the pots and pans are arranged, with space below for charcoal or other fire.

The camping outfit, which should appeal particularly to automobilists off for a day's outing, consists of one 8-qt. aluminum cooking pot with cover, one

7-qt. aluminum percolator coffee pot, one aluminum frying pan with detachable handle, one tin-plated steel meat broiler and toaster, and one tin-plated cam grid and charcoal grate. These things all fold and fit together so that they really take a surprisingly small space when their bulk in unpacked condition is considered. In addition, special canvas cases are provided for carrying them. The cooking pot being the larger, the other utensils all nest nicely in it. The price of this complete outfit is $7.50.

The United company also sells several styles and sizes of grids separate from the complete outfits. These are arranged to fold flat, with the standards pointed to stick into the ground. With a charcoal grate below the grid, the article is priced at 75 cents in aluminized finish and 95 cents in tin-plated finish. This is the 10 by 14-in. size. There is a larger size, 13 by 21½ in., this selling at $1.10 and $1.35 for the two finishes. Then there is the type without the underneath grate, which comes at 50 and 75 cents for the aluminized and tin-plated finishes respectively in the 10 by 14 size. This same thing in the larger dimensions is 75 cents and $1.—United Steel & Wire Co., Battle Creek, Mich.

Su-Dig Series Ignition Plug

The Su-Dig spark plug is designed for use with two-spark ignition systems where there are two plugs in each cylinder sparking simultaneously, irrespective of whether the source of current is battery or magneto. The plug is intended to be placed between the magneto or coil and the second plug which may be of the conventional type. Preferably the series plug is placed over the intake valve and the other in the center of the cylinder head, or, if the motor is a T-head design, over the exhaust valve, though this is a matter of union.

The insulation is of heavy porcelain, and there are two insulated electrodes with two outside binding nuts, the wire from the source of current being attached to one while the other is connected to the second plug which is grounded in the conventional manner. The Su-Dig plugs sell for $1.50 each.—Superior Motor Specialty Co., Philadelphia, Pa.

Lennon Light Protector

This device is designed to prevent headlight rays from being reflected upward, thus keeping them from glaring into the eyes of drivers of cars and wagons approaching, while at the same time not interfering with the illumination of the road in front of the car. It consists of a nickel-plated spring-brass shield which slips over the bulb, covering the lower half and leaving the upper half clear. The light rays which would ordinarily be reflected upward from the lower portion of the lamp are cut off and only those which are reflected downward on the road from the upper portion are permitted to escape. The price of the protectors is $1 per pair.—Lennon Mfg. Co., Willimantic, Conn.

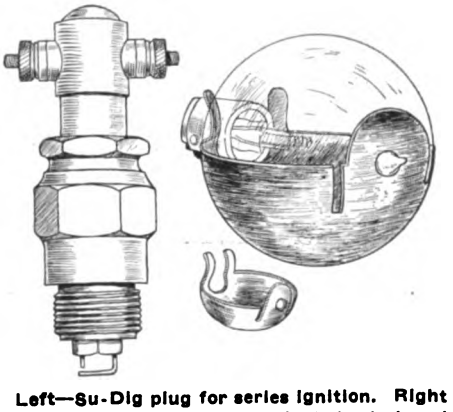
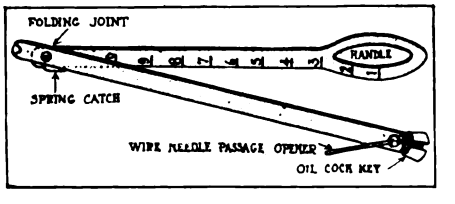
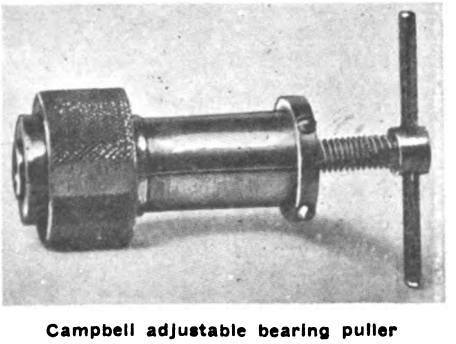
United camp cooking outfit with steel grate



Left—Su-Dig plug for series ignition. Right—Lennon Light Protector which is designed to prevent headlight glare



Manzel gasoline and oil key for Fords



Campbell adjustable bearing puller

American Four-Wheel Jack

All four wheels of the car are run up on runways, which form part of the jack; the axles engage with four rubber-cushioned supporting heads and drop sections under the wheels are automatically lowered when the car reaches the proper position, leaving the tires an inch clear. To release the car a pedal is pressed, when the car moves backward off the jack. Price, $37.50.—American Automatic Jack Co., Hicksville, Ohio.

Manzel Oil and Gasoline Key

This is a folding tool for Fords, 24 in. long open and 13 in. folded, with an oil-cock key and an oil-cock cleaning needle on one end and a gasoline tank scale marked on the shank. With the oil-cock key the oil-level cock under the engine can be reached and tried without difficulty, and if necessary the oil and other passages can be cleaned out with the wire. The scale on the shank is marked to read in gallons to indicate the quantity of fuel in the Ford tank. Price, 60 cents.—Charles W. Manzel Co., Buffalo, N. Y.

Campbell Bearing Puller

A device for pulling magneto, electrical generator, or other bearings of this type, has often been found a necessity in shops doing work on electrical apparatus. With this device it is simply necessary to slide a large knurled ring back toward the handle of the device, allowing the jaws to expand. The puller is then placed over the bearings and the ring again pushed back toward the bearing, which will lock it in place, after which the bearing can be pulled out by turning the handle screw to the right. The puller is adjustable to different sized bearings without any other tools, which makes it a valuable device, since it is self-contained. The material used is steel throughout. The device sells for $10.—Campbell Auto Works, Stockton, Cal.

Cadillac Eight Touring Car Goes 100 Miles in 82 Min. 46 Sec.

DETROIT, MICH., Sept. 27—In a test run just made on the Chicago speedway under the supervision of the Automobile Club of America, an eight-cylinder Cadillac touring car, fully equipped and carrying a spare wheel and tire, covered 100 miles in 82 min. 46 sec., or at an average speed of 72.49 m.p.h. Windshield and top were down. The fastest lap was made in 1 min. 38 2/5 sec., or at a speed of 73.17 m.p.h., a new record for touring cars.

Two cars were tested, one a new car out of regular production which had never been run prior to being driven to Chicago from Detroit. It had covered 345 miles when the tests began. The other car had been used for experimental work, but the first made the better time, although by only a small margin.

Both cars were put through 100-mile runs, and their performance was strikingly uniform, the new car beating the older one by 1 min. and 30 sec. for the 100 miles. Each car was also given a 1-hr. test, the new car traveling 72.41 miles in that period, which was 1.35 miles more than the other ran in an hour.

The older car traveled the 100 miles in 84 min. 16 4/5 sec., or at the rate of 71.19 m.p.h. The two cars made a total of 200 miles in 167 min. 2 4/5 sec., also a touring car record for this country. The drivers were members of the Cadillac organization.

Indiana S. A. E. Talks Twelves and Aluminum

(*Continued from page* 602)

the single carbureter is the practical arrangement for all touring car purposes so far as we know at the present time. If you are building a motor for the highest possible speed, then you may use a double carbureter or even more carbureters. I believe four would give more power. In fact, I have a twelve-cylinder Sunbeam with four carbureters which performs very well at high speed but not very well at low speed. As to the gasoline economy, I made an official test in Chicago on the board track—which doesn't mean anything—which ran 13 miles to the gallon, at an average speed of 30 m.p.h., or just over that, thinking that would represent ordinary touring speed. By leaning the mixture one notch on the dash control I could have made fifteen, but it would not have been good business, as it would not be the way a customer would drive the car.

"I think every engineer has had experience at some time or other with some fellow who was some sort of a mechanic and would get possibly twice as much mileage and get it consistently, but he would be proud simply of his mileage and would not care for his car to run smoothly and sweetly. Now, the best information I have as to how these cars are going to run under actual conditions is the record of the demonstrators. I have taken the record of the demonstrators which have run several thousand miles and naturally as a technical man would, I have kept track of the gasoline consumption and the grand total is an average of 10.2 miles per gallon. That has been done under demonstrating conditions, where the car was idled, where it ran slowly, pulled hills on high, and where high speed had to be shown. It was about average running conditions to the customer. Some customers will have more favorable conditions and some average conditions will not be as favorable. I try to keep away from giving actual figures on gasoline economy because I have found figures vary too greatly and you cannot be sure the customer will get the same mileage you can, unless you make it absurdly low.

The compression is about 19.5—that is, the combustion chamber is 19.5 of the total volume. We take our compression at 120 r.p.m. and in our case it goes to 75 lb. compression."

The Vindication of the V

THE paper on the twin six engine read both at Detroit and at Indianapolis by J. G. Vincent has been remarkable by reason of the fact that it has stirred up no opposition, no real criticism, in the discussions. If the Packard twelve had appeared a year earlier, if Mr. Vincent's paper had been read simultaneously with D. McCall White's on the eight last winter, what a storm of disbelief would have been raised!

That the earlier paper raised so much excitement while the later one is treated rather as a matter of course is certainly due to the complete success of the V motor principle as applied to modern engine designs. There is now no longer any opportunity to express disapproval of the duplex connecting rod, the carburetion or ignition layout, the cooling or the power output of a V motor *because* of its being a V.

There are plenty of engineers who hold that four or six cylinders properly applied can give as good results as eight or twelve, and it is very interesting to observe that their ideas do not seem to make good material for discussion in a meeting. It is now clear that early objections to the "complication" of V motors have been overcome, that the strongest engineering objections were matters of mechanical detail rather than of principle, and it is a remarkable thing that the engineering outlook should have changed so much in so short a time.

Speedways and Engineering

PROBABLY the Indianapolis speedway has this year been the scene of more testing work than ever in its history, excepting tests made solely for racing purposes, as visitors from Detroit have made great use of it in addition to the permanent usage of the Indianapolis manufacturers. Not only this, but the Chicago track has also been employed for tests that are demonstrations, or demonstrations that are tests. All this activity on the speedways is serving to again demonstrate their immense value to automobile engineers as testing grounds.

A really good track in Detroit, owned by the manufacturers of Detroit and intended for testing rather than for racing would improve the average Detroit product at least 20 per cent within a year or two. It would be worth the while of every manufacturer to put down a good sum and contribute an annual income for the building and upkeep of such a track and it is remarkable that a scheme along this line has not yet developed. But there is another side to the speedways as well as testing and racing, and this is their value for demonstration performances such as the recent speed tests of Packard and Cadillac at Chicago. There is hardly a member of the industry who does not agree that cars will be sold more and more on performance and less and less on specification, so the value to a manufacturer of officially observed tests is immense, from the publicity viewpoint.

With the speedways thus tending to assist the manufacturer by helping him to improve his cars by private test and to demonstrate the result by public test, the owners of the tracks have a right to ask the automobile manufacturers to be a little more generous. There are two ways of enabling the speedway corporations to make a reasonablee trading profit, one being a wider use for testing and a slightly higher rate of pay for demonstration runs, the other to build more racing cars and help to make American cars that will beat and replace the foreign vehicles. The public will flock to see racing just so long as that racing is good racing, and it cannot be good without the annual production of good speed cars, for the old ones cannot be used again and again.

Speedway Opportunities Neglected

Recent developments in speedway circles show that this is realized, but the making of racing cars is not a task lightly to be undertaken, and it is impossible to hope for more than a moderate number every year. This being so, there is a growing feeling that the increasing public interest in automobile performance will re-create the stock car events. To devise stock car rules is not impossible, and that the public would be attracted to see stock car racing is incontestable. Then, too, there are one-make races which will always draw every owner of that make from miles around and there are other things as well. If every member of the trade would give a little time to thinking on the subject, would realize what an immense asset the speedway is to his business, we should soon have schemes enough afoot to utilize the speedways properly and profitably.

France to Declare 45% Tariff

American Cars Imported Into French Territory to Pay—War Orders Exempt

PARIS, FRANCE, Sept. 27—*Special Cable*—On good authority it has been declared that France will shortly follow the lead set by England, by declaring a duty of 45 per cent on all American cars sold into France or its possessions. This new move is looked upon as a protection measure of the French automobile manufacturers against the American industry and also as a source of revenue. America has a tax of 45 per cent on French automobiles imported costing over $2,000 and of 30 per cent under $2,000. The present action of France exactly reverses the situation. At present the duty on American cars entering France is 75 francs per 100 kilos, or $15 for every 220 lb. On a car weighing 3000 lb. the duty is $225. On the 45 per cent basis this duty will be nearly $700 or more than three times what it is at present. This duty will not affect war orders of trucks or automobiles, but will have a serious effect on American manufacturers retaining agencies in France.

Heretofore England, which has been the greatest purchaser of American cars, has been a free trade country, requiring no duty whatever on American cars entering the British Isles. The present duty of 33 1/3 per cent entirely changes the aspect of American makers so far as export business is concerned.

Moline Plow to Build Cars

FREEPORT, ILL., Sept. 25—The Moline Plow Co., has decided to abandon the construction of buggies in one of its two plants here and, instead, will construct automobiles. The demand for carriages has dwindled rapidly with the increase in automobiles and it is likely that the company will gradually make the shift in other plants as business conditions warrant. The officers of the Moline company are now planning the model for their automobile construction and may reach a definite conclusion during the coming fall or winter.

Kelley Maxwell Consulting Engineer

DETROIT, MICH., Sept. 28—William Kelley has rejoined the Maxwell Motor Company's staff as consulting engineer with especial duties in adapting car design to manufacturing facility.

Moloney Gibney New York Manager

NEW YORK CITY, Sept. 29—Edward F. Moloney has joined the forces of the Gibney Tire & Rubber Co. as manager of the New York branch. He started in his new position Sept. 27 with complete charge of sales in the New York territory under the direct supervision of General Sales Manager C. A. Gilbert. Mr. Moloney was formerly manager of the solid tire department of the Firestone, New York branch.

Sales Manager Gilbert has left for the Coast to establish a branch in San Francisco that will take care of the growing truck tire business West of the Rockies.

American Car Agents in England Oppose New Tax

LONDON, ENGLAND, Sept. 24—It was declared to-day that the 33 1/3 per cent ad valorem import duty on all automobiles and their parts will at present affect only the American manufacturers. The purchasers of American cars will have to pay the new duty, except in the case of one low-priced car. The manager of the London office of this firm explained that only one-third of each car of this make sold in this country comes from America so that duty has to be paid only on one-third of the value of each car.

Several other American cars, however, already have put up the price, one of them being raised $235, while a more expensive car has gone up from $2,300 to $3,000.

Representatives here of American automobile firms are strongly opposed to the new tax urged by Reginald McKenna, the British Chancellor of the Exchequer. A reduction of 15 per cent will be asked.

Anderson Reports Good Conditions

DETROIT, MICH., Sept. 29—Lee Anderson, sales manager of the Hupmobile, who is on the coast, having driven from Chicago there, reports that there is more automobile business in the West than the manufacturers can possibly supply this year. Dealers are generally short of cars and the demand everywhere is exceptionally great.

Joyce Leaves Kelly-Springfield Truck

SPRINGFIELD, OHIO, Sept. 25—James Joyce, for two and one-half years Eastern manager of the Kelly-Springfield Motor Truck Co., this city, has resigned to become Eastern manager of the Houk Mfg. Co., Buffalo, N. Y. Mr. Joyce's resignation becomes effective Oct. 1, 1915.

Hartdorn Grossman Factory Rep.

NEW YORK CITY, Sept. 28—L. G. Hartdorn, until recently production manager of the Emil Grossman Mfg. Co., Inc., Brooklyn, N. Y., has been appointed factory representative to cover the manufacturers in the territory west of Buffalo.

Fail to Settle Time for New Cars

N. A. C. C. Committee To Meet in New York Oct. 6—Definite Action Expected

DETROIT, MICH., Sept. 29—The committee of the National Automobile Chamber of Commerce, Inc., met here yesterday with the hope of evolving some solution of the troublesome question of announcing new models at all seasons of the year, and after considering all of the data on hand, was unable to make any definite announcement as to how the trouble could be remedied. An adjournment of the committee was made to meet in New York, Oct. 6, when some definite action will be taken. Those comprising the committee are: Hugh Chalmers, president Chalmers Motor Co.; John N. Willys, president Willys-Overland Co.; C. W. Nash, president General Motors Co.; C. C. Hanch, treasurer Studebaker Corp.; Alvan Macauley, vice-president and general manager Packard Motor Car Co.; W. C. Leland, manager Cadillac Motor Car Co.

Kansas City Dealers Favor Announcing New Cars Jan. 1

KANSAS CITY, MO., Sept. 24—The Kansas City Motor Car Dealers' Association has put itself on record as favorable to an announcement of their new models for the forthcoming year on Jan, 1 by all automobile manufacturers. A resolution to that effect was adopted by the association at its most recent meeting without opposition. The meeting was that for the election of officers and there was a very large attendance. The consensus of views was that the present plan of making these announcements at uncertain and irregular dates causes confusion and the change proposed is in line with the sentiment of automobile dealers throughout this part of the country.

The association fixed the date of the next automobile show for Feb. 7, 1916, and set in motion the arrangements to make the exhibition the greatest ever given here. Record sales are expected during the coming winter.

Officers Elected

Nelson W. Riley was chosen president of the association, William Brace vice-president and the following were made directors: W. E. Mallory, George A. Bond, Estell Scott, Chas. A. Williams, H. G. Kirkland, A. F. Norton and Henry Bruening. Mr. E. E. Peake will, it is understood, continue as secretary-treasurer, but that election does not come until later.

Chandler Declares 25% Dividend

Board of Directors Favors Issue of 200% Stock Dividend on Common

CLEVELAND, OHIO, Sept. 28—A 25 per cent quarterly cash dividend on the common stock payable to the stockholders Oct. 1 has been declared by the Chandler Motor Car Co., this city. The board of directors also voted in favor of a 200 per cent stock dividend on the common stock subject to ratification by the stockholders Nov. 2.

The common stock of the Chandler company is now $225,000 and if the stockholders ratify the 200 per cent stock dividend this will be increased to $675,000. The preferred stock of the company is $200,000.

Imperial Four Now $850

JACKSON, MICH., Sept. 23—Taking effect to-day, according to an announcement made by J. I. Handley, vice-president and general manager of the Mutual Motors Co., maker of the Marion and Imperial, the price of the Imperial four will be $850. This is a cut from $995, made effective July 1 this year and a reduction of $235 since last season. The price of the Imperial six remains the same.

Edison Battery on Ward Special

NEW YORK CITY, Sept. 27—The Ward Motor Vehicle Co., New York City, will offer its Ward Special, a 750-lb. delivery wagon, for $875 on easy monthly payments, with one year's rental of the Edison battery included. This offer will be open until Oct. 31. The plan is to be tried in Greater New York and New Jersey and may be extended to other cities in the future.

Indiana Service Men Meet

INDIANAPOLIS, IND., Sept. 29—The first of three annual meetings of the Indiana Automobile Service Managers' Association, will be held at Hotel Severin in this city, 3 p. m., Saturday, Oct. 29. The meeting will be of the get-together type, with an address by President H. W. Drew, followed by talks by other members on the recent service managers' convention in Detroit.

Couple-Gear Trucks for England

GRAND RAPIDS, MICH., Sept. 22—Negotiations are pending between the Couple-Gear Freight-Wheel Co. and representatives from the British army, concerning the building of eighty scout motor trucks for Great Britain. These trucks are to be similar to several which the local manufacturer has furnished to the United States Government, and are to be used especially in searchlight and radio work. The trucks are 16 ft. long and 6 ft. wide and have a 60-hp. motor. It is said they will cost $10,000 each.

Studebaker Has 76,000 Orders for 1916 Cars

DETROIT, MICH., Sept. 24—The Studebaker Corp. has over 70,000 domestic orders scheduled for 1916 cars, and more than 6000 orders for shipment to foreign countries, including Canada, Great Britain, Australia, India, China, Philippines, South Africa, South America, Cuba, Porto Rico, Central America and continental Europe. The plants are working to full capacity.

De Lorenzi Sails for London

NEW YORK CITY, Sept. 27—Ernest A. DeLorenzi, export manager of the Maxwell Motor Co., sailed on the Orduna Saturday for his headquarters in London. Mr. DeLorenzi reported that Spain and Portugal are the biggest buyers of motor cars on the continent at the present time. There are scarcely any sales to Norway, Sweden, Holland and Denmark because of the tire embargo situation.

Regal Winter Tops Ready

DETROIT, MICH., Sept. 29—The Regal company has now its series of detachable Sedan tops for winter use for all three of its 1916 models. The new top takes the place of the standard one-man type which can be quickly replaced for summer use. The detachable Sedan type is finished in accordance with the remainder of the body, is electrically lighted, and has large glass windows.

New Studebaker Convertible Top

DETROIT, MICH., Sept. 27—The Studebaker Corp. is now offering a new convertible Sedan top at $150. The top is easily applied to both four and six-cylinder touring models, and weighs but 75 lb. more than the touring car top. The glass of the windows and panels is removable, and when in place, the top is wind, water and weatherproof.

Lozier Moves to Cleveland

CLEVELAND, OHIO, Sept. 25—Harry A. Lozier, who announced last June the H. A. L. twelve, selling at $1,750 either as a two-passenger roadster or seven-passenger touring car, has moved from Detroit to Cleveland. A description of the car appeared in THE AUTOMOBILE for July 1.

Trade Review of the Past Week

Detroit Factories Still Rushed—Dealers Report Good Sales Conditions in All Sections

DETROIT, MICH., Sept. 28—The demand for cars continues unabated, and with favorable conditions, dealers are quite outspoken in their belief that the year will close as a record one for them, so far as this territory is concerned, at least.

The increasing of the price of the Packard cars has not surprised the selling field here to any great extent, for they believe it quite logical under present materials market conditions, and as a matter of fact, they believe that more such advances would not be out of reason. The price increasing of this kind is not regarded as any hindrance to the sale of a car of the Packard type, and there is a general commendatory note regarding it.

Factories Behind Orders

At the Cadillac plant they are now building ninety cars a day, and all departments are working to that schedule. Ford continues to feel a strong demand, and is the usual number of orders behind. The present manufacturing schedule is about the same as it has been for some time—2000 cars total being made in the plant here and branches throughout the country. The factory production is about 500 completed cars now. September sales of Maxwells are said to be far beyond August, which were double the sales of the same month a year ago.

The financial statements of the concerns which have made them public have come in for a great deal of favorable comment among the trade. The feeling is quite general that management of all the concerns has been of the best, and that in spite of some damaging conditions early in the past fiscal year, the makers have so far as possible anticipated the prosperity now being experienced, and have been commendably alert in the matter of conserving every penny in order to give the people better cars for the money, and making money for themselves at the same time.

Good Conditions Everywhere

District representatives calling on the trade in all parts of the country report almost uniformly good automobile conditions everywhere, and the same optimistic view is held by dealers visiting here. They say, however, that in some sections other lines of business do not seem to be feeling the same degree of prosperity. The business man is rapidly awaking to the necessity of the automobile in his business.

Detailed Export Statistics Show That U. S. Dominates Automobile World

United Kingdom Continues Best Buyer, Taking 2619 Cars Worth $3,836,296 in July—France Imports 615 Worth $1,260,693—Big Gains in Exports to S. A. and Asia

WASHINGTON, D. C., Sept. 28—America's supremacy in the automobile world is shown in the latest export figures, published this week exclusively in THE AUTOMOBILE. These figures are in addition to the gross figures published exclusively in a recent edition.

When exports of commercial cars jump from fifty, valued at $106,400 in July, 1914, to 2469, valued at $6,803,001, in July last, and exports of passenger cars leap from 1265, valued at $1,143,419, to 4118, valued at $3,835,347, during the same periods, there can be no question about the United States dominating the automobile world. To this must be added the exports of parts, which jumped from $420,975 to $1,663,997 during these periods.

United Kingdom Largest Buyer

In value of imports from this country the United Kingdom continues to hold first place. The imports of cars from this country into King George's domain increased from 227 cars, valued at $183,988, in July, 1914, to 2619 cars, valued at $3,836,296, in July last. During the seven months ended July these imports from this country increased from 4967 cars, valued at $4,087,763, in 1914, to 14,494 cars, valued at $21,998,-112, in 1915.

Sixteen cars, valued at $15,803, were shipped to France in July, 1914, while in July last the number had increased to 615 cars, valued at $1,260,693. During the seven months' period these exports increased from 1044 cars, valued at $625,-636, in 1914, to 4268 cars, valued at $10,547,826, in 1915.

Italy's imports of cars from this country are not as large as formerly. In July, a year ago, there were sixteen cars, valued at $8,640, shipped to that country, and in July last there were also sixteen cars shipped, but the value had dropped to $6,340. The seven months' period shows that the exports to Italy dropped from 228 cars, valued at $147,-388, in 1914, to 108 cars, valued at $63,-295, in 1915.

While Germany imported sixteen cars, valued at $17,364, from the United States in July, 1914, that country failed to receive a single car from this country last month, while the seven months' imports dwindled from 1063 cars, valued at $799,552, in 1914, to four cars, valued at $2,800, in 1915.

which embraces all European countries not mentioned above, big gains are shown. In July a year ago 152 cars, valued at $130,227, were sent to these countries, while in July last the number had increased to 1144 cars and the value to $4,033,680. During the seven months' period the exports to "Other Europe" increased from 2366 cars, valued at $1,876,114, in 1914, to 4822 cars, valued at $13,089,008, in 1915.

Canada's imports of cars from this country have taken a jump, increasing from 257, valued at $386,234, in July, 1914, to 643, valued at $428,348 in July last. However, during the seven months' period the exports amounted to 3356 cars, valued at $4,069,621, in 1914, and to 3961 cars, valued at $3,192,526.

Although Mexico is having war the figures show that exports of American cars have increased from two, valued at $1,647, in July, 1914, to nineteen, valued at $22,001, and from fifty-four, valued at $65,974, during the seven months of 1914, to sixty-one, valued at $56,306, during the same period of 1915.

The West Indies and Bermuda have taken a big jump in the imports of American cars, the figures showing that forty cars, valued at $35,033, were imported there in July a year ago, increasing to 377, valued at $197,292, in July last, while during the seven months' period the imports increased from 320 cars, valued at $286,063, in 1914, to 1704 cars, valued at $916,448, in 1915.

South American Gains

South American countries are taking more kindly to American cars, the figures showing that the exports to our Southern neighbors increased from ninety cars, valued at $62,288, in July a year ago, to 315 cars, valued at $157,964, in July last, while during the seven months' period the exports rose from 872 cars, valued at $709,239, in 1914, to 1212 cars, the value of which, however, was only $643,718, in 1915.

The exports of cars to British Oceania in July, 1914, were 311 cars, valued at $237,780, increasing to 382 cars, valued at $335,698, in July last, but during the seven months' period there was a drop from 2587 cars, valued at $2,233,471, in 1914, to 2369 cars, valued at $2,046,047, in 1915.

Asia Also Gains

Exports of cars to Asia and other Oceania are increasing. In July, a year ago, the number exported to those countries was 115 and the value, $121,896, increasing to 252 cars, valued at $189,227, in July last, while during the seven months' period the number exported increased from 1179, valued at $1,110,001, in 1914, to 2178, valued at $4,309,410, in 1915.

The detailed tabulation of exports and imports is given herewith.

Mexico to Canada Non-Stop Run

Chandler Six on 1789-Mile Trip Without Stopping Motor or Wheels

CHICAGO, ILL., Sept. 28—*Special Telegram*—With but two days' preparation a Chandler six stock touring car started last Sunday from Tia Juana on what is claimed to be the most strenuous automobile tour ever attempted. From Mexico to Canada, without stopping either the wheels or the motor, is the record for which C. H. Hunter of Los Angeles and four companions are trying.

Eat and Sleep in Car

The non-wheel non-motor stop Chandler passed through Sacramento at 4 o'clock with the speedometer registering 767 miles. The total distance for the trip is 1789 miles and it is claimed that unless the tires blow out or the men break down under the strain the run will be completed at an early hour Thursday morning.

The men are eating and sleeping in the machine as well as taking gasoline and oil on the run from the Chandler dealers along the route. A long funnel with an elbow is used to get at the gasoline tank. The run attracted such wide attention in southern California that the Universal Film Corp. sent a camera operator on the tour to tell the story of the great demonstration of the efficiency of the modern automobile in film for the Universal Weekly. This is the first time that a picture company has devoted a reel to an automobile demonstration without cost to the manufacturer.

The car passed through Marysville, 815 miles, by morning half way to the Canadian line on the first non-stop run across the United States.

Equipment Features

Equipment features of the car are: Goodyear cord tires, Gray & Davis electric system, both Klaxon and Sparton horns, Boyce Motometer, Stewart speedometer and vacuum fuel feed, Bosch spark plugs, Rayfield carbureter and Monogram oil.

Rules Gasoline Is a Domestic Necessity in Texas

AUSTIN, TEX., Sept. 27—According to a ruling of the state attorney general's department gasoline is a provision and a domestic necessity and as such it can be sold on Sunday mornings up to the hour of 9 o'clock. One of the State's blue laws permits the sale of certain foodstuffs, produce and milk before 9 o'clock in the morning on Sundays. While gasoline is not mentioned in the law the attorney general holds that it comes within the exempted provisions. However, the enforcement of the so-called Sunday law as to gasoline and other articles and goods is confined to only a few towns of the State. In all the larger cities gasoline is sold all day long and it is also possible to buy most kinds of foodstuffs and nearly everything else except intoxicants on Sunday. The request for a ruling on the sale of gasoline question came from the county attorney of Hays county at San Marcos.

S. O. Raises Gasoline 1 Cent in St. Louis

ST. LOUIS, MO., Sept. 29—*Special Telegram*—For the second time in two weeks the Standard Oil Co. to-day followed the lead of the independent refiners by raising the price of Red Crown gasoline 1 cent per gal., the new price being 10.9 cents. Since Sept. 15, the independents have been selling their No. 3 gasoline at 9.9 cents from wagons and at 11 cents at filling stations. It is expected that the independents will soon announce another increase as they have declared their intention of bringing the price back to 17.5 cents where it was two years ago, before the Standard started its series of eight cuts of 1 cent per gal. each.

S. O. Meets Gasoline Price Increase

KANSAS CITY, MO., Sept. 24—The Standard Oil Co. has met the increase in the price of gasoline established by the Independents. On Sept. 16 the Standard announced the 1-cent rise in the Kansas City market, and now both independents and Standard are getting 9.8 cents a gallon. In some cities of Missouri gasoline is selling at 14½ cents, after an increase of 2 cents a gallon coincident with the 1 cent rise by the Standard at Kansas City. In Springfield the E. M. Wilhoit Oil Co. is getting 11.6 cents for gasoline, while the Standard and others are getting 10.6 after the 1 cent rise.

Gasoline Up 1 Cent in Milwaukee

MILWAUKEE, WIS., Sept. 24—In common with other markets, gasoline prices in Milwaukee have been raised 1 cent. Both Standard and independents have announced the advance, attributing it to an increase of 1 cent in the price of crude. The advance is due largely to the falling off in the supply in the Cushing fields in Oklahoma. So-called low test gasoline is selling for 11½ cents at filling station; 65 deg. at 15 cents and other grades correspondingly higher. Prices, however, were lower in 1914.

Swedish Embargo on Rubber

STOCKHOLM, Sept. 25—The Swedish Government has placed an embargo on rubber and varnishes.

Increasing Output of High-Class Cars Feature of Indiana Progress

Factories Rushed to Keep Up with Orders—Accessory and Parts Makers Also Busy—Friendly Rivalry of Engineers Brings Out Best of Designs

INDIANAPOLIS, IND., Sept. 27—Indianapolis is apt to be neglected somewhat by comparison with the greater center of Detroit, but if it were not for the concentrated industry of the latter city Indianapolis would certainly rank high among the automobile cities of the world.

For enterprise, take the most recent developments, and we find that Indianapolis is producing two twelve-cylinder cars, the National and the Pathfinder, to the one of Detroit. Take originality, and we can easily point to a half dozen firms in the Indianapolis section who design and build their own cars practically throughout. Take quantity, and it is easy to show that Indianapolis ranks high in output, more especially if we except such cities as Toledo whose output of automobiles is dependent mainly upon one large factory.

The Indiana Spirit

Without doubt Indiana in general and Indianapolis in particular has derived great benefit from the presence of the speedway. It is on this racing track that the automobiles of the Indiana manufacturers are tried and proved, and it is here of all places on the surface of the earth that automobile engineers have gathered together in friendly rivalry with experimental machines.

Last week, just before the reading of J. G. Vincent's paper on the twelve cylinder motor, almost any day would have found a gathering of Indiana's automobile engineers at the 2½-mile oval. On Sept. 24, for example, W. G. Wall (National); J. G. Vincent (Packard); Howard Marmon (Marmon); George Weidely; A. E. Winckler (Case); F. H. Nutt (Haynes), and several other engineers took turns to drive each other's 1917 experimental models.

Indianapolis Prosperity

With them were a score of others all more or less vitally interested in the engineering side of automobilism, each gaining knowledge and experience by the courtesy and freedom of the others; each helping to advance the automobile by free interchange of opinion with the others. Perhaps this ought to be called the speedway spirit, rather than the spirit of Indianapolis, but however this may be it is to the credit of Indianapolis that it is the first city of the globe to see such gatherings a common sight.

Like Detroit, Indianapolis is experiencing a year of prosperity, the like of which has never before been seen. Of its big factories, the National is building additions that will almost double its size and capacity—partly owing to the twelve, but more on account of general excellence of trade. The Pathfinder Co., lately reorganized, have orders on their books which encourage all production records to be broken. The Cole Co. have had a wonderfully prosperous season with their eight and look forward to a continued demand which will tax the resources of the engine makers for many months to come, while the Empire Co. are busy too, and the Nordyke & Marmon Co. are making the new Marmon 41 as fast as the factory can handle the material.

Outside Indianapolis, but in the same district, the Haynes Co. of Kokomo are so busy that their final inspection is being conducted in large tents, pending the completion of new buildings, which will enable the output to be raised to between 30 and 40 cars per day. In the same city the old Apperson Co., who also make practically every part of the car that bears their name, are turning out an exceptional quantity, and the same is true of every manufacturer in Indiana.

Nor is it only the complete automobile manufacturers that are busy, for it must not be forgotten that Indianapolis and the district surrounding can boast several important parts makers.

For instance Wheeler & Schebler are making an ever-increasing number of their carbureters, and their output now totals at the rate of over 350,000 per annum, nearly half a million. At Kokomo another well-known carbureter, the Kingston, is being made at a rate of well over 1000 per day, together with coils and magnetos which also are products of the Bryne Kingston Co.

At Marion, a stone's throw from Kokomo, is the Rutenber factory, which is rushed to the limit, despite recent new buildings and additions, since the Rutenber light six of 3 by 5 in. has proved one of the hits of 1916 with the automobile manufacturers.

South Bend, Anderson and other surrounding towns of automobile importance are likewise busy to the limit of capacity, and a bit over, so Indiana is without doubt taking its full share of the great wave of prosperity which is being enjoyed by the automobile industry of America.

Probably in thinking of Indianapolis few people would fail to remember first of all the Prest-O-Lite Co., but no doubt many would also reflect that the coming of electricity must have injured the automobile end of this great business. How little it really has been affected may perhaps be gaged by the following figures.

Taking the Prest-O-Lite gas tank service as it bears upon the automobile only, and neglecting the gas used for welding, for house lighting and for other purposes, the bill that the Prest-O-Lite Co. has to foot for the transportation of empty and full gas tanks still stands at the astounding figure of $675,000 per year. In the last twelve months over 20,000 car loads of automobile size tanks alone were handled, and it is computed that the number in use exceeds 1,400,000 tanks. A rough average tonnage of freight per annum on empty and full tanks handled by the main factory and its twenty-one charging branches reaches the amazing total of 700,000,000 lb.

—

Blood Bros. Discontinue Cornelian

DETROIT, MICH., Sept. 29—The Blood Bros. Machine Co., Allegan, Mich., which has been making the Cornelian cars in addition to its universal joints has decided to discontinue the manufacturing of automobiles of which about 100 were made. Hereafter the factory will be devoted exclusively to the manufacturing of the Blood universal plants of which 3000 to 3500 are now made per month. Over 100 men are employed and the concern states that it has already enough business to occupy its attention for three months with orders from truck makers. Negotiations are under way to sell the car business to Allegan interests.

—

Packard's New Prices—Why They Are Higher

DETROIT, MICH., Sept. 25.—As reported briefly in last week's issue of THE AUTOMOBILE, the Packard Motor Car Co. has increased the selling price of its Twin Sixes of both models, the raise being from $150 to $200, according to the model or the body style. The new prices for all Packard cars are given herewith.

In a letter to all its dealers the Packard company made some interesting statements as to the reason for increasing the prices. Part of the letter reads as follows:

"The cost of aluminum has advanced $50 per car, consisting of approximatively 300 lb. of castings, which have increased 12 cents per pound; 110 lb. of sheet aluminum, which has advanced 11 cents per pound, and aluminum molding, which has increased $1.50 per car. Brass and copper have advanced approximatively 4 cents per pound. There are approximatively 250 lb. of brass castings

on each car, and these represent an increased cost of $10. The materials for our radiators have advanced $2.50 to each radiator. Lamps have gone up $2 per set. Crankshaft and connecting-rod bearings have advanced $2.50 per car. The advance on door handles alone represents 50 cents to each car.

"High-grade steels show a terrific increase, and the advance from this source is approximately $13 per car. We have to pay $2 more per motor for tungsten steel valves, and ball-bearings represent an increase of $3.50 per car. Frames represent an advance of $4.50, and the trimming leather alone costs $17.50 more for each car.

"Together with many less important items the total increase in actual cost of materials is between $150 and $200 per car, with no prospect of relief."

An out-of-town Packard dealer in speaking about the new prices said that if the war in Europe will last another six months the probabilities are that not one automobile manufacturer will be able to reduce his prices next year. In fact, the example of the Packard and Cadillac companies will most likely be followed by other concerns, as it is getting more and more difficult to get materials, even at higher prices.

—

Perfection Tire Appears

FORT MADISON, IOWA, Sept. 23—A new tire, guaranteed to be heat-and-water proof and to give satisfactory service for 7000 miles without punctures or blowouts, will shortly be placed on the market by the Perfection Tire & Rubber Co., Fort Madison, which is now erecting two plants. The first unit will be entirely completed, with machinery installed, by Oct. 15. The second will be ready for occupancy not later than Dec. 1.

The initial output will be 1000 tires a day, commencing Dec. 1. These tires will be manufactured under the Evans patent, which combines the use of asbestos and rubber.

The Perfection Tire Sales Co., which will have its main office in Buffalo, N. Y., will take care of the sales end of the business. J. N. Sochrest will head this department.

Troubles with Trucks at the Front

—

Efficiency Improved—Ignition, Cooling and Brakes Some Weak Points

LONDON, ENGLAND, Sept. 10—In a recent visit made by an American truck representative with a military transport to the front in Flanders, an opportunity was afforded of observing the work of motor trucks in the war zone. Since the opening of the war many changes have been made which have increased the efficiency of the trucks. Chief in this regard is putting men who have had most experience on certain makes of trucks and keeping them driving these makes. It has also been found profitable to keep trucks of the same make as close together as possible in the same convoy and increasing the size of the convoys to do this. It has been found advisable to have a reserve wagon accompany convoys, this wagon equipped with the necessary spare parts, and skilled mechanics for the particular make of truck used in the convoy.

A frequent trouble with many English makes of trucks using force feed lubrication is that they have the pump in the bottom of the crankcase sump with outside oil pipes delivering the oil from the main bearing to the crankshaft. These external pumps are rapidly broken by vibration, which is immediately followed by loss of oil and in nearly every case burned out bearings follow.

Ignition Not Waterproof

Not sufficient protection is given the ignition system to make it waterproof in several makes of trucks. Bad weather conditions have made many of the roads near the front veritable water bogs, the water splashing through the radiator and then carried by the fan through the ignition terminals.

On many English makes the road clearance is not sufficient, with the result that the tie rod of the steering gear frequently strikes the ground, throwing the wheels out of line. There are other makes which, because of the small clearance, really bury themselves in the mud and some with large rear axles which catch the mud have not power enough to drag themselves out.

Some trucks are very much behind in the matter of lubricating the wheels, which in some cases is done by a large grease cup threaded into the outside of the hub. The same is true with universal joints. It is the exception rather than the rule to see grease cups remain in; they all loosen, due to centrifugal force.

Cooling Most Important

Trucks without water pumps are generally boiling all of the time. In fact, cooling is one of the most serious matters with many trucks. This is aggravated by the lack of attention given trucks by many drivers, and also by road conditions.

Another serious fault is that clutches are not sufficiently fool-proof and quite frequently have not a large enough factor of safety to take care of the overloading and poor driving the vehicles are subjected to. In almost ninety-nine out of 100 trucks observed the drivers had their heavy military boot resting equally heavily on the clutch pedals, which meant early trouble.

It seems as though the majority of designers have tried to show how heavy they could make the fan and how light or cheaply they could buy the belt. This, coupled with a very inefficient inaccessible belt adjustment, does not help the cooling situation. Many makers are only beginning to realize that they must have better protection in front of the radiators.

So often each particular maker has his own idea to what particular height the body should be from the ground with the result that scarcely any two trucks can back up to the same load platform and unload or load heavy crates. In addition, in the same make of trucks there will often be half a dozen different designs of tailboards, and as these invariably get broken, there is needless trouble in replacing them.

Brake Adjustments Poor

Brake adjustments are very poor, being so frequently in inaccessible places or requiring some special kind of tool, which is invariably lost to make the adjustment.

There is a great scarcity of rubber tires. Scarcely a week ago 150 American trucks of one make were still being held in the crates at a French port waiting for tires.

The situation in England with reference to America is quite unusual. The sentiment against American trucks is strong, but it is a dog-in-the-manger attitude because all of the British makers are booked up with the War Department for 6 or 8 months, and as trucks are needed they must come from America.

New Prices on the Various Models of Packard Cars

	Model I-25		Model I-35

Maxwell Earnings $2,337,950

Net Income $2,303,314, Equal to 18.75 Per Cent on Preferred Stock

DETROIT, MICH., Sept. 24—The annual report of the Maxwell Motor Co., this city, whose fiscal year ended July 31, 1915, shows net earnings of $2,337,950.21, a 61 per cent increase, compared with $1,430,445 in 1914. The total income, amounting to $2,560,041 was $789,618 greater than that of 1914, which amounted to $1,770,424. After deducting $256,726 depreciation, the surplus or net income amounted to $2,303,314.41, equal to 18.75 per cent on $12,279,932 outstanding first preferred stock as against 12.26 per cent on the same stock in the previous year. This would permit a distribution of 7 per cent on this stock, 6 per cent on the $10,127,468 second preferred and 6.5 per cent on the $12,778,057 third preferred.

President Walter E. Flanders in his report to the stockholders stated that the net working assets of the company at the close of its second fiscal year were approximately $7,165,000, as compared with $5,835,000 at the close of the first fiscal year. The cash on hand is $2,652,629 as compared with $1,783,993.

Following out the policy established at the time of its incorporation, the company has disposed of its remaining idle plant at Tarrytown, N. Y., and is, therefore, operating factories at Dayton, Ohio; Newcastle, Ind., and Detroit.

The total volume of sales during the past fiscal year shows an increase of 62 per cent. The company manufactured and sold in Aug., 1915, 5217 cars, as compared with 2161 cars in Aug., 1914. Shipments in Sept., 1915, will probably exceed those of Aug., 1915.

Income Account of Maxwell Motor Co., for 1915 and 1914

	1915	1914	Changes
*Net earnings..	$2,337,950	$1,430,445	$907,505

Total	$41,896,135	$38,723,693

*The real estate additions during the year amounted to $310,202; increase through reappraisal, offset by corresponding increase to reserve for depreciation, $420,202, making the total of $5,192,626 on July 31, 1915.

Aluminum Again Advances

NEW YORK CITY, Sept. 28—Markets this week made a few small changes. The trading conditions were somewhat brisker. A substantial gain took place on Wednesday in Bessemer steel which rose to $24.50, a gain of 50 cents. The open-hearth market was firm during the whole week making no change at all. Aluminum, which had continually been rising, again advanced on continued heavy buying from domestic users. The price yesterday was 47 and 49 cents for spot in ton lots, and even at this high price there is very little to be had. The antimony market showed further weakness, with no bidders in sight. The copper market had one of its determined upward spurts last week. Producers marked up their prices to 18¼ cents for thirty days delivery. There was a firm demand and it is expected that it will continue to rise. The exports of copper for the week ending Sept. 23 were 3396 tons, against 3927 tons for the same week last year. The exports since Sept. 1 are 8823 tons, compared with 14,087 tons in the same period last year. That Europe is in need of a large amount of lead is evident by the fact that foreign countries are making enormous inquiries in the local market. An advance in the price of lead will be made within a few days. Lead has advanced 10 cents a 100 lb. The rest of the metal markets remained dormant.

The oil and lubricants markets were weak, making only two changes. Linseed oil made an advance of 2 cents. The principal rise took place on crude oil. Pennsylvania crude went up 5 cents a barrel, making the price now $1.70.

The crude rubber market was not particularly active last week and contained no essentially new features from those previously reported. There is a good demand for rubber, but it is more or less routine and does not vary to any considerable extent.

Pathfinder Adds Two Directors

INDIANAPOLIS, IND., Sept. 27—Following a considerable increase in business, the Pathfinder company has found it expedient to enlarge its organization and to this end two new names have been added to the board of directors. These are W. E. Stalnaker and G. H. Mosher. The new board of directors now includes the following: President, W. C. Teasdale, Jr.; vice-president, W. E. Stalnaker; sec.-treas., W. K. Bromley; directors, Crawford Fairbanks, C. J. Root, George H. Mosher, Karl Feilcke.

Mattingly and Chichester on Blood Board

ALLEGAN, MICH., Sept. 22—L. H. Mattingly and F. I. Chichester have been appointed members of the board of directors of the Blood Bros. Machine Co. Mr. Chichester is president of the First National Bank and Mr. Mattingly represents among other interests those of the Kalamazoo City Savings Bank, Kalamazoo. Mr. Mattingly is managing director of the company.

M. P. M. Maker Elects Directors

MT. PLEASANT, MICH., Sept. 20—At a meeting of the stockholders of the Mt. Pleasant Motor Co., which makes the M. P. M. four- and eight-cylinder cars,

two new directors were elected, J. A. Damon and C. A. Kellogg, while H. A. Sanford, W. A. Keen and N. J. Brown of the old board were re-elected. The capital stock of the company has been increased to $15,000 and an effort will be made to add at least an equal amount within the next few weeks. The business outlook is reported by officers of the company to be most promising.

—

Toledo-Ford Tire Elects Directors

TOLEDO, OHIO., Sept. 25—The first annual meeting of the stockholders of the Toledo-Ford Tire Co., was held recently in this city. The following directors were re-elected: R. F. Teall, R. O. Wire, William Dunbar, C. E. Taggart, A. O. Hamilton. The two new members of the board are G. N. Graham and Henry Hard. The company is producing about 400 tires a day or around 12,000 a year.

—

Duplex Power Car Elects

CHARLOTTE, MICH., Sept. 22—At the annual meeting of the board of directors of the Duplex Power Car Co. the old officers were re-elected. The officers are, Frank P. Town, president; Frank E. King, vice-president; Horton H. Bryan, treasurer and M. J. Lamson, secretary.

—

Republic Truck's Second Increase to $500,000

ALMA, MICH., Sept. 4—For the second time this year the stockholders of the Republic Motor Truck Co. have voted to increase the capital stock of the company. The first time this increase was from $50,000 to $250,000. Now they have decided to increase it to $500,000.

Securities Markets Strong

Many Substantial Gains in Various Issues—Trading Conditions Normal

NEW YORK CITY, Sept. 28—Stocks were active and generally strong last week, with pronounced advances in a number of issues. The recent distribution of a 50 per cent cash dividend by General Motors acted as a renewed stimulant for the so-called war stocks. With the many gains that took place General Motors once again was the feature of the markets. There was a strong tone at the opening with a continued rise in all issues except two, these declining but a few points. The closing bid of General Motors was 540, a gain of 58 points. Another noted rise among the specialties was Overland with a gain of 21 points. Maxwell served to stimulate an advancing movement in the company's shares, and all three issues rose to substantial gains. There was a total volume of 61 per cent sales increased over 1914. The rest of the specialty stocks made but a few points gain.

Tire Markets Boom

The tire issues last week all recorded net advances ranging from one-half to 27 points. A 20-point rise in the Goodyear common on top of a 10-point advance was taken as convincing evidence that the company proposes a large stock distribution. Kelly-Springfield featured the tire market with a 27-point rise. With the betterment in tire sales it is likely that the U. S. Rubber Co. will earn a balance above preferred dividends equal to more than 8 per cent on the $36,000,000 common. Many other small gains took place in the tire issues, such as Firestone with a gain of 15 points and Goodrich with 3½ points. The rest made but minor gains.

Detroit Conditions Normal

Although the Detroit issues recorded many good gains the trading conditions were normal. General Motors featured the market there also with a gain of 55 points. Maxwell's closing price was 53, which was 9 points above last week's rating. Studebaker common made a very good rise on Friday, rising 17 points and on Saturday dropped but 2 points. The rest of the stocks made a few small changes.

—

White Co. Increases Capital to $8,000,000

CLEVELAND, OHIO, Sept. 24—Following a reduction in capital stock on Sept. 22 from $3,000,000 to $2,500,000, the White Co., this city, has filed an application for an increase to $8,000,000.

These changes are in line with the recent announcement by which notice was given of the calling of $500,000 preferred and the issue of an enlarged preferred stock which will be distributed among members of the White organization who desire to retain their investment, but to drop out of the active management. Holders of the old preferred were also given rights to the new preferred. The public interest is limited to $500,000 of preferred, all of the remaining stock being held by the White family.

Kissel to Double Production

Two Additions Started—Four-Story Office Building Also on Enlargement Schedule

HARTFORD, WIS., Sept. 24—Ground was broken last week for the first of an important series of building operations at the plant of the Kissel Motor Car Co., this city. The company is preparing to double its production in the near future.

Two new buildings are started, one for storage and shipping, and one for the enameling department. The former is to be 100 ft. long and the other 110 ft. long, each being 35 ft. wide. The third structure, soon to be started, is a four-story office building, which will house all of the executive and clerical forces of the company, including the cost and drafting departments. A production of thirty to thirty-five passenger cars per day will be possible.

—

Splitdorf Electric Buys $1,000,000 Plant

NEWARK, N. J., Sept. 24—The purchase for $1,000,000 of the Sumter Electrical Co., Sumter, S. C., by the Splitdorf Electrical Co., this city, has been closed. This new plant will be used to produce magnetos of every type, including low-tension types for use on stationary, marine, and tractor engines. The company is building nearly 1500 Dixie magnetos a day.

—

To Subscribe $250,000 for Flint Workmen's Homes

FLINT, MICH., Sept. 21—At the weekly meeting of the Board of Commerce held to-day, announcement was made that within a few hours after the general campaign for workingmen's homes was started this morning, $31,000 had been subscribed. Last week $65,000 was subscribed and it now looks as if the $250,000 which is needed will be forthcoming ere long. C. S. Mott, president of the Weston-Mott Co., is general chairman of the work and trustee for the fund. It is intended to have 1000 houses built as soon as possible. At the present time there is such a shortage of homes that in many houses twice the number of people are housed than normally.

—

Page Makes Trailers

MARSHALL, MICH., Sept. 18—The Page Bros. Buggy Co., an old established concern which has been making buggies and carriages for many years, is now also making trailers which will be known as the Page Auto Trailers.

The trailers are made in four models. Models A and B have 750 lb. capacity, but while the former has 1⅛ by 5/16 in. round edge steel tires and costs $40, the other model is equipped with 1⅛ in. solid tires, the price of this model being $50. Both have the same kind of body, 38 by 82 in., with 7 in. sideboards and 4½ in. flareboards. Sheldon axles and springs are used. Both models C and D are listed at $75 and have 1250 lb. capacity, 1⅜ in. solid rubber tires, artillery wheels. The former model has 7 in. straight sides but model D has 11 in. straight sides.

—

Dry Climate Tire Plant Starts Active Manufacture

DENVER, COL., Sept. 22—The Dry Climate Tire Mfg. Co., a new $200,000 Colorado corporation, started its Arvada factory yesterday. A force of twenty-five men is preparing compounds and fabric, and the concern expects to be turning out tires for the trade next week. A few special tires will be built the last of this week for exhibition at the Automobile Trades Association's fall show starting next Sunday in connection with the International Soil Products Exposition.

The company expects to have two or three shifts of fifty men each at work within a few weeks. With this force and the present equipment, the plant will have a capacity of 100 casings and 350 tubes every eight hours. The building making the first unit of the factory cost $28,000 and the machinery, which is the most modern obtainable, cost $35,000. Plans are under way for additional buildings, and enough extra equipment has already been ordered to increase the capacity of the plant more than 50 per cent. The factory manager is W. J. Kreuder.

The new concern aims to reach about ten states in the Rocky Mountain territory, and has a special process of curing and compounding designed to increase the life of tires in this dry region.

The factory is located 7 miles from Denver, with good shipping facilities.

—

Dividends Declared

Paige-Detroit Motor Car Co., Detroit, Mich., 5 per cent for September, payable Oct. 10 to stockholders of record Sept. 30.

Republic Rubber Co., Akron, Ohio: Quarterly, 1¾ per cent on common and preferred, payable Oct. 1.

—

35 Per Cent Dividend to Walpole Creditors

BOSTON, MASS., Sept. 27—Judge Dodge in the U. S. district court has allowed a seventh dividend amounting to 35 per cent to all creditors of the Walpole Tire & Rubber Co. This brings the total dividends to 85 per cent.

Motor Truck Too Much for R. R.

Kentucky Commission Exonerates C. F. & S. from Long and Short-Haul Rule

LOUISVILLE, KY., Sept. 24—The Kentucky State Railroad Commission recently entered an order exonerating from the operation of the long and short-haul rule, which forbids a lower freight rate from one given point to another than is charged to intermediate points, the Cincinnati, Flemingsburg & Southeastern into Flemingsburg. The order is subject to a reopening of the case upon ten days' notice after any complaint may be filed.

This is the first exoneration from the long and short-haul clause on account of conditions arising from competition between a railroad and an automobile. It was shown that by reason of the operation of a motor truck between Maysville and Flemingsburg revenues of the 5-mile railroad line, making but the one point, Flemingsburg, have been reduced more than 50 per cent, and this competition is a matter of life or death with it.

—

Pratt & Whitney Tool Makers Strike for Eight-Hour Day

HARTFORD, CONN., Sept. 27—The machinists and other employees of the Pratt & Whitney Co. at a meeting to-night voted to strike for the inauguration of an 8-hr. day with no reduction in pay in the plant. At present the plant is run on the open shop plan, 10 hr. a day, with a half holiday Saturday.

Last week twenty-five tool makers employed in the plant went on strike as a protest against the discharge of two other tool makers. The company employs about 3200 men.

—

Brown & Sharpe Foundrymen Strike

PROVIDENCE, R. I., Sept. 24—Two hundred men in the foundry of the Brown & Sharpe Co. joined the strike declared against the plant by the machinists several days ago.

—

Weldum Succeeds G.-A. Aluminum Co.

NEW YORK CITY, Sept. 24—Owing to difficulties created by the war, the Weldum Co., an American concern, has taken over the business of the German-American Aluminum Co., whose home offices are in Berlin. The Weldum Co., whose officers are practically the same as those who controlled the interests of the German-American concern in this country, is now manufacturing under the name Weldum the metal used for replacing welding in aluminum repair work by using practically a soldering process.

Weldum, which was described in THE

AUTOMOBILE for Sept. 17, 1914, under the name of German-American aluminum solder, is the invention of a German metallurgist and is in common use in that country by the German government. The manufacturers claim that no breaks are too complicated to be repaired by it. Its tensile strength is about double that of aluminum and due to its low melting point, 400 deg. Fahr., a common gasoline torch can be used. By careful work no machining is said to be necessary after the work is completed. It is a secret compound containing eight ingredients, five being metals and the other three salts of metals.

—

New Departure Adds

BRISTOL, CONN., Sept. 30—The New Departure Mfg. Co., this city, is erecting extensive additions to its 10-acre plant, and is installing machinery that will enable it to double its present production.

There is in process of construction in this city what will be one of the largest buildings specially designed and equipped for grinding purposes in the world. Another extension will be that of its heat-treating buildings. This building, when completed, will contain 230 oil-fired furnaces. Supplementary to the furnaces themselves, will be a new arrangement of the quenching vats and the operation of a liquefied ammonia gas refrigerating system, which will increase the amount of work per furnace, and hold the processing of the steel to practically perfect uniform quality. Other departments will be increased correspondingly, so that the present 23-hr. per day production capacity will be doubled.

—

Pontiac Gets Columbia Truck

PONTIAC, MICH., Sept. 25—The local board of commerce has succeeded in inducing the Columbia Motor Truck Co., Kalamazoo, Mich., to move to this city. A site of five acres will be furnished to the truck manufacturer, and the board of commerce is to take charge of the erection of a suitable plant. The Columbia company expects to build 300 trucks within the next twelve months, it is said.

—

Goodyear to Hire 1000

AKRON, OHIO, Sept. 23—The Goodyear Tire & Rubber Co., this city, has started a house-to-house canvass to find rooms for 1000 men that the company will bring here within the next two weeks. Four new buildings, an addition to the plant, will be put in operation as soon as the company can find men to work in them.

—

Knox Motors Grants 8-Hr. Day

SPRINGFIELD, MASS., Sept. 23—The Knox Motors Co., this city, employing 400 machinists, has granted an eight-hour working day, without loss of pay, to its employees, to go into effect Oct. 4.

Wins Pa. Speed Trap Appeal

—

Court Holds Trap Must Be Worked from Both Ends To Be Legal

CHESTER, PA., Sept. 25—For the first time since the passage of the automobile law of Pennsylvania in 1913 a judge of the State passed on the methods to be used by officers in enforcing the law. Daniel Griffith, was arrested for speeding at Marcus Hook and the magistrate before whom the case was first taken convicted him, whereupon an appeal was taken. Judge Johnson, before whom the case was taken, decided that in order to maintain a speed trap it would be necessary for officers to be at both ends of the trap with stop watches and to be in communication with each other. For a long time many officers in the county have been reaping a harvest by jumping out of bushes and arresting automobilists on the charge of speeding. Judge Johnson also decided that the decisions of all magistrates could be appealed and dismissed the charge brought against Mr. Griffith.

—

Enforcing Non-Glare Ordinance in K. C.

KANSAS CITY, MO., Sept. 27—Kansas City police are actively enforcing the ordinances prohibiting glaring lights on automobiles. Recently twenty-one cases were called one morning in police court against owners and drivers charged with violations. Fines imposed ranged from $2 to $5, although the judge hinted at the chance that some maximum fines of $500 might be assessed against repetitions of the offense.

—

Non-Glare Ordinance in Minneapolis

MINNEAPOLIS, MINN., Sept. 24—With the adoption of a light dimming ordinance by the Minneapolis city council last Friday the Twin Cities are now on a common basis as to lights and frequent arrests are likely to be cut down. The ordinance forbids use of electric or other headlights that dazzle on automobiles. It also prescribes zones in which street car headlights must be dimmed.

—

Solve Delaware and Pennsylvania Tangle

WILMINGTON, DEL., Sept. 27—The tension between Delaware and Pennsylvania automobilists, because of an obnoxious feature of the Delaware law, taxing cars owned by outside corporations, firms and partnerships which come into the State, is such that a state of warfare has existed lately, in that traps have been set in Pennsylvania especially to catch Delaware cars when there was any violation of the Pennsylvania law.

It now looks as if Pennsylvania will take a reasonable view of the matter and will call off the traps, as the motorists are not responsible for the obnoxious feature of the law and have promised to endeavor to have the next Legislature repeal it. Meanwhile the local authorities are giving offending drivers an opportunity to take out a license.

—

100 Maxwell Dealers Talk Economy Contest at Plant

DETROIT, MICH., Sept. 27—Maxwell dealers from zone No. 1, which includes all the New England States, New Jersey, Maryland, eastern New York and eastern Pennsylvania, are here to the number of nearly 100. They came to visit the Maxwell Motor Co.'s plant and receive the final instructions for the cross-country economy run or contest which has been arranged for them and for which president Walter E. Flanders has donated three cash prizes.

This economy test started from Buffalo Tuesday. To-night the dealers and at least eighty Maxwell cars will make the trip per boat to the New York State city. Upon arrival there the run will be started, the cars being filled with lubricating oil and water here, the oil tank being sealed. The tank contains 1 gal. of lubricant, which is considered sufficient to enable every contestant to reach his destination. Several of the dealers will travel from 500 to 700 miles and may require three days to get home.

They will leave in two divisions, one traveling east and the other south, and as these divisions near their respective homes they will split. All contestants have received a special blank form of affidavit which they must fill out and mail to General Manager and President Flanders. It is expected that the winner will average 30 miles or better to the gallon.

—

Shadow-Boxes Test Headlights in St. Louis

ST. LOUIS, MO., Sept. 20—Shadow boxes to test the projection of headlight rays and enable the municipal adjusting bureau to adjust them to the degree required by a recent ordinance, are being tried out in St. Louis this week. Meanwhile the police have called a temporary halt of their war on headlights.

The shadow-box is in reality a darkened area-way 75 ft. in length and affording space for an automobile to drive in. Should the one now in use at the city hall prove a success, similar shadow-boxes will be installed at all police stations. The police plan to stamp every headlight which has been thus adjusted and approved and such a stamp will exempt the owner from arrest under the dimmer ordinance.

Ford Race at Mich. State Fair

Every Owner of Model T Is Eligible—Heats 5 Miles—Final 10—$500 Prizes

DETROIT, MICH., Sept. 27—Every owner of a Ford Model T car in the State of Michigan is eligible for the race meet which will be held on the 1-mile dirt track of the Michigan State fair grounds, Sunday, Oct. 17, and which is being promoted by General Manager G. W. Dickinson.

It is to be the first race for a trophy to be known as the Michigan Ford Championship Cup, to be competed for twice a year. In addition to the trophy there will be prizes aggregating in value $500.

The principal condition is that the car must be entered by the owner who, like the driver, must be a resident of Michigan.

It is expected that there will be so many entrants that several heats will be necessary. While no distance has as yet been decided upon it is said that the heats will very likely be run over a distance of 5 miles and the final over 10 miles.

The promoter is going to get the advice of the engineers of the Ford Motor Co. as to the distance most suitable or advisable.

—

No Race for Corona?

CORONA, CAL., Sept. 22—There is only a possibility of a 1915 Corona road race. Since the Nov. 20 date has been abandoned, opposition to the race has grown and it is now hardly probable that interest can be kept up until the highways into Corona are completed. It is known that the Contest Board will not sanction the race this year unless there is a 75-ft. safety zone between the outer edge of the course and the guard rail of the grandstand and with the stands placed back of the pepper trees which line the course, it is hardly probable that the race will be a financial success as it would be almost impossible for the spectators to see it.

—

Hyatt Roller Bearing Announces Winners in Talk Contest

DETROIT, MICH., Sept. 27—The Hyatt Roller Bearing Co. has made known the names of the winners in the contest which which it recently promoted to determine the best talks on Hyatt bearings which salesmen are using to automobile prospects. The winners who are listed in an attractive booklet entitled. "The Six Best Sellers," are as follows: F. E. Cerf, retail sales manager, Ralph Temple Automobile Co., Chicago; Henry Crowther, vice-president Crowther Motor Co., Philadelphia; Albert Hoyt, Chevrolet Motor Co. of Illinois, Chicago; J. E. Staley, Holsman-Stevens Automobile Co., Des Moines, Iowa; Curtiss M. Betts, Mitchell Automobile Co., Chicago; L. S. Vaughn, Oklahoma-Oakland Co., Oklahoma City. In addition prizes and special mention were awarded the following: A. R. Meyer, sales manager, Albaugh Motor Sales Co., Cleveland; G. A. Volbrey, Weber Implement & Automobile Co., St. Louis; Thomas A. Murphy, Ford Motor Co., Portland, Ore.; Edward Coyle, De Luxe Automobile Co., St. Louis; E. B. Valtzay, Warner Gear Co., Detroit; C. W. Ingrayn, Driggs-Seabury Ordnance Corp., Sharon, Pa.; J. A. Baird, General Motors Truck Co., Pontiac, Mich.; T. M. Leahy, Mitchell-Lewis Motor Co., Racine, Wis.

—

Indianapolis Race on Oct. 9 Abandoned

INDIANAPOLIS, IND., Sept. 27—The special invitation 100-mile race which was scheduled to be held on the speedway here, Oct. 9, and for which the American Automobile Association had granted a sanction, has been declared off. It is believed the cause for the abandonment of the contest was the objection of De Palma and Resta to competing against more than one car of the same make in this event. As a preliminary to the race, a 100-mile event for Ford cars had been planned, and though this has been abandoned as well, it may be revived.

—

Goodyear Extends S-V Truck Tire Test

NEW YORK CITY, Sept. 28—The Goodyear Tire & Rubber Co., Akron, Ohio, will extend its special S-V truck tire competitive free test offer for another six months. This will make the offer cover a year instead of the three months originally decided on. The new six months' period will end April 1, 1916. The offer is as follows: Equip opposite wheels—at the same time—one with a Goodyear S-V, one with any other standard make tire of like rated size bought in the open market. If the Goodyear S-V fails to cost less per mile than the other, the company will return its purchase price.

—

Forty-nine Makes at Cincinnati Show

CINCINNATI, OHIO, Sept. 27—Cincinnati's fall exposition given under the auspices of the Cincinnati Automobile Dealers' Association, will be opened at Music Hall, Oct. 2. To date forty dealers representing forty-nine makes of passenger cars and trucks, have applied for show space. Thirteen accessory houses have so far closed for space.

Topeka Dealer Show Is Success

Have Building of Their Own—Room for 14 Spaces for Exhibition of Cars

TOPEKA, KAN., Sept. 24—The automobile and supply men of Topeka probably got more good out of the State fair than any other group of exhibitors—and their exhibit had been swiftly arranged for, like the things that are done on the spur of the moment. They had a building of their own—and it made such a hit with the fair officials and the county officers, that it may be enlarged.

The automobile men of Kansas—particularly of Topeka—didn't want to take cars to the free State fair and exhibit them in a tent. E. B. Kellam, an old-time Topekan, who had been away for two or three years, got interested, and worked up a plan for the erection of a special automobile building. He and H. H. Southwick of the Southwick Auto Supply Co., and J. R. Cowdrey of the Cadillac Sales Co. got enough subscriptions to pay for a building—then got some more to make the building better.

On a space of 50 by 112 ft. a substantial concrete and brick bed was laid, rising about 3 ft. from the level of the ground, and reached by steps. Posts were set at intervals, and a roof guaranteed for fifteen years raised over this floor. Canvas curtains were installed for walls. The experience of State fair week this year, during which there was a lot of rain, was that canvas walls are adequate—there is no wood inside to be damaged by winter storms or during the summer when the canvas curtains are stored away. And they can be raised for clear sweep for breeze during fair days.

In this Motor Hall are fourteen spaces for exhibition of cars and equipment, each space is 16 by 18 ft. and capable of containing two cars. Each space was filled for the fair. There is a 12½ ft. aisle.

—

Electrical Show in Kansas City

KANSAS CITY, MO., Sept. 24—Albert T. Clark, manager for the Anderson Electric Car Co. here started something in the meeting of the Jovian Electric Club of Kansas City last week, and the result may be an electric show during Electrical Prosperity Week, Nov. 29 to Dec. 4.

—

To Survey for Los Angeles Speedway

LOS ANGELES, CAL., Sept. 23—The Los Angeles Speedway Association yesterday closed a contract with G. P. Robinson, a Los Angeles engineer, to run the preliminary surveys on the 300-acre

tract near Bell Station, recently purchased by the corporation for the purpose of building a speedway. The engineer is to establish levels and grade lines at every 100 ft. for the use of the contractor who is to be in charge of the construction work. The contracting engineer will probably be George H. Shank of Chicago, who is now in Los Angeles making his headquarters at the offices of the speedway corporation.

—

Chicago Clubs in Reliability

CHICAGO, ILL., Sept. 23—The fall Interclub reliability team match between the Chicago Athletic Association, Chicago Automobile Club and the South Shore Country Club to Joliet and return, yesterday resulted in a division of honors between the C. A. A. and C. A. C. The Chicago Athletic Association won the Mayor's cup, which went to the team having the lowest total amount of penalizations, while the Frank X. Mudd trophy, offered the team having the greatest number of perfect scores, was won by the Chicago Automobile Club. The South Shore Country Club had only two of its members penalized, but one of them accumulated a total of 248 points.

—

8000 at Los Angeles Show

LOS ANGELES, CAL., Sept. 23—The attendance at the automobile show staged at the Shrine Auditorium here, under the management of Walter Hempel, has shattered all records. There were 1400 machines parked outside the auditorium on opening night and the attendance was figured at 8000. Upon an average, 5000 visitors have attended the show each night.

—

Brand Co. Has Pierce in Ohio

CLEVELAND, OHIO, Sept. 28—Pierce-Arrow cars and trucks will be handled exclusively in Cleveland and adjacent counties in Ohio by the Fred P. Brand Motor Co. Mr. Brand assumed full ownership and charge of the business last week and already has under way extensive plans in forming a progressive selling campaign. The new company will inaugurate a service station.

—

County Sales Tour a Success

CHAMPAIGN, ILL., Sept. 25 — The Champaign County Automobile Trade Association gave a show tour through the county on Wednesday and Thursday, Sept. 29 and 30. Thirty 1916 models comprised the caravan accompanied by as many salesmen. A few minutes was spent at each place and it is believed that the tour will prove effective in interesting the people of the smaller cities in automobiles and increase the number of sales. It is planned to make these tours twice a year hereafter.

Sales Feature Show at Springfield, Ill.

—

Despite Rain, Cold Weather and Other Handicaps Dealers Did Well

SPRINGFIELD, ILL., Sept. 24—Political aspirations of Illinois gubernatorial candidates compensated to a certain degree for lack of a certain class of attendants at the Illinois State fair by reason of the hoof and mouth disease epidemic which kept so many from the farming districts away. The fair which began Sept. 17 had two days of rain, one day church session, two days of cold weather and finally on the sixth day of a nine-day event an attendance which broke any record for a number of years, brought many to the extensive automobile exhibit, and resulted in many sales and good prospects for future sales.

Automobile exhibitors at the fair are almost unanimous in the opinion that the present method of exhibiting cars is antiquated and loses much of its value through their being scattered about the grounds and sandwiched in between other exhibits of every description. They believe that something should be done to segregate the car exhibits where for purposes of comparison as to finish and detail of construction examination may be more readily accomplished by persons interested. The success of the Milwaukee show last week virtually has been shouted from the house tops; at least it has been heard by exhibitors at the Illinois State fair and considerable comment has been heard, which may result in similar action next year here.

Good Year for Farmers

It is interesting to note the wide range of opinion expressed as to the benefit to be derived from exhibiting cars at the fair, especially this year. Dealers, who have been taking their new models to the fair show for the last six or seven years, find conditions changing every year and many of them look upon the material reductions in prices as a controlling factor in selling the farmer a car. Several dealers expressed the opinion that inasmuch as the farmer's money comes more slowly than that of the city buyer, he naturally spends it somewhat more conservatively and for that reason becomes a more ready purchaser this year since he appreciates that he is getting as good if not a better car for less money than he could have done previously.

One thing more noticeably evidenced this year than heretofore is the fact that the farmer has graduated from the low to the medium priced car, in other words those selling from $1,000 to $1,500. Careful survey of the various exhibits develops the fact that fully one-third of the cars shown have been sold on the spot, and before the end of the fair it is likely dealers will have very few cars to take out of the grounds. Several times to-day persons were heard to inquire if they might have certain exhibited cars immediately, or when the fair was over.

Much interest was shown in the farm tractor demonstrations held at intervals in a field adjacent to the grounds. The International Harvester Co. demonstrated its tractors issuing pass-out checks to all those who wished to go out of the grounds to watch the plowing.

Many New Agencies

Many new agents have been appointed during the week and some exhibitors have arranged for enough demonstrations to keep them busy for several weeks. Incidentally it might be said that these demonstrations are not confined exclusively to Illinois, one dealer in particular having arranged demonstrations in four adjoining States.

—

Barnes Resigns from Overland

TOLEDO, OHIO, Sept. 25—Claire L. Barnes has resigned from the Willys-Overland Co., Toledo, after having spent two years of special work for which President Willys engaged him. His resignation is to take effect Jan. 1. Mr. Barnes' knowledge of the material and parts business gave him an opportunity in securing favorable prices and satisfactory deliveries of materials for the various Willys plants.

—

Kirk Opens Toledo Office

TOLEDO, OHIO, Sept. 25—Ezra E. Kirk has re-entered the automobile field by becoming a manufacturers' distributor with offices at 719-725 Jefferson Avenue, this city. He will handle a number of lines for automobile parts and accessories makers who are seeking representation in the Middle West section.

—

Hutchinson Returns to Hupp

DETROIT, MICH., Sept. 25—O. C. Hutchinson, in charge of distribution in the East for the Hupp Motor Car Co., has returned to Detroit, where he will have charge of Hupmobile branches and other duties. V. C. Scriven succeeds him, heading the Hupp Motor Car Co. of New York.

—

Kansas City Dealers' Tour Oct. 11-16

KANSAS CITY, MO., Sept. 24—The Automobile Dealers' Association of Kansas City has arranged for its annual trade tour, to begin from this city on the morning of Oct. 11 and continue until Oct. 16, taking in the leading towns of western and southwestern Missouri and eastern and southeastern Kansas. The association will not undertake to cover

over 500 miles, and will devote 4 or 5 hr. in each city to talking good roads and showing cars. Upwards of forty cars will participate.

Included in the planned itinerary are Warrensburg, Clinton, Appleton City, Nevada, Lamar, Carthage, Webb City, Joplin, Pittsburgh, Ft. Scott, Pleasanton, Ossawatomie, Paola and Olathe.

—

Chicago Electric Association Disbands

CHICAGO, ILL., Sept. 28—The Electric Garage and Dealers' Association, which was formed a short time ago, was disbanded last night at a meeting held in the hotel Metropole. Soon after the formation of the body, an effort was made to join it to the Chicago Garage Owners' Association as a section but dissension arose. The garage association foresaw a possible change in name being necessary and objected to the electric men coming in as a section, holding they must come in as individual members. The Anderson Electric Car Co. and three others withdrew at the meeting last night and it was voted unanimously to disband and join the Electric Vehicle Association. The funds remaining in the treasury were turned over to charity.

—

Only 33 Jitneys in Louisville

LOUISVILLE, KY., Sept. 24—Adverse legislation has curtailed the number of jitneys in Louisville. Only thirty-three cars are now being operated on five streets by the Louisville Jitney Bus Co. Back in April when the movement was at its zenith, 300 jitneys were competing with the street cars.

The latter part of April an ordinance was passed by the city council requiring jitney operators to give a $5,000 indemnity bond, and pay $10 for annual license for cars with eight passengers, $20 for cars carrying eight to fifteen passengers, and $25 for larger cars. The above licenses are not in lieu of other licenses already required.

The new ordinance drove practically all of the operators out of business, when it was enforced about a month later. The Louisville Jitney Bus Co. was organized and thirty-three cars have been operated ever since by this concern under one $5,000 bond.

—

$100,000 N. J. Jitney Co. Formed

JERSEY CITY, N. J., Sept. 24—Articles of incorporation of the Auto Hack Co., this city, have been filed. The company has a capital of $100,000 and will start business Oct. 1 with five seven-passenger cars, which will run in Bergen Avenue and Montgomery Street to the Pennsylvania ferry. The company intends to do jitney business.

Jitneys Win Fight in Richmond

$500 Bond Ordinance Repealed and Cars Resume a 5-Cent Service

RICHMOND, VA., Sept. 27—After a legal fight which started in the police court and terminated in the Virginia Supreme Court, in which the city of Richmond was sustained in its fight to place an indemnity bond of $500 on each car thus engaged, Richmond is again enjoying jitney service, though the number of cars is not as great as heretofore because of the high cost of gasoline.

After the city was sustained in upholding its ordinance, citizens of the West End held a mass meeting and urged the City Council to give the jitneys new life. The fight was carried into the Council chamber, and as a result the ordinance was repealed. Mayor George Ainslie signed the repeal papers, and on Wednesday the 5-cent fare cars began regular service. The jitneys are regulated as to the number of passengers they shall carry—no passenger being allowed on the running boards on the doors of the cars. The regulations as to routes are being adhered to and all of the city regulations are being recognized.

The Motor Transit Corp., a subsidiary of the Virginia Railway & Power Co., which put on about forty cars, withdrew the same from service after the independents had been driven to cover because of adverse legislation, and announced that its losses had been about $700 per month besides the wear and tear. The Motor Transit Corp. will not put back the jitneys, but will continue the operation of several large motor buses as feeders for the street cars. It is probable that later transfers will be given from the motor buses to the street cars operating in opposite directions.

—

Montreal's Jitneys Vanish

MONTREAL, QUE., Sept. 27—Montreal's jitney service has passed away quietly after a fitful existence of about two months. Started in the middle of April, they enjoyed a fair measure of success at the start, but the service was gradually decreased, and was finally dropped in the middle of July when the Jitney Association of Montreal suspended its operations. The chief cause for the failure of the innovation, as given by one of the promoters of the Association, was lack of co-operation and discipline on the part of the drivers.

—

Jitney Insurance Exchange Enters Field

KANSAS CITY, MO., Sept. 23—The National Indemnity Exchange, insuring jitneys and livery cars, has been licensed in Missouri, Oklahoma and Minnesota, and is writing an especially long line in the last-named State. Application is now being made in Arkansas, where it is said many jitney owners wish insurance, and California and Pennsylvania will be entered next. Recently the company received a communication from a jitney organization in New Orleans urging it to enter that city, but Louisiana has no laws under which an interinsurance concern could be licensed. The same situation prevails in Texas. Hundreds of cities have jitneys now which will be eliminated from the streets upon the enforcement of ordinances requiring heavy bond, and in other cities similar present legislation operates against the entrance of the insurance company.

—

Holds Jitney Ordinance Illegal

BALTIMORE, MD., Sept. 25—The city ordinance placing an annual tax of $25 per seat on jitney buses has been held to be illegal by Judge Elliott in the Circuit Court, Part 2, on the grounds that the law is discriminatory and prohibitory. The decision is a real victory for the jitney owners. It is probable that the city will take an appeal in the case or that the city council will be called upon to pass another ordinance regulating jitneys.

The Public Service Commission and members of the Automobile Commissioner's force will hold a conference next week at which time they will talk over plans to enforce the rule handed down by the commission which prohibits the overloading of jitneys.

—

Special License for Solid Tires

BALTIMORE, MD., Sept. 25—City Engineer McCay, of Baltimore, has given until Oct. 1 for owners of solid tired motor trucks to take out the special license for these vehicles.

—

Jitneys Decrease in Washington

WASHINGTON, D. C., Sept. 25—Since the jitneys were placed under the jurisdiction of the Public Utilities Commission the number of machines in use has decreased from sixty to thirty. Eight companies and individuals are now operating jitney buses here. Within the last month two companies operating buses have had financial difficulties and one of these companies has suspended operations because its machines were seized for non-payment of the purchase price. Aside from putting them under the control of the Public Utilities Commission there has been no legislation here affecting the jitneys.

A license fee of $12 is required for each machine carrying ten or more passengers and $6 for each machine carrying under that number. In addition a personal tax of 1½ per cent of the assessed value of each machine is levied.

Factory Miscellany

Selden Starts Addition—The Selden Motor Vehicle Co., Rochester, N. Y., is excavating for an addition to its plant on Probert Street.

To Make Spring Starters—G. L. Rock's spring starter will be manufactured in Jonesville, Mich. A building formerly used for automobile assembling will be used.

Falls Rubber Plant Ready—The Falls Rubber Co.'s plant in Cuyahoga Falls, Ohio, is nearly ready for operation. The new machinery has arrived and is being installed.

Remington Buys Vaughan Plant—The Remington Motor Co. has bought the plant formerly occupied by the Vaughan Motor Car Co., Kingston, N. Y. This plant has been idle for two years.

New Paige Addition—A building permit was obtained to-day by the Paige-Detroit Motor Car Co., Detroit, Mich., for a four-story addition, 312 by 60 ft., the cost being estimated at $61,500.

To Erect Plant—The E. E. Wentworth Corp. of Maine, that has the entire distribution of Overland cars for the State, is to erect a big plant at Springvale for the manufacture of cars, bodies, etc. It will cost $50,000.

To Make Signals—The Sherman-Crane Automobile and Signal Co., Denver, Col., manufacturer of automobile direction signals, has written to the St. Paul Association of Commerce regarding a proposed site in the Midway district. The company is capitalized at $100,000.

Studebaker to Build Testing Track—The Studebaker Corp. has effected a lease for a large tract of river frontage, directly across from plant No. 3. This is to be used as a testing park for Studebaker cars as they come out of the factory. The corporation will build a track on the grounds.

To Make Automobile Hardware—The Keeler Brass Co., Grand Rapids, Mich., makers of automobile hardware, metal specialties, etc., will immediately commence the construction of an addition to its plant, 150 by 200 ft., to be used for cutting operations with punch presses and automatic screw machines.

Seattle Co. to Build—The Western Automobile Co., Seattle, Wash., has been incorporated with $1,000,000 capital stock, by C. A. Cawley, G. L. Grant and S. L. North. The company has acquired a factory at Rainier Avenue and Lane Street, Seattle, and will establish an assembling plant and machine shop.

Firestone Foremen Hold Outing—Sept. 18, foremen, superintendents and officials of the Firestone Tire and Rubber Co., Akron, Ohio, to the number of 200 motored 60 miles to the old Firestone Homestead at Columbiana, Ohio, where they spent the day as the guests of President H. S. Firestone. It was the third annual Homestead Outing.

Lakey Foundry to Enlarge—At a meeting of the directors of the Lakey Foundry Co., Muskegon, Mich., it was decided to enlarge the plant and double the number of men employed. The foundry now occupies 25,400 sq. ft. of floor space and when the additions are completed the floor space will be 43,600 sq. ft., while the working force will be increased from 200 to 400.

Sphinx Ships Delivery—The Sphinx Motor Car Co., York, Pa., which recently made the announcement of putting on the market a light-weight delivery car, shipped the first car from the factory this week. The car sells for $695, the same price as the touring car manufactured by the Sphinx company. It is of 1000 lb. capacity and is equipped with an electric lighting system and self starter. Increased shipments of Sphinx cars are being made from the factory.

No Homes for Muskegon Workmen—Like Flint, Pontiac and other Michigan automobile manufacturing centers, Muskegon, Mich., is now facing the serious problem of being able to house all its workers. When the additions to the Continental Motor Mfg. Co.'s plant will be finished, 1200 more men will be employed. Several other plants, such as the Campbell, Wyant & Cannon Foundry Co., the Lakey Foundry Co., the Muskegon Motor Specialty Co., will add several hundred men to their forces, although there are hardly any houses for rent now. One real estate company which had sixty-three homes for sale two months ago now has only four unsold, and another which had more than thirty now has none. There is talk of getting city officials and leading citizens together to organize a corporation with a capital of possibly $100,000 for the purpose of building several hundred houses at once.

The Automobile Calendar

Sept. 26-Oct. 10	Denver, Col., Show, International Soil Products Exposition. Automobile Trades Assn. of Colorado.

The Week in the Industry

Watson a Service Head—The Kent Motors Corp., New York City, distributor for the Abbott and Marion, has appointed William Watson superintendent of service.

Hobert Handling Master Carbureter—T. R. Hobert, formerly with the Peerless Motor Car Co., Cleveland, is now handling the Master carbureter in St. Louis, headquarters being at 5205 Delmar Avenue.

Wickham Resigns from Minneapolis Studebaker—F. A. Wickham has resigned his position with the Minneapolis branch of the Studebaker Corp., having been with it for more than five years. He is planning organizing a company to handle tires.

Barnett King Factory Rep.—I. S. Barnett, until three weeks ago president of the Kentucky Automobile Co., Louisville, Ky., Cadillac dealer, has been appointed factory representative of the King in Kentucky and southern Indiana, with headquarters in Louisville.

Recent Haynes Appointments—J. C. Tegder has been made assistant sales manager of the Southern department of the Haynes Automobile Co., with headquarters at Atlanta, Ga. F. B. Cornell and Harry Chalfant have been appointed district representative and service department head, respectively, with headquarters at Atlanta.

Smith in Charge—G. A. Smith has been detailed by the Ford Motor Co. to take charge of the service and repair departments of the Everyman's Car Co., corner of Sparks and Kent Streets, Ottawa, Ont. The latter has been delegated the exclusive right to sell Ford cars in Ottawa with sub-dealers at Vankleek Hill, Russell, North Gower, Casselman and Aylmer. Its big new plant is now in operation.

—

Dealer

Louisville Co. Adds White—The Callahan Motors Co., 811 South Third Street, Louisville, Ky., agent for the Scripps-Booth and Chandler cars, has acquired the agency for the White in the Louisville territory.

Mitchell in Salt Lake City—The Meredith Automobile Co., Salt Lake City, Utah, has taken on the Mitchell. The company is located at 65 West Fourth South Street. J. B. Hamby is sales manager. The company has taken on the distribution for Utah, Idaho and Wyoming.

Motor Men in New Roles

Beltzig Firestone Office Mgr.—E. H. Beltzig has been appointed office manager of the St. Louis branch of the Firestone Tire & Rubber Co., Akron, Ohio.

Shetter Heads York Co.—The Penn Auto Co. has opened sales rooms at 31 West Philadelphia Street, York, Pa. G. W. Shetter is the manager of the new company.

Yancey a Manager—L. T. Yancey of St. Louis, has been appointed manager of the service department of the Columbia, Mo., branch of the Hudson-Phillips Motor Car Co.

Oswald Heads Louisville Co.—The Reliable Double Tread Tire Co. has opened an office and workshop at 907 West Broadway, Louisville, Ky. J. F. Oswald is the new manager.

Cooper Goes to Topeka—J. R. Cooper, formerly factory representative of the Overland at Kansas City, has been made manager of the truck department of the Overland at Topeka, Kan.

Curtain Resigns—T. E. Curtain has resigned as sales manager of the Columbus Cadillac Co., Columbus, Ohio, to engage in business for himself. His plans for the future have not yet been made public.

Ranney Heads Seattle Willard—The Storage Battery Service Co. of 1532 Broadway, Seattle, Wash., has been appointed agent and service station in Seattle and surrounding territory for the Willard storage battery. L. J. Ranney is manager of the firm.

Fisher Retires—R. T. Fisher has retired from the Campbell-Fisher Sales Co., Columbus, Ohio, Madison distributer, and will devote his time to other interests. H. B. Gilchrist, vice-president of the company, will assume the duties of secretary and treasurer.

Thomas Resigns from Moline—J. V. Thomas, who has been associated with the sales department of the Moline Automobile Co., East Moline, Ill., for the past year, has resigned. He will be succeeded by D. M. Beal, who has been manager of the branch in Omaha.

Campion Handles Swinehart Tire—Ed Campion, former sales manager of the Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio, and former manager of the Seattle branch of the Firestone Tire & Rubber Co., has opened a distributing house for Swinehart tires in Seattle. His territory embraces the States of Washington, Oregon, Idaho and Montana and the Canadian province of British Columbia. Campion's store is located at 909 East Pike Street.

Returns to Ranney Staff—W. H. Van Deusen, formerly in charge of the wholesale department of the A. Elliott Ranney Co., New York City, and since June wholesale manager for the Carl H. Page Motors Co., is again associated with the Ranney company in charge of the wholesale distribution of King cars.

Patten Succeeded by Buse—R. H. Patten has resigned his office as vice-president and general manager of the Buse-Patten Motor Car Co., Buffalo, N. Y. Gustave Buse will succeed him in the management of the company which distributes Grant, Hupmobile, National and Moon cars in Western New York.

Foss Pierce Commercial Mgr.—W. J. Foss has been appointed commercial manager of the Pierce-Arrow Motor Car Co., Buffalo, N. Y. Mr. Foss has been associated with that company for the last 10 years as treasurer of the Foss-Hughes Co., distributor of that car in Philadelphia, Baltimore, Washington, Wilmington, Providence and Newport.

Guyon Joins Elyria Co.—F. R. Guyon has left the American Ball Bearing Co. to become assistant manager of sales of the Elyria Iron and Steel Co. The executive offices of the Elyria concern have recently been moved to Cleveland.

—

Dealer

Master Carbureter in Cincinnati—The Carbureter Sales Co. has been organized in Cincinnati, Ohio, by C. Shuster and Edward Voss, Jr., to handle the Master carbureters. Headquarters have been opened at Court and Elm Streets.

Packard Service Bldg. in Chicago—An addition is planned for the Packard Motor Co. of Chicago. The new structure will cost $125,000 and is located at 2338-42 Indiana Avenue, just north and in the rear of the present property at Michigan Avenue and 24th Street. It will be completed by Jan. 1. Fireproof construction will be utilized on the five-story service station. It is to have a frontage on Indiana Avenue of 78½ ft. and will be 160½ ft. deep.

To Make Tires—The Huntington Tire & Rubber Co., Huntington, W. Va., capitalized at $25,000, will make automobile tires in that city. The plant will have a capacity of fifty tires a day. The incorporators are F. M. Bailey, J. F. Schmidlapp, J. M. Thornburgh, P. M. Walker and Roy Bailey.

New Garage for Canton—Oscar Sogan and J. C. Opperud have bought the White Front garage at Canton, S. D., from Elling Ellingson.

Ward Makes N. Y. Lease—The Ward Motor Vehicle Co., New York City, has leased a store and basement at 1838 Broadway, New York City.

Handles Gray & Davis Line—Jenkins & Robinson, proprietors of the Blue Ribbon Garage, at 69 Central Street, Worcester, Mass., have been appointed representatives for the Gray & Davis equipment and a service station has been installed.

First Municipal Garage in Texas—The first municipal garage ever established in Texas, is located at Dallas. It is in charge of chief mechanic G. L. Vaughan. It is fully equipped for the work and was established only a few weeks ago.

John & Arthur Moves—The John & Arthur Co., one of the biggest accessory houses at Boston, Mass., has been forced to vacate its salesrooms at 117 Massachusetts Avenue because it has outgrown them, and it will be located at 165 Massachusetts Avenue shortly after Oct. 1.

Pope Parts Service in Mass.—Owners of Pope-Hartford cars in Massachusetts and the northern New England States are to be taken care of in the matter of new parts by the Pope-Hartford Co. of Boston, which in the future will carry a complete line for the various models.

The Hartford Motor Car Co., Hartford, Conn., is enlarging the parts plant and is going into the manufacture of all parts for these cars on a larger scale then ever before.

New Stations Completed—The new service stations under construction at Springfield, Mass., one at Winchester Square for the Corson-Berry Co., agent for the Studebaker, and the other at 600 State Street for M. G. Barrett, who has the Metz line, have been completed.

Maguire to Build—J. W. Maguire, who has sold the Pierce-Arrow at Boston, Mass. for years, has petitioned the city authorities to grant him a permit to build a service station at 1061 Commonwealth Avenue, right beside the structure now owned by the Packard Motor Car Co.

Packard Buys Land in Cleveland—The Packard Company will build a $125,000 fireproof structure running from Prospect Avenue, S. E., to Carnegie Avenue, Cleveland, Ohio, to be used as an agency. The building will be two stories with a 98-ft. frontage on Prospect Avenue, and a 322-ft. depth.

Baltimore Trade News—The Double Mileage Tire Co., Inc., of Buffalo, N. Y., has opened a branch at 533 North Howard Street, Baltimore. It is said that other branches will be opened in other parts of Maryland.

The new headquarters of the Baltimore Buggy Top Co., 107 West Mount Royal Avenue, Baltimore, have been formally opened. H. D. Coulson is in charge.

The Wayne Oil Tank & Pump Co., North Avenue near Linden Avenue, now is handling the products of the company of Fort Wayne, Ind. The members of the local agency are H. Winternitz, Jr., and M. J. Gutman.

The Beehler & Ogden Motor Company, Lexington Street, near Carey Street, has taken the agency of the Allen cars.

Colorado Trade News—J. A. Nisbet, who recently secured the Scripps-Booth agency for Colorado, has moved into permanent quarters at 1551 Broadway, Denver.

A. C. Friedman has started a plant for making over old tires at 1241 Broadway, Denver, under the business name of the Western Double Tread Tire Co.

The Platt-Fawcett Motor Co., 1249 Broadway, Denver, Stearns and Mitchell distributor, has taken the State agency for the Paige, which was recently given up by Lester G. Palmer.

George Stroehle Sons, Idaho Springs, Col., are planning to build a garage next month. The building will be 60 by 110 ft., and will be arranged for an accessory display. C. K. Miller, at present in charge of the automobile work machine shop, will be manager of the new garage.

Late Ill. Trade News—Donald Joy has taken the agency for the McFarlan car for Morgan and adjoining counties in Illinois, and will make Jacksonville the distributing point.

J. B. Harris of 116 East Washington Street, Springfield, has taken the agency for the National car.

Naffziger & Holderly of Minier, Ill., have taken the agency for the Argo.

The Frank H. Cole Motor Car Co. has outgrown its present quarters at 217 East Front Street, Bloomington, Ill., and has leased the double building of two stories, now occupied by the Bloomington Motor Co., distributor for the Ford car. The latter company is completing a large, fireproof building of three stories at 305-11 West Jefferson Street and, as soon as possession is taken of the new structure, the Cole company will move into the one vacated. The changes will be made about Oct. 1.

Late St. Louis Items—The George C. Brinkman Motor Car Co., 2818 Locust St., St. Louis, Mo., has been appointed distributor of the King line in the St. Louis district, including the eastern half of Missouri and the southern half of Illinois.

The Illmo Motor Mdse. Co. has moved into its new quarters at 1174-76 North Kingshighway, where it will handle Michelin tires and a full line of oils, accessories and supplies and is equipped with a complete vulcanizing plant. H. F. Goudy is manager.

The Independent Tire Co., 3150 Locust Street, St. Louis, Mo., will triple its space in the near future. The company has leased the building at 3152 Locust Street recently vacated by the Koochook Rubber Co.

The Missouri Auto Specialty Co. has doubled its sales room space and service capacity by moving into its newly equipped building at 1903-1905 Locust Street.

Philadelphia Automobile Agencies Combine—The Stearns Motor Car Co. of Philadelphia and the Eveland Motor Car Co. have been consolidated under the firm name of the Yerkes-Eveland Co., to handle the Stevens-Duryea account, the Stearns-Knight and the Stewart truck. For the present the locations of the two organizations will remain as heretofore, namely on Ridge Avenue above Broad Street for the Eveland company, and the northeast corner of Broad and Mount Vernon Streets for the Stearns. The main offices will be at the latter location and the main service station at the first-named address. Plans are under consideration, however, to merge the two establishments at one location, the truck department to be conducted separately under H. C. Minor. Officers of the new concern are: William C. Yerkes, formerly of the Stearns company, president, and Winsor Eveland, formerly of the Eveland Motor Co., vice-president and general manager.

Toledo's New Garage—What is said to be the most modern, most completely equipped and one of the largest garages in the Middle West is the new home of the United Garage at the corner of Jefferson Avenue and Ontario Street, Toledo, Ohio. The new home contains 60,000 sq. ft. of floor space and occupies the five-story and basement structure formerly known as Burt's Theatre. The building has been completely remodeled and rebuilt. The building is constructed of brick and concrete and is equipped with automatic sprinkler system and automatic fire alarm. Among the other modern features of the garage are rest and retiring rooms for ladies, shower baths for tourists, electric elevators of the largest size, that travel 60 ft. a minute, tire-inflating service to every foot of space in the entire structure, equipment to wash two cars at once in the shortest possible time, a service and repair department that will overhaul a car in a few hours' time, so that tourists will not be delayed, and special road and travel information bureau.

Recent Incorporations in the Automobile Field

Canada

HAMILTON, ONT.—East End Garage Co., $40,000. F. A. Robertson, C. R. Robertson, G. S. Dunkin.

OTTAWA, ONT.—Auto Products Co.; $250,000. W. J. Halpin, P. J. Daly, L. R. O'Connell.

OTTAWA, ONT.—Everyman Car Co.; $40,000. A. M. Jacques, F. H. Jacques, C. A. Jacques, J. W. Nicoll, R. I. Schram.

VANCOUVER, B. C.—Ford Lock Co.; $25,000; maker. B. P. Youmans, J. M. Hoff, G. B. Simpson.

DETROIT—Hurst Garage Co.; $1,000. H. W. Hurst, A. E. Badge and J. C. Shields.

DETROIT—H. P. Engineering Co.; $1,000. H. E. and O. A. Peters, E. R. Holmes.

DETROIT—Cole Tire-Protector Co.; $100,000. F. S. Baker, S. M. Cole, H. M. Cole.

WYANDOTTE—Detroit-Wyandotte Motor Co.; $300,000 to $100,000.

Minnesota

MINNEAPOLIS—Twin City Cord Tire Co.; $50,000. C. A. Ennis, M. A. Hessian, C. L. Archer.

Missouri

JEFFERSON CITY—Battery Service Co. of St. Louis; $3,000. W. O'Shuhre, M. J. Cline, E. B. Jennings.

JEFFERSON CITY—The Motor Transportation Co. of St. Louis; $10,000. H. C. Stifel, R. A. Huber, N. C. Hadley.

ST. LOUIS—Velie Automobile Co.; $7,500. H. L. Schnure, A. Steiner, W. L. Hausman.

ST. LOUIS—H. Bender Tire Co.; $2,000. S. Vazis, H. W. Killersman, C. F. Mieke.

ST. LOUIS—H. S. H. Mfg. Co.; $10,000; maker of radiator caps. P. G. Hoffman, H. A. Hood, Garrard Strode.

New Jersey

NEWARK—Self Vulcanizing Rubber Co.; $25,000.

NEWARK—Empire Mfg. Co.; $25,000; spark plug maker. J. L. Cobb, F. J. Miles, W. P. Murphy.

New York

BROOKLYN—Delling Auto Co.; $10,000; dealer. J. A. Lederman, B. L. Lockwood, M. M. Salomon.

BUFFALO—Transmission Ball Bearing Co.; $100,000; maker. W. J. Murray, J. P. Beatty, W. M. Wilson.

BUFFALO—Derrick, Gannon Motor Sales Co.; $10,000. R. L. Derrick, F. T. Gannon, J. G. Lesswing.

ROCHESTER—Double Mileage Tire Co.; $10,000; manufacturer. F. L. McCausland, Warren Bulkeley, J. Mahker, 319 Electric Avenue.

ROCHESTER—Big Six Auto Livery Co.; $25,000. J. Rodenbecker, C. J. Trumeter, C. R. Bradley.

UTICA—R. and V. Motor Co.; $10,000. W. A. Van Wie, J. M. and G. B. Russell.

New York City

Duffy Motors Corp.; $5,000. L. J. Goldman, G. S. Ludlow, S. C. Duffy.

Lexington Motors New York Corp.; $50,000. F. I. Barrows, A. A. Woodruff, W. S. Fowler.

O'Toole Motor Renting Service; $5,000. A. J., J. J. and T. F. O'Toole.

Utilities Sales Assn.; $5,000; parts. D. Doell, B. Sommer, F. H. Hull.

United States Auto Service Corp.; $50,000. J. De Barbier, J. Condon, L. Ferger.

Schuyler Garage & Supply Corp.; $5,000. John Irving, Beatrice Irving, J. F. Ford.

Westchester Accessories Co.; $5,000. P. M. Pelletreau, B. J. Wagner, C. H. Ludder.

North Carolina

ACME—Moore and Connor Co.; $10,000; automobiles and accessories. T. V. Moore, D. R. Connor, E. P. Moore.

Ohio

ASHTABULA—Ashtabula Auto Sales Co.; $4,000. G. A. Brockway, G. M. Parker, W. H. Collender, J. C. Moran, M. C. Collender.

CANTON—Auto Garage and Sales Co.; $10,000. J. H. Boose, E. C. Scheffler, E. N. Sweitzer, C. E. Halliwell, A. N. Hurst, R. J. Keeder.

CINCINNATI—Double Life Tire Co.; $5,600. Harry Frank, Sophie Frank, Louis Goldstein, Julius Loewenstein, Ignatz Stern.

CLEVELAND—Cleveland-Ford Tire Co.; $10,000 to $100,000.

CLEVELAND—Brown Spring Oiler Co.; $10,000. W. H. Brown, B. B. Wickham, D. H. Tilden, W. J. Budd, G. M. Reilly.

CLEVELAND—Superior 105 Garage Co.; $10,000. A. Frankel, W. G. Cole, H. Jones, Hazel Cole, Florence Frankel.

CLEVELAND—B. & B. Valve & Motor Co., $1,000. B. A. Beckett, C. C. Vrooman, C. E. Bellen, H. L. Parmenter.

CLEVELAND—Cleveland Automobile Show Co.; $7,500. Richard Inglis, R. J. Bulkley, F. X. Cull, I. W. Sharp, M. T. Flanagan.

COLUMBUS—Columbus Cadillac Co.; $25,000. Morton McGiffin, F. E. Felton, T. B. Bolton, E. S. Jenkins, R. G. Morrison.

COLUMBUS—Fireproof Garage Co.; $10,000. W. D. Huber, A. C. Huber, A. E. Huber, Olive Swift, J. A. Keever.

DAYTON—Fireproof Garage Co.; $10,000. W. D. Huber, A. C. Huber, A. E. Huber, O. M. Swift, J. A. Keever.

FINDLAY—Crofoot Mfg. Co.; $25,000; to make a contrivance for shipping automobiles. E. H. Crofoot, C. L. Casterline, J. E. Fennerty, G. L. Cusac, S. W. Maschoo.

LIMA—Gramm Motor Truck Co.; $1,250,000 to $2,500,000.

OWENSBORO—Owensboro Motor Car Co.; $4,500. O. C. Williams, R. F. Keene, Lee Hart.

SALEM—Porter Rubber Co.; $125,000. J. C. Porter, A. H. Boyd, W. F. Church, C. F. Smith, L. P. Metzger.

SEBRING—Sebring Tire & Rubber Co.; $200,000. John Hotchkiss, W. F. Smith, C. B. Smith, H. D. Weaver, W. B. Stevenson.

TOLEDO—Ohio Tire Service Co.; $1,000. G. W. Henne, M. E. Hubbard, Samuel Lover, J. M. Lover, A. C. Moore.

TOLEDO—Universal Motor Co.; $100,000. Howard Lewis, H. J. Kehoe, F. S. Lewis, P. W. Alexander, F. W. Gaines.

TOLEDO—Jonas Battery Co. changed to Toledo Battery Co.

YOUNGSTOWN—Security Automobile Mutual Insurance Co.; no specified stock; to write automobile insurance. B. E. Cornelius, C. A. Cochran, Phillip Wiel, G. H. Kennedy, E. E. Dennison.

CLARKSBURG—Harrison County Automobile & Garage Co.; $10,000. G. H. Gordon, R. L. Strother, O. L. McDonald, C. E. Ash, J. S. Blackman.

VOL. XXXIII. NEW YORK—THURSDAY, OCTOBER 7, 1915—CHICAGO No. 15

The AUTOMOBILE

Careful Design Gives Lightness

Weight Is Cut from Franklin Car By Careful Choice of Materials and By Elimination of Useless Metal

TO the engineer who is really desirous of learning the secrets of Franklin light weight automobile manufacture, the list of weights of parts and the drawings herewith are practically sufficient a story. The fact that the Franklin has an air-cooled engine probably helps the weight reduction, but each engineer must settle this for himself by making comparison with the weights of parts and assemblies from his own car.

Since the article Cutting the Weight which appeared in THE AUTOMOBILE for Aug. 5, the steady stream of correspondence has proved beyond any doubt, if indeed there was any beforehand, that light weight is the most desirable attribute of the automobile which it most commonly lacks at present, except in isolated instances. Much experiment on the speedways has shown that the weight factor is all-important in determining accelerative power, and that a few hundred pounds saved is the equivalent of quite a large increase in the cylinder capacity of the engine; also it is well known that tire wear and gasoline consumption are connected very intimately with weight.

What Is a Light-Weight Automobile?

There are three classes of automobile from the passenger capacity point of view. The largest is for seven, the medium for five and the smallest for two or three passengers, and it is desirable that there should be developed some notion as to just what is a commendably light weight for each of these three. Manufacturers who have aimed at the greatest luxury have paid the least attention to weight, so we find that the most expensive seven-passenger cars weigh from 4500 to 5000 lb. and the cheaper ones are very little lighter, the weight difference being made up of differences in equipment and in the solidity of accessories.

The five-passenger car is more difficult to place, as its weight varies much more, there being a wider choice of horsepowers than is obtainable in the seven-passenger class. But to make a carefully considered estimation it will be fairly close to 3500 lb. often heavier than this, and seldom lighter. At the other end of the scale, perhaps the Ford is the lightest of all with is approximate 1500 lb. in five-passenger form, and this car being a fairly good performer, there seems plenty of room between the average of 3500 lb. and the minimum of 1500.

When we come to two- and three-passenger jobs they are so seldom specially built that the weight runs almost as high as for the five-passenger, but signs are not wanting that there is a real demand for a three-passenger car which is loaded to capacity with this number of persons. Taking the very few examples that do exist, an average of about 1700 to 1900 lb. is obtained, so that the five-passenger Ford is a good deal lighter than most specially built two-passenger cars.

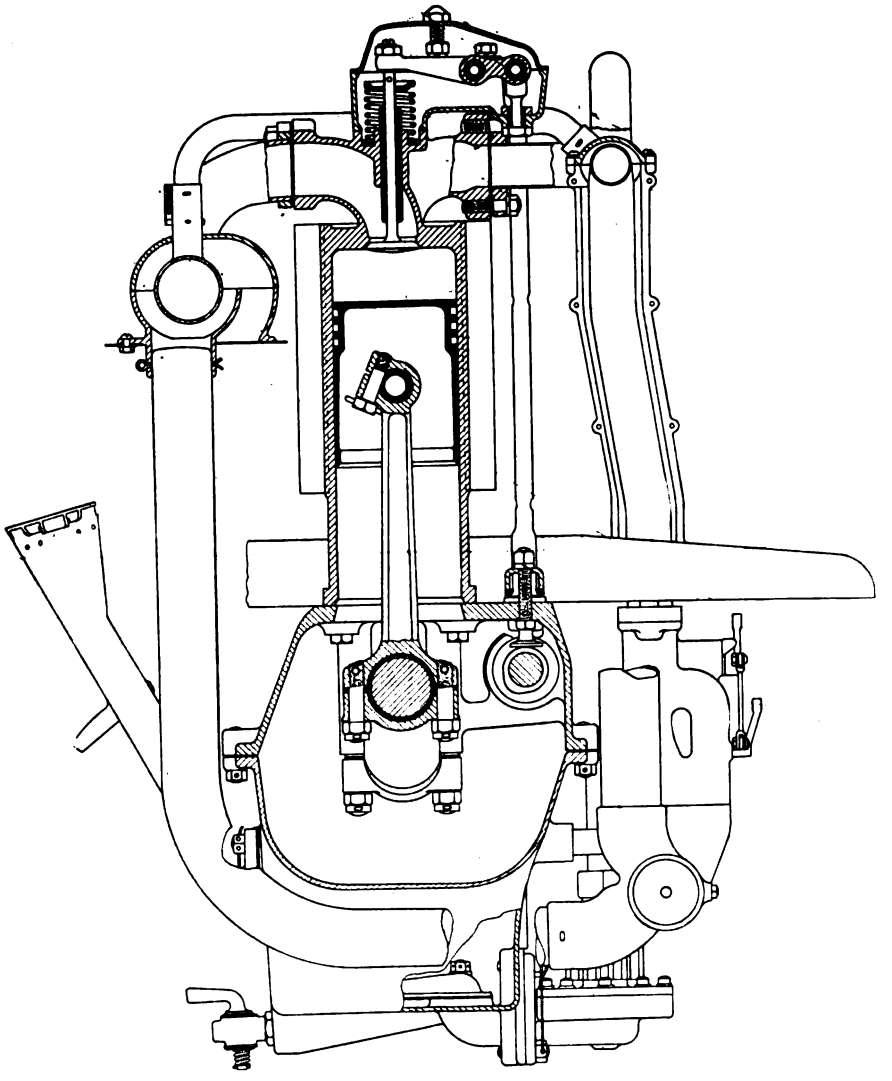
How then can it be said what is "light" and what is "heavy" when such amazing differences as this exist?

In any form of human striving it is always a help to have some target, to have some tangible goal. For the seven-passenger car it might be 3000 lb., for the five-passenger 2250 lb. and for the smallest class of car 1500 lb. The truest of all proverbs is "you never know what you can do till you try" and in weight cutting so few have tried as yet.

Franklin Pioneer in Lightness

Low weight has been a Franklin ideal for years and it is admitted by the company that however light their five-passenger car may be now they hope to make it still lighter as experience suggests new ways for saving. Allowing for manufacturing variations, which is always fairly large in the most carefully made chassis, the average weight of the 1916 Franklin car complete would be approximately 2600 lb. and this lightness is not obtained by any skimping of the essentials.

At the present moment the Franklin company is producing a series 8 car which is the same as the series 7, for which a number of detail weights are given, and it is easy to show the way in which weight is steadily cut out by quoting a few differences between the two series models. Using aluminum instead of steel for the fenders has permitted a *saving* of 38 lb. to be made. Substituting aluminum for steel in other places where sheet metal is used as for the running board shields and dashboard parts, has saved 30 lb. more. Careful analysis of the body construction has enabled wood and metal to the tune of 21 lb. to be eliminated without effect upon the strength, the capacity or the comfort. Redesign of the universal joints and the driveshaft has reduced the weight 5 lb. Just these few things have together cut 94 lb. from the weight and the extra cost is very little, so little that it



This section of the Franklin engine shows the amount of cast iron saved by the air cooling

The wood frame of the Franklin with angle steel supports attached to support the engine and gearset. Observe that there is only one real cross member, this being at the rear end

would be practically nothing were it not for the present high price of aluminum.

Crankshaft Is Heaviest

In the lists of parts chosen more or less at random and arranged in groups in the center columns of pages 640 and 641 will be found parts of every sort of material. The complete assembly weights are hardly so instructive as those of the petty portions because it is only by study of the detail that the assemblies have been kept so light. In the engine it is noteworthy that the crankshaft, wherein weight has *not* been saved, weighs 44 lb. and the six cylinders total 132 lb., exactly three times as much. Here, of course, is a chance for more saving still, as the use of aluminum, which is not impossible with air cooling, would at least halve the cylinder mass. One of the most amazingly light parts is the flywheel disk—6 lb.—but this is merely the back plate and the weight of the wheel when the fan parts have been joined to it is not exceptionally low.

In making power plant comparisons, remember that the total of 637 lb. for the complete engine includes all the cooling system and that the equivalent of the water weighs nothing, so the weight compares with that of a watercooled motor plus radiator plus water. That the valve gear in total is heavier than the valves and operation of an L-head motor is probable but the overhead construction is a great aid to the success of the air cooling.

Riveting a Feature

Throughout the whole chassis it may be noticed in the illustrations that a very free use is made of rivets for effecting permanent junction between parts. Also it may be observed that a very large number of small individual pieces is used so that each piece is quite small and light until it reaches the assembly stage. Naturally, the main object of this form of design is to suit the requirements of the production end of the business, for the Franklin factory system is one of the most elaborate and yet simple of its kind. Facsimile production is assisted by the use of small unit parts rather than heavy pieces, but lightness plays a very large part in swaying the engineering department toward their use.

As an example take the drawing of the clutch which shows the light, stamped steel outer case or shell with the keys that secure the disks attached by rivets. To machine them solid would call for both a heavier stamping or a casting and would add considerably to the cost. Then again in the gearset the gears themselves are separate pieces and are riveted to the countershaft but there are no flanges, merely a slightly raised collar on the shaft to correspond to the position of each gear. The rivets pass through holes drilled half in the collar and half in the gear providing a perfectly secure attachment and a series of driving keys simultaneously. This method eliminates the flange, gives a cheap and simple countershaft and the simplest possible form of gear blank. Further the gear blank being of equal section throughout is stated to be less susceptible to warping in the hardening process.

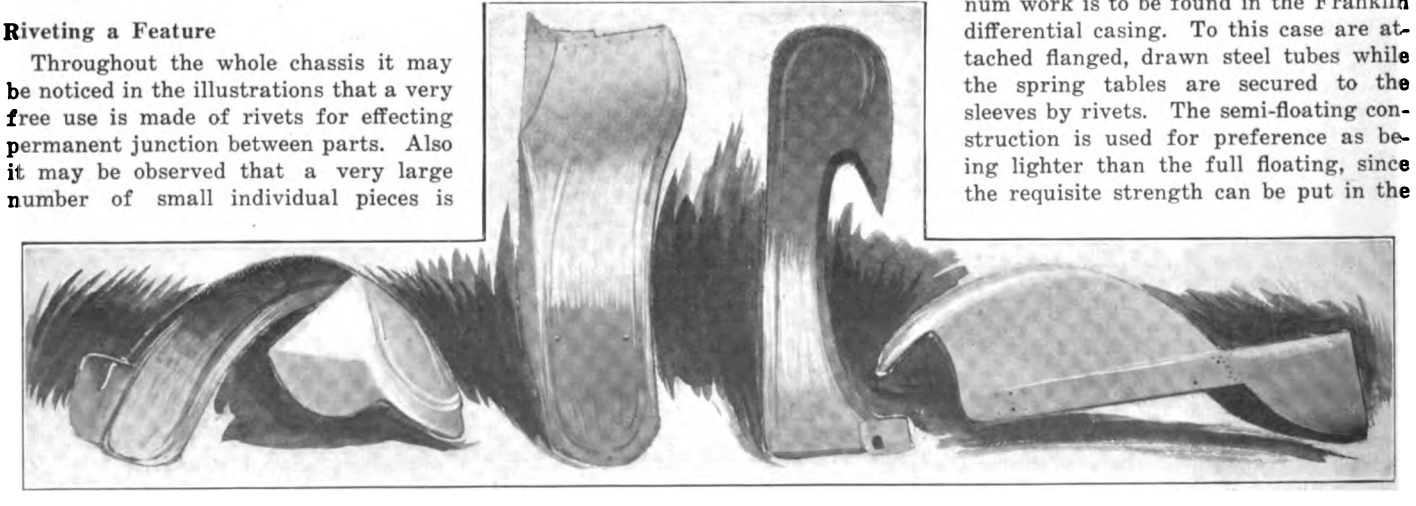
Another lightness feature shown in the gearset section drawing is the service brake, a band lined with Raybestos on a light, wide drum. This brake replaces the usual pair of external brakes on the rear axle with their brackets, bands, pull-off springs, etc. Being of smaller diameter and requiring much shorter linkage to the pedal it cannot weigh as much as half the ordinary service brake. Of course there are some who object to a driveshaft brake, but this is outside the present subject.

It will be granted by any engineer that a good transmission brake is satisfactory if properly designed and the Franklin construction shows how much weight it can save. Incidentally the brake is lighter than the majority of shaft brake designs in general use.

In the same drawing as that of the gearset is the steering gear which is also very light, and it is particularly interesting to learn that the Franklin Co. uses malleable iron for the case because, with the riveting system of assembly the lightest job is obtained with a fairly hard and strong material. Aluminum has been tried for this gear inclosure, but when the construction is modified to suit it the final result is not lighter than that in use. It may be observed that there is no waste metal in the gear, the malleable iron casing conforming closely to the configuration of the worm gear inside.

Rear Axle Complete 253 Lb.

The Franklin Co. was among the first users of die-castings and one of the neatest examples of permanent mold aluminum work is to be found in the Franklin differential casing. To this case are attached flanged, drawn steel tubes while the spring tables are secured to the sleeves by rivets. The semi-floating construction is used for preference as being lighter than the full floating, since the requisite strength can be put in the



A set of aluminum fenders for the series 8 Franklin. These are the same as the steel mudguards used on the series 7 but weigh 38 lb. less. Strength is obtained by beading and the fenders are quite as rigid as steel

driveshafts with a smaller expenditure of metal than would be necessary if the weight of the car was to be borne by the axle tubes. Bearings are reduced in number and therefore in weight correspondingly.

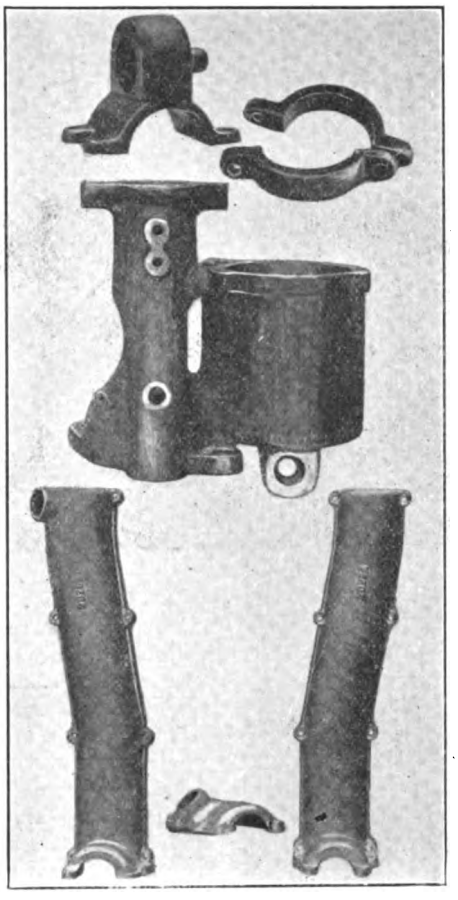
In making the cylinder castings the vertical cooling fins are set in the sand and so secured by the act of casting, this making a lighter and more efficient construction than is obtainable with cast-iron fins.

It may be observed from the table that the gearset is remarkably light, as from the drawing, that the same quality characterizes the clutch, and it may here be explained that the Franklin practice of using a separate gearset is dictated only partly by the difficulty of combining the motor to make a unit power plant. Of course, where the flywheel is used as a powerful cooling fan it is not so simple to make a unit job, but it would not be impossible to do so.

It is considered, however, that keeping the two assemblies separate allows weight to be saved in both gearcase and crankcase, while the frame attachment of the gearset does not weigh as much as the arms which otherwise would be needed to secure it to the crankcase with an adequate degree of rigidity.

Reasons for Wood Frame

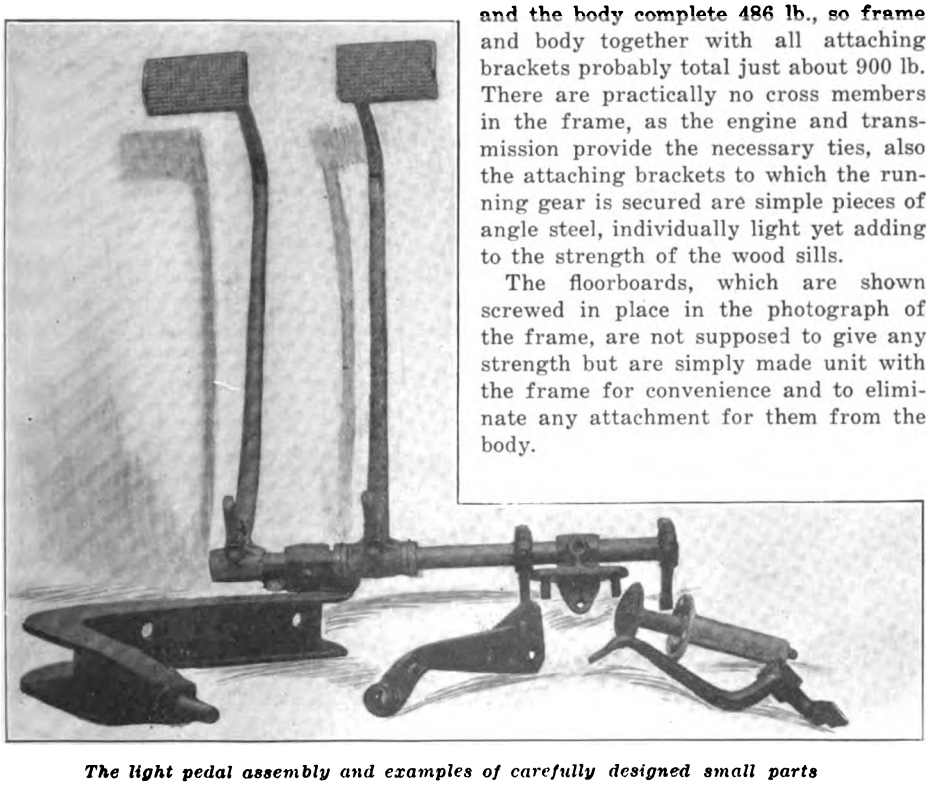
Coming to the main peculiarities of the Franklin, apart from the engine, there are the wood frame and the full elliptic springs. The latter are solely a question of designer's preference; they are used because the engineering faculty of the Franklin company thinks them the best form, and weight has little to do with the matter.



Aluminum carbureter body and hot air pipe and malleable iron muffler cut out

The frame is not quite the same proposition, however, as the system of assembly depends upon it, and it adds a good deal to the rigidity of the body. The sill with running board weighs 176 lb. and the body complete 486 lb., so frame and body together with all attaching brackets probably total just about 900 lb. There are practically no cross members in the frame, as the engine and transmission provide the necessary ties, also the attaching brackets to which the running gear is secured are simple pieces of angle steel, individually light yet adding to the strength of the wood sills.

The floorboards, which are shown screwed in place in the photograph of the frame, are not supposed to give any strength but are simply made unit with the frame for convenience and to eliminate any attachment for them from the body.



The light pedal assembly and examples of carefully designed small parts

It is claimed that the wood frame is much stronger and less liable to injury by accident than any steel frame, but it seems possible that the weight could be reduced in a different type of chassis by the Brush system of specially disposed sheet steel. Thus we may write down the wood frame as a peculiarity of design obtained without sacrifice of lightness.

Careful Detail Work

Where much weight is put in an ordinary chassis needlessly is in the petty parts. Just a few of these are shown in the photographic illustrations, and of these the most striking is the pedal assembly. Using good steel for the forgings a very small shaft can be employed, and there is no lack of strength or rigidity in the pedal arms. The foot plates are of the ordinary width which enables the dimensions of the other parts to be judged by eye.

In the same photograph are included three small brackets for various purposes, these being iron. Their feature is the use of webs to give strength, care being taken that the webs are in the proper places. The little bracket in the center would often be a mass of steel two or three times as heavy and yet no stronger or better.

In the top photograph are examples of aluminum work in the carbureter and the hot air pipe; the latter being a sand casting weighing only 15 oz. At the top is a malleable iron exhaust cut out, and this is practically as small as it could be with no waste metal whatever in it.

Think About Detail

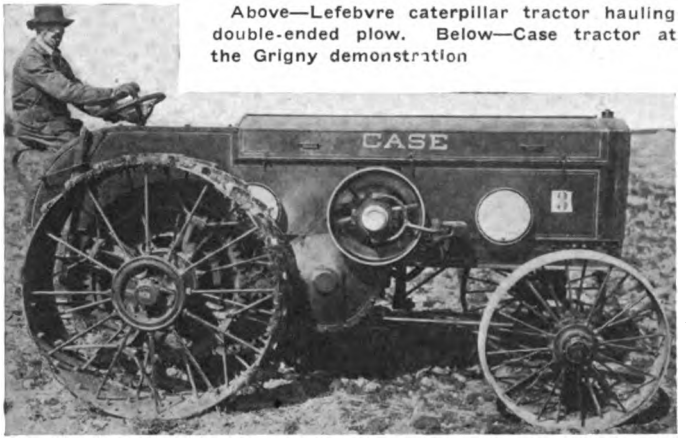
The Franklin car is in many respects peculiar, its mechanical features are largely unique and engineers may disagree as to the merits of some of them, but the points illustrated in the foregoing almost all of them apply to any sort of chassis. Eliminate the motor and the full elliptic springs and there remains just as much originality of thought in the more ordinary portions remaining.

Some of the parts look absurdly light; many engineers might without shame be afraid to use such light constructions, yet the Franklin has a reputation unimpaired by any doubts on the score of durability. To those, therefore, who are looking for ways to reduce the weight of a chassis the Franklin details of design provide probably the most instructive study that is readily available to-day.

A year or two more will show to what extent the same principles will come to be applied generally, and there are many who think that once the engineering thought of the industry is concentrated upon the making of truly light automobiles, the results will exceed the wildest speculations. In the race for "ability" it is likely that weight will prove more important than cylinders.

France To Subsidize Farm Tractors

Maximum Is One-Third Purchase Price Except In War Districts Where It May Be One-Half



Above—Lefebvre caterpillar tractor hauling double-ended plow. Below—Case tractor at the Grigny demonstration

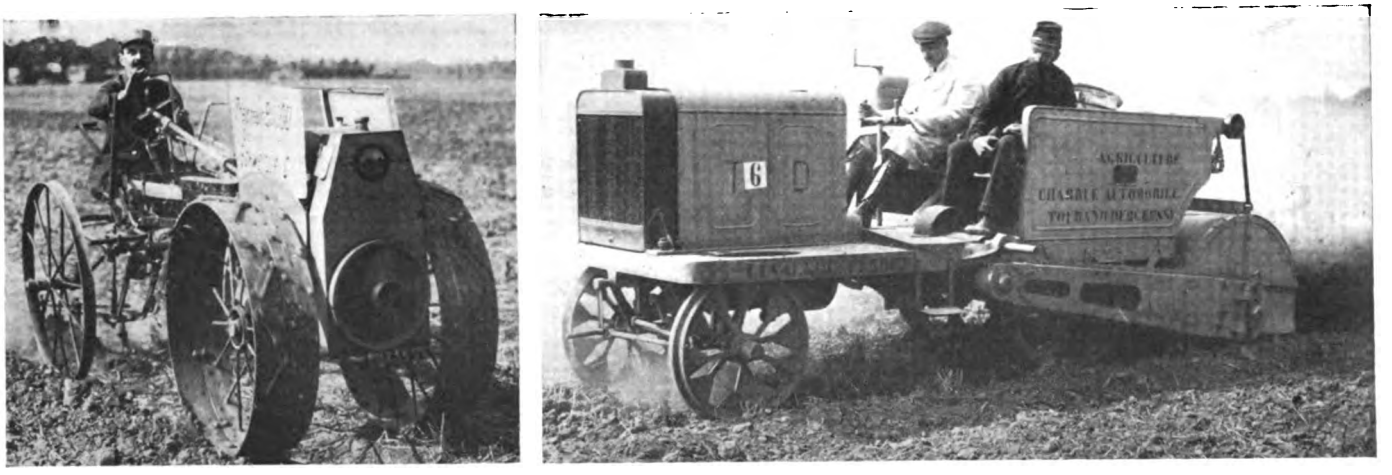
PARIS, Sept. 15—Subsidies are now granted by the agricultural department of the French government to farmers, groups of farmers, and municipalities for the purchase of motor plows, motor tractors and motor-driven agricultural machinery. Applications for the subsidy must be made through the district Prefect and must be accompanied by a description of the motor it is intended to purchase, cost price, conditions of payment, and a technical report on the nature of the land and the conditions under which the motor will be used. The scale of subsidies fixes the maximum at one-third the purchase price, except in the case of districts which have suffered by the war, when the amount may be increased to one-half. The subsidy will be paid immediately proof has been given that the motor has been delivered and that the purchaser has paid his share of the cost. Each year the government district agricultural inspector will deliver a report to the Minister of Agriculture on the results obtained by the use of these subventioned motors in his district.

This subsidy scheme, which goes into force immediately, will undoubtedly bring about an immense increase in tractors. The entire scheme is remarkably simple. It provides for the grants to established groups of farmers comprising not less than seven members, co-operative societies, syndicates of small farmers. The grants can be made to the communes or townships during the war only.

The announcement of this subsidy scheme gave additional interest to the motor tractor demonstrations held this week at Grigny, about 20 miles to the south of Paris. The demonstrations were privately organized, but received the presence of the Minister of Agriculture, and the management were given the use of some reserve troops for the necessary work in connection with the motor farming. American, French and Italian machines were presented and shown at work. The American-made machines were the two Bull tractors; the Aultman & Taylor gas tractor; the Case tractor, and the Bijou machine. Italy showed but one machine, the Moto Aratrice, a three-wheeler having a twin vertical motor and a single driving wheel. Among the French machines were two with rotary plows; the Motoculture, a very small machine with a compact modern type four-cylinder motor driving the road wheels through a two-speed gearset and the rotary picks by shaft and bevel gears, and the Tourand-Derguesse. This latter machine is a very modern construction with the latest type of four-cylinder block motor type, magneto ignition, forced feed lubrication, inclosed working parts, and drive to the road wheels and to the plow by means of chains. Another French machine was the Lefebvre caterpillar, which has been in service in France for a number of years.

While all the machines have long got past the experimental stage, the smaller units attracted greater attention, and much importance was attached to ability to turn readily in small

Left—La Motoculture machine with driver astride four-cycle motor. Right—Bull tractor in Grigny demonstration



Left—Bijou twin-cylinder tractor, like the Case and Bull, an American product. Right—Tourand-Derguesse with rotary plow

fields. Heavy tractors of 60 to 100 hp. were almost automatically ruled out under French farming conditions, by reason of their great size and time lost in turning them at ends of the fields. Agricultural conditions vary considerably in France, but as a rule it is the small and medium size tractor which attracts attention. Another point to which American manufacturers must devote attention if they wish to enter this market is fuel economy. With gasoline selling at 52 to 55 cents a gallon leakages cannot be afforded. The French government having decided to monopolize denaturized alcohol and encourage its use for internal combustion motors, it is certain that this fuel will be almost exclusively employed under the new scheme for farm tractors. Thus foreign manufacturers will have to be prepared to supply motors and carbureters specially designed to run on denaturized alcohol—this fuel will doubtless be 50 per cent alcohol, 50 per cent benzol.

Moto Aratrice twin-cylinder single wheel drive tractor

American Truck Survives Shell Fire

AFTER six months' active service, the first of the Pierce-Arrow 5-tonners has fallen to German shells. This truck, together with a number of others, was delivered in England minus a body. It was substantially armor plated at an automobile and armament factory in the Midlands and fitted with a special quick-fire gun for anti-aircraft work.

Under modern methods of warfare even a 5-ton truck with an armor-plated body is an inconspicuous object on the landscape. To-day its sides may represent a brick wall; to-morrow they will have changed to a stone wall; during the next night they have been metamorphosed into a hay-rick; another coat of paint and they have become a common wayside hedge.

On the particular occasion under review the first shot was 100 yd. short, but this was sufficiently near for the crew to dive into a convenient dug-out where, with 4 ft. of earth and stout beams above them, they watched through a loop hole. The second 6-in. shell was 50 yd. over. The third hit the car on the left-hand side, carrying away all the lower supports of the armor, loosening up every rivet and shearing off a large number of them. The explosion occurred inside the body and carried away the doors and window flaps and burst the gasoline tank. A fraction of a second later the entire car burst into flames, for the 12 gal. of gasoline had flowed over the whole floor.

It was at this moment that the fun began, for there were 300 rounds of ammunition for the gun and 1000 rounds for the rifles and small arms aboard that car. From the safety of their dug-out the crew watched the firework display.

That night another Pierce truck crept up to the armored car and a delicate towing job was undertaken. The right rear wheel had five spokes burned out and had lost all the rubber with the exception of the strip in contact with the ground when the firework display started. The steering wheel had disappeared, but a lever clamped to the column served to guide the truck.

An examination showed that there was no necessity for this. It was almost impossible to move about within the body owing to the mass of twisted and shell-nicked pieces of metal. But the motor was in good condition. The water-jackets were intact; the radiator had lost no water; most of the lubrication pipes had their joints unsoldered; all ignition wires had gone; the rear wheels were useless and an entire set of tires had to be obtained. In three days that chassis was in running order.

Shipping 2000 Cars a Day

System in Shipping Department Enables Ford to Ship 333 Freight Carloads of Automobiles Daily—204 Loading Platforms Assist in Preventing Accumulation of Cars

By Marc Braun

THREE hundred and thirty-three freight carloads of automobiles have been shipped daily by the Ford Motor Co., Detroit, Mich. This is more than six trainloads of fifty railroad cars per train, and is based upon a manufacturing schedule of 2000 Ford cars per day.

The story of how the Ford company has systematized its manufacturing methods, to enable it to build 2000 automobiles or more a day, has been told. It has been found highly interesting. Little, however, has been made known as to how the company manages to ship such an enormous daily output.

System Makes It Possible

Because if it seems extraordinary, even in these days of wonderful progress and achievements in the automobile industry, for one manufacturer to build in a single day as many cars as was the total annual production of many a leading automobile maker only a few years ago, it is almost as astonishing that it is possible to ship 2000 or more automobiles, not only once or twice after special railroad and other arrangements had been made, but regularly, day after day, and without special previous arrangements.

System made this possible.

Preventing Accumulation of Cars

Just as it required systematizing the work in every department connected with the construction end of the business, so it was necessary to find ways and means and new methods to enable the daily production to be entirely shipped daily. The policy of the company is to get rid of the day's output in order to avoid accumulation of finished cars, as this would disorganize the working system.

300 People in Shipping Work

To take care of this shipping 300 men and women are employed exclusively in the Detroit traffic and shipping departments, attending only to matters having to do with outgoing and incoming freight cars and materials.

The Body Chute

The actual shipping work begins at the body chute which is located in the shipping yard and connects with the body stockroom. Under this chute the tester drives the chassis to a designated point where, as soon as the chassis arrives it receives its body. This comes down the chute, and, almost automatically, finds its way into a temporary position on the chassis. The car is then driven to the finished car assembling platforms, where it is taken in hand by crews of freight handlers, who take off the body, wheels, fenders, guards, etc., before loading into the freight car.

Domestic Shipments Disassembled

Cars for domestic trade are nearly all shipped partly disassembled. This means that the chassis is loaded vertically in one end of the freight car and the body in the other end. The wheels, guards and fenders go separately. In this manner six automobiles are loaded into a 36-ft. freight car, or eight into a 40-ft. car, the latter being used for shipments west of Chicago.

About 95 per cent of all the cars are shipped that way,

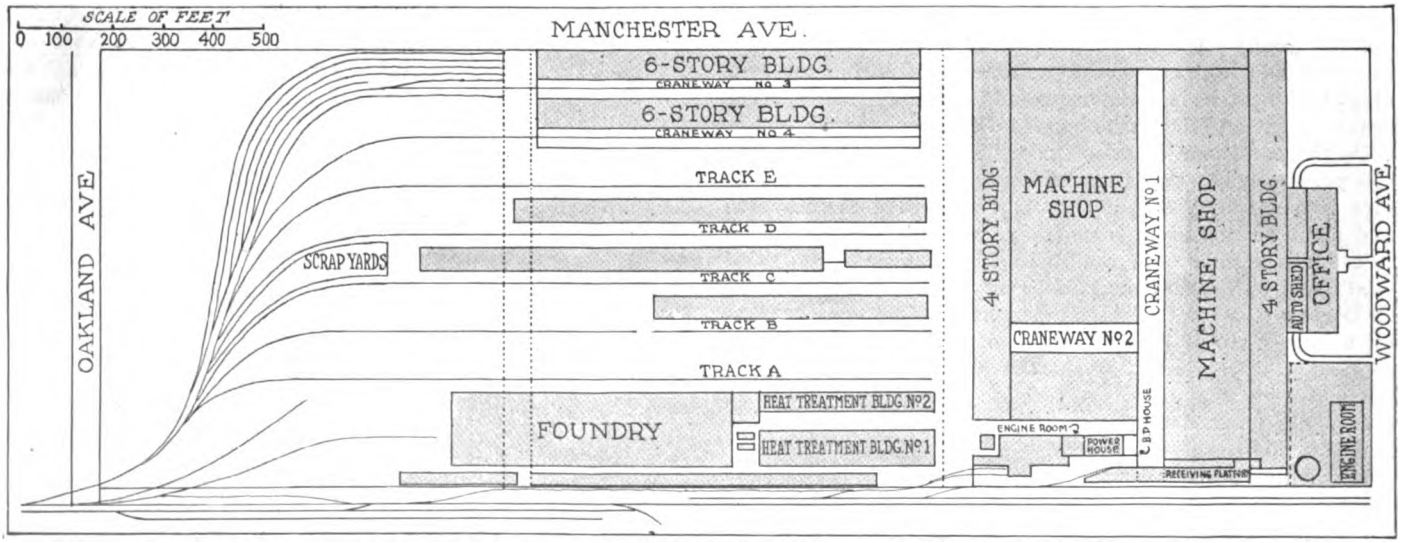

Diagram showing layout of the Ford Motor Co. shipping department. Two of the seven tracks entering the Ford yards are in the six-story building while the others are indicated at A, B, C, D and E, these having loading platforms on each side with covered wooden buildings or sheds to protect from rain goods stacked there for shipment. There are 204 loading platforms facing the two railroad tracks which enter the six-story building and two traveling cranes lift specially constructed carriers of incoming materials upon these platforms or lower to the ground loading floor goods which are to be shipped

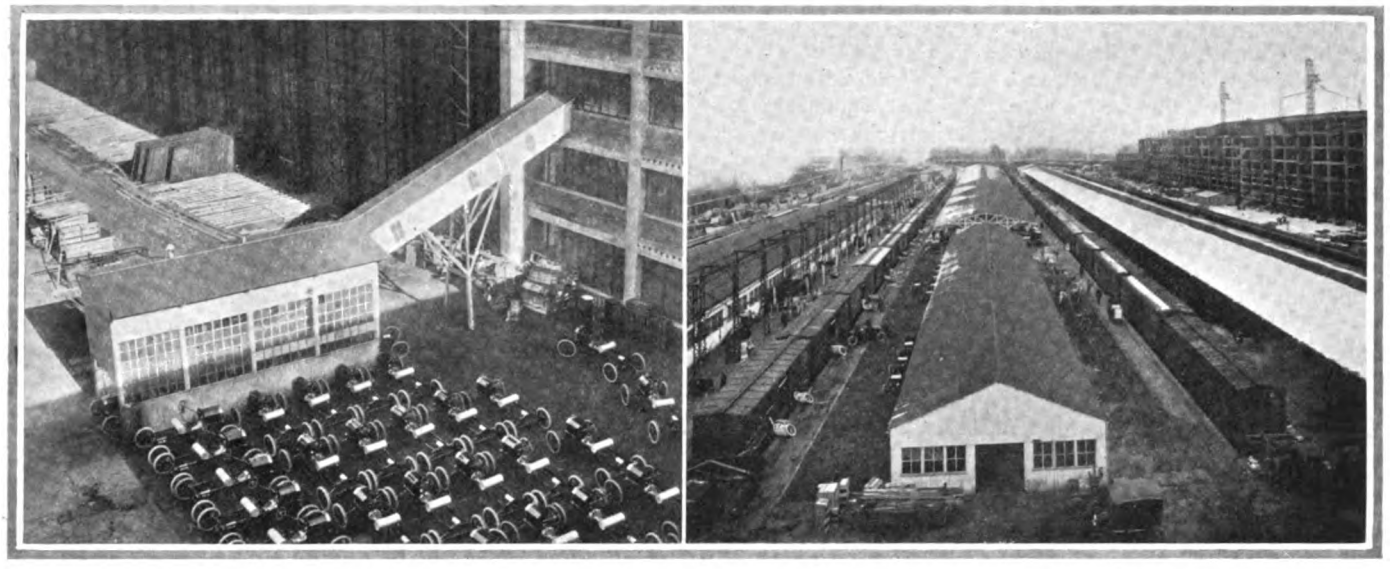
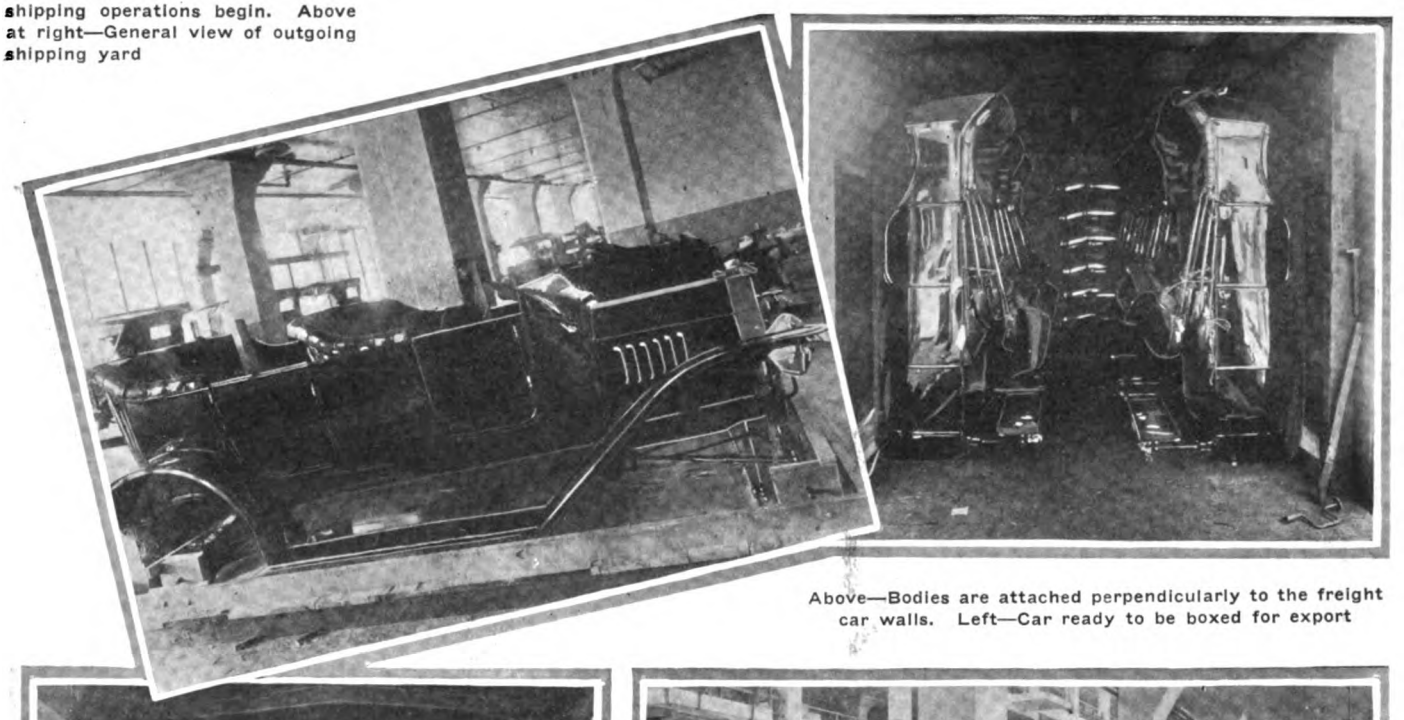
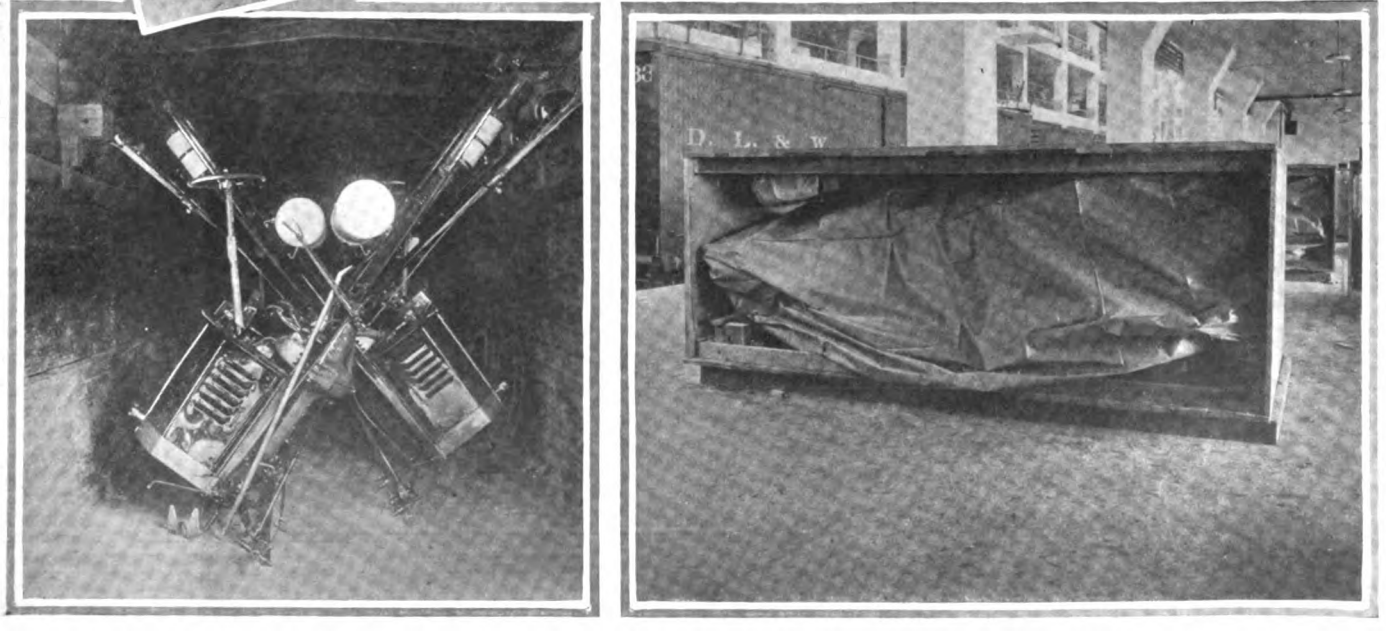


Above at left—Body chute where shipping operations begin. Above at right—General view of outgoing shipping yard



Above—Bodies are attached perpendicularly to the freight car walls. Left—Car ready to be boxed for export



Left—Chassis are loaded into the freight car diagonally. Right—Car wrapped up and ready for boxing

the other 5 per cent going forward completely set up or ready for immediate use. When shipped in this way only three automobiles go into a freight car. Only dealers who cannot order more than three cars at a time have shipments forwarded that way inasmuch as the freight charges are the same as if six cars are sent. The railroad rates are always per 10,000 lb., and the actual total weight of six Ford cars will not exceed that figure.

The loading operation consists in placing and attaching the bodies in two rows of three in one-half of the freight car, and the chassis, also in two rows, in the other half of the car. While these are placed in a diagonal and alternate position, the bodies are placed perpendicularly. Fenders and mud-guards are fastened together in lots of six, and then attached against the sides of the freight car. The wheels are fastened all along the walls.

Inspection and Checking

After a car is loaded a loading inspector comes to see if everything to go into that freight car has been placed in it. After he is through, the shipping clerk is called for the final checking. Then the car is turned over to the sealer who locks and seals it and attaches upon the door an instruction tag for the railroad.

This tag reads as follows:

Important—Rush Car No. .....
This Car Loaded by
Ford Motor Company
Highland Park Plant.
Switch to.....R. R.
Date.....

For loading and unloading work 130 men are now employed exclusively on the shipping platforms. They start at 6.30 in the morning and go home at 3.30 in the afternoon, having half an hour at noon. They work in shifts or crews of five or six men and load 100 cars into the freight cars in 1 hr. It requires an average of 20 min. to load six Fords into a freight car.

Cars for Foreign Countries

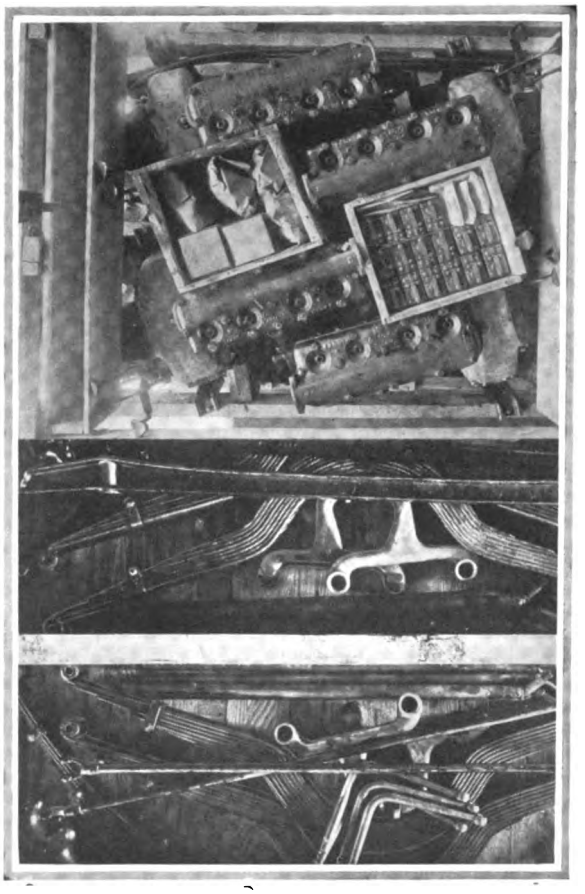
Cars for shipment to foreign countries, excepting those for the Ford assembling plant in Manchester, England, are knocked down and completely boxed. This means that the wheels, springs, guards, fenders, windshield and top are taken off, leaving the chassis with the motor and body on. In this way the car takes up much less room, which means a big saving in freight charges. At the same time, only such parts and accessories are taken off as will not require the service of a specialist to again put on.

For the Manchester Plant

Shipments of cars for Manchester go forward entirely disassembled. The motors are shipped four in a box, together with all the motor's parts or attachments. Frames and bodies go forward in lots as motor car parts.

For some time an average of twenty-five cars have been shipped daily to foreign countries. This does not include what is being sent to Manchester.

Seven tracks of the Detroit Terminal Railroad are in the yards of the Ford plant, and they connect with all the Detroit freight stations. Five engines are in constant use exclusively for the company, three during the day and two at night,



Above—Top view of a shipment of motors to the Manchester, England, assembling plant of the Ford company

Left—Shed platform where cars for export only are brought to be loaded

Below—A view in the six-story shipping building, showing some of the 204 loading platforms

to haul outgoing and incoming freight cars.

190 Carloads Go Out Daily

The daily outgoing traffic averages 190 carloads, and the inbound freight averages seventy-five carloads a day.

The loading capacity of each of the seven tracks is 1000 ft., and they hold twenty-four ordinary 36-ft. freight cars.

The tracks for incoming freight are located in the huge shipping and stockroom building. The entire ground floor of this six-story structure, which is 850 ft. long and 200 ft. wide, is used as a receiving department for incoming materials, while the other five stories hold the radiator, top and body, curtain and upholstering, painting and trimming, windshield, finished and miscellaneous stockrooms.

This building has on each floor facing the two railroad tracks seventeen loading platforms on each side, or, all told, 204. Through the entire length of the building two craneways, each having two traveling cranes, are in constant operation. They are used to lift upon the platforms in specially constructed carriers the incoming materials or to let down to the ground loading floor goods which are to be shipped.

In the yard outside of the main shipping building are the other five tracks, on each side of which are loading platforms having either a wooden building completely covered or simply a shed under which goods for shipment are stacked and thus protected from rain.

General Traffic Department

The general traffic department's personnel consists of a general traffic manager and three assistant managers, one on claims, tarriffs and classifications; one in charge of the loading and checking of outbound carload shipments, and one in charge of all inbound shipments. There are also a chief clerk, the rate clerks, billing clerks, car checkers, stenographers, yard master and clerks, all told twenty-five employees in addition to the 130 loaders on the dock.

Less-Than-Carload Shipments

There is a second shipping department for less-than-carload shipments at the head of which is a chief shipping clerk. He has 123 assistants, such as office clerks, packers and checkers.

Parts and Accessories Separate

Besides shipping 2000 cars a day to dealers and distributors, large quantities of parts and accessories are shipped daily to some of the Ford assembling plants throughout the country. The loading of these parts is done generally on the tracks in the shipping building, thus not interfering with the loading of complete cars.

Canadian Exports to U. S. $97,013

The total automobile export trade by Canada with the United States to March 31, 1915, which closed the fiscal year, amounted to $97,013 as compared with $138,978 in 1914. Automobile parts amounted to $35,558 in 1915 as compared with $36,341 in 1914.

Canada shipped fewer cars to Great Britain in 1915 than to the United States, the total value of these amounting to $76,050 against $320,407 in 1914. Automobile parts, however, amounted to $130,001, considerably larger than the United States figures. The parts shipment in 1914 to Great Britain amounted to only $1,895.

Shipments to other countries in 1915 amounted to $2,472,761 as compared with $3,112,477 in 1914. Automobile parts in 1915 to other countries amounted to $243,070, a considerable gain over 1914, which amounted to $197,621.

Imports from the United States, Great Britain and other countries were considerably larger than the exports to these countries. Automobiles and trucks to the value of $4,591,182 were sent from the United States to Canada in 1915, a drop of nearly $2,000,000 from the 1914 figures which were $6,528,086. As a matter of fact, imports from Great Britain and other countries in 1915 also showed large drops from the 1914 figures. Great Britain shipped cars and trucks in 1915 to the value of only $252,898 as compared with $621,979 in 1914.

Automobile parts imports to Canada were also lower. The United States imports, though lower, led in value, the 1915 imports being $2,142,895 as compared with $3,926,077. Great Britain showed a proportionate drop, its 1915 figures being $22,337 as compared with $31,981. Imports from other countries amounted to only $961 compared with $8,321 in 1914.

The Engineers' Forum

Early Days of Aluminum Pistons

By Joseph Leopold,
Engineer, Walker M. Levett Co.

NEW YORK CITY—Editor THE AUTOMOBILE:—In view of the interesting discussion which has appeared in your journal of late, relative to the utility of aluminum and its alloys for efficient automobile construction, it is perhaps, opportune at this time to offer some brief historical data and instances of extremes beginning from the time when aluminum alloy made its début in this progressive field, and leading up to the present day; the elapsed period being, needless to say, comparatively short.

I consider it recognizable that my company is the pioneer foundry making a specialty of aluminum alloy for piston purposes, and, assuming this to be authentic, it quite naturally follows that it has been most intimately associated with the expanding wave of popularity accorded these metals and while refraining from the extreme, observation based on practical experience has created the conviction that Magnalite pistons have become a fixture and will be of still greater importance in the future development of the high-speed motor.

Aluminum Cylinder Preceded Piston

Prior to the time when the automobile manufacturer became cognizant of the fact that weight in reciprocating parts must be materially diminished if high speed was to be obtainable, we were invited to experiment in casting cylinders for an extremely high speed, intensely efficient type of aeroplane engine. Cost was to be a secondary consideration—reduction in weight imperative. Subsequently, after repeated efforts and diligent experiments, we succeeded in producing an aluminum alloy cylinder which fortunately met every requirement. Our customer completed, in his experimental department, the most rigid of tests before mounting the motor, and from all information in our possession the same motor is giving satisfactory and efficient service to this day, the cylinder walls showing a remarkably low percentage of wear.

The proposition of using aluminum alloy pistons apparently had not occurred to anyone up to that time. It dawned upon this manufacturer that if this alloy would answer for cylinders it should also answer for pistons and we naturally then made them the object of experiment. The cast-iron pistons used at that time weighed slightly in excess of 6 lb. each. We made up a set of pistons which weighed about 2 lb. each from an alloy somewhat analogous to Magnalite. It might be said at this point that all concerned in the experiment were more or less dubious as to the ultimate results and consequently "the bench engineers" of our foundry, as well as those of the motor plant, expressed an assortment of theories about as numerous as the number of persons employed, but the pistons accomplished even more than we anticipated.

It was, perhaps, chiefly fortune that the clearance and remaining factors of importance were approximately correct, for if failure had resulted at this instant, it is extremely probable we should have passed up the matter of aluminum alloy pistons as impracticable. From this point the development of Magnalite pistons was evolutionary.

From all data obtainable, Fred S. Duesenberg, manufacturer of the motor bearing his name, was one of the first engineers to attempt a practical succession of experiments with the aim of determining constant factors in Magnalite piston installation. It was easy to realize the benefits that would surely accrue if these pistons could be made to respond to every requirement. The exceptionally light weight and quick thermal conductivity were obvious as elements of great magnitude, particularly where high speed or light weight were consequential considerations.

As Mr. Duesenberg was specializing in high acceleration motors for both racing and aeroplane usages, it was manifest that the merits of Magnalite pistons at that period should readily appeal to him and so aluminum alloy pistons were introduced to automobile racing. Their utility and adaptability soon won the hearty indorsement of the entire racing fraternity, and it was not long after this that automobile manufacturers conjectured it might be practicable to increase the value of their standard productions by the use of Magnalite pistons with the result that Magnalite is now a familiar product to a major part of your readers.

It might be of interest to note here that out of thirty-six cars equipped with these pistons participating in twenty-four of the largest races in 1915, sixteen have taken first place, sixteen second place and four third place. In one instance—the 100-mile Chicago Challenger Race—the remarkable work performed by the Stutz car equipped with Magnalite pistons is most worthy of especial consideration since it was the initial American car to sustain a track record of over 100 m.p.h. in competition. James Pugh's Disturber IV, equipped with Magnalite pistons was the first motor boat to maintain an average speed of more than 60 m.p.h., a truly remarkable performance.

Cerman Allcy a Basis

The origin of alloys is usually a matter of speculation and Magnalite is no exception to the rule. In Germany for a number of years a metal was produced called Magnalium which possessed many Magnalite qualities. The high cost of aluminum at that time limited its general use and production, consequently, while the metal offered valuable properties for a variety of purposes, the price was then prohibitive for general commercial adaptation. As the methods for producing aluminum were simplified the price of the metal decreased; therefore a diversified use of it was possible on a huge scale. Our experimental department then undertook to produce a metal which would combine all of the desirable qualities of this German product and simultaneously eliminate certain features which were undesirable for automobile piston requirements. These endeavors resulted in Magnalite, which is a specially adapted Magnalium form of metal for piston construction.

Since the use of alloy pistons has become universal, the rules governing their machining and installation are becoming more generally known, with the result that where

such deterrent influences as seizing, piston slap, or scored pistons might have been prevalent in experimental stages, they are now simple details which may be avoided.

The extremes to which Magnalite pistons have been subjected up to the present time with successful results, include a design of 12⅞ in. bore for a heavy duty engine contrasted with a ⅞-in. piston for a working model of an air-cooled aeroplane engine. Limits such as these called for specific consideration.

Some idea of the endurance of this metal may be had through racing experience at the recent Twin City meet. A broken valve worked itself into the cylinder while the car was running at a speed of approximately 90 m.p.h. The terrific hammering of the piston against the tungsten steel valve forced it through the top of the cylinder, but left the piston itself intact and except for a wide gash in the dome, it showed little indication of what had happened.

At the Chicago race, an oil feed in one of the motors became clogged in such a way that insufficient oil was circulated and after each lap or so it was necessary to stop the motor in order that it might cool off. During the time it was running, the heat generated was so great that the top of one of the pistons fused sufficiently to sink down between the arms of a system of special ribbing which was designed for racing purposes. As the motor remained intact the piston was not removed, and when the oil trouble was overcome the car went back into the race badly distanced, but still "in the running" with probably what was one of the most peculiar looking pistons ever finishing in an automobile race. A number of other racers had iron pistons give way on account of the excessive speed and heat. This customer feels that he need not worry any more about piston trouble.

In another car a set of pistons had been used for approximately 2500 miles of actual racing with an additional 1500 miles of practice work. During one race a connecting-rod broke near the wristpin boss with the result that the piston was jammed against the top of the cylinder forcing the latter about 2 in. above its normal position. Except for the fact that in forcibly pulling the piston out of the cylinder it was badly scored, there were no other signs of serious damage. This connecting-rod broke at a speed of well over 90 m.p.h.

Piston Wear Is Slight

A recent examination of a motor equipped with Magnalite pistons after running over 20,000 miles showed a maximum cylinder wear of 0.00125 in., while with iron pistons that had formerly been used in this motor, a wear of 0.011 in. in 18,000 miles was determined by caliper. Perhaps one of the most interesting evidences of the extreme possibilities of Magnalite pistons may be found in a carte-blanche order which we recently received from a firm now making one of the finest automobile racing and aeroplane engines. The letter accompanying the order for an experimental set of fourteen pistons for this concern stated that it had been their practice to machine their pistons from the solid steel billet. Light weight was mandatory, so it was left entirely to our judgment to produce if possible a piston that would stand up as well as one of steel and at the same time permit them a saving of approximately $160 per engine. One restriction was that the Magnalite pistons must be as light—lighter if possible—than the piston machined from steel.

Examination of the blueprint showed that 1 mm. thickness was allowed for finished steel construction in the skirt, offering some idea of the light weight construction employed. After giving the matter due thought, we finally produced a piston which weighed less than 11 oz. or about 1 oz. less than the steel piston. We permitted our skirt a thickness of 2 mm. in the alloy metal, and by the system of ribbing referred to above, we secured a rigidity and strength at the points of principal stress which we believed would meet every requirement. Furthermore we advised our customers on shipping the order that if they were willing to permit us to design another piston for them, with the understanding that the results were to be regarded as purely experimental, we were confident that a further saving in weight of at least 2 oz. could be made possible by slitting segments from parts of the skirt which do not carry any appreciable stress other than that of simply guiding the piston movement. We believe that the satisfactory results following the tryout of the first order, as evidenced in a subsequent large order for pistons of the same design, will warrant this company undertaking the experimental work with the lighter piston at an early date and are awaiting their decision with much interest.

Prefers Iron or Steel

By E. H. Sherbondy

Consulting Engineer, Clay & Sherbondy

BUFFALO, N. Y., Editor THE AUTOMOBILE:—In reference to the discussion which has appeared in recent issues of THE AUTOMOBILE, on the comparative merits of the use of aluminum motor pistons and cylinders:

The two fundamental considerations with regard to the use of aluminum for motor pistons and cylinders, are taken to be the maximum strength of the material in question, and the heat flow from the gases of combustion to the cooling water and crankcase air. The heat flow depends only on the heat capacity of the gases of combustion and the cooling water. The piston proper is heated by convection and radiation; this heat is carried off mainly by convection to the cylinder lubricating oil film and the rate of convection depends upon the maximum temperature within the cylinder and the piston speed. This heat is again carried by convection from the lubricating oil film to the cylinder wall, and in turn carried by conduction through the cylinder wall proper and finally by convection to the cooling water. It then results that the conductivity of the material employed for the piston is not of material consequence.

Inertia Forces Unimportant

The second consideration for the use of aluminum as a piston material is the necessity of reducing the inertia force values to a factor within reasonable limits. Consideration of the inertia forces of reciprocating mechanisms is very old in the field of kinematics, and has been treated of in almost all text books on mechanics. However, consideration of the inertia forces alone is only a partial treatment of this subject, the important factor being the resultant secured by combining the inertia diagram with the indicator diagram. At low motor speeds the inertia forces are always very small, though the indicator pressures may be very high. Under these conditions the maximum turning effort is developed during the first half of the piston stroke. At high rates of revolution quite a different state of affairs exists. The inertia forces gain very materially in value, in fact, as the square of the motor speed, and it then results that the maximum turning effort is developed during the last half of the piston stroke. I believe that automobile motors are ordinarily designed on the basis of an initial indicated pressure of about 350 lb. If this pressure is taken as the basis of construction, it is clear that the values of the inertia forces are of little matter until they exceed the indicator pressure. The speeds at which this occurs are beyond those reached by any excepting a few racing motors. Clearly, of course, we do not wish to have the inertia diagram cut the indicator diagram at two places during the expansion stroke, as this would result in a rapid reversal of pressure on the bearings, putting the connecting-rod in tension.

Automobile motors of current construction, which are ap-

plied to touring and commercial vehicles have such restricted valve capacity that it is impossible for them to reach rates of revolution high enough so that the inertia factor is a matter of very great importance. Until motors are constructed for current use which have speeds of from 4000 to 5000 r.p.m., we shall not be much concerned with the minor problem of inertia.

Piston Friction Large Factor

Professor Reidler has shown that the friction between the piston and cylinder walls amounts to more than 30 per cent of the total friction of the motor. Professor Tower on lubrication concludes as a result of his experiments that where an oil film exists between two metal bodies having relative motion, the friction is independent of the material of which they are composed. The coefficient of friction of aluminum on any other material is not a factor for consideration as long as lubrication persists. The mechanical efficiency of the motor can only be increased by reducing the friction of the machine elements and that due to the movement of the gases.

The writer has tried various aluminum alloy pistons in automobile, stationary and aeronautical motors, and in every case where a motor was operated at maximum power for long continued periods failure resulted. Cracked heads, cracked piston pin bosses, scoring, and in one six-cylinder, two-stroke motor of 5 in. bore, we melted the deflector heads off the pistons.

I cannot but agree with F. R. Porter that what we need in motors having a high output relative to the displacement, is materials which have a great maximum of strength, which is not enormously impaired at the temperatures occurring in internal combustion engines. After having tried aluminum, steel and cast iron for piston and cylinder construction, the writer concluded that for this service cast iron is far superior to any other material yet tried.

High Tensile Iron

By recent metallurgical experiments we have been able to increase the maximum strength of cast iron to between 60,000 and 70,000 lb. and, where it has been desirable, to give this material the same hardness which commercial chrome nickel steel has in its untreated state.

Again where the cost factor enters into the problem, as it always does, commercially, steel is out of the question, and we believe that cast iron is far the best compromise.

Empire Engineer Thinks Sixes Good for All Cars Up To 2600 Lbs.—No Excuse for Cheap Twelves

By Louis Schwitzer
Production Manager, Empire Automobile Co.

INDIANAPOLIS, IND.—Editor THE AUTOMOBILE:—The multi-cylinder engine has been the logical consequence of the necessity for reducing the cubic inch displacement of the individual cylinder to obtain maximum efficiency combined with smooth, quiet running and long durability.

The decrease of the bore brings with it light moving parts and reduction of the inertia stress, light bearing pressures and facilitation of the lubrication problem. The light power impulses of the individual cylinder reduces the vibration to the minimum so it cannot be noticed by the occupants of the car when accelerating the motor, giving the desired smoothness.

There is no question that the multi-cylinder engine, may it be the eight-cylinder, or twelve-cylinder, will not replace the four and six, each type of engine having its own field.

It is shown that the average American car has about 1 cu. in. piston displacement for each 10 lb. of its weight. Each maker simply will decide how many cylinders of an individual maximum displacement of 50 cu. in. per cylinder are necessary to propel his cars to give them the necessary ability. The different classes of cars group themselves in about the following groups: up to 2000 lb., 2500 lb. to 2600 lb., 3000 lb. and above.

It is obvious that the four-cylinder motor with 200 cu. in. displacement, this being the multiple of the "50 cu. in. maximum piston displacement per cylinder" will handle the 2000 lb. car very well, while the six-cylinder of the same individual cylinder displacement will take care of all cars as high as 2600 lb. Above that there is no doubt multi-cylinder engines will be employed.

The "50 cu. in. maximum piston displacement cylinder" will have its bore limited (in the writer's opinion) to about 3½ in. maximum diameter. These are the logical consequences as seen from the engineer's point of view, but there are other conditions which influence the individual maker of cars, especially of the low priced, light weight type.

The national advertising campaigns of a few big concerns create a demand for certain types of cars which he often must follow, even against his best judgment as to what is best for his product. The advertised features of the big manufacturer may be necessary improvements and features of his own product, but entirely superfluous and not desirable in the product of the smaller manufacturer, who is building a different type of car, but yet these National campaigns make the features advertised for the general public a "fashion hint" which tries to force the other makers.

This is particularly the case with the multi-cylinder motor. The public in general does not realize why the multi-cylinder motors have been built. They simply take them as a development which applies to all motor cars. The writer remembers when the first eight cylinder motor was announced in this country. All our dealers simply got scared to death, and worried because we did not want to decide to build an eight-cylinder car, and believed that they would be entirely out of the running with the four or six. Of course time has proven this to be different. It has been shown that the small car works with excellent satisfaction with the four- or six-cylinder motor with the proper individual cylinder displacement, and that the low-priced multi-cylinder car has disappeared from the market. This probably was partially because of the low cost that could be allowed for the construction of such a motor. It could not be built with the same degree of care, workmanship and material as could the four or six which was ample for this weight of car.

The announcement of the twelve-cylinder motor has caused a similar disturbance in the trade, and there are appearing already low-priced twin-six cars for the construction of which there is absolutely no necessity from the manufacturer's point of view, but which are being built for reasons as said before.

It is not only a matter of necessary piston displacement for the individual car, but also of economy. On cars of greater weight, above 3000 lb., which naturally are also higher priced cars, economy does not play as important a factor as it does on the low priced and light weight car, because a different class of the public buys it. This is another reason why the multi-cylinder engine, in the writer's opinion, will not not conquer the field of the low priced car, except in individual cases where it will be employed as a stimulant of sales, and not because it will perform better.

Luxurious Streamline Body Not Yet Built

Some Suggestions for Future Development

By Julian F. Brasor

NEARLY two years ago there appeared in this magazine a criticism of automobile bodies in general, written by the writer of this article, in which were pointed out the errors of the designs then in use, how they had remained practically unchanged since the back-door type of tonneau and that it seemed as though the manufacturers would never have time to consider the most important part of a car, its general appearance. Suggestions were made as to the improvement of the bodies, the principal one being the body with only two doors, it being argued that this was the only logical step toward a real improvement in the general appearance of the car. It was predicted that in 5 years this type of design would be common and would meet with great favor, and that not until then would the automobile have become an automobile, a complete change from the horse-drawn carriage.

The Two-Door Design

Within the last year no less than four great manufacturers have offered cars with the two-door idea. They are old and well established companies, so it must be taken that they have considered this idea a good one. The purpose of this article is to show that the real streamline car with a luxurious body is yet to be built, and that merely closing the fore doors and dividing the front seats is not arriving at this type of body. The accompanying illustration gives a clear idea how different it is from the present two-door cars, yet it is not radical in any way.

The chassis has a very long wheelbase in order to place all the weight of the car between the axles, without sacrificing any space in the body, and as it is hung low and the running boards are hung below the axles these features give the car a sturdy, well balanced and fast appearance, the whole secret of which is in the long horizontal sweeping lines of the body. Note the one piece oval fenders and how the rear ones are swept over the wheels, the cantilever spring suspension permitting the jacking up of the car if necessary, without getting besmeared with mud. Note the rounded radiator, that it is placed considerably back of the front axle and that the water cap is unusually large, and that the bonnet and cowl rise in a straight line to meet the windshield, which is built into the body and is really a part of it.

Comfort and Style

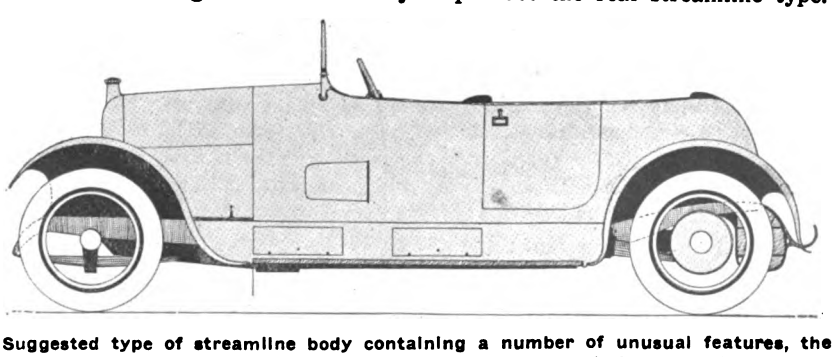
Most windshields look as though they were merely stuck on the bodies. The bonnet widens on all sides to meet the body in one smooth surface. The perfect union of the bonnet and body is the secret of the real streamline car. The body is unusually wide and is slightly wider at the top than at the bottom, this feature giving the five passengers plenty of room as well allowing the use of deep, heavy upholstering and thick cushions which rest flat on the floor of the body and are kept from sliding forward by concealed leather stays when not in use. Note that the upholstery is barely noticeable above the top of the body, yet this does not spoil the comfort of the seats since the body is high-sided without being top-heavy. Note how the rounded back pitches forward, placing the rear seat in front of the rear axle, a feature which makes for easy riding and also overcomes any heavy strain on the rear axle and tires.

Note the sweeping horizontal lines extending from the one-piece windshield to the rounded back, yacht-like lines obtainable only in the two-door type of car, which make it a genuine "streamline" body. Note the shape and size of the doors, that the hinges are concealed yet the handles are left exposed to break the monotony of the perfectly smooth sides. To overcome poor ventilation in the fore part of the body, which is unusually roomy, a new kind of ventilator is used. Louvres have never given real ventilation except in the hood.

Armored-Car Type Ventilators

This ventilator was suggested by the armor plates of the armored cars of Belgium. Its shape and size are in perfect harmony with the lines of the car and above all things it will give perfect ventilation. It fits flush with the sides of the body and is opened from the inside. It can be opened any distance up to right angles with the car. It slides on a brass bar with a screw-lock so it may be held perfectly rigid at all times. Of course the front seat is divided, left hand drive with center control is used, the steering column having a pitch of 33 deg. It is placed near the cowl, which has an instrument board within easy reach. The motor may be either of four or eight cylinders, generating its own electric light and having an electric starter, while worm drive with underslung cantilever springs and wire wheels are used. Since the body is very wide it extends over the chassis frame several inches, the space between the running boards and the frame being utilized for the tool boxes and batteries. The oil and gas are carried in a large tank in the rear which is built rigidly onto the frame. Note that the tire irons are also built onto the frame and that they are pitched forward. There is nothing more unsightly than to see one or two heavy tires hanging over the back of a car just as though they were ready to fall off. The entire body and hood are of cast aluminum with the radiator and other metal trimmings of brass highly polished. The color is preferably a light one with dark running gear. Very dark colors tend to hide the lines of a car if it has any.

This cannot help but show that there are yet many undeveloped possibilities in body design especially in the open types, and while cars cannot be built to suit individual opinions nor new ideas "rushed" on the public, now is just as good a time as any to produce the real streamline type.



Suggested type of streamline body containing a number of unusual features, the idea being the combination of artistic appearance and riding comfort

Fan Design Remains Unstandardized

Although Total Variation in Diameter Is Small There Are Many Intermediate Sizes

By J. Edward Schipper

ONE of the parts of the car which is absolutely non-standardized is the fan. If you take a dozen names of manufacturers at random, you will find that the fans are not only widely different for the same size of cars, but are different in diameter, the number of blades, pitch of the blades, and in the speed ratio at which they are driven. When a car is designed the draftsman draws a fan and it is turned over to the manufacturer with little attention. In many instances it would be difficult for the car manufacturer himself to tell why a certain type of fan has been adopted. The result is that nothing like standard, or even similar, practice will be found in cars of the same size and same cooling arrangement.

Naturally the fan diameter will be governed by the amount of space the designer is able to allow beneath the hood. The width of the radiator and its height must be carefully considered in order that there will be a draught through the entire radiator. As it is, however, this is not always accomplished. In some radiator and fan arrangements, there is a reverse flow through some sections of the radiator; in other words, instead of suction, there is ejection of air.

Definite Classification Possible

It can readily be conceded that it would not be possible to come down to one standard fan diameter. It would be possible, however, to make up a set of drawings which would embrace definite classifications of the types now in use, and would provide standard dimensions to work it. The best efficiency of the fan will be secured at a certain definite rotative speed, but even with an engine which revolves at varying speeds it would be possible to bring the fan speeds to whatever is desired by simply changing the ratio between the pulleys.

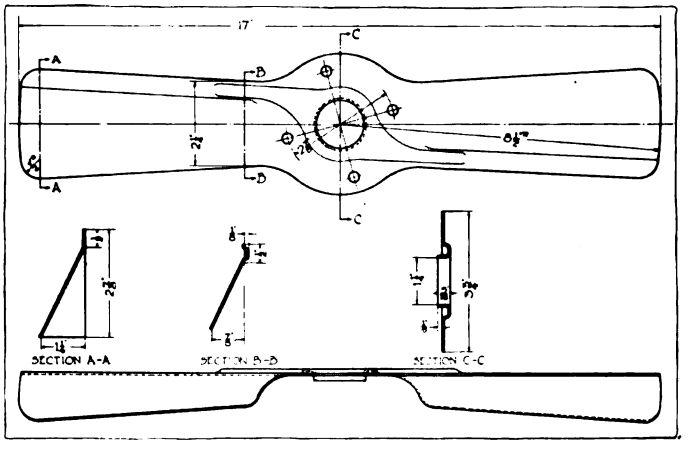
The accompanying tabulation was made up from a list of cars selected at random. It will be noted that the projected radiator areas vary all the way between 1.49 and 4.47 sq. ft. Taking care of these varying areas which represent the differences to be found between the smallest and largest cars, the variation in fan diameter is only a little over 7 in. for passenger cars, or between 14 and 21.125 in. The Knox tractor, which is included in the list, has a fan diameter of 24 in. Taking the passenger cars alone, a variation of 8 in. if gaged in steps of 2 in. could be divided into four diameters which might possibly be 14, 16, 18 and 20 in., if another size was needed, a 22-in. diameter could be used. The diameters used in the passenger cars listed are 14, 16, 18, 14.25, 19.625, 21.125, 20, 17, 13 and 19.5, or, in other words, nine different diameters, some varying from others by only 0.25 in. In this same set of fans, the number of blades runs all the way from two to six, exclusive of a sixty-four-blade Sirocco fan used on the Franklin. The pitches of the blades vary between 25.5 and 67 deg. to the plane of rotation. The ratios between the crankshaft and fan vary between 1 to 1 and 1 to 2.1.

Fourteen Variables

Ideal fan design to meet conditions such as obtain in a gasoline engine used in automobile work, where the speeds vary over a wide range, is such an elusive and impossible condition that it is out of the question. There are at least fourteen variables in fan design. These added to the varying quantities introduced by the requirements of an automobile fan render anything but empirical design impossible. It is of course true that there are several known conditions to be met. It is quite obvious that the fan has its greatest work to do when the motor is running on low gear. Another condition under which the fan must be efficient is when the motor is idling, with the car stationary. Again, the fan must do good work at ordinary touring speeds. Here are three different conditions of fan velocity under which good efficiency is required. These speeds are different for each motor and conditions are therefore anything but constant. Nevertheless, there are so many other variables entering into the necessary calculation, that no matter what fan is used it can be nothing better than a compromise and hence it would not be difficult to arrange a series of design which would cover all conditions and which would reduce the widely varying designs now on the market to standardized conditions.

Blades Are Factors

The question of blades will probably be one of the difficulties in the way of making compromise designs, but even if four standard sizes and pitches in two, three, four, five and six-bladed fans were made it would be a great step in advance. The light pressed metal fans depend upon a larger number of blades not only for efficiency but for spoke strength. The two-bladed aeroplane designs are favored where castings are used. Between these two extremes, there are all the types mentioned, and each has a large number of users. It seems that if any type could be abandoned it would be the five-blade as this is used by fewer concerns than any of the other types. The three-blade is not used to as large an extent as the four and six, but there is no doubt that higher efficiency at most speed ranges can be obtained with this type when considering the necessities of automobile design. The two-bladed fan is also a highly efficient type and a typical design of this sort is shown in the accompanying illustration.



Typical two-bladed fan used on the Hupmobile

Tabulation of Fan Dimensions, Showing Variation

Car	Model	Max. Hp.	Front Rad. Area, Sq. Ft.	Fan Dia.	Blades	Pitch	Crank-shaft to Fan Ratio
Buick	D-45	48	2.288	16	5	32°	1 to 1.5
Cadillac	51	70	3.43	19.5	6	25	1 to 1
Chalmers	26-C	53	3.1	18	3	55	1 to 2.25
Chalmers	32-B	47	2.44	18	3	67	1 to 2.25
Dodge	1915	35	2.08	16	6	24	1 to 2.3
Ford	T	20	1.82	13	4	25	1 to 1.71
Hupmobile	N-1916	40	2.46	17	2	..	21 to 19
Knox (Tractor)	35	..	4.23	24	4	30	1 to 1.65
Locomobile	48	82	3.93	20	6	30	1 to 1.5
Pierce-Arrow	A-3	..	4.47	21.125	6	60	1 to 1.375
Pierce-Arrow	B-3	..	3.74	21.125	6	60	1 to 1.375
Pierce-Arrow	C-3	..	3.37	19.625	6	60	1 to 1.375
Saxon	Four	18	1.49	14.25	2	25.5	1 to 1.828
Saxon	Six	34.7	3	14	4	25.5	1 to 2
Studebaker	1916-4	40	2.9	18	6	34	3 to 4
Studebaker	1916-6	50	2.9	18	6	34	3 to 4
Willys-Overland	83	35	2.63	16	6	34	1 to 2.1

The standardization of the fan, of course, has for its object the saving of money to both the manufacturers of automobiles and fans and for all practical purposes the only work which could be undertaken immediately in this direction would be that which would have effect on the costs of fan manufacture. The reduction in the number of pressed metal fan sizes to be made would be the first point to consider. To reduce the number of sizes, the first step would be to make four or five standard diameters, allowing the pitch and number of blades to remain matters of choice with the fan manufacturer.

Where the diameter is limited in this way, it would immediately give the fan manufacturers fewer sizes to work to and would no doubt result in a saving. In addition, the dimensions at the hub are also capable of standardization, particularly in the pressed metal designs. The bore of the fan and the dimensions of the bolt circle together with the bolt sizes and distribution are also susceptible of standardization since practice in mounting does not vary so widely that it could not be brought into line at this point.

The cast fans are more difficult to handle than the pressed metal design because when cast the design has been worked out to fit some particular mounting condition in most instances. Still, it might be possible that pressed metal and cast practice could be brought down to the same level as regards hub dimensions and bearing mountings. Where ball bearing fans are used, and this is rapidly becoming general practice, the bearing mountings are certainly a feature which could be well brought down to a limited basis.

Pitch Relatively Unimportant

No radical step such as making hard and fast rules for fan diameters pitches and numbers of blades could be thought of at the outset, but it is reasonably certain that with the diameters determined the number of blades used would begin to reduce itself to a standard quantity for fans of given dimensions. The matter of pitch is relatively unimportant in the pressed metal design because it is simply a question of bending the blades to the required angle. It is quite certain that the variations of pitch angle will not be so great but that a slight variation in the bending process will take care of the entire range of pitches. Referring to the table herewith, an angle of about 30 deg. to the plane of rotation seems to strike quite close to general practice.

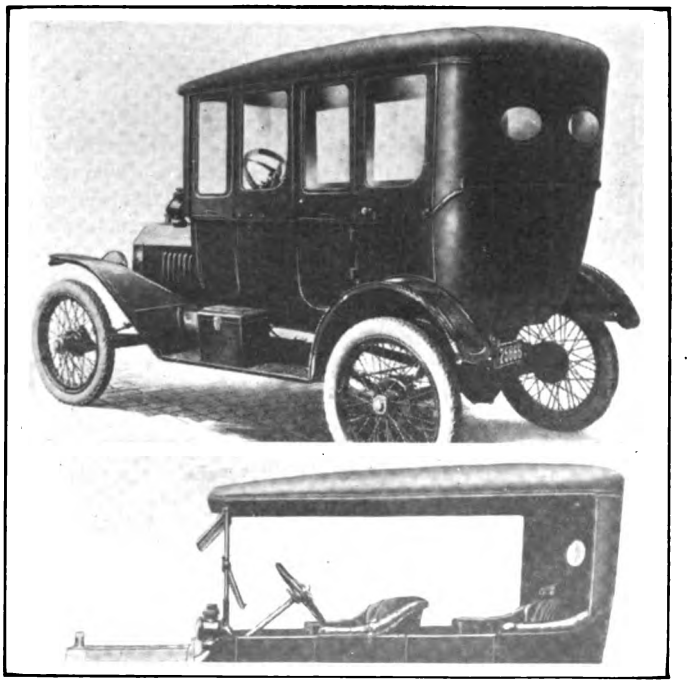
In spite of all these variations in pitch the problem as regards this matter is not one which need fundamentally to be examined until after the work of inducing fan manufacturers and automobile manufacturers to accept a series of graduated diameters for pressed metal fans which will cover the desired field and yet require only a few designs in place of the large number now in use. The standardization of the hub will also be of benefit to ball bearing manufacturers.

Weather-Proof Top for Fords

A TOP designed to make the Ford an all-year car in the strictest sense of the word has been brought out under the name of the limousine top for Fords, by the Detroit Weather-Proof Body Co., Detroit, Mich. It is an attractive and practical removable top which can be easily handled and sells for a moderate price. The top is designed to be of good appearance and to have attractive lines while at the same time having substantial workmanship.

The canopy frame work is made of wood and the braces are of light and strong sheet steel. The entire top and sides are covered with a high grade of imitation leather which is weather-proof. The inside lining is of fine gray cloth giving a very smart finish. The side panels are plate glass. The doors are a patent flexible design which slide noiselessly up and down, disappearing entirely from view when raised. It is possible with this door to open it partially for ventilation and it is claimed by the designers that with this arrangement the top has exceptional conveniences for ventilation. With everything closed, the car is entirely storm and weather-proof, but by removing the side panels and doors, which can be done quickly, a very handsome fair-weather top remains. A rain-vision windshield is included.

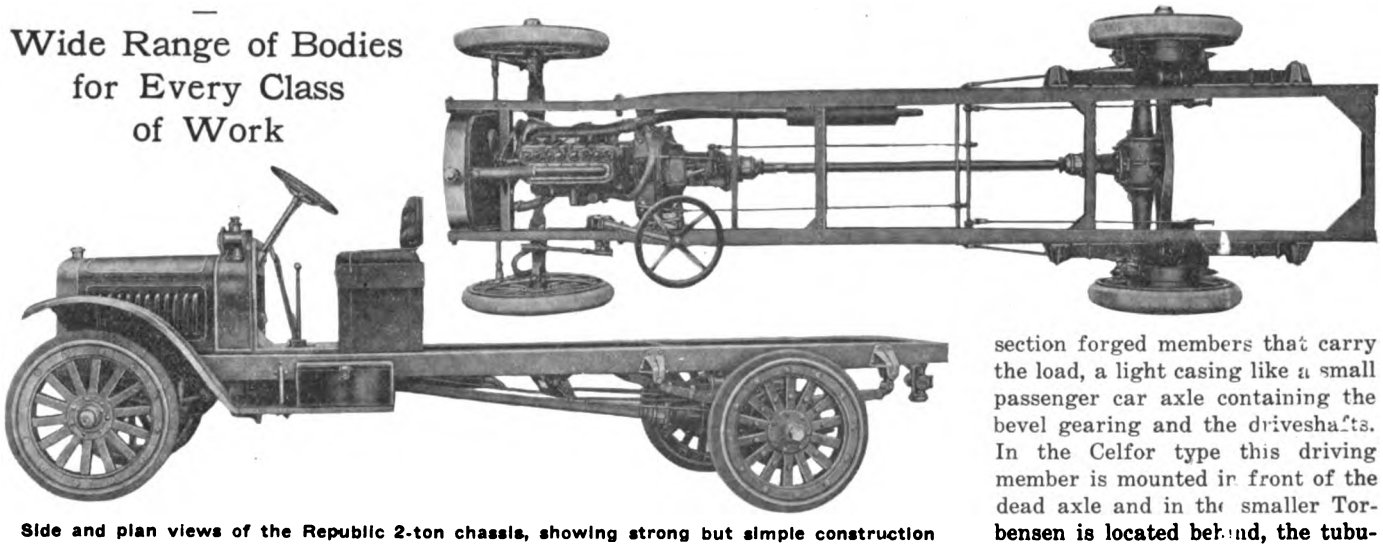
The limousine top for Fords which has been designed and built with a view of obviating any rattle can be put on by anyone who is able to handle a wrench and screwdriver and for owners of 1914 Fords a special cowl is supplied for a small additional sum. The tops sell for $77.



Limousine top for Fords open and closed

Simplicity Features Republic Trucks

Wide Range of Bodies for Every Class of Work



Side and plan views of the Republic 2-ton chassis, showing strong but simple construction

IN the passenger car field the big outputs of moderately-priced cars come mainly from factories where the assembly system of manufacture has been adopted, and it is reasonable to suppose that much the same industrial condition prevails in the truck division. But there is one striking difference, which makes it impossible for passenger car procedure to be applied to truck manufacture without any change in method and this is the fact that absolute single model specialization is an impossibility.

The assembler of truck chassis can make a wide range of sizes without great expense because the whole field of motor and parts manufacture offers him so wide a choice of components. Careful layout design enables the assembly process to be closely similar for quite a wide range of models, and the truck lacks the elaborate fittings and body parts of a passenger car, so it is possible to make half a dozen commercial vehicle models almost as economically as to make one only.

Acting on this principle the Republic Motor Truck Co., Alma, Mich., is able to produce a sufficiently wide range of vehicles to suit almost any sort of work at distinctly moderate prices, as instance the ¾-ton at $995 and the 2-ton at $1,830.

The Republic company is an upholder of the internal gear drive, using this type of axle on both chassis. Two makes of axle are used, the smaller truck having a Torbensen and the other a Celfor. All have unit power plants and large diameter tubular propeller shafts.

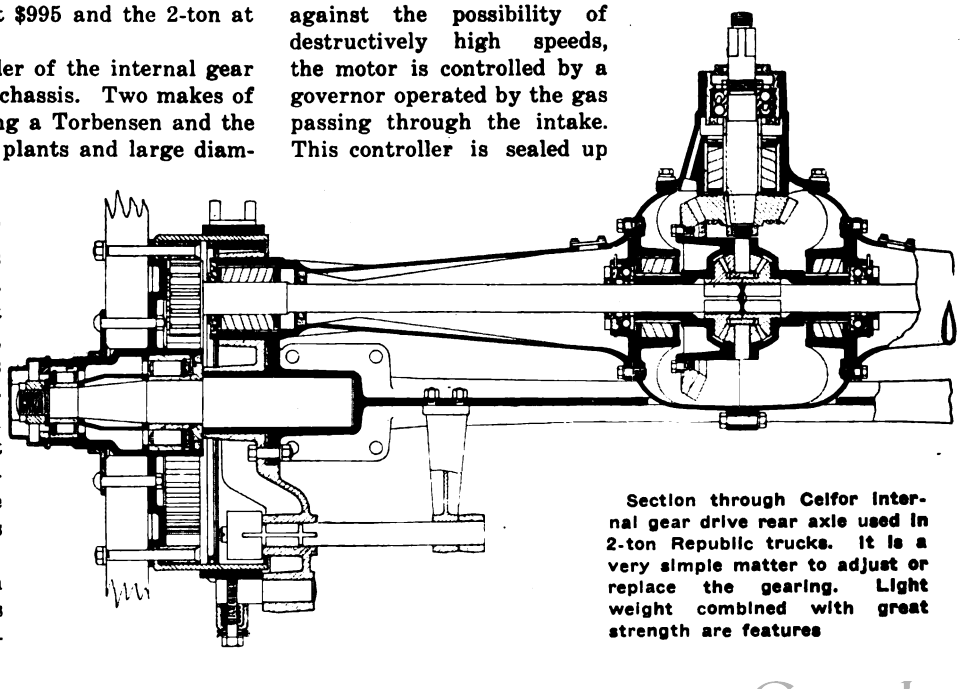
The choice of the internal gear axle has been dictated by the belief of the Republic company that its light weight in proportion to its strength is a very real advantage. It is easy to obtain a wide range of sizes, and another very large advantage is that the gear ratio is readily variable. To suit the size of the pinion and of the annulus gear to the district where the truck will be used is a simple and inexpensive process, and the ultimate renewal of worn gearing is equally easy.

Both the Torbensen axle used on the small chassis and the Celfor axles of the larger model have stout I-section forged members that carry the load, a light casing like a small passenger car axle containing the bevel gearing and the driveshafts. In the Celfor type this driving member is mounted in front of the dead axle and in the smaller Torbensen is located behind, the tubular driveshaft from the gearbox passing through the center of the dead axle which is enlarged and pierced for this purpose. All torsional and driving stresses are resisted by the ample rear springs and all shafts throughout the axle members are supported on roller bearings.

In the design of the axles there are no right or left hand parts, which means that bearings, brake bands, etc., are all interchangeable, and this further facilitates repairs or adjustments. Brakes are internal and external on drums which inclose the driving mechanism at each end of the axle and it is to be observed that the length of the various levers and the layout of the links enables a very powerful retarding force to be exerted without great effort on the part of the driver.

Motor Is a Continental

The motors used are Continentals, one size caring for the ¾-ton model, and a larger size for the 2-ton. Moderate size of motor and a fair crankshaft speed are favored because the high speed engine weighs less for its power than the slow speed kind. To guard against the possibility of destructively high speeds, the motor is controlled by a governor operated by the gas passing through the intake. This controller is sealed up



Section through Celfor internal gear drive rear axle used in 2-ton Republic trucks. It is a very simple matter to adjust or replace the gearing. Light weight combined with great strength are features

inside the intake pipe and has no external connections whatever, so it cannot be tampered with except by tearing down the assembly. The Stromberg carbureter bolts to the intake pipe and can be removed or replaced without any interference with the governor mechanism so the governor is practically integral with the cylinder block.

The difference in motor size between the two models is not great as the stroke is 5 in. in both, the bore of the smaller engine being 3½ and that of the larger 3¾ in.

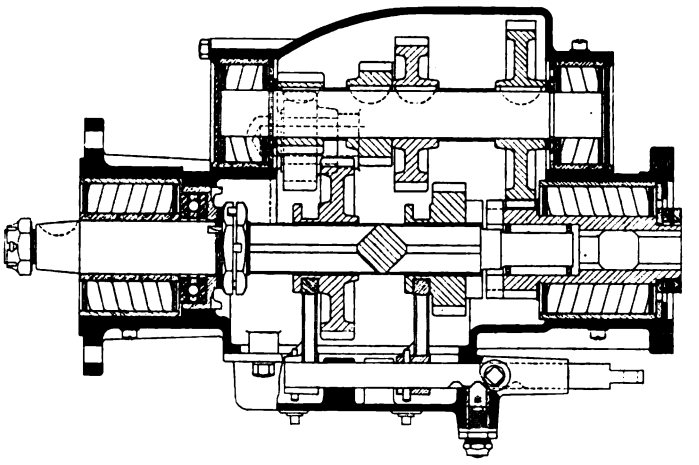
Crankcase of Aluminum

The governor is set to allow a maximum road speed of about 20 m.p.h. for the ¾-ton job, and about 17 m.p.h. for the 2-ton. The motors are L-head block types with individually accessible valves. To save weight the whole crankcase is aluminum, and in the interests of simplicity the water pump is dispensed with, ample syphon circulation being insured by large water ways within the cylinder casting and big outside pipes. Lubrication is a combination of forced and splash, the three main crankshaft bearings having a pressure supply while dip troughs care for the connecting-rod bearings. To the helical timing gears at the front end there is a separate lead from the pump, which latter is a plunger type operated from the camshaft. Ignition is by Bosch magneto, though a complete electrical equipment, including starter and Westinghouse lighting outfit, is obtainable for an extra charge.

A multiple plate dry disk clutch is housed in part of the crankcase that incloses the flywheel and the gearbox is bolted up on a bell housing. This, being small, is of cast iron, and provides three forward speeds, the control being central. Large roller bearings support the gearshafts which are of a special alloy steel and it is claimed that the gearset is designed to support a 50 per cent overload, a highly desirable feature for a commercial vehicle.

Frame Is Flexible

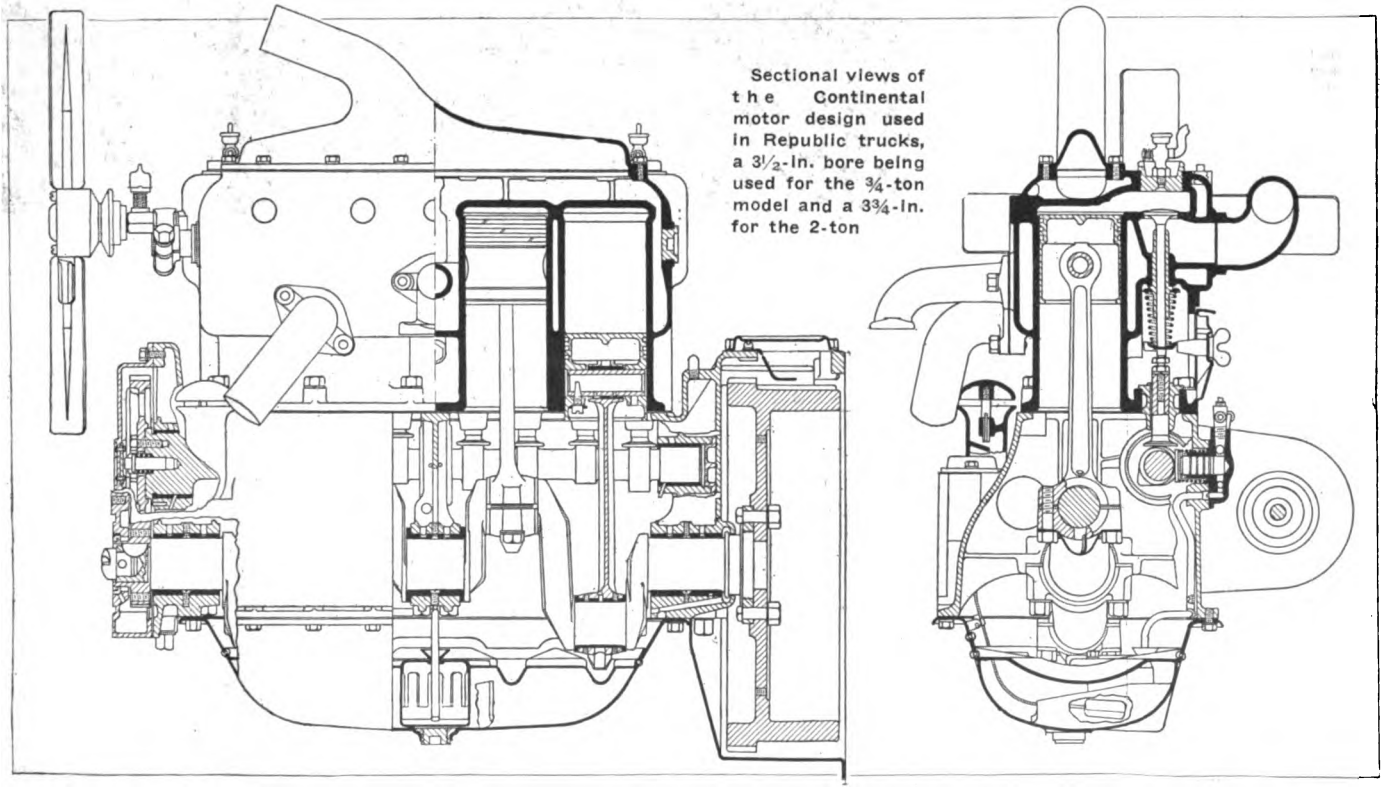
In the frame there is no rigid member, the disposition of the components being such that freedom to weave cannot affect alignment detrimentally. For the engine there is a three-point suspension, two motor arms lying close to the flywheel and a front end swivel being bolted to a cross member, but this same member is not used for the attachment of the radiator. It is essential above all else, that frame weave shall not affect the delicate structure of the cooling apparatus, so a special dropped, cross member is mounted in front of the motor support and the radiator rests on two pads about half the width of the frame apart. A recent change in Republic design is the substitution of a pressed steel radiator shell with a removable core for the integral design used previously.



Three-speed Covert gearbox used in the Republic trucks

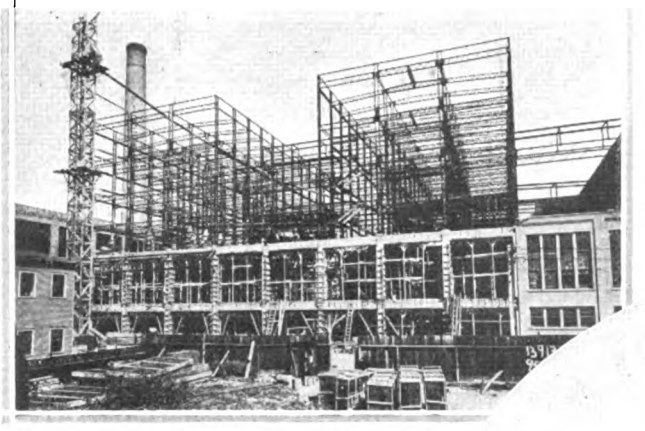
Wide Range of Bodies

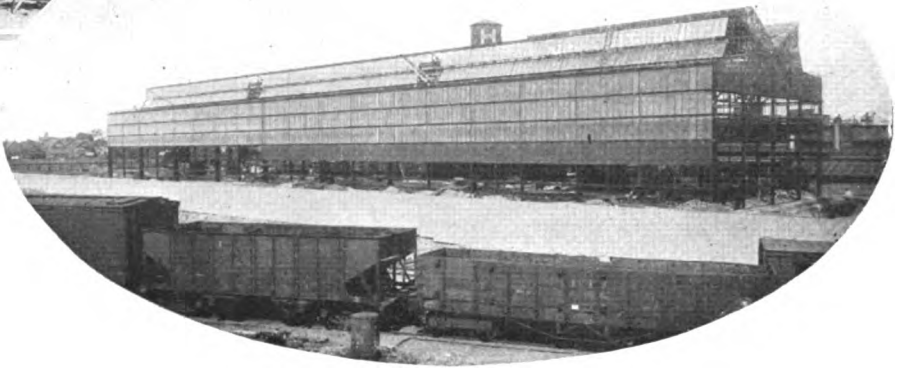
In details the Republic chassis are well cared for, there being no joint without its greaser, but more important still, there are a minimum of places that require lubrication. When the body is on, the only places that are in the least difficult of access are the universal joints, and these call for but infrequent attention. As regards the rest, ten minutes would more than suffice to care for everything. Of course the range of bodies available is wide. These are all made in the Republic plant and the company takes considerable pride in the quality of workmanship and the degree of finish.



Sectional views of the Continental motor design used in Republic trucks, a 3½-in. bore being used for the ¾-ton model and a 3¾-in. for the 2-ton

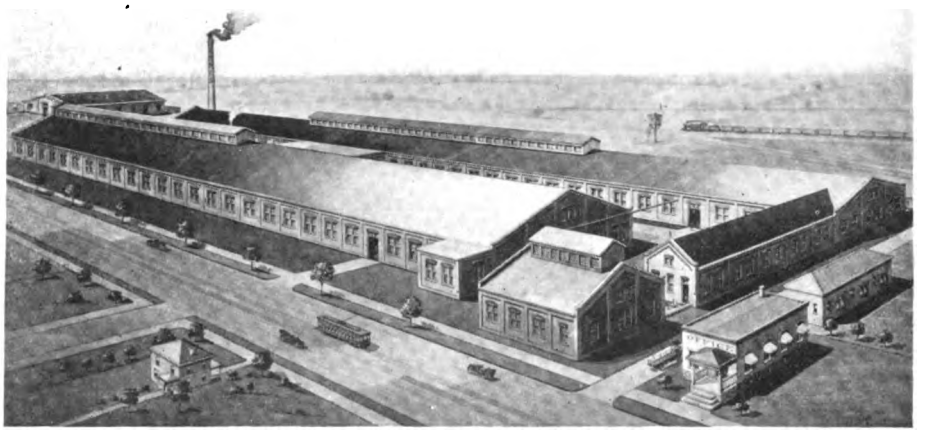
Some Recent Factory Building Operations



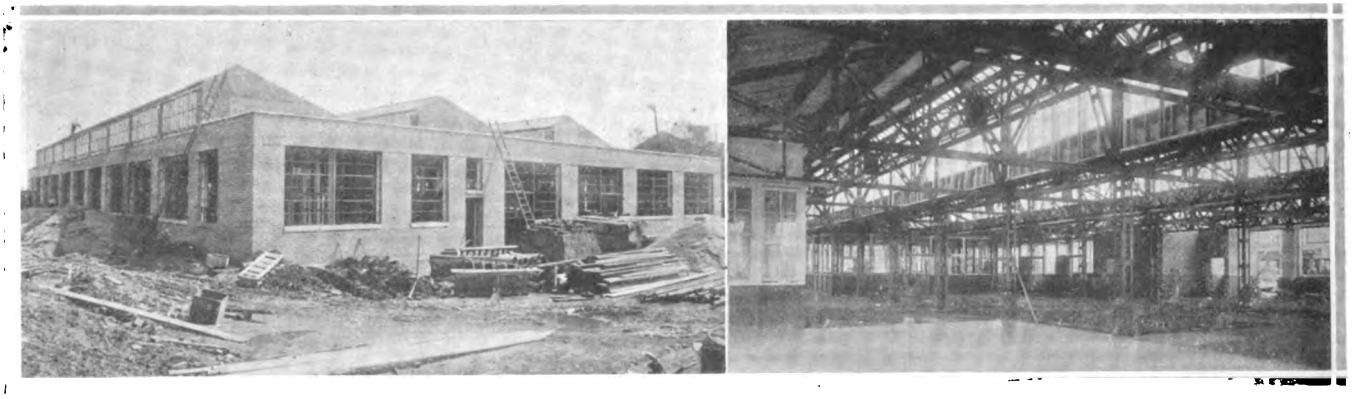


Above—One of the five additions to the factory of the Firestone Tire & Rubber Co., Akron, Ohio, which aggregate over 300,000 sq. ft. or 7 acres of floor-space. It is expected these additions will be completed before snow flies. Through these additions the present output of 7500 tires per day will be increased to 12,000 per day, a gain of 60 per cent.

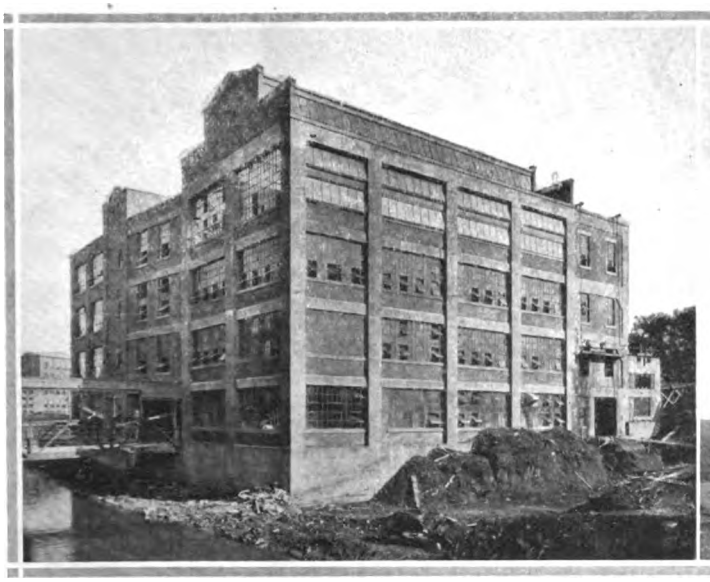
Oval—Recent addition to the plant of the Hydraulic Pressed Steel Co., Cleveland, Ohio, which was originally designed to be 360 by 80 ft., the materials used being steel, concrete and glass. An interesting feature of this building is the fact that the contract called for its completion in 8 weeks but the contractor completed it in 42 days, thereby earning a bonus of $100 per day. Before the building was completed it was found necessary to enlarge it and the contract was let to extend it 200 ft. further, making it 560 ft. long and 80 ft. wide



Right—Plant of the Oakes Co., Indianapolis, Ind., which has added three large buildings, increasing the capacity of the plant to 2000 fans per day. The new plant contains new machinery, several 46,000-lb. presses, enameling ovens, etc. Several acres comprise the grounds and private railroad switches have been built

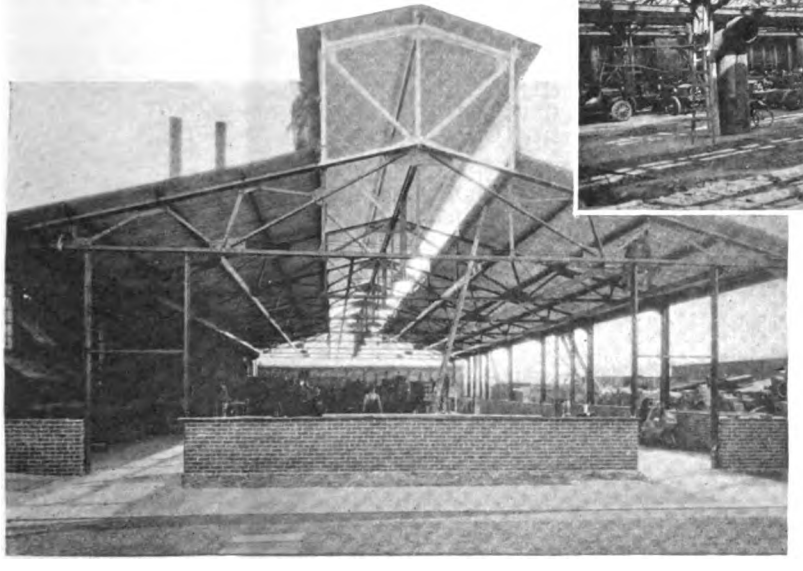


Above are illustrated the exterior and interior of the nearly completed addition to the factory of the Aluminum Castings Co., Cleveland, Ohio. The greatly increased demand for aluminum products and especially for castings of this metal for use in the automobile industry is taxing the facilities of the company to a marked degree



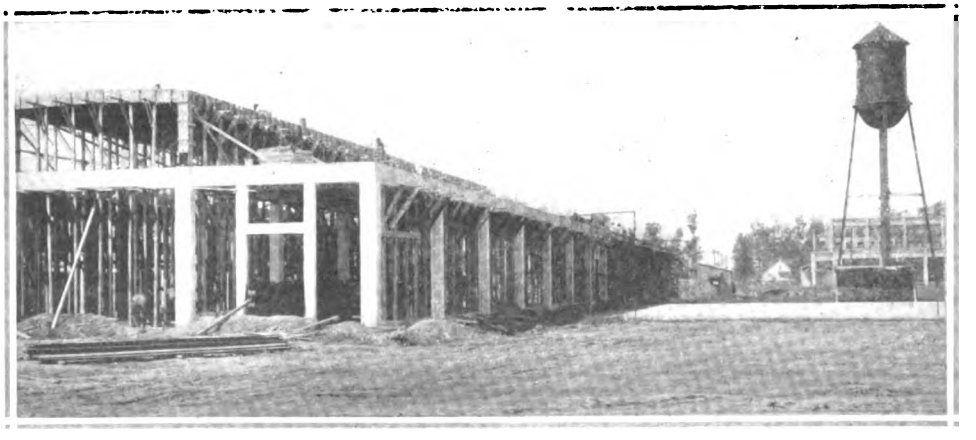
Above at the left is illustrated the addition recently completed by the New Process Gear Corp., Syracuse, N. Y. This structure is four stories in height and 120 by 100 ft. The main plant across the creek is connected with the new building by the bridge illustrated. Excavation at the right is for an additional five-story building, 180 by 100 ft.

Above at the right is the new four-story commercial car worm drive axle plant of the Timken-Detroit Axle Co., Detroit, Mich. The total floorspace is about 100,000 sq. ft., and with machine equipment the cost is about $500,000



Above—Interior of the new truck erecting department of the Packard Motor Car Co., Detroit, Mich. This building is 240 ft. square and of steel and glass construction. As shown in the illustration, over 100 trucks were run in on the completed portion of the new floor and given final adjustment as fast as the cement dried

Left—One of the two new factory additions of the Remy Electric Co., Anderson, Ind., which, like all the other Remy buildings except the administration structure, are one story high so that with high ceilings an exceptional amount of fresh air and light is admitted



Right—New storage battery plant of the Prest-O-Lite Co., Inc., Indianapolis, Ind., which will increase the total floorspace of the company's plant 45,000 sq. ft., or 33⅓ per cent. This addition, which will cost $60,000 and machinery $25,000, is to be completed Dec. 1, all construction being handled by the company's own engineers with the exception of the roofing. The company is at present turning out 400 storage batteries per day, and this output will be greatly increased by the added facilities

The Rostrum

Reasons for Motor Overheating

EDITOR THE AUTOMOBILE:—Will you kindly publish a wiring diagram of the Coey Flyer 1916 model? This car is new and has a starter which never did work. I think that the wiring has been tampered with in transit.

2—Also, the motor heats up on level or down grade and won't pull at all on a hill or up grade. It does not miss and the motor idles nicely, but when it starts up hill the engine seems to choke up and stop. It does this on low gear with wide open throttle. The mixture smells too rich and the carbureter is a Carter with dash control. Have tried the control in all positions.

E. Palestine, Ohio. G. E. M.

—The wiring of the diagram you request is published in Fig. 1. It would be well to see if the coil is securely grounded to the angle platform as the system on the Coey is grounded throughout. The ignition wiring diagram is in the cover of every coil box and the diagram shown is for the lighting and starting system.

2—The reasons which may be assigned to the trouble you mention are:

a—spark is retarded too much.

b—float too high in the float chamber.

c—hot air pipe giving too hot a mixture.

d—spark shorting across terminal inserts in distributer.

To eliminate the first trouble, the igniter should be advanced on the vertical shaft as far as possible and carried practically up to the point where an ignition knock develops.

The second trouble may be remedied by adjusting a small knurled nut on the top of the float chamber to the point marked *L* or to the point where you obtain the best results.

The third trouble if it is from that, can be remedied by taking off the hot air pipe until the weather becomes cooler.

The fourth trouble can be remedied by cleaning and sand papering the inside of the distributer until it is perfectly smooth.

Gathered Wheels for Easy Steering

Editor THE AUTOMOBILE:—Why is the distance between the front wheels of an automobile greater at the top then at the bottom?

2—How are the valves of a four-cycle engine re-timed?

3—What is a floating rear axle?

4—What is the difference in connecting the battery cells in series or in parallel?

5—Will you explain the method of changing from high to low speed when a sliding gear transmission is used?

F. Warren, Mass. W. N. T.

—The reason for this is to make steering easier. The object of tipping the wheels in this manner is to bring the point of contact between the wheel and the ground in a vertical line below the axis of the steering knuckle. When the line of the center of the steering knuckle produced is coincident with the contact of the tire and the ground, there is less tendency for the wheel to be thrown out of line when an obstruction is met on the road.

2—By re-timing the valves you probably refer to bringing them back to the original time of opening and closing after the timing for some reason has been disarranged. On the flywheel of the motor there are marks which indicate the actions of the valves when these marks register with a fixed point on the engine frame. Taking for instance the mark I. O. 1. This indicates that when this mark registers with the permanent point, the inlet valve on No. 1 cylinder is just starting to open. Therefore, with these two marks registering, the camshaft gear must be turned until the camshaft is in such a position that the inlet cam on No. 1 cylinder is just starting to open the valve. The gear is then slipped back into mesh and the motor is timed.

3—THE AUTOMOBILE published in the issue for Sept. 9, on page 472, an article explaining the different types of axles. The floating axle is one in which all the weight is taken upon the axle housing and the wheel bearings are mounted on the outside of this housing. The axle shaft only transmits the driving torque and therefore the shaft can be withdrawn without altering the position of the wheel.

4—When batteries are connected in series, the positive poles of one cell are connected with the negative of the next, and so on. When in parallel all the negatives are connected and all the positives. Connecting in series gives the effect of adding the voltages while connecting in parallel adds the amperage. Thus, if six 1-volt cells were connected in series, the result would be a 6-volt current while in parallel the voltage would be about 1.

5—In changing from high to low speed, when a sliding gear transmission is used, the process merely consists of taking out the clutch by depressing the clutch pedal and bringing the shifter lever back in the gate to secure the low gear mesh. If there is difficulty in doing this without noise the clutch should be merely slipped a little and not entirely withdrawn. Move the lever with a moment's pause in the free position and the clutch will speed up to suit the faster revolution of the lower gears; or increase the motor speed while in neutral with clutch momentarily engaged.

Troubled with Explosions in Muffler

Editor THE AUTOMOBILE:—I have a 1913 Studebaker 35 and am troubled with explosions in the muffler. I have ground in the valves and have tried adjusting the carbureter and valves without effect.

I get the explosion whenever I cut down the gas and particularly in going down hill. Am using an exhaust horn. Would this have any effect upon it?

2—I also have a 1914 Buick truck which does not start on the battery without spinning it for 3 or 4 min., but will start quite easily on the magneto and will run after starting on either magneto or battery. Can you tell me what the trouble is and how I could remedy this?

Allston, Mass. F. W.

—The only reason for getting an explosion in the muffler is that an unburned charge has found its way into this part of the car. This means that the cylinders are not firing regularly and consequently that there is trouble with the functioning of either the carburetion or ignition. It would be well to examine the spark plug points to see if they are not too far apart and also to adjust the carbureter so that the motor fires regularly on all four cylinders. The exhaust horn

has nothing whatever to do with the muffler explosions which are due to the fact that an unburned charge escapes into the muffler to be followed by a hot exhaust which explodes the unburned charge in the muffler.

2—No doubt the batteries are weak and need renewal.

Setting Loosened Automobile Wheels

Editor THE AUTOMOBILE:—Kindly give me the proper method of setting automobile wheels that have loosened in the felloe and hub.

2—Give me the timing of the 1910 4-40 Locomobile.

Manhattan, Nev. F. C.

—This work will have to be done by a competent wheelwright who will have to thoroughly go into the causes of the loosening before he can make a repair. It would be dangerous to attempt to do this work yourself as the failure of the wheel might result, with serious consequences.

2—The timing of the 1910 4-40 Locomobiles is as follows: Admission opens on top center; admission closes ⅜ in. past bottom center; exhaust opens ¾ in. before bottom center, and exhaust closes ⅛ in. past top center.

Complete Circuit for Splitdorf Ignition

Editor THE AUTOMOBILE:—Will you kindly publish sketch showing the complete circuit for a Splitdorf coil, showing both battery and magneto circuits?

Barberton, Ohio. F. S.

—You do not mention the model magneto you refer to nor whether you are using the dash transformer or the tube transformer. A typical wiring diagram for each is given in Fig. 2.

Operation of Chevrolet Electric System

Editor THE AUTOMOBILE:—I have recently bought a Chevrolet roadster and would like to get a simple description of the workings of the electric starting, lighting and ignition systems used on this car; Auto-Lite and Connecticut ignition.

If such descriptive articles have appeared in THE AUTOMOBILE please mention issue.

Washington, D. C. J. S. C.

—The starting, lighting and ignition system is composed of the Auto-Lite for cranking and lighting and the Connecticut for ignition. The Auto-Lite lighting and cranking system is the two-unit type, an electric motor connected through the Bendix drive with teeth in the flywheel rim, serving for rotating the crankshaft and a separate generator driven by helical gearing providing current for lighting and ignition. The latter has in unit with it a Connecticut coil and distributer to take care of the ignition. A complete description of the Chevrolet line appeared in THE AUTOMOBILE for Nov. 26, 1914, on page 989.

Weights of Franklin Power Plants

Editor THE AUTOMOBILE:—Kindly publish the weight of Franklin series five and eight motors, no electrical equipment for lighting and starting in either case.

Chula Vista, Cal. H. A. SPRAGUE.

—The weight of the Franklin motors is always computed as assembled completely with the clutch which is housed in the flywheel. Including the starter, the series 5 Franklin motor weighs 634 lb. The series 8, 642 lb. The starter alone for the series 5 weighs 92 lb. and for the series 8, 58 lb. These figures do not include the battery unit.

Building High-Speed Light Six Racer

Editor THE AUTOMOBILE:—I contemplate building a small bore, high-speed racer. I want to use a small light weight, high-speed motor of 3 by 5 bore and stroke, six-cylinder, delivering its maximum power at 3000 r.p.m. I contemplate using a 3 to 1 gear with 32 by 4 tires. Is this type of motor suited for this work and is this gear too big? Any other information along this line would be greatly appreciated.

Tompkinsville, N. Y. G. S.

—The best way to proceed is first to build the motor, then place it upon the block securing the horsepower curve after which the gear ratios can be laid out so that the motor is capable of operating at the peak of the horsepower curve when the maximum effort is desired. The arrangement of the manifolds, gas passages, etc., have so much to do with the motor that it will be impossible to predict the performance in advance.

Extreme Bore Limited by Practice

Editor THE AUTOMOBILE:—Would you kindly advise me the extreme bore regardless of the length of the stroke which could be used in a motor to come under the 300 cu. in. piston displacement?

Orchard Lake, Mich. C. H. B.

—By this you no doubt mean to infer that the motor must be within the limit of practical design and since you do not mention the number of cylinders, a four-cylinder motor will be assumed. Taking a motor of 3-in. stroke as being about as little as possible to come under the head of even reasonable practice, the bore of such a motor would be 5⅝ in. to give a displacement of 295.2 cu. in.

Information on a 1908 Pope-Toledo

Editor THE AUTOMOBILE:—Will you kindly furnish me with the following information regarding a 1908 Pope-Toledo four-cylinder motor, 4⅞ by 5?

1—Center to center distance on the tie rod.

2—Timing of valves.

3—In the bore of the driving gear on the camshaft are

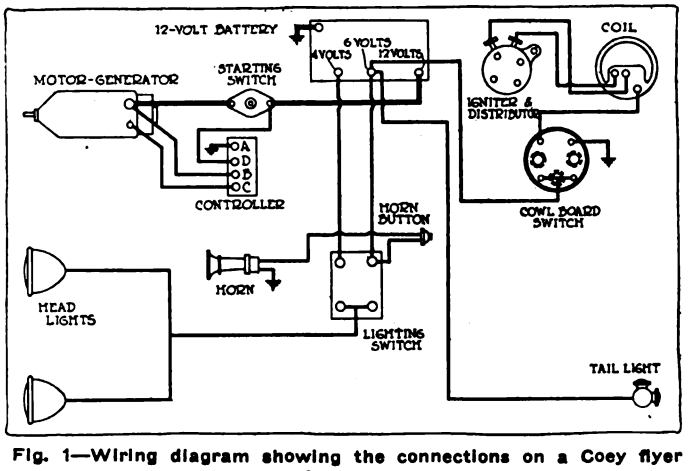


Fig. 1—Wiring diagram showing the connections on a Coey flyer 1916 model

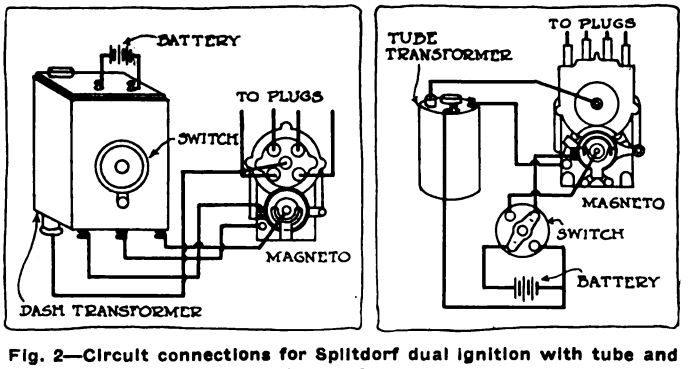

Fig. 2—Circuit connections for Splitdorf dual ignition with tube and dash transformers

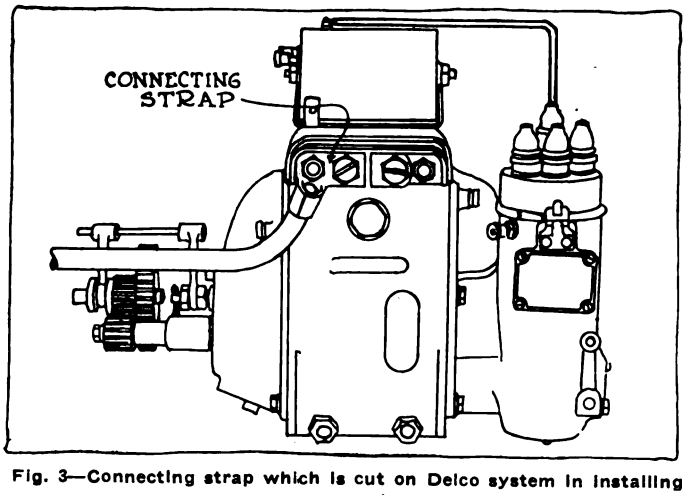

Fig. 3—Connecting strap which is cut on Delco system in installing an ammeter

two keyways. Are these intended for setting for high or low speed?

4—Center to center distance from rear to front axle spindles.

5—Principles and operation of the oiler with which this machine is equipped. It is a five-feed oiler with a single pump, but the oil is delivered through individual sight feeds. It would appear that it is forced under a small piston inclosed in the sight feed glass which rises under the pressure. The top of the piston shows a white telltale and the oil is by-passed under the piston to the delivery tube.

6—Is the auxiliary dash tank equipped with any form of automatic shutoff to take care of pressure delivery from the rear tank?

7—The splash oiler does not appear adequate to properly supply oil to the crank throws and it is contemplated installing a high pressure single-cylinder pump connected by manifold to the crank throws and camshaft bearings. Is this advisable?

8—When reducing the load on the chassis is it possible to remove some of the spring plates?

Camden, N. J. W. S. C.

—The distance, center to center, on the tie rod is 46¼ in. The dimensions of this motor are 4⅞ by 5¼ in.

2—The timing of the valves is as follows: The exhaust opens ½ in. before center, and closes ⅛ in. past center. The intake opens 1/16 in. past center and closes according to above. This is measured on the flywheel.

3—In the bore of the driving gear on the camshaft are two keyways. These are not intended for setting the high or low speed.

4—The center to center distance from the rear to the front axle spindles is 125¾ in.

5—The oil in the five-feed oiler is forced under a small piston inclosed in the sight feed glass which rises under the pressure. The top of the piston shows a white telltale and the oil is by-passed under the piston to the delivery tube.

6—The auxiliary dash tank is equipped with any form of automatic shutoff and will take care of pressure delivery from the rear tank. It is not advisable to install a high pressure single-cylinder pump connected by manifold to the crank throws and camshaft bearings.

7—No.

8—It is suggested that you install new springs when reducing the load in the chassis, and we would not advise removing the spring plates.

Wants to Install Ammeter on Delco System

Editor THE AUTOMOBILE:—We have a Buick 37, 1914 model, equipped with Delco system and would like to install an ammeter showing the charging rate, but not to show a discharge when the starter pedal is pressed down to start the engine.

Iuka, Kansas. M. & P.

—The accompanying wiring diagram shown in Fig. 4, gives the connections necessary to install the ammeter. In order to make this operative it is necessary that the brass strap connection between the motor terminal and the generator terminal on the side of the motor generator be cut. This is a very easy matter with the later types of these instruments where the strap is on the outside, but which will be considerable labor if the instrument is of the earlier type in which the connection is on the inside of the frame.

A diagram showing how this may be connected on the Delco system is given in Fig. 3.

Zip Motor Built in Detroit

Editor THE AUTOMOBILE:—Can you tell me who built the motor and who built the wheels for the Zip cyclecar? Is it possible to replace the bearings in these wheels without removing the spokes first?

2—What size Hess-Bright ball bearings would fit these wheels?

Pueblo, Col. L. C. J.

—You do not state the model you are driving. The Zip Cyclecar Co. discontinued operations last November, although the service business is at present being continued by H. A. Huebotter, 2110 Main Street, Davenport, Iowa. The twin-cylinder air-cooled motor was made by the Universal Machinery Co., Milwaukee, Wis. The four-cylinder water-cooled motor was built by the Hermann Engineering Co., Detroit, Mich. The wheels were made by the Standard Welding Co.,

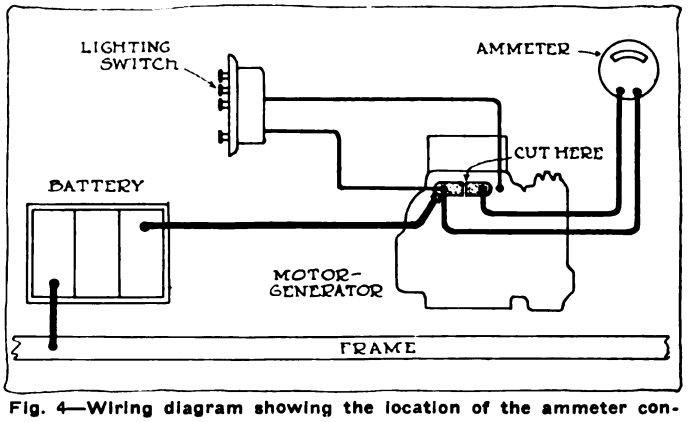

Fig. 4—Wiring diagram showing the location of the ammeter connections on the Delco system

Cleveland, Ohio. The cups of the wheel bearings cannot be taken from the hub without disassembling the wheel and it is generally preferable to replace the wheel altogether. Prices on the different parts can be obtained from the address given. No record of any experiments with annular ball bearings in these wheels are on file.

Piston Displacements of Racing Cars

Editor THE AUTOMOBILE:—What is the bore and stroke of the four racing cars, Mercedes, Peugeot, Delage and Bugatti?

2—What piston displacement have they?

3—How many cylinders?

4—What radiators do they use?

5—Do six-, eight- and twelve-cylinder cars compete with four-cylinder cars on the Chicago board track providing the piston displacements are the same?

St. Louis, Mo. A. L. E. B.

—Bore and stroke of the 4.5-liter Peugeot is 3.62 by 6.64. The new Peugeot racers known as the 3-liter cars, have bore and stroke of 3.07 by 6.13. The Bugatti has a bore of 4 in. and a stroke of 5.937. The Delage has a bore of 3.65 and a stroke of 7.1 and the Mercedes is 3.69 by 6.3.

2—The piston displacements are as follows: Mercedes 270.9; Peugeot 183 and 274; Delage 299, and Bugatti 298.

3—These cars are all four-cylinder types.

4—The radiators are not alike and THE AUTOMOBILE has no record of the manufacturer.

5—The racing rules do not limit the number of cylinders, merely providing a piston displacement limit.

Starting on Compression Not Harmful

Editor THE AUTOMOBILE:—Does starting the engine of an automobile on compression affect the engine in any way?

Dallas, Tex. W. B. S.

—This method of starting will not harm the motor, although at one time its effects were seriously considered. The general consensus of opinion is that the explosion is so much weaker than the ordinary one that no harm could possibly result.

Brake and Drawbar Horsepower

Editor THE AUTOMOBILE:—Please explain the difference between brake horsepower and horsepower at the drawbar? Also, is the horsepower the same for all manufacturers and is its value 550 ft.-lb. per second?

Rock Island, Ill. C. H. H.

—Brake horsepower signifies the horsepower delivered by the crankshaft of the motor and is generally measured upon some form of braking device such as the Prony brake or some type of dynamometer. Horsepower at the drawbar is generally a measure of the towing power of the vehicle.

Horsepower means the same to all manufacturers as it is a definite quantity meaning 33,000 ft.-lb. per minute, or 550 ft.-lb. per second.

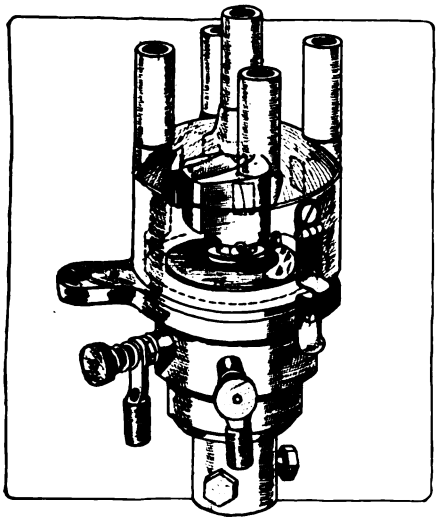
Timing of the Two-Speed Model A Krit

Editor THE AUTOMOBILE:—Please give me the timing of a Krit model A two-speed motor? Kindly show the position of crank throw as spark occurs in the first cylinder.

Marion, Ohio. D. G. T.

—The spark timing of this motor is such that the explosion occurs when the piston is within 3/32 in. of completing the stroke. This will enable you to set your ignition timing accordingly.

New Connecticut System Is More Compact



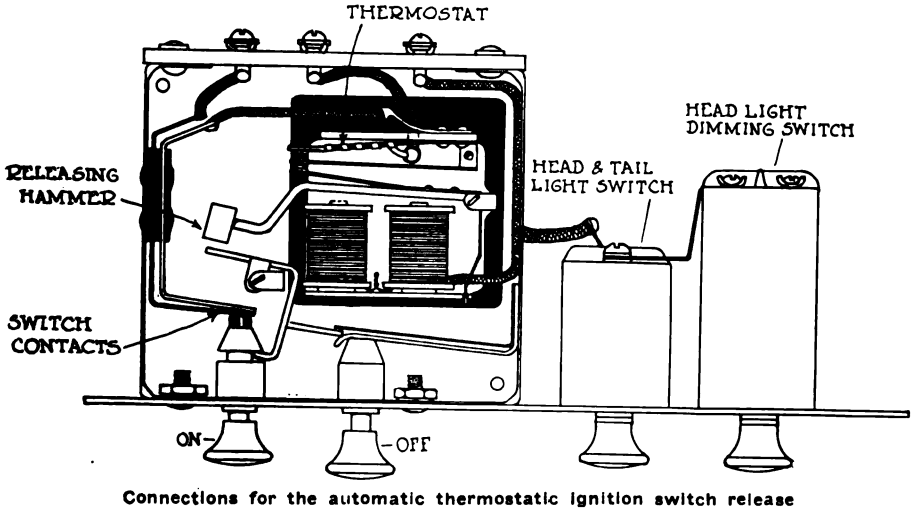
New Connecticut igniter housing which has a rounded top for the reception of the leads to the spark plug. This improved design eliminates the gathering places for moisture and dust and is an improvement over the flat top design

THE Connecticut Telephone & Electric Co., Meriden, Conn., has brought out an improved type of its automatic ignition system which is considerably simplified and more compact than previous types. The principle has not been altered, the improvement having to do only with mechanical construction.

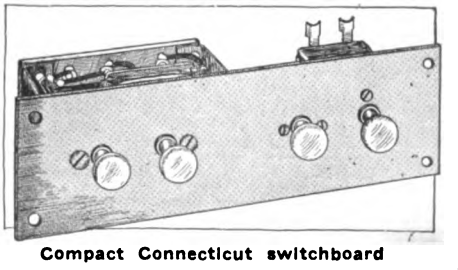
The igniter housing now has a rounded top for the reception of the leads to the spark plugs, this form being an improvement over the flat top in that it provides no lodging place for moisture and dust, etc. At the same time, the housing which carries the distributer segments has been made lighter. The distributer arm also has been lightened and made more compact. Other improvements include the adoption of a new type of compression lock washer holding the cover plate over the breaker mechanism in place and a new type of inclosed ball bearing at the lower end of the driving shaft.

In principle, the new type of switch, which is in addition to the standard round type, is exactly like the older one except that it is mounted entirely behind the dash with nothing in view except a plate and four switch buttons. One of these serves to make the ignition circuit and another to break it. A third button switches on head and tail lamp and the fourth button dims the head lamps for city driving. Any combination of lighting switches can be incorporated in the switch plate.

When the ignition switch is closed, current drawn from the storage battery is caused to pass through a tiny thermostat on its way to the coil and thence to the distributer and finally to the plugs. If the motor is not started within a short time after the switch is closed—the length of time is easily adjustable—the thermostat closes a circuit through a tiny electric buzzer operating a releasing hammer which automatically opens the ignition circuit and thus prevents the battery draining itself. Obviously, if the motor is stalled and not again started, the thermostat will open the circuit in the same way. Thus, it is impossible for the motor to stand idle for more than a minute or so with the ignition switch closed. When the motor is running the amount of current passing through the thermostat is so small that it is negligible and has no effect.



Connections for the automatic thermostatic ignition switch release



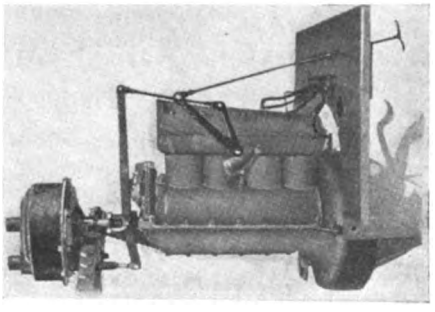
Compact Connecticut switchboard

ACCESSORIES

Cleveland Starter for Fords

UNDER the name of the Cleveland spring cranker a starter has been brought out for Ford cars which derives its power from a flat chrome-vanadium spring 2½ in. wide and 12 ft. long. This spring is coiled like the main spring in a clock, one end being fastened to the steel case and the other to an extension of the crankshaft. The winding is accomplished by a pawl and ratchet arrangement which is released by a trigger on the dash.

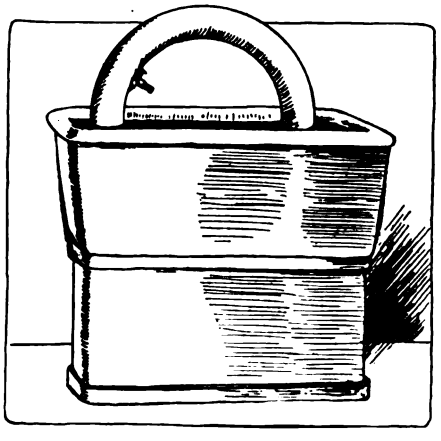
When the motor starts running under its own power the spring automatically rewinds, and when fully wound the apparatus ceases to operate. The rewinding takes from 20 to 30 sec., according to the speed of the motor. The price complete is $45.—The Forest City Electric Co., Cleveland, Ohio.



Cleveland starter on Ford motor

Ideal Tire Testing Tank

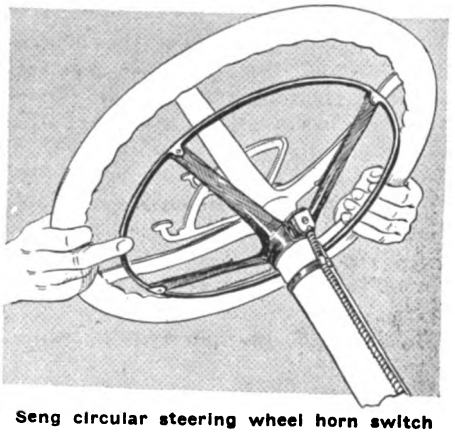
For a garage convenience there has been brought out a tire testing tank of porcelain under the name of Ideal. The white porcelain background reflects instantly the bubbles as they arise from the leak in the inflated tube. The porcelain used in these tanks is highly glazed so that its surface may be cut clean and white without any trouble. The tank stands 30 in. from the floor and will hold the largest tube. Its height from the floor to the top of the rim is 32 in.; inside depth is 15 in.; inside width, 8 in.; length over all, 36 in., and inside length, 32 in. To connect this fixture with the sewer a 1½-in. trap should be used. It may be filled with water by hose or overhead swinging faucets as desired.—The Trenton Potteries Co., Trenton, N. J.



Ideal porcelain tank for tire testing

Seng Circular Switch

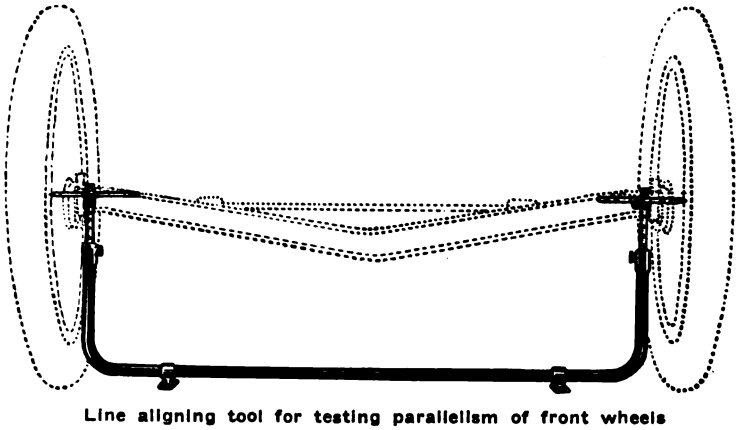
The Seng ring, of smaller diameter than the steering wheel, is placed under the wheel and concentric with it; its diameter is such that it is conveniently reached by the fingers. Pressure on it closes the horn circuit and sounds the signal; the pressure may be applied at any point, and the position of the steering wheel makes no difference. Price $3, Ford type $2.50.—W. P. Seng, Chicago, Ill.



Seng circular steering wheel horn switch

Line Wheel Aligner

The Line tool for testing the alignment of the front wheels of a car consists of a tubular shank with the ends bent at right angles and carrying adjustable pointers which can be applied to the rims, obtaining true measurements and eliminating the uncertainty due to measuring from tires which are not perfectly true. The vertical adjustable rods are graduated, as is also one of the horizontal pointers. The bent shank facilitates getting the measurement at the rear of the wheels. Price, $10.—Mechanical Utilities Corp., Chicago, Ill.



Line aligning tool for testing parallelism of front wheels

Holophane Reflectors

A heavy metal reflector, designed especially for outdoor work where it will be subjected to the action of the weather, is one of the products of the Holophane Works. Heavy porcelain enamel is used on all the surfaces, white inside and green outside, with the exception of a copper nut at the top. This reflector is suitable for headlights and is detachable.

The nut is tapped for ½-in. pipe connection and is locked to the reflector by a bearing of ample surface. By using four lights around a car an excellent illumination is obtained. The angle type, 12¼ in. in diameter and 14½ in. deep, is suitable for such work. A lamp for use in this work is turned out which has 200-watt argon-filled Mazda light. The list price of the reflector is $4 each.—General Electric Co., Cleveland, Ohio.

Camp Bed for Small Cars

A canvas bed, utilizing the seat cushions and braced by iron rods, is slung under the raised top of the car and affords comfortable sleeping accommodation for two persons. The makers state that it can be put up in about 3 min. When not in use the bed can be rolled into a compact bundle and stowed on the running board or any other convenient place.—Price, Ford type, $7.50; other small cars, $8.50.—Auto Bed Co., Bellingham, Wash.

Stevens Duplex Reamers

A new line of reamers specially designed for repairmen handling Ford cars has been brought out under the name Duplex. Among others, two reamers are for fitting of the spindle bodies and spindle arm bushings. The diameters of the two reamers which are contained in the one tool are 0.564 and 0.506 in. The reamer is supplied with both

straight and twisted flutes. Other reamers made by the same concern are plain and expanding types of special Ford sizes for use on worn or refinished parts. These are used in work of various bushings in the Ford car and can be brought up to 0.005 in. over size when desired.

To meet the demand for a cylinder reamer that can be used in an ordinary drill press the same concern is marketing one which is made with inserted blades having a cutting angle in clearance requiring but little power to operate. This reamer is fitted with a No. 4 Morse taper reamer shank, and the maker states that it will ream the Ford cylinders accurately in 15 min. It enables the reaming of cylinders for taking 1/32-in. oversized piston. The prices of the above tools are $2 for the Duplex reamer, prices on request for the plain and expanding reamers, and $16 for the cylinder reamer.—Stevens & Co., New York City.

Norton's Spring Leaf Spreader

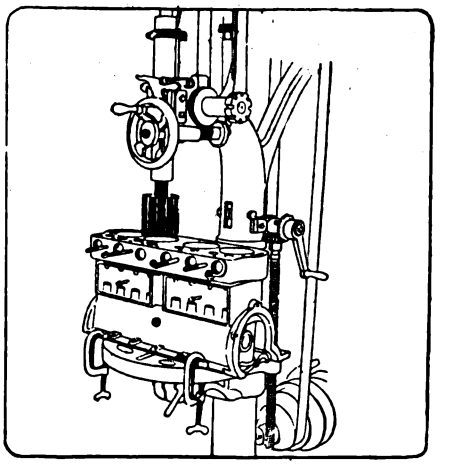
The leaves of the spring require lubricating as well as any other part of the car, for if they become dry they are likely to rust together, preventing free sliding and increasing the tendency toward squeaks. Springs which have become rusty between the leaves cause hard riding which in turn results in worn tires and finally broken springs. With this spring leaf spreader, the heaviest springs can have the leaves separated widely enough to insert graphite, the best known lubricant for this purpose.

As shown by the illustration, the tool is complete in itself, being strong and serviceable and designed to resist wear. The spur or wedge is of chrome nickel steel while the lever which spreads the leaves is a hard steel casting. The end of the lever is a cam enters itself on one side of the spring and at the same time draws the spur in on the other. The price of the tool is $2.—I. S. Spencer's Sons, Guilford, Conn.

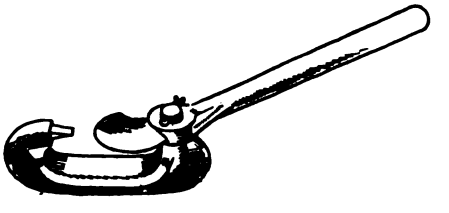
Tempco Spark Plug Brush

A spring steel wire brush set into a malleable iron handle and designed for cleaning carbon and other foreign matter from spark plugs is the Tempco. The end of the handle is forked and forms an alligator useful for turning small nuts, such as terminal nuts. The head terminates in a screwdriver tip, which is useful for adjusting spark plug points. The brush sells for 40 cents.—Tempco Mfg. Co., Chicago, Ill.

Canvas bed for use on small cars. It is illustrated folded and unfolded

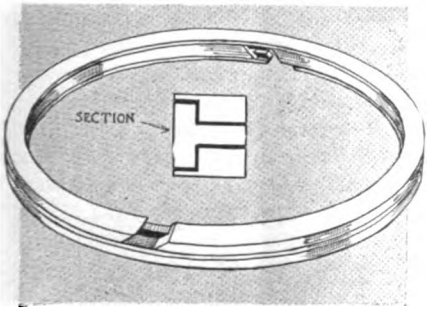


Stevens cylinder reamer for Ford motors

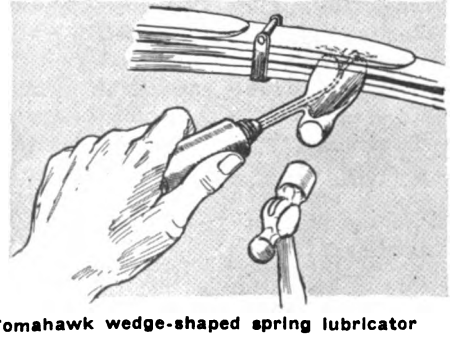


Norton spring leaf spreader for lubricating the leaves

Tempco steel spark plug brush



Trump piston ring, showing section



Tomahawk wedge-shaped spring lubricator

Trump Triple Piston Ring

Made in three sections. The central section is of T-shaped cross section, having flanges which fit into recesses in the two outer sections. All are diagonally split and the joints are set at equal intervals. The sections are concentric. The ring may be applied complete, as if it was of ordinary construction, or it may be put on one section at a time. The makers state that the interstices between the rings hold oil which forms a seal. The rings are 75 cents each.—Trump Mfg. Co., Crown Point, Ind.

Tomahawk Spring Lubricator

A wedge-shaped spreader for leaf springs has a forked edge, in which is a hole for the passage of grease; the spreader head is attached by means of a short shank to a cylindrical grease container, a passage through the shank conveying grease to the outlet in the fork. A twist of the container forces grease through the passages and out at the spreader. The butt of the spreader is made so that it can be hammered to force the tool in. Soft graphite grease is recommended for the work. Price, 75 cents.—C. W. M. Co., Buffalo, N. Y.

Marvel Body Cleaner

This cleaner is a liquid which the maker states is non-poisonous and non-volatile and which, when applied to varnished body work with clean waste and wiped off with dry waste, is designed to remove all dirt and leave a polished surface. It is intended to take the place of ordinary washing and cleaning in addition to furnishing the polishing feature. It sells for $3 per gal., $1.75 for ½ gal., $1 per qt.—Drew Auto Supply Co., Brooklyn, N. Y.

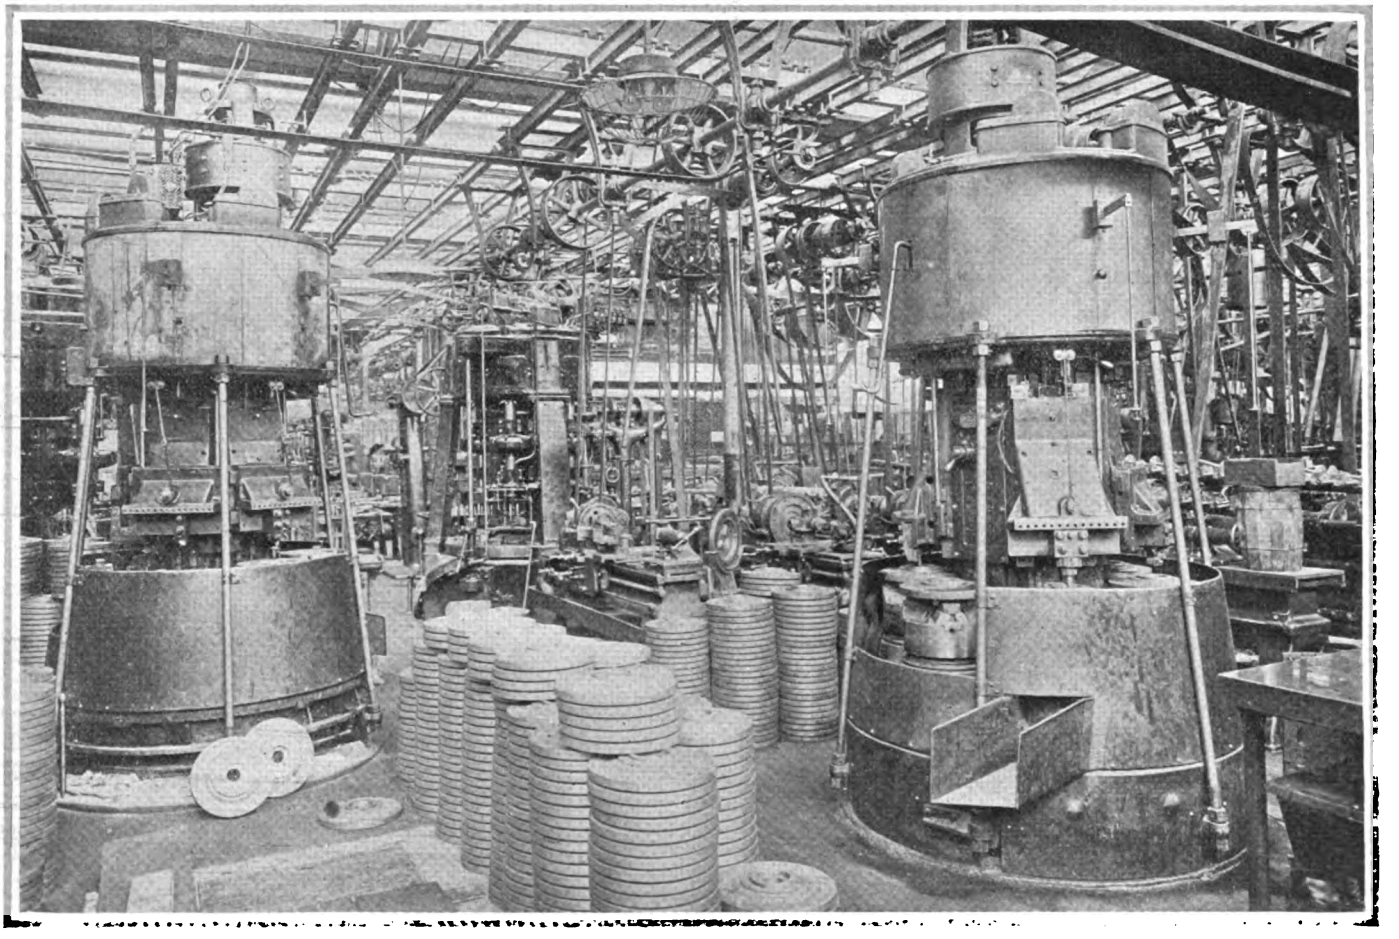
Efficiency Gas

While this method of lubricating is not new, the makers of Efficiency Gas state that their product mixes with gasoline much more thoroughly than does ordinary lubricating oil and that it vaporizes in the cylinders and is deposited on them; a film is formed on the walls of the combustion chamber and, the makers assert, prevents the adherence of carbon.

It is stated that Efficiency Gas will thoroughly mix with gasoline without stirring or otherwise agitating it; that it will not gum up the needle valve or other parts of the carbureter; and that it will thoroughly lubricate the cylinders. One gal. is sufficient for treating 640 gal. of gasoline. The price is $4.50 per gal., $2.50 per half gal.—Gas Engine Efficiency Co., St. Louis, Mo.

Big Turning Machine Saves $250 Daily

Bullard Multimatic Machines Ford Flywheel in 1 Min. 44 Sec.



A COMPARATIVELY new tool is the Bullard Multimatic illustrated above, its object being to enable the rapid automatic production of flywheels or similar parts, the only handling required being the insertion of rough castings and removal of finished work. Essentially the machine consists of six vertical spindles akin to those of a boring mill, but arranged on a circular table. This table is itself on a center and is used to bring the work into seven successive positions. There are six tool carriers located on a massive frame that forms the upper part of the machine so of the seven revolving work spindles six are in position at one instant beneath different cutters and one is idle.

Method of Operation

From this brief description and the illustrations the action of the tool is made obvious. To start work a flywheel in the rough is placed on the open work table and the first indexing movement of the large circular table brings the casting under the first tool. While this is at work on the first operation the attendant places a second rough casting on the next work table and at the next indexing this is carried one stage forward while the first wheel is carried on to a position beneath the cutter for the second operation. At the seventh indexing the first wheel comes opposite the operator in the finished state and he has merely to remove it, substituting a fresh casting.

Needless to say, such a gigantic machine is only of value where fairly large output prevails, but in the Ford plant it is stated that the first two machines to be installed saved $250 a day. In a 10-hour day it is possible to produce nearly 1,000 flywheels from one machine. The price of the tool is about $8,000 but in writing the makers some 6 months after the first installation the Ford company said that the cost of the first two had been worked off. Similar equipment is to be found in several other plants and one of the Multimatics will be used in Packard production for this season.

This tool is a particularly good example of the type of new machinery which is assisting to cut down the cost of manufacture mentioned in THE AUTOMOBILE article last week which dealt with the reasons for the reduced prices prevailing in 1916 model cars.

Had it not been for the great pressure of war orders on all branches of the engineering trade of America it is probable that a much larger number of machines similar to those illustrated would have been available for the rapid and economical production of other parts. It is only recently that the automobile trade has had special attention from the machine tool manufacturer, and the latter is certain to devote more of his time to studying it as soon as the present state of affairs relaxes a little. The production of crankshafts, gears and special work of a like nature could be speeded up greatly by new processes and the quantities are now great enough for it to be worth while to spend large sums in developing new tools.

The British Import Duty

GREAT BRITAIN has imposed an import duty of 33 1/3 per cent on automobiles and parts with a view to producing revenue and also protecting the British automobile manufacturers. It cannot be questioned that the revenue is assured, but the efficacy of the protection is to be doubted. The enormous success of American automobiles throughout the British Empire is due to their quality and to the manufacturing methods which enable them to be produced so cheaply. Unless the British makers revise their methods of manufacture the duty will not be of greater assistance to them, in their home country, than it has been in the past in the British colonies. In Canada, Australia, New Zealand and South Africa the American car is supreme despite a high import duty which the British maker has not got against him in these countries. Why, therefore, should it help him particularly at home?

The American automobile industry has never made a great effort to secure British business; it has rather taken the orders that are brought to it and it often allows its British agents to add extravagant profits. The effect of the British duty is more likely to lead American manufacturers to study the valuable British field more closely than it is to act against them. Nothing stimulates the American manufacturer so much as obstacles to be overcome in the development of trade.

Eliminating Waste Metal

EVERY pound of metal or wood in an automobile that is not working is as useless to the owner as the mud that collects inside the fenders. And it is worse than that for it cannot be washed off, and it costs money to carry about from place to place.

It is only because there have been so many other wonderfully interesting things to develop and discover that automobile engineers have so long neglected the weight question, but the neglect has had an evil effect in that it has blinded the eyes of most of us to its absurdity. There are still plenty of engineers who will say with conviction that a comfortable car must be a heavy car. Such an opinion is due to lack of thought and lack of experience with light machines.

In THE AUTOMOBILE for Aug. 5 the possibilities of weight saving by use of light metals was considered and in this issue there is an account of another method for obtaining lightness through the design of all parts primarily from the weight viewpoint. It is by a combination of both systems that the automobile of the future will be developed in which the waste material will be no more than a man could carry.

A Chicago Section

CHICAGO has been chosen as the home of a new section of the Society of Automobile Engineers. Far greater possibilities than the grouping together of the members of the society located in this section of the country may be expected from the organization of this new branch. Chicago is the meeting place of the great agricultural section of the West, the great manufacturing industry of the central states and the most important market place of the continent. It is the greatest educational section west of New York. It is the gateway to the Great Lakes and in the heart of giant industries of every description.

An industry of as varied a nature as the manufacture of automobiles cannot fail to draw inspiration from the environment surrounding the new section. The Chicago I-will spirit is bound to permeate the atmosphere of its meetings and reflect itself in the work of the new organization. The sections are the roots of the society and the new offshoot from the parent organization could not have struck richer soil than the metropolis of the middle West. New thoughts, new ideas and a rich field of endeavor cannot fail to have their influence on the work of the society.

Here is the connecting link between the manufacturer and the consumer. Instead of intimate conversation of manufacturer with manufacturer it can readily be conceived that discussion of subjects of a broader interest will find their way into the proceedings of the new body. The people of the Chicago territory are eagerly following the progress of the automobile industry. The annual exhibitions bring to the city thousands of the natives of other states, and it is indeed fit that this great center has been selected as another center for S. A. E. activity.

Britain Taxes Ceylon Rubber

2⅜ Cents a Lb. Charged on Shipments from London—Will Stabilize Prices

NEW YORK CITY, Oct. 6—Rubber from Ceylon and exported by England has been taxed 2⅜ cents a pound by Great Britain, thus adding about $500,000 yearly to the cost to rubber importers in this country. This export has been added for revenue purposes. The United States from Jan. 1 to Aug. 16 imported from Ceylon 8,567,536 lb. of rubber. Last month, the imports ran up to 1,726,000 lb. At this rate imports amount yearly to about 20,000,000 lb. As the United States is the second largest user of this rubber and as about 95 per cent of the tire companies are using it, it is expected that prices will be more stabilized. It is expected that rubber from the other Eastern States will also receive a tax.

The United States in normal times consumes 50 per cent of the world's production of rubber, and since the war its consumption has grown to about 60 per cent of the total supply.

It is doubtful whether the imposition of the tax will turn American buyers from the British supply to the Brazilian, as it is stated that the Ceylon rubber is 25 per cent richer than the Para product because of loss in washing. And then again, the material derived from cultivated plantations in the East, where modern facilities for gathering are established, is superior in condition to the Brazilian output gathered by natives. The Ceylon rubber is cleaned, milled and dried upon purchase and is ready for manufacturing, whereas South American Para requires from one to two months to be made ready for the mills. This means that firms patronizing Brazilian agents must have capital tied up for a longer period, must employ extra labor and must increase their mill capacity. At the present time there is a drought in the northern part of Brazil.

Plan Automobile Reserve Corps

NEW YORK CITY, Oct. 5—The organization of an Automobile Reserve Corps is being effected in this city following the publication in *Motor Print* of an article by Secretary of War Garrison approving of the idea.

Among the officers of the National Guard in New York City who are leading in the movement are Major General John F. O'Ryan and Captain Lorillard Spencer, the latter a member of the Metropolitan Section of the S. A. E. The Automobile Club of America has given its indorsement.

It is likely that within the next two weeks a mass meeting of motorists will be held in one of the largest armories in the city, at which military authorities and well known motorists will be asked to speak.

Governor Phillips Lee Goldsborough of Maryland, announced to-day in a statement that he heartily approves of the organization of the Automobile Reserve Corps in each State and trusts that it will be successfully carried out. This will mean the establishment of a corps in Maryland as the Governor is commander-in-chief of the militia.

Anyone interested in the movement should address G. T. Bindbeutel, 239 West Thirty-ninth Street, New York City.

Olwell Resigns from Chalmers

DETROIT, MICH., Oct. 5—Lee Olwell, vice-president of the Chalmers Motor Car Co., has resigned, his resignation to take effect Nov. 1. Mr. Olwell came to Detroit in March, 1914, from Dayton, Ohio, where for three years he had been advertising director of the National Cash Register Co.

Maxwell May Pay Back Dividends

NEW YORK CITY, Oct. 6—The plan for the wiping out of the 16 per cent back dividends on Maxwell first preferred stock is expected to be announced in the near future. The method to be adopted will probably be an issue of warrants convertible into the first preferred at par for the amount of accumulated payments. As this issue is now on the 7 per cent dividend basis, the putting into operation of the plan would leave the way open for disbursements on the second preferred, as earnings on the $10,000,000 outstanding were equal to more than 14 per cent.

The annual meeting of Maxwell stockholders will be held Oct. 19 in Wilmington, Del., for the election of directors, etc.

Detroit Co. to Build Tractors

DETROIT, MICH., Oct. 5—Several men prominent in the automobile industry in this city are interested in the Standard Detroit Tractor Co., which has been incorporated and has a capital stock of $100,000. Its object is to make motor tractors. The incorporators are M. L. Pulcher, vice-president and general manager of the Federal Motor Truck Co., who will be president of the tractor company; Edward P. Gemmer, president of the Gemmer Mfg. Co. and Frank G. Jacobs.

Coghlan Klaxon Sales Manager

NEWARK, N. J., Oct. 2—Walter P. Coghlan, formerly in charge of Klaxon sales in the Northwest, takes the place of W. O. Turner as sales manager of Lovell-McConnell Manufacturing Co.

Plan Chicago S. A. E. Section

Project to Be Pushed at October Meeting of Standards Committee at C. A. C.

NEW YORK CITY, Oct. 4—Advantage will be taken of the meeting of the Standards Committee of the Society of Automobile Engineers to push the business of founding a Chicago Section of the society. This is a matter which for the last year has been under consideration by the council and at the last June session of the society, President Van Dervoort mentioned the October meeting of the Standards Committee as a suitable time for carrying it out. At that time, President Van Dervoort stated that he had written a letter to more than 150 members of the society who resided in the Chicago territory and had received a large percentage of favorable replies. It is therefore quite certain that during the month the new section will be organized.

The society officers think that it is fitting that a section of the society be organized in Chicago due to the varied interests which are centered about the metropolis of the Middle West. While the membership in the society may not be as great in the Chicago territory as it is in some other parts of the country, it is certainly a territory in which the membership should grow. Nothing will have the effect of stimulating this growth as much as the foundation of a section where interesting meetings are held frequently.

At the present time in the Chicago territory there are 101 concerns who have representation by 136 members in the society. In addition to these, there are a large number of other members who are attached to concerns not in the territory. The grand total of possible members to draw upon is somewhat over 150. Greater Chicago includes a territory in which a large percentage of manufacturers are engaged in some line of business which could be benefited by membership in the S. A. E.

627 Overlands in One Day

TOLEDO, OHIO, Oct. 5—A new shipping record was established by the Willys-Overland Co. on Sept. 29 when 627 cars left the factory. In the four days from Sept. 27 to 30 inclusive 2233 cars left the plant.

From April 21, when the shipments of new models first began to leave the factory up to Sept. 30, the company had shipped 49,977 cars, an increase of 133 per cent over the 21,426 shipped in the same period last year

Build 1800 Gasoline Cars Daily

Present Total Output of 16 Detroit Factories—Ford Credited with 500

DETROIT, MICH., Oct. 5—The daily output of automobiles from the sixteen active producers in this city is now running approximately 1800 gasoline machines. This total is reached after getting close approximations from each maker, and includes a 500-car schedule for the Ford company. That is, only the proportion of the total daily Ford production throughout the country that is actually assembled here is included. If the total included the number of Fords assembled daily in the various assembling plants it would be close to 2000 cars, bringing the Detroit total, on that basis, to 3300. This would be logical, because all parts of Ford cars are made here, even when assembled elsewhere.

There are several makers in this list with outputs well over 100 cars a day, and three with totals over 200. Attention should be called to the fact, in connection with these figures, that they are conservative. The amount credited to each maker was not an extraordinary day's output, but the average of several days recently.

Production would be considerably greater if makers were not all handicapped for lack of materials. Many of the makers are being held up for certain raw materials, and aluminum seems to be a big offender. The situation is causing much worry among makers generally, not only the car producers but the parts people as well.

—

Williams Returns to Overland Plant

TOLEDO, OHIO, Oct. 2—Ralph T. Williams, well known in the automobile trade, has returned from his work with Willys-Overland, Ltd., of London, England, to take the place made vacant by the resignation of Juan T. Yrigoyen, assistant manager of the foreign department at the Willys-Overland Co.'s factory at Toledo.

—

Ansted Lexington-Howard Manager

CONNERSVILLE, IND., Oct. 5—Frank B. Ansted has been named vice-president and general manager of the Lexington-Howard Co. Mr. Ansted is the son of E. W. Ansted, president of the Lexington Co.

—

Dodge Houk Sales Manager

BUFFALO, N. Y., Oct. 2—R. D. Dodge, formerly Pacific Coast manager for the Olds Motor Works, has been appointed sales manager of the Houk Mfg. Co., this city. F. W. Kyte, former sales manager, has been made assistant general manager.

George W. Houk was elected president at the annual meeting; Ed. McMaster Mills, vice-president; Ira Gleason, director; C. A. Kane, director; and F. H. Moody, treasurer.

—

Cannot Fix Uniform Time for Announcing New Models

NEW YORK CITY, Oct. 6—At the regular meeting of the board of directors of the National Automobile Chamber of Commerce, Inc., held here to-day, the committee on a uniform time for announcing new models reported that it had been unable to come to any definite conclusion and that in view of the numerous variable factors involved it could not see how a definite time could be set for this. If new models were announced Sept. 1 many factories which had cleaned up their year's business in May would be idle for three months; this would also affect the closed-car market; if Jan. 1 were chosen the fall trade would be hurt, especially that in closed cars which is rapidly growing; if May 1 were adopted the entire selling season would be affected.

The directors consider the British tax on American cars discriminatory, it being felt that if this tax were for revenue it might be ineffective because virtually prohibitive. The directors agree with the action of the English dealers who have voted and recommended that the tax be not more than 15 per cent.

—

No Increase in Hupp Price

DETROIT, MICH., Sept. 29—President J. Walter Drake of the Hupp Motor Car Co. has announced that there will be no increase in the price of the 1916 Hupmobile models, notwithstanding the increased cost of raw material or other causes. The Hupp company is now over 2500 cars behind orders.

—

Merinbaum Joins Sun Co.

BUFFALO, N. Y., Oct. 4—S. A. Merinbaum, who has been identified with the Haynes Automobile Co., Kokomo, Ind., for a number of years, first in the capacity of advertising manager and later as sales promotion manager, arrived in Buffalo this morning and took up his new duties with the Sun Motor Car Co.

—

Lott Is Chalmers Secretary

DETROIT, MICH., Oct. 4—Charles F. Lott, who has been private secretary to Hugh Chalmers, president of the Chalmers Motor Co. has been appointed secretary of that company. This function had been performed by C. A. Pfeffer, vice-president and assistant general manager.

Standards Meeting Oct. 14

Dates of Section Meetings—S. A. E. Members Invited to E. V. A. A. Convention

NEW YORK CITY, Oct. 5—Thursday, Oct. 14, will be devoted to standards work by the Standards Committee of the Society of Automobile Engineers, who on that day will hold their meeting at the Chicago Automobile Club, 321 Plymouth Court, Chicago.

Through the hospitality of the C. A. C. the members of the Standards Committee have secured a convenient location for their meeting. The club is but a few doors from the Jackson Boulevard and is surrounded by ample hotel accommodations. The purpose of the meeting is to consider reports of some of the standard divisions and new matters which may be brought to the attention of the committee. Some of the divisions have already held recent meetings to prepare reports for presentation at this October meeting. Meetings of the Iron and Steel, Miscellaneous, Springs, Research and Engine and Transmission divisions are scheduled to be held in Chicago on Oct. 13 or elsewhere before that date.

It is expected that those divisions which do not have final reports to present will make reports of progress on the various matters pending. With the establishment of an office and permanent headquarters in Detroit, the affairs of the Standards Committee have progressed even more effectively than in the past and it is expected that the meeting in Chicago will be replete with interesting new data for presentation to the Society at its annual meeting to be held in January.

Some of the subjects which will come up in Chicago at the October meeting, are: Cone clutch housings; headlight glare; standard wire specifications for electrical equipment of gasoline automobiles; lock washers for small machine screws; license plates; piston ring grooves; location of engine and chassis numbers; standard weight of cars; screws for cowl-board mountings; water hose and clamps; spring clip length, opening, etc.; standard inspection methods of physical tests for leaf springs; solid motor vehicle tires smaller than 36 in., and industrial truck standards.

Dates of Section Meetings

October meetings for the Detroit, Indiana and Metropolitan sections will be held Oct. 12 at 8 p. m. in the Convention Hall of the Hotel Pontchartrain, Detroit. K. W. Zimmerscheid, metallurgist of the General Motors Co., will present a paper

on the influence of metallurgy on design.

The Indiana section meeting will be held on Oct. 29, at 8 p. m. at the Claypool Hotel where Charles S. Crawford, Cole Motor Car Co., will present a paper on the characteristics of the eight-cylinder motor.

The Metropolitan section meeting will be held Oct. 21 at 8.30 p. m. at the Automobile Club of America, New York City. The evening will be devoted to metallurgical subjects. There will be an exhibition of motion pictures by the National Tube Co., showing the manufacture of steel tubing from the mine to the finished tube. There will also be a short talk on metallography by Prof. William Campbell.

The E. V. A. A. Meeting

The Electric Vehicle Association of America has extended to the members of the S. A. E. an invitation to attend its convention in Cleveland Oct. 18 and 19. An interesting program has been arranged and a tentative list of the papers includes the following:

Industrial Trucks in the Service of the Pennsylvania Railroad Co., by T. V. Buckwalter; The Electric Taxicab, by I. S. Scrimger; The Edison Battery Service System, by W. M. Thayer; The Function of the Electric Garage, by R. Macrae; Comparative Development of General Power and Commercial Electric Vehicle Loads and Function of Power Salesmen as Electric Vehicle Solicitors, by H. H. Holding; Problems We Are Facing and How They May Be Met, by George H. Kelly; Field for the Small Electric Delivery Vehicle, by Charles A. Ward; Electric Vehicles in Municipal Service, by Arthur J. Slade and R. Duval Dumont; and the Comparative Operation of Electric and Gasoline Machines in the Same Service, by W. J. Miller in collaboration with T. D. Pratt.

—

Show Space Drawings Oct. 7

NEW YORK CITY, Oct. 4—A very large attendance of the members of the National Automobile Chamber of Commerce is expected in this city Thursday, when the drawing for show spaces at the New York and Chicago shows will take place at the association headquarters, 7 East Forty-second Street. Applications for space by passenger car makers are as great as in former years and it is expected that all available space in the Grand Central Palace, in New York, and at the Coliseum, in Chicago, will be taken up. The distribution of accessory space will be decided later, and will be handled as formerly by the Motor and Accessories Manufacturers' Association. The order of drawing space by car makers will be according to production during the previous season, this plan having been followed for several years.

Astor Cup Race for Oct. 9

—

Postponement of Opening Race at Sheepshead Speedway May Help Late Entries

NEW YORK CITY, Oct. 2—The 350-mile race for the Astor Cup on the Sheepshead Bay 2-mile board speedway, which was scheduled to start at 12 o'clock to-day was postponed at 8 o'clock this morning because of rain. It started raining in New York and vicinity yesterday morning and has rained constantly ever since, the storm being a part of the tropical hurricane that devastated the Southern States. The race will take place on Saturday, Oct. 9, starting at 12 o'clock noon, postponement of a week being necessary for various reasons; first the grounds, which were practically covered with water, would not be sufficiently dried for a race on Monday; and second, several hundred of the help required in conducting the meet could not be obtained except on a Saturday.

Much disappointment was expressed by out-of-town guests at the postponement of a week, many of these coming from places as far distant as Omaha, Atlanta, and St. Louis, having to return home without seeing the race. A canvass of the New York hotels showed over 20,000 out-of-town guests registered, all of these being classed as speedway attendants.

May Swell Starting List

What the result of the postponement will mean cannot be gaged at this time, as many who intended to be present cannot. The effect of the postponement on the number of cars starting may mean the addition of one or two that were not ready but were to have taken their elimination trials early Saturday morning before the race. These cars have not yet taken their trials, but will take them on Thursday, Oct. 7. Fortunately there are no other racing events scheduled so no inconvenience will be caused to the drivers.

De Palma to Drive Stutz

Ralph De Palma will drive a Stutz car at the Speedway Saturday, the motor on his Mercedes being so badly damaged as to make repairing impossible. He will drive the Stutz which Rooney had been originally scheduled to pilot. It is possible that Ralph Mulford may drive the Peugeot car which is a duplicate of Resta's and which is expected to arrive from France the end of this week. Some doubt was expressed concerning whether Barney Oldfield would be able to drive on Oct. 9. This has now been settled and Oldfield has been able to cancel a date in Illinois and will drive his Delage.

The sale of seats for to-day's race exceeded $80,000 and it was expected that if fine weather had prevailed yesterday and to-day that over 125,000 spectators would have attended.

The complete list of starters with their official numbers follows:

NO.	CAR	DRIVER
1.	Peugeot	Resta
2.	Peugeot	Aitken
3.	Delage	Oldfield
4.	Peugeot	Burman
5.	Stutz	Anderson
6.	Peugeot	Wilcox
7.	Stutz	Rooney
8.	Stutz	Cooper
9.	Duesenberg	O'Donnell
10.	Maxwell	Rickenbacher
11.	Mulford Special	Vail
12.	Pugh Special	LeCain
14.	Sebring	Halbe
15.	Duesenberg	Haupt
16.	Duesbenberg	Henderson
17.	Maxwell	Mulford
18.	Peugeot	Hughes
19.	Delage	Limberg
20.	Mercedes	DePalma
21.	F. R. P.	Poporato
22.	Ogren	Alley
23.	Erwin Special	G. Bergdoll

It is not yet certain whether all of the twenty-two will be starters, as some of them have yet to show whether they can make the requisite speed of 85 m.p.h. for a lap of the track.

—

Denby Adds 3-4-Ton Truck

DETROIT, MICH., Oct. 4—In addition to its 1-, 1½- and 2-ton models, the Denby Motor Truck Co. now has placed on the market a ¾-ton truck which sells at $890 with open express body. With panel body there is an additional charge of $90 and with open express body but with top, $60.

This light truck has been made to meet the growing demand from department stores, bakeries, meat markets, groceries, and many other merchants having use for a rather small truck which does not have to carry more than 1000 to 1500 lb. It is also a model truck greatly in demand in small towns.

The new Denby is called type U and has a wheelbase of 119 in. Its motor is a four-cylinder block 3⅛ by 4½. Solid tires are furnished, 34 by 3 front and 34 by 3½ rear. The standard color is blue for the body and red for the chassis. In general construction the truck is similar to the other Denby models. Electric starting and lighting will be furnished at an additional cost of $85.

—

Eckhart, Auburn Founder, Dies

AUBURN, IND., Oct. 1—Charles Eckhart, 74 years of age, automobile and buggy manufacturer, philanthropist and at one time candidate for governor of Indiana on the Prohibition ticket, died here yesterday following a long illness. He was the founder and president of the Eckhart Carriage Co. and the Auburn Automobile Co., although his son, Morris Eckhart, was in active charge of both businesses.

Car Sales Gain 50% in Canada

7000 More Cars Sold in Ontario Alone Than During Year of 1914

DETROIT, MICH., Oct. 2—Louis Logie, district manager for Canada for the Chalmers Motor Co., reports after an extensive investigation of conditions in Canada, that the sales of automobiles have been about 50 per cent greater thus far this year than in 1914, and that in the province of Ontario, where most of the Canadian automobile manufacturing plants are located, 7000 more cars have been sold thus far this year than up to that time in 1914. The condition is the more remarkable when it is considered that war taxes have been a big drain upon the people while on imported cars the duty is now 42 per cent.

Elkhart Four at $775

ELKHART, IND., Oct. 5—The Elkhart Carriage & Harness Mfg. Co., is bringing out a new low-priced model to sell at $775 as a five-passenger touring car. The specifications include a unit power plant having an L-head 3½ by 5 four-cylinder motor with separate head, vacuum fuel feed with tank in rear, three-speed gearset, Raybestos-faced cone clutch, floating axle, three-quarter elliptic rear springs, wheelbase 114 in. The body is an advanced streamline effect with high sides. Equipment includes electric starting and lighting system, one-man type top, quick attachable curtains and demountable rim with one extra.

Holland Leaves Anderson Electric

SEATTLE, WASH., Oct. 1—Walter E. Holland has resigned his position as research engineer of the Anderson Electric Car Co., Detroit, to become a firm member of the Broadway Automobile Co., Inc., of Seattle, Wash., agents in the Northwest for Detroit electric passenger cars, Walker electric trucks, Elwell-Parker industrial trucks and Philadelphia storage batteries. Mr. Holland will be secretary and treasurer of the Broadway Automobile Co.

Woods Returns to England

NEW YORK CITY, Oct. 4—G. Hubert Woods, representative of the British Westinghouse Electric Mfg. Co., Ltd., who has been at the Westinghouse factories in this country studying the electric starting and lighting systems as applied to American cars, sails this week for England where he will resume his duties as manager of the automobile department of this company. Mr. Woods believes that after the war the electric starter and generator will be as definite component parts of the gasoline engines in Europe as they are in America. Up to the present many British concerns have not mounted these electric units as standard component parts but have listed them as extras.

Mr. Woods is of the opinion that the question of price reduction will sooner or later take a slight change in America and that more attention will be given to car quality, which may mean a slight increase in price.

Tread Committee Report Expected

NEW YORK CITY, Oct. 4—At the regular meeting of the National Automobile Chamber of Commerce, Inc., to be held at this city Oct. 7, it is expected that the committee on automobile treads will report. This committee met in Detroit last week and has its recommendations ready. The manufacturers will continue to produce cars with 56 in. tread as standard, which naturally means that the 60 in. tread is being dropped. The chamber made a broad canvass of dealers through the Southern States and discovered that sentiment was strongly in favor of the standard 56 in. tread. With these dealers the difficulty with the 60 in. tread has been in getting deliveries. The factories have pushed the standard tread orders through as they have represented nearly 100 per cent of production and dealers with orders for 60 in. treads generally had to wait.

It was found in a canvass of road conditions in the South that only in two sections is it difficult to use the 56 in. tread, these being Southern Georgia and Northern Florida, which are bad road sections.

1916 Sphinx for $640

YORK, PA., Oct. 5—For 1916 the Sphinx Motor Car Co., this city, continues its five-passenger touring car with minor refinements at $640, or $55 less than for 1915 and also sells the same chassis for $600 and, with commercial body, for $675.

The new car uses a 3¼ by 5 block L-head motor instead of 3⅜ by 5, developing 28 hp., has Connecticut ignition system and the body has been lengthened and made slightly narrower, while its appearance is lower, the clearance being 9 in., as compared with 10½ for 1915. DuPont Fabrikoid upholstery and Raybestos brake lining are used. Wheelbase remains unchanged at 112 in. and the tires at 30 by 3½.

Mooney with Taylor-Critchfield-Clague

DETROIT, MICH., Oct. 4—Frank J. Mooney, former sales and advertising manager of the Hupp Motor Car Co. has become associated with the Taylor-Critchfield-Clague Co. advertising agents. He will specialize on automobile work.

Sheepshead to Open 1916 Season

Gets May 13 and Sept. 30 on Racing Schedule—Sixteen Dates Allotted

NEW YORK CITY, Oct. 1—The Sheepshead Bay speedway will open the 1916 American racing season. At the A. A. A. contest board meeting in this city yesterday, New York was given May 13 in the spring and Sept. 30 in the fall. This year's racing schedule is placed on a more systematic basis. With the exception of two clashing dates on July 4 at Minneapolis and Sioux City, the rest of the dates are arranged so as to fall, in a majority of cases, about two weeks apart. Sixteen dates, in all, have been allotted ten cities. Two spring races are scheduled, one at New York and the other at Indianapolis on May 30. Following these are two for June, one on the 17th at Chicago and the other at Des Moines on the 28th. Then come three races for July including the two July 4 events at Minneapolis and Sioux City and one at Omaha, July 15. Tacoma and the Elgin Road Race are scheduled during August, the first on the 5th and the latter on the 18th and 19th. Providence and Indianapolis are one day apart in the September dates, the former falling on the 16th and the latter on the 15th. Des Moines has a race scheduled for Sept. 4 and New York for Sept. 30. Omaha and Chicago will hold races on the 7th and 14th, respectively, the latter date closing the season.

Philadelphia Meet April 29?

There is a possibility that the Philadelphia Motor Speedway Association will hold a meet during the latter part of April. C. L. Hower, secretary and treasurer of the association, and P. A. Shaner conferred with Chairman Kennerdell regarding the date for the event at Philadelphia. The track is near completion.

Among these present were: New York City, Everard Thompson, A. T. Herd, W. M. Grove; Chicago, D. F. Reid, Frank Foster, Chris Weihe; Indianapolis, C. G. Fisher, James Allison; Minneapolis, D. F. Wheeler; Omaha, F. J. McShane; Des Moines, Henry Gehring; Tacoma, George Dunn; Sioux City, E. Schultz, and Providence, F. H. Perkins.

The Tentative Schedule

The tentative racing schedule follows:

Philadelphia	April 29
New York City	May 13 and Sept. 30
Indianapolis	May 30 and Sept. 15
Chicago	June 17 and Oct. 14
Des Moines	June 28 and Sept. 4
Minneapolis	July 4
Sioux City	July 4
Omaha	July 15 and Oct. 7
Tacoma	Aug. 5
Providence	Sept. 16
Elgin Road Race	Aug. 18 and 19

England Imposes 33⅓% Duty

British Opinions on Efficacy Vary Widely—Appears Unlikely to Injure American Exportation Seriously

NEW YORK CITY, Oct. 4—At last, after many years of anticipation, Great Britain has imposed sundry import duties including one of 33 1/3 per cent on automobiles and automobile parts. So far Great Britain has been the best automobile customer of the United States overseas, much the best customer in fact, and lately the British demand has exceeded all former vigor. Owing to the war the British automobile trade has been utterly tied up, making cars or other things solely to government order with no output for the private consumer, and this has sent the British dealers flocking to our shores, seeking cars for private customers and also for semi-war purposes. The chancellor of the exchequer has since proposed to waive the duty on motor trucks and parts thereof used solely for industrial purposes.

Dealer's Lot Hard

The lot of the British dealer has been very hard indeed, for depending for his living upon having cars to sell and customers to buy them, he has suddenly lost almost all the former and a large share of the latter. Naturally, he has come to America to replace the British manufacturers, and a study of the news columns of THE AUTOMOBILE for the past six months will show the extremely large number of prominent British retailers who have been in Detroit seeking cars and parts of cars. In this search quite a number of British manufacturers have participated, because the unskilled labor which could assemble a car from American made parts is available in the forms of old men and youths, while the skilled labor necessary for machine shop and other manufacturing departments is entirely absorbed by government demands.

British Consumer Pays

Thus the conditions which at the moment lead to an exceptional British demand are temporary, and it seems unlikely that any duty imposed upon automobile imports will have much effect upon the volume of business done during the war. American cars are selling in England because they are the only cars that can be bought, not because they show up well in competition with the home product, which is the true situation in normal times.

The effect of the tariff can only be guessed, but it seems most probable the immediate result will be that the British consumer will have to pay a slightly higher price. Many Britishers have lately bought American cars at $1,250 who would have willingly spent $2,000 for a home-produced car had they been able to get one, and this class of consumer will not balk at an extra 33.33 per cent.

After the War

There is also to be considered the after-war period, for this will affect the American manufacturer much more than the present instant. When the British industry is freed from munition making and again turning out automobiles the question arises as to how much the duty will act against the American exporter. Herein it may be remarked that the profit secured by the British dealer has often been excessive in the past. With three main exceptions—Ford who manufactures bodies and assembles chassis in England, Overland who imports complete cars, and Studebaker who does likewise, most of the American cars going to Great Britain have been bought here by dealers for the lowest possible price and sold in England for the highest possible price. Often between the two there is a very large margin, considerably in excess of a proper trading profit. Thus the British price for American cars is not likely to be advanced by 33 1/3 per cent to the British consumer.

British Opinions Conflict

Lately *The Autocar*, the leading British automobile paper, has devoted much space to discussion of the subject, and the general consensus of opinion is that, whatever the tariff imposed, the British manufacturer is too old fashioned and too inert to grasp the opportunity offered to him by the tariff. Writing in our contemporary, J. P. Holland, a journalist well known on both sides of the Atlantic and for some time engaged in automobile journalism in America says:

"Eleven years ago I interviewed Alfred Harmsworth (Lord Northcliffe) in New York on his return from a visit to Detroit, Cleveland, and one or two other cities of the Middle West, then rapidly coming to the front as motor car producing centers. The gist of that interview, as published in the *New York Herald*, was to this effect: 'The American small car is destined to dominate the markets of the world if American manufacturers continue to progress as they have done in the past few years.'

"There is no use disguising the fact that the motor industry, that is, the manufacturers of motor cars, have not lost money by the war. On the contrary, they have been flooded with orders, and their factories have been busy night and day. The ordinary overhead charges of selling their product, salesmen's wages, and so forth, have been eliminated. And as an evidence of the profitable margin at which they have done this government work, we have had a striking object lesson in a recent lawsuit, where two middlemen disputed the question of division of commissions, and one of them was awarded the neat little sum of $75,000 as his share in the divided commission. The fact that this sub-agent claimed $250,000 came in the shape of a startling revelation to the public.

Exceptional Treatment Folly

"Under these circumstances, to ask the public to agree to any exceptional treatment of the motor industry after the war would, I claim, be the very height of folly. The mere suggestion of such a proposal would rather have the effect of instituting an inquiry as to the reasonableness of special taxation of the war profits of the motor trade.

"Whether the reasons I have briefly put forward be considered strong enough to warrant the statement that the three courses suggested, namely, prohibition of imports, high protection, or government subsidy, all are equally inadequate to meet the case, I do not know. Should they prove to be so, or, what amounts to the same thing, should the powers that be after the war decide against their adoption, the question still remains to be answered, 'What is the British motor industry going to do about it: How will it regain the position it held before the outbreak of war?'

"This brings me back to the Harmsworth interview of 1904, the fulfilment of which has been so unexpectedly hastened by the events since August, 1914. In that interview Lord Northcliffe rightly placed the responsibility for the future success of the American small car where it properly belonged—on the shoulders of the American manufacturer.

Protective Tariff Inadequate

"The first of these, namely a high protective tariff, will fall far short as an efficient means for building up a domestic industry as compared with its effect a dozen years ago in the United States. This will be readily seen when one considers the state of affairs in New York in the early years of the present century as compared with England to-day. In those days the total output of American factories barely exceeded 15,000 cars annually. The prices paid for imported cars sound fabulously high nowadays. Mercedes chassis, $11,000, Panhard, $10,000, and even a little Darracq 12-hp. heading the list of imported cars in point of numbers at the modest figure of $6,000 apiece. Under such conditions, it may

readily be seen that a high wall of protection gave the American manufacturer plenty of margin for the development of his infant industry.

"Contrast with that state of affairs the British market as it will be when peace is proclaimed. Flooded with American cars selling at prices never touched by British cars, it is doubtful whether a protective tariff which would double the cost of the imported cars would meet the difficulty. Certainly such a duty would fall far short of giving the British manufacturer anything approaching the leeway his American confrère had when French and German cars were selling in New York for three or four times their present-day value.

"It will be necessary, therefore, to seek further afield than the purely nursery methods of protection or subsidy if the British manufacturer hopes to tackle his American rival with his own weapons. And at this point I am afraid I must leave to more technical experts the task of diagnosing between British and American methods for the purpose of adopting the best of American for the future well-being of the English. There are, however, some broad features which even an inexpert like myself cannot fail to observe, and which, I am sure, would well repay the experiment of adoption."

Importance of Colonial Trade

This was of course, before the tariff had been decided upon. Another writer in the same issue of the same publication urges the importance of the Colonial trade of Great Britain, so far neglected by the British manufacturer. He says:

"Protection alone will not save the British motor industry from destruction; enterprise and scientific methods properly co-ordinated on a wide national basis must be our main weapons in the new era of industrial development.

"Unless the British manufacturer is prepared to expand an outlook hitherto essentially insular, and think in terms of an Empire market rather than of an English, Scottish, and Irish market, he might just as well abandon hope of ever making an impression upon an invader who never thinks in less than two hemispheres nor fails to organize his production accordingly.

"I greatly fear, however, that the splendid opportunity for the British motor manufacturer which, to the Imperial thinker existed yesterday, is to-day very much less of an opportunity. Yesterday Greater Britain would have offered open-armed welcome to cars from the Motherland which fitted Colonial conditions, including Colonial purses. To-day the Overseas Dominions may well be visualizing themselves as motor car manufacturing countries.

Canada a Big Producer

"Canada is a case very much in point. Canada to-day produces for her own consumption, and for the consumption of other British colonies and dependencies, probably six times more motor vehicles than we produce in this country. The Ford company's Canadian plant alone is responsible for 35,000 to 40,000 vehicles. Overland and Studebaker are two other big firms similarly operating; and it is the same with one or two tire companies. It makes no difference whether these firms are run with American or Canadian money. They are there, in the British Empire, occupying territory which the manufacturer here at home might have occupied if he had thought Imperially yesterday, instead of merely applauding a florid phrase; and if, as is most likely, any fiscal rearrangement be made, it will leave free trade within the Empire, and these Canadian companies will be inside our tariff wall.

"Where in that case is protection for the British manufacturer? Suppose no other American car makers trek across the frontier what is going to happen to the Ford, Overland and Studebaker? It is the competition of the Ford and the Overland in this country that matters most. Between them these two companies probably sell more cars than all the British manufacturers put together; and I make no doubt that, if necessary, either or both firms would manufacture right inside these islands.

Consumer the Sufferer

"I see no protection from these manufacturers that will do the British car makers the least bit of good; and even if it were otherwise, it must be a protection entirely at the expense of the consumer, and of the distributor, middleman, or agent. As a consumer, I am, not unnaturally I hope, without enthusiasm for any such protection.

"What does the request made by the British manufacturer amount to? It asks that the consumer should go without motor vehicles until after the war, and then should be prevented, if possible, from buying any except British vehicles. This request is made by manufacturers who cannot at present supply cars themselves, and do not propose to attempt to supply cars in price competition with the American vehicles later. Most of the British manufacturers are making a fairly healthy profit out of the war. Many of them are doubtless doing better than if the war had not happened. One or two have probably been saved from extinction by the war. Yet these excellent gentlemen are asking that the profits which they might have made if the war had not happened shall be saved up and handed over to them when they have finished making profits out of the war!

Agents Not Considered

"They are not concerned about the agent of whose indispensability in their scheme they used to sing, and whose service they will seek again most eagerly presently. The agent, with none except American cars to sell, should cease from selling them, shut up the shop, and find another job until wanted! The manufacturers are not concerned about the consumer, yet probably nine-tenths of the consumers have bought other cars partly or wholly for business reasons; and business reasons to-day mean, directly or indirectly, work in connection with the war—work upon which the successful prosecution of the war and the efficiency of the fighting forces depend. The manufacturers are concerned with none of these things."

Against these two, yet a third writer points out that however true the statements of the others may be, the imposition of a tariff will undoubtedly make things better for the British manufacturer. Perhaps, however, the most important utterance is to be found in the editorial columns of the issue which contains these three opinions. In it the editor—a man famous throughout the British Empire for clear thinking on automobile subjects—says:

"It is not a question whether protection in normal times is desirable or undesirable, but entirely a matter of self-preservation. If the British motor industry in common with a number of other home industries be not protected, a large portion of it will be wiped out. This fact is clearly recognized by the greatest commercial rivals of Britain, the United States; indeed, it is so obvious to them that they would regard the British as fools if they did not protect themselves.

Foreign Plants in England

"*One of the strongest arguments against protection is that if a tariff on motor cars be imposed it will merely result in foreign makers establishing factories within Britain itself.* Undoubtedly this prophecy will be realized, but obviously the moment a factory is established within British territory, it becomes a *British factory*. It may result in severe competition for certain existing British firms, and this competition may indeed be very severe and even fatal to some of them; but the nation as a whole will not suffer so *seriously*, inasmuch as the foreign factories established in our midst will in the main give employment to British workmen. On the other hand, with no tariff there will be no incentive for foreign makers to establish themselves in this country, and the natural result will be that the automobile mechanics who to-day are actually in the army, navy, or air service, or are engaged in the manufacture of munitions, will be thrown out of work, and they will not be able to get work in this country at all in many cases, and their only salvation will be emigration and the further impoverishment of the nation.

"At the same time, in all the articles we have published it has been made *plain that tariff or no tariff the British manufacturer will not conserve his industry and his interests if he does not reform his manufacturing methods and his business methods too.* This is one of those statements which at first sight look exceedingly damaging. We would be the last to contend that the British manufacturer could not and should not improve his manufacturing and commercial system, but it must be borne in mind that a very large proportion of the home makers recognize this fact as fully or even more fully than the opponents of a motor car tariff. The view the British manufacturer takes is not that he wants a tariff to enable him to carry on his business precisely as he carried it on before the war, *but it is rather that without a tariff he will be unable to carry it on at all in many cases.*"

Will British Makers Reform?

With the soundness of this summary no thinking American could disagree in general, and all who are well familiar with the British industry will recognize the truth of it. The great question is therefore, will the British manufacturer reform or will he not? If he does not his case seems to be a parlous one in the opinion of his own particular journal and if he does he will have to move mountains if he is to fight American competition on an equal basis.

Chevrolet Capital $20,000,000

200,000 Cars Planned for 1917 —Banner Buggy Owner Interested in Co.

FLINT, MICH., Sept. 29—Through the incorporation of the Chevrolet Motor Co. of Delaware, with a capital stock of $20,000,000, which will become a holding company for the Chevrolet Motor Co. of this city, the latter will at once expand its manufacturing facilities and contemplates rivaling within another year or two the Ford and Willys-Overland companies, as to output, it is said.

Chain of Assembling Plants

In another direction the Chevrolet company will follow the lead of the Ford company, by establishing a chain of assembling plants throughout the country and Canada and by using the local or parent plant principally for the making of the parts needed in the assembling plants. The Chevrolet cars will continue to be made at the main plant, but the 1917 models may be turned out principally from the assembling plants. Of the latter those in New York, Tarrytown, N. Y., and Toronto, Canada, are already in operation, manufacturing cars which they will continue to do in addition to the assembly work. The one in Oakland, Cal., is to be started soon. Still another one will be located in St. Louis, Mo., where the Chevrolet Motor Co. of St. Louis has just been organized and incorporated, the capital all paid up being $1,000,000, Russell E. Gardner, owner of the Banner Buggy Co., being strongly interested in that company. The three-story Banner plant will be turned into an automobile factory as soon as possible. It is planned to employ 500 men and to turn out 25,000 cars a year. The Oakland and St. Louis plants will do assembly work only.

While the output schedule for the Chevrolet Four-Ninety for the 1916 season calls for 60,000 cars, plans have already been laid out for 200,000 cars of this model for 1917. A new assembling plant which will employ at least 1000 men will be started at once. The plant of the Mason Motor Co. and that of the Walker-Weiss Axle Co. where motors and axles are respectively made for the Chevrolet cars, will be greatly enlarged and production will be practically doubled.

According to a statement made by general manager A. B. C. Hardy, the Chevrolet Motor Co. of Delaware will be absolutely controlled by W. C. Durant and his present associates. The rumor that a consolidation with the General Motors Co. is contemplated, is denied by Mr. Durant.

The Chevrolet Motor Co. was organized in November, 1911, in Detroit, its capital stock being $2,500,000. In September, 1912, the company absorbed the Little Motor Car Co. in Flint, and moved into its plant. Its production, which had been 550 cars in Detroit, rose to 3500 the first year here. The second year 7000 Chevrolet cars were made.

—

New Rumely Farm Tractor

LAPORTE, IND., Oct. 2—The Rumely General Utility tractor is the name of a new product of the Rumely Co., this city, which has just been standardized and which is now to be manufactured for the market. The company expects the new tractor will fill a demand for a light weight machine and will sell for $725. Its weight is 5700 lb. Its wheelbase is 10 ft. and the total length is 16 ft. The drivewheel is 26 in. wide and 4 ft. 8 in. high. At the side of the big wheel is a smaller idler wheel, the same height, but narrower than the drivewheel. It is 8 in. across. The 15 hp. four-cylinder motor is block cast. All connections in gears and driving shafts are made in side tight cases and all bearings run in oil. The completion of this design gives the Rumely company two distinct types of tractors. The utility tractor is made on motor truck lines while the Oil-Pull designs in the one and two-cylinder models follow out the heavier lines of construction. There are to be two of the new types. The smaller one, which was developed first, is made to pull two plows, with 8 and 15 hp., and will sell for $725. The other will pull three plows and will be 13 and 22 hp. and will sell for $1,300.

—

Porter Leaves Chase—Inness and Collard Are Promoted

SYRACUSE, N. Y., Oct. 2—J. A. Inness, formerly manager of the Chase Motor Truck Co., Philadelphia branch, succeeded F. B. Porter of the New York branch Oct. 1. Mr. Porter, who has been the New York branch manager for the past nine years, is leaving the company to take up another line of work.

C. E. Collard, formerly with the New York office of the Chase organization, succeeds Mr. Inness as Philadelphia branch manager.

—

Atlanta Co. to Build Trucks

ATLANTA, GA., Oct. 1—Commercial vehicles are to be built in this city. The E. G. Willingham Lumber Co. is preparing to enter the industry upon a large scale, discontinuing its lumber interests in order to devote its attention to trucks.

A steel concrete plant, containing 2500 sq. ft. of floor space, is being erected at the corner of Stewart Avenue and Whitehall Street. The plant will be ready for occupancy by the middle of November.

P. O. Contracts Are Awarded

Ford, G.M.C., Buick, Kelly-Springfield, White and Packard Get Truck Orders

WASHINGTON, D. C., Oct. 2—Acting on bids opened several weeks ago and published in THE AUTOMOBILE at the time, Postmaster General Burleson has awarded contracts for furnishing a number of motor trucks for use in the postal service in Detroit, Philadelphia, St. Louis and Chicago. The new service in Chicago, Philadelphia and St. Louis will go into effect Nov. 15 and will supplant, in part, screen wagon, electric car, mail messenger and city delivery services. The contracts were awarded as follows:

One-half-ton capacity—Ford.

Three-quarter-ton—G. M. C., Buick and White.

One and one-half-ton—G. M. C., Packard and White.

Three-ton—Kelly-Springfield, White, and Packard.

—

Chicago Section E. V. A. A. Meets

CHICAGO, ILL., Oct. 5—Fourth annual meeting of the Chicago section of the Electric Vehicle Association of America, was held at the Hotel LaSalle to-night. Reports of officers were limited to 1 min. Secretary F. E. McCall reported that the section has 125 members which is a gain of ten over last year. Thirty members joined and twenty resigned within the year. Forty-two regular meetings were held and expenses were $324.58 or $31.22 a month.

D. C. Arlington, chairman of the traffic regulation committee, told of the work of the year which included recommendations on south side boulevard lighting, starting of street cars by light signal rather than by bell when crossing boulevards, which was condemned, standing of cars in the Loop and the teaching of traffic rules to car owners.

Harry Salvet, chairman of the garage committee, created a sensation by declaring that he had visited seventeen gasoline car branches to-day, saying he was wavering between a gas and electric car. Eleven gasoline men advised him the electric makers were going out of business. One electric dealer told him not to buy of a competitor as he was going out of business and the competitor said the same of the former.

W. F. Bauer, chairman of the standards committee said his committees had recommended a certain number of cells, the method of assembly in trays and the size of rubber jars. This has been presented to President Gilchrist, who has promised to take it up with the execu-

tive committee of the Electric Vehicle Association.

Officers were elected in unanimous vote, supporting the report of D. C. Arlington, chairman of the nomination committee, as follows: George B. Foster, Commonwealth Edison Co., chairman; William F. Bauer, Edison Storage Battery Co., vice-chairman; secretary-treasurer, F. E. McCall, executive committee; W. C. McNitt, chairman membership; D. M. Simpson, chairman papers and program; Gail Reed, chairman garage committee; W. F. Bauer, chairman standards committee; A. J. Brechtel, chairman nominating committee.

Homer E. Neisz, toastmaster, introduced several speakers, among them R. Bland, president of the Associated Garages of America, and W. B. Saylor, president of the Illinois Garagemen's Association. The latter's message was that the electric garagemen should standardize his costs. W. J. McDowell, retiring chairman, was presented with a gold fob.

—

Electrical Exposition Opens

NEW YORK CITY, Oct. 6—The Electrical Exposition and Motor Show of 1915 opened here to-day at the Grand Central Palace. As in the past, some of the electrical vehicle concerns take advantage of this exhibition to demonstrate their products. At the 1915 show the members of the automobile industry taking part are the Baker-Rauch & Lang interests, General Vehicle Co., Ward Motor Vehicle Co., Edison Storage Battery Co., Philadelphia Storage Battery Co. and the Electric Storage Battery Co.

The Baker exhibit will be a D. A. Baker coupé, with a thirty-six-cell Exide battery. The Rauch-Lang is a town car with forty-two cell Exide battery. The General Vehicle Co. will show two 1000-lb. wagons, one worm and the other chain-driven. The chain drive job is one of an order of nine from the Arnold Constable Co., New York City, and the worm drive is a fancy panel job for a New York millinery establishment. The Ward Motor Vehicle Co. will have an extensive exhibit including two standard Ward special delivery wagons, one with Edison and one with lead battery, a trailer for this car which sells for $90, a stripped chassis, two rectifiers, one for the Edison and one for the lead battery and in addition one of the new coupés.

New Ward Coupe

The new Ward coupé sells for $1,295 and is fitted with a four-five-passenger body in which all the passengers face forward. The body is of hammered metal streamline design. It is fitted with Goodyear special electric tires, size 33 by 4 in., and the battery equipment is a Philadelphia forty-two-cell nine plate. The mileage is guaranteed at 40 to 60. The finish is royal blue with gray upholstery.

France to Fix Price of Alcohol

—

Denatured Product Becomes Gov. Monopoly Jan. 1, 1917, by Law Before Parliament

PARIS, Sept. 17—The law now before the French Parliament dealing with the monopolization of denaturized alcohol and its extended use in the automobile industry, provides that denaturized alcohol shall become a State monopoly on Jan. 1, 1917. The State will arrange for its necessary supply of alcohol from the distillers by means of contracts. The retail price of denaturized alcohol will be fixed by government decree for periods of five years, this price being determined so as approximatively to cover the purchase of raw alcohol, its storage and delivery to wholesale dealers. The denaturizer will be supplied by the State. Its cost, also the expenses in connection with the inspection of establishments allowed to use alcohol not denaturized in the ordinary way, as well as any deficit there may be by reason of the low selling selling price of denaturized alcohol, will be met out of the revenue from the taxation of alcohol for human consumption. The probabilities are that the law will be accepted by Parliament without any important changes.

—

Standard Oil Gets Injunction

ATLANTIC CITY, Oct. 1—The Standard Oil Co. has received an injunction in New Jersey against certain garages which were selling a competitor's gasoline under the name of Standard Oil. The injunction forbids the use of the words Standard Oil in connection with the sale of any products not made by the Standard Oil Co.

—

Old Knox Co. Stockholders' Claims on Mayo Estate

SPRINGFIELD, MASS., Oct. 2—Holders of preferred stock in the Knox Automobile Co. are endeavoring in the Supreme Court of Massachusetts to have the value of the stock made good to them from the estate of the late Alfred N. Mayo.

The plaintiffs base their suit upon the grounds that the Knox preferred stock contained a proviso that when the surplus of the company exceeded $100,000 the excess over that amount should be applied to the paying off of the preferred stock. In 1906 they claim that the surplus amounted to $466,000; but that Mr. Mayo, who dominated the company, used his influence to cause the company to break the agreement with the holders of the preferred stock. Instead of using the excess money to redeem the stock, it was used, with other money borrowed by the company, for the expansion of the plant and the enlargement of the business. When the company failed the stock became valueless. The stockholders claim that they would not have suffered this loss if it had not been for Mr. Mayo's action in inducing the company to break its agreement with them. They therefore ask the court to order the Mayo estate to make good to them this loss. Two suits have been entered by them, one in equity and one in law. The defendants demurred to both of these suits and were sustained by the Superior Court, and the petitions referred to the full bench of the Supreme Court. A decision will be reached in about a month.

—

Chandler Six Completes Non-Stop Run Across U. S.

LOS ANGELES, CAL., Oct. 5—*Special Telegram*—Across the United States from Mexico to Canada without a stop of the motor or the wheels is the feat accomplished by a Chandler six. The car left Tiajuana, Mex., Sunday morning, Sept. 26, at 9 o'clock with the starting pedal and crank socket sealed with the official seal of the Panama-California Exposition. The following Friday afternoon at 1.20 o'clock the car came to a stop at the command of the Canadian customs and emigration officials at Vancouver, B. C., after it had crossed on to Canadian soil.

At the finish of the run the speedometer registered 1889.5 miles. This distance had been stretched on account of detours made at different points to avoid ferries on the scenic Pacific highway. The crew of the car snatched sleep whenever possible on the road, eating and sleeping in the car throughout the entire tour. Chandler dealers and friends along the route supplied the men in the car with food and supplies, gasoline and oil were taken on while the car was moving, by the use of a large funnel with an elbow.

The most remarkable feature of the trip and the one which saved the car from coming to a stop was the drive over the $50,000 north bank railroad bridge which crosses the Columbia River.

A. J. Davidson, superintendent of the Spokane, Portland & Seattle system, with R. C. Wegner, master mechanic of the same road, took a personal interest in the feat of the Chandler and after tieing up five railroad systems and blocking the river traffic the railroad officials rode across the bridge in the first automobile that ever traveled the entire length of the Pacific highway on its own power, the first automobile to ever cross the 3-mile railroad bridge and the first car to travel across the United States without a stop of motor or wheels.

$1,000,000 Stock for Hayes Wheel

Officers of Co. to Submit Plan for Increase from $300,000 to Stockholders

JACKSON, MICH., Oct. 1—The officers of the Hayes Wheel Co. will submit to the stockholders of the company a proposition tending to increase the capital stock from $300,000 to $1,000,000. A stock dividend of 166 per cent, or $500,000, is to be declared and the balance, or $200,000 in stock, is to be given to the owners of the property of the Pioneer Shaft & Pole Co., Anderson, Ind., which the Hayes company has just purchased. This newly acquired plant will supply timber for the manufacture of wheels. The local concern's business has been growing to such an extent that some time ago a plant was started in St. Johns, Mich., where truck wheels only will be made. Still further extensions are contemplated.

General Motors Co. Voting Trust Dissolved

NEW YORK CITY, Oct. 4—The voting trust of the General Motors Co. has been dissolved. The voting trustees were J. N. Wallace, Frederick Strauss, J. J. Storrow, W. C. Durant, and E. W. Clark, who acted under the agreement dated Oct. 1, 1910.

Sufficient funds have been deposited with the Central Trust Co. to pay the 6 per cent, five-year notes maturing Oct. 1, 1915. Holders of stock may now receive stock certificates upon presentation of their stock trust certificates at the Central Trust Co. The trust certificates must be presented prior to Oct. 26, as the books of the company close on that date, to reopen after the annual meeting, Nov. 17.

At a special meeting of the governors of the New York Stock Exchange, $14,985,200 preferred and $16,506,800 common stock was issued by the General Motors Co., in exchange for $14,583,700 voting trust certificates for preferred and $16,189,000 voting trust certificates for common stock, with authority to add $3,053,200 preferred and $3,367,200 common. This makes the total amounts of General Motors authorized to be listed $16,038,400 preferred and $19,874,000 common.

Packard's Fiscal Receipts Estimated at $16,000,000

DETROIT, MICH., Oct. 4—The gross receipts for the fiscal year to Aug. 31 of the Packard Motor Car Co., are estimated at $16,000,000, a gain of $3,000,000. This represents an increased income of 23 per cent. The company, it is stated, sold and delivered 1800 passenger cars, against sales of 2625 the year before and 2983 in 1913. In other words, the sale of cars fell off 30 per cent, but gross gained 23 per cent.

Simms May Increase Capital

NEW YORK CITY, Oct. 6—A special meeting of the stockholders of the Simms Magneto Co., East Orange, N. J., will be held at Room 1400, 25 Broad Street, this city, on Oct. 13 to consider and vote upon a proposition to amend the capital stock of the company from $1,750,000 par value, consisting of 17,500 shares of par value of $100 each of which 12,500 shares are common and 5000 preferred, to $1,855,000 par value, consisting of 12,500 common and 6050 preferred.

Few Market Changes

NEW YORK CITY, Oct. 5—Trading conditions in the markets this week were somewhat brisk, but the changes were few and small. Aluminum has again moved upward, holders asking 48 and 50 cents for spot in ton lots. Antimony is firm and receiving fair support. The asked price is quoted at 27½ and 28¼ cents for duty paid and 26¾ cents in bond. The copper market was firm at the opening of the week with the metal in large demand, sales being made to domestic consumers at 18¼ cents thirty days delivered for Electrolytic and 18 cents for Lake with the same terms. The steel markets were firm with a good general demand for the metal but there was no change in the price.

France and Italy still continue to buy all the steel-making iron that they can secure. Yesterday a new inquiry for 6000 tons of Bessemer steel came into the market for one of the allied countries, reported to be Italy. The lead market was easier last week because of a decline in the London market. All last week outside interests were asking 4.55 cents, which is 5 points over the price of the leading interest.

The oil and lubricants markets were also firm with but two changes taking place. There is a good market for all the refined products, and the demand is even better than anticipated for this season of the year. Crude oil is firm, but there have been no further advances reported.

Swinehart Earns 17%

AKRON, OHIO, Oct. 4—Directors of the Swinehart Tire & Rubber Co. have issued an annual statement showing that the company enjoyed a year of prosperity confined wholly to American trade. Gross earnings exceeded $2,000,000 and net earnings passed the $135,000 mark, which is about 17 per cent on the $800,000 capital stock.

The directors discussed a probable increase of dividends to 7 per cent Jan. 1. No definite action was taken. The regular quarterly dividend of 1½ per cent was declared.

Current assets in the statement issued show: cash $35,022; accounts and notes receivable, $258,822.58; inventories, $741,605; prepaid accounts, $12,211; real estate, buildings, machinery and tools, $319,522.84. Total, $1,417,213.97.

Liabilities are: accounts and notes payable, $400,955; accrued labor, $5,205.95; contingent liabilities, $15,432; capital stock, $800,000; surplus, $195,580.62. Total, $1,417,213.97.

Detroit Commercial Increases Capital

DETROIT, MICH., Oct. 2—The capital stock of the Detroit Commercial Car Co. has been increased from $1,000 to $100,000. This concern was recently organized to make the Detroit package delivery wagon, to sell at $690 with open express or panel body and at $745 with a more elaborate body.

Springfield Metal Body Elects

SPRINGFIELD, MASS., Oct. 1—The Springfield Metal Body Co., this city, has increased its capital stock and elected

Claims for $5,500 on Midland

MOLINE, ILL., Oct. 2—An echo of the failure of the Midland Automobile company two years ago, was heard this week when the attorneys for the petitioning creditors, filed a claim for $1,000 fees, while the receiver asked for $1,500. The attorneys engaged by the receiver put in a bill for $3,000, making a total of $5,500. The report of the receiver will be read before the referee in bankruptcy in Peoria on Oct. 18 and action will be taken upon the claims and report at the same time.

—

Orders 1000 Automobile Cars

DETROIT, MICH., Oct. 1—Word was received by the traffic department of the Detroit Board of Commerce from the Michigan Central Railroad that in addition to the 500 special cars for automobiles ordered several weeks ago, the road now has placed another order for 500 more freight cars for automobiles. This is one of the first results of the Board of Commerce efforts.

Dividends Declared

Kelly-Springfield Tire Co., New York City; quarterly of 3 per cent on common, payable Nov. 1 to stockholders of record, Oct. 15.

Securities Markets Active

—

Kelly-Springfield Features Market—Anglo-French Loan Is Market Factor

NEW YORK CITY, Oct. 4—Trading is going on an enormous scale and further violent price movements were recorded in last week's securities. There were many changes which showed marked advances. Kelly-Springfield tire featured the market with an advance of 30 points. With Goodyear closing at 335 making a total gain of 25 points and Firestone closing at 560, a gain of 20 points, these tire issues this week showed the largest gains. The rest of the tire issues showed but small gains, ranging from 1 to 10 points.

The specialties markets did not show up as strong as usual, there being but a few small gains. General Motors, which for some weeks has been having a remarkable high record, made but a 4-point rise. The bidding was a little lighter in the specialties during the first part of the week but it was reported that it would again grow strong in a few days.

This seemed to stimulate the market a bit and on Friday there was a marked rise. Chalmers rose from 116 to 140, making the total gain 24 points. The rest of the market gains ranged from 1 to 10 points.

The Detroit markets were strong, the gains being heavy and many. General Motors featured the market, its closing bid being 345, a gain of 55 points. Then followed Chalmers with a gain of 18 points. Continental made a gain of 15 points and Paige a rise of 5 points. These were the main gains in the active stocks. The inactive stocks were weak, there being only two changes made, one a loss and the other a gain of ½ point.

—

Goodrich May Issue Quarterly Statements

NEW YORK CITY, Oct. 4—Officials of the Goodrich Tire & Rubber Co. are considering the advisability of issuing quarterly statements in the future. It is probable that figures for the September quarter will be given out next month.

—

Acme Die Casting Capital Increase

BROOKLYN, N. Y., Oct. 4—The Acme Die Casting Corp., Bush terminal, will increase its capital stock from $125,000 to $200,000. The company is at present increasing its plant.

—

Taylor Puritan Machine Secretary

DETROIT, MICH., Oct. 4—Oscar R. Taylor, formerly with the Port Huron Engine & Thresher Co., Port Huron, Mich. and also with the General Motors Co., has been appointed secretary of the Puritan Machine Co. with which he has been connected for over a year.

—

Sigle Sommer Production Manager

BUCYRUS, OHIO, Oct. 1—W. E. Sigle has become production manager of the Sommer Motor Co. Mr. Sigle has occupied a similar position with the Maxwell company at Dayton.

$1,000,000 Addition to Tire Plants

Goodrich and Goodyear to Expend That Sum for Larger Manufacturing Quarters

AKRON, OHIO, Oct. 2—Announcements are made by the Goodyear and the Goodrich companies that additions to their plants to be started in the near future will mean an expenditure of more than $1,000,000.

The B. F. Goodrich Co. is excavating on Bartges Street for a five-story building 800 by 270 ft., which will be the largest of any of the structures in the plant. A six-story building is also being erected on Falor Street, on the site of the employment office. The structures on Bartges Street will cost in the neighborhood of $800,000.

The Goodyear Tire & Rubber Co. will erect an eight-story building 200 ft. wide to its present uncompleted addition on East Market Street.

—

Empire Acquires New Plant

INDIANAPOLIS, IND., Oct. 2—The Empire Automobile Co. has acquired a new plant in this city. The factory affords a manufacturing floorspace of approximately 150,000 sq. ft. in three combined buildings. The entire Empire production will be carried on in the Indianapolis plant after Jan. 1, the acquisition of this plant centralizing all the interests of the company. Heretofore the general offices have been maintained in Indianapolis while the manufacture of cars was carried on at Connersville. The general sales and executive offices are now located at the factory.

—

Paige Breaks Production Records

DETROIT, MICH., Sept. 28—Production at the Paige-Detroit Motor Car Co. is now averaging 150 cars a day. Shipments during the past two weeks were the largest in the company's history. The additions to the plant now completed provide over 100,000 sq. ft. additional floorspace. When all additions are completed, all the new machinery installed and an increased working force added, production will permit the finishing of 250 cars or more per day.

—

Knox Motors Co. Refuses to Sell Plant

SPRINGFIELD, MASS., Oct. 5—Overtures have been made to purchase the plant of the Knox Motors Co., by one of the big organizations manufacturing war munitions. The officials of the Knox company admit that offers were made, but state they will not sell the plant. Three companies were bidding for it, the Bethlehem Steel Co., the New England Westinghouse Co. and the General Electric Co. The New England Westinghouse Co. has purchased the Stevens-Duryea plant in this city. As officials of that company are here now an effort was made to get some inkling from them. Vice-president L. A. Osborne of the company stated that they were not after the Knox plant. The Knox company is understood to have filled some of its large war orders for tractors for the past few months as sub-contracts for the Bethlehem Steel Co. so an intimate line has been established between the two companies.

—

Briscoe To Build Plant

JACKSON, MICH., Oct. 1—After several months of negotiations between the Briscoe Motor Co. and the Chamber of Commerce, it was announced to-day that as a result, the Briscoe company will build a new plant on Wildwood Avenue which is to cost no less than $100,000 and where possibly more than 5000 men will be employed.

One of the principal conditions for the realization of the expansion plan was that something would have to be done by the city or the citizens to provide at least 200 lots for the erection of workingmen's homes. An organization known as the Billancourt Land Co. was effected and it owns now 130 acres of land on Wildwood Avenue. Two hundred lots are to be offered for sale at $300, payable $50 down and $50 per month. The City Bank, People's Bank, Union Bank and the State Savings Bank are co-operating and will provide loans, with which the new Briscoe plant will be erected. The automobile company will lease the factory and site of about 15 acres for a period of ten years at $10,000 a year, it is said, with privilege of purchase at liberal terms.

The expansion of the Briscoe plant will also mean an extension of the Argo and other concerns in which Benjamin Briscoe and his associates are strongly interested.

—

Frost Gear & Forge Adds

JACKSON, MICH., Sept. 28—An addition to the plant and equipment of the Frost Gear & Forge Co. will increase the production capacity of the concern at least one-third. The addition consists of a structure 42 by 132 ft. and when completed the plant will increase its working force of 350 to at least 450. Night shifts are being worked in both the gear cutting and drop forge departments. Orders on the books now will keep the plant working to full capacity for a year and exceed any previous year's business of the company.

Studebaker Plant to Expand

Acquires Additional Property —Co. Plans to Build 75,000 Cars for 1916

DETROIT, MICH., Sept. 30—The Studebaker Corp. has acquired a large property which adjoins its plant No. 3, and will begin at once the erection of additions to that plant. Other additions to be put up in this city consist of a three-story extension to plant No. 5, a new drop forge shop, 62 by 264 ft. and an addition 62 by 140 ft. to the blacksmithing shop, both of steel, glass and tile, to building No. 25. The old De Luxe plant, which is part of plant No. 3, will be torn down and a four-story building 52 by 326 will be erected to be used for machining work. An extension, 35 by 120 ft., will be made to the power house and the freight shipping platforms of plant No. 3 will be rearranged and extended.

These additions to plant No. 3 will probably be followed by others to other local Studebaker plants. Originally the corporation planned to make 60,000 cars for the season 1916, but according to vice-president L. J. Ollier, 75,000 cars have been contracted for.

—

Champion Spark Plug Co. Increases Production to 50,000

TOLEDO, OHIO, Oct. 1—An increase in production from 35,000 to over 50,000 spark plugs per day is reported by the Champion Spark Plug Co., this city. This concern recently has been forced to enlarge its factory facilities by the addition of over forty new automatic machines. There has been a proportionate increase in other equipment of the factory.

—

Hardwood Men to Boycott Metal Bodies —Boost Wood

MILWAUKEE, WIS., Oct. 2—The propaganda instituted by the hardwood lumber manufacturers of the north, centered in Wisconsin, to induce automobile manufacturers to return to the use of wood bodies instead of sheet metal, contemplates a carefully detailed campaign which is to bear fruit in 1917 and succeeding years. It will be principally an educational campaign, but the lumbermen will use direct means of forcing the issue by gathering their cohorts into an army that will refuse to purchase cars unless the bodies are of wood construction.

H. E. Christiansen, a well known hardwood lumber dealer of Milwaukee, who is taking a leading part in the movement says: "It is a fact that in 1910 and

1911 one motor car builder alone was using lumber at the rate of 20,000,000 ft. a year. In 1915 the same manufacturer is using only 2,000,000 ft. The profit is at least $2 per thousand, so we can see that $36,000 has been lost to the lumber trade in one instance alone."

Every lumberman who purchases a car in the future is to make a particularly strong effort to have his machine equipped with a wood body, according to the plans of the hardwood manufacturers. It is admitted that such procedure will be difficult for 1916, but by 1917 the propaganda is expected to have made sufficient headway to count.

—

Goodyear Passes $2,000,000 Mark

AKRON, OHIO, Oct. 4—The annual sales conference of the Goodyear Tire & Rubber Co. was brought to a close last Wednesday, district and branch managers from all over the country having been the guests of the company for a week. The company's record during the past year was reviewed and sales plans laid for the forthcoming season. It was brought out that this has been the Goodyear company's greatest business year, among other things the $2,000,000 mark set for the automobile tire department a year ago having been reached and passed, and it is confidently expected that 1916 will be a still greater year.

—

Electric Brush Co. Formed

DOVER, N. J., Oct. 4—The Electric Brush Co. has been formed here with the purpose of producing brush parts for all makes of electrical apparatus used on automobiles. The company plans to carry in stock at all times brush parts which will fit all sizes and types of lighting generators and starting motors, magnetos, etc., produced by all of the various companies.

—

General Electric Men Strike

SCHENECTADY, N. Y., Oct. 4—Ten thousand employees at the local plant of the General Electric Co. went out on a strike to-day in their fight for an 8-hr. day, and the remaining 3000, comprising the molders, coremakers, and blacksmiths, voted to-night not to report for work in the morning. This means tying up the entire plant with the exception of the office force.

—

Market Warner Products Direct

CINCINNATI, OHIO, Oct. 4—The Warner Auto Top Co., which heretofore has marketed its upholstery and top covers through distributors, has altered its sales policy and hereafter will market its product direct to the trade. All the Warner products hereafter will be marketed under the company's own name.

140,168 Cars in Iowa

—

36,000 More Than Total for 1914—Farmers Big Factors in 33% Gain

DES MOINES, IOWA, Oct. 2—Iowa now has 140,168 automobiles registered for the present year. This is an increase of 36,000 or over 33 per cent as compared with the total for 1914 and the total for the present year is expected to reach the 150,000 mark. The registration figures show the notable fact that there are relatively more cars in the rural districts than in the cities.

Using the last federal census as a basis, Iowa now has one automobile to every fifteen persons in the State. In the counties with a large urban population the percentage of car owners is lower. Polk county, in which Des Moines is located and which has the largest urban population of any county in the State, has 5550 cars which is one to every nineteen of population. Woodbury county, in which Sioux City (the second city of the State) is located has 2966 cars or one to every twenty-two of population.

Buena Vista county, with a population of 15,891 which is largely rural, has 1722 cars or one car to every nine persons. Clay county, also largely rural in population, has 1385 cars for 12,766 of population. The same situation prevails in Humboldt, Kossuth, Ida, and other counties with preponderantly rural populations.

Automobile registration fees for the State have been $1,137,500 so far this year as compared with $1,040,135 for the entire year of 1914. The following table of automobile registration fees in Iowa for the years from 1907 to 1915, inclusive, shows the remarkable growth of the automobile business in the State:

YEAR	FEES
1907	$7,202
1908	20,880
1909	36,347
1910	65,608
1911	259,736
1912	485,300
1913	600,000
1914	1,040,135
1915 (to Sept. 28)	1,137,500

—

New Milwaukee Gasoline Prices Favor Quantity Consumers

MILWAUKEE, WIS., Oct. 2—A readjustment of the scale of prices on gasoline in Milwaukee and neighboring territory to the end that motorists will pay a premium over the prices made to quantity consumers, has been effected by both independent and Standard companies. For several years, or since the filling station came into vogue, motorists have been paying the same price per gallon for 5 or 10 gal. of gasoline that buyers of 100-gal. lots were charged. For example, a motorist who drove his car to the filling station, of which there are more than 100 in Milwaukee, was able to fill his tank, no matter how little he required, at the same price per gallon which was charged the garage across the way. The readjustment, together with general advances in the price of gasoline, has brought the quotation per gallon on 60 deg. gasoline to 12½ cents at filling station; 11.6 cents per gallon for tank wagon delivery, and 10.6 cents per gallon for tank wagon delivery, 100 gal. or more. From May to September, the price per gallon to individuals buying small quantities ranged from 10.5 to 10.6 cents, or the same price now quoted in lots of 100 gal. or more. The uniform quotations effective Oct. 1 are as follows:

Sp. Gr.	Filling Station, Cents	Tank Wagon Delivery, Cents	Tank Wagon 100 Gal. Delivery or More, Cents
60 degrees	12.5	11.6	10.6
65 degrees	16.5	15.5	14.5
70 degrees	18.5	17.5	16.5
72 degrees	20.5	19.5	18.5

—

Gasoline Up 1 Cent

CHICAGO, ILL., Oct. 6—The price of gasoline has been raised during the last week 1 cent. In this city, the Standard Oil Co. of Indiana is quoting gasoline at 11½ cents a gallon for 10 and 50 gal. lots. In Tacoma, gasoline is retailing for 12 to 12½ cents. And in Portland, Ore., it is selling wholesale at 11 cents. For the past six months a number of stations in this city have sold gasoline at the wholesale price, 10 cents. The price went up 1 cent to-day in Denver, Col., most garages selling it at 16 and some at 20 cents.

—

Gasoline Up in St. Louis

ST. LOUIS, MO., Oct. 2—The independent refiners have raised the price of gasoline 1 cent, from 11 to 12 cents per gallon. This increase in price followed closely upon an increase made by the Standard company from 9.9 to 10.9 cents.

When the price had been reduced from 17.5 cents to 8.9 cents a gallon the independents called a halt and started to boost the price with the avowed intention of bringing it back to what it was before the price-cutting war. Thus when the independents sold gasoline for 10 cents the Standard sold for 8.9. When the Standard brought its price to 9.9 the independents raised their price to 11 cents. Last Wednesday the Standard raised its price to 10.9 and the independents immediately brought theirs to 12 cents. At the same time the independents raised the price of their No. 2 from 13 to 14 cents and No. 1 from 14.5 to 15.5. They attribute these increases to the increased cost of the crude product.

Michigan Service Men to Organize

First Steps in Formation of Automobile Service Managers' Assn. of Michigan

DETROIT, MICH., Sept. 29—The first steps toward the organization of the Automobile Service Managers' Association of Michigan were taken this afternoon when under the presidency of Alfred Reeves, general manager of the National Automobile Chamber of Commerce, service managers from Detroit and other Michigan factories met at Hotel Statler.

A committee consisting of C. R. Lester, chairman, Packard; D. H. Haselton, Regal, and A. O. Weise, Oakland, was appointed to prepare by-laws and a constitution. Another meeting will be held Oct. 26, when the final organization will be effected.

One of the service managers present stated that the object of such an association is primarily to reach an understanding among all automobile manufacturers of the State as to what the service department should ultimately be; or in other words, to provide a standard service policy. There was no discussion on the subject at this first meeting except that most of those present thought that this serious question of service can be better solved or at least brought to a better and more universal policy by having an organization of those men who look after the service departments in the plants. Such an organization has just been perfected among the Indiana automobile manufacturers and will very likely be before long in the States of Ohio and New York. Quite likely there will be a national organization as a consequence.

The service managers who attended the meeting were: in addition to those already mentioned, C. W. Matheson, Dodge; E. A. Haskins, Federal; Pierre Schon, General Motors Truck Co.; R. O. Gill, Saxon; J. E. Fields, Hupp; J. L. Kenyon, Cadillac, and E. V. Rippingille, Hudson.

—

Columbus Garage Convention Postponed

COLUMBUS, OHIO, Oct. 5—The State convention of garage owners which was to have been held here during the three days, Oct. 4, 5 and 6 has been postponed three weeks. The new dates selected are Oct. 25, 26 and 27.

—

Detroit Salesmen Organize

DETROIT, MICH., Oct. 2—Preliminary arrangements have been made for the organization of the Detroit Salesmen's Association. A committee was appointed to prepare recommendations to be submitted at a general meeting to be held next week. Among the members of the committee are: C. C. Cunningham, director of sales, Hudson Motor Car Co.; Norvell A. Hawkins, general sales manager, Ford Motor Co.; Harry W. Ford, president, Saxon Motor Co.; H. H. Hill, sales manager, Packard Motor Car Co.; Joseph Mack, president, Mack Printing Co.; F. H. Dodge, general sales manager, Burroughs Adding Machine Co.; H. Wilbert Spence, Mutual Life Insurance Co.; D. M. Barrett, editor *Salesmanship*, and James W. Fisk, director of selling service, J. L. Hudson Co.

—

Firestone Salesmen Meet

AKRON, OHIO, Oct. 4—Fully 500 salesmen, branch managers, department heads and officials of the company, attended the home coming of the Firestone Tire & Rubber Co., held here last week. Special cars were run from many parts of the country, bringing in the tire men to attend the meeting. On Sept. 29 the men were received in the executive offices of the Firestone plant and later a number of addresses on tire making and selling were made. At noon a luncheon was served in the restaurant of the company which was followed by an inspection of the plant.

An all day session of the branch managers and department heads was held Sept. 28.

—

Wants to Represent Parts Makers in Coventry

COVENTRY, ENGLAND, Oct. 4—G. R. Bromley of the British Components, Bedford Street, Coventry, is looking for several agencies, such as the representation of automobile parts makers, also firms that can supply forgings and stampings of all descriptions and nickel crankshafts. Mr. Bromley is also interested in taking up the sole agencies with anything connected with the engineering, motor and machinery trade.

Mr. Bromley has been in the automobile trade since 1899, having been connected with the Daimler Motor Co. for several years and for two and one-half years with J. L. Lambie of the Bedford Motor Co. or the General Motors, Ltd., Long Acre, London, W. C., as chief outside representative.

—

Accessory Jobbers Meet Oct. 20-22

KANSAS CITY, MO., Oct. 4—The National Association of Automobile Accessory Jobbers, whose headquarters are in Chicago, will meet in this city at a convention Oct. 20, 21 and 22, at Hotel Muehlebach. The organization has in view the betterment of merchandising accessories and correcting of existing abuses in the merchandising of accessories.

Denby To Teach Salesmanship

Free 36-Lesson Correspondence Course to Truck Buyers—Course Lasts a Year

DETROIT, MICH., Oct. 4—Something entirely new in the way of assistance or help to the purchaser of trucks has been inaugurated by the Denby Motor Truck Co. It consists in giving free to the Denby truck purchaser a correspondence course of retail salesmanship in thirty-six lessons, extending over a period of one year. The purpose of this business-building and sales-efficiency service is to develop, among the employees of every owner, at least one thoroughly efficient salesman, able to take advantage of the wider trade possibilities that the truck opens up.

The purchaser or owner of the truck is to designate whoever is to be given the lessons, preferably the driver, stating that it believes that he is usually the only man regularly out in the field, that he meets many customers who do most of their buying by telephone and that on his manner, appearance and methods is based the whole reputation of the store with many people.

The correspondence course is divided into four quarterly periods of nine lessons each, which are sent to the students at the rate of three a month. With every lesson there is a number of questions, which the student must answer and return to the Denby company, these answers having a bearing upon the awards of the various cash prizes aggregating $3,000 which the company has set aside to stimulate the interest of the students.

There will be one award or prize of $1,000 which will be paid Nov. 1, 1916, to the student who has shown the greatest progress, whether he has at that time finished the entire course or not. Four quarterly awards of $200 each will be paid to the student who has shown the most progress during the quarter, and there will be four prizes of $150 and four of $75, one for each quarter, to be given respectively to the second and third best students. In addition to these prizes $15 will be paid each month to the student ranking highest for that month and $10 to the one ranking second.

The lessons to be sent to the students will deal with such subjects as getting new customers, making old customers buy more, introducing new goods and many other subjects.

Boston Dealers Show in Tents at Rockingham Fair

BOSTON, MASS., Oct. 2—Boston motor car dealers took advantage of the fall weather to make a big exhibit at Rock-

ingham Fair the past week. The show was held in two large tents placed together with the side flaps removed, making it one large area. The cars, trucks and accessories were spread around in a circle in each tent, and so one could look about without hindrance. All the Boston agents with exhibits had salesmen there, and the dealers in the border cities and towns on the New Hampshire-Massachusetts line were also on hand. The crowds were big, so the sales made and prospects secured were encouraging.

—

Ward Electric on New York-to-Cleveland Trip

NEW YORK CITY, Oct. 5—To secure data on the cost of operating an electric vehicle over country roads, a Ward Special will be sent from this city to Cleveland during the Electrical Exposition and Motor Show at the Grand Central Palace, Oct. 6 to 16. The car will be started in time to reach Cleveland by Oct. 18, the date of the opening of the annual convention of the Electric Vehicle Association of America. The car will use the Edison battery known as the G4. The route to be followed will traverse Albany, Utica, Buffalo and Erie.

—

Seventeen Car Makes at Denver Show

DENVER, COL., Sept. 29—The two weeks' fall show under the auspices of the Automobile Trades Association of Colorado has started favorably, with more than twenty exhibits, a good attendance and an excellent sales outlook. It is being conducted in the Automobile Building, one of the separate structures provided near the City Auditorium to furnish extra space for the International Soil Products Exposition, with which the automobile show is connected.

The event is being attended by thousands of visitors from a wide territory, many of whom are prosperous farmers and regarded as prospects for cars. A few sales were closed during the first three days of the show, and many more are counted upon. Seventeen cars are exhibited by ten dealers, and there are eight accessory and supply booths and one special exhibit presenting the work of the trades association.

—

Conrad Bell Sales Manager

YORK, PA., Oct. 2—H. W. Conrad, former sales manager of the Pullman Motor Car, York, Pa., has been made the sales manager for the Bell Motor Car Co. W. F. Grove, who filled that capacity since the organization of the Bell company, has been made the factory superintendent. Work on the erection of the one-story frame assembling plant at the Bell factory is being completed and the several departments have been moved into the new addition. To further facilitate operations another addition, 110 by 30 ft., is being erected.

Ohio Jitney Drivers Organize

—

Form Ohio Auto Bus. Assn.—To Fight Unfavorable Legislation in State

YOUNGSTOWN, OHIO, Oct. 4—The preliminary organization of the Ohio Auto Bus Association was finished at a meeting of jitney bus drivers held in this city last week. Local organizations in Akron, East Liverpool, Ashtabula, Lima, Marietta and Cincinnati were represented at the meeting. The object of the organization is to fight unfavorable legislation both on the part of the Ohio Legislature and various city councils. The next meeting will be held in Columbus.

—

Jitney Bus Plan for Denver Practically Abandoned

DENVER, COL., Sept. 29—All efforts to establish jitney bus transportation in Denver have been fought so bitterly that the enterprise has been practically abandoned. Although there is now pending in court a mandamus suit to compel the city commissioners to issue permits for operating jitney bus lines, there is little hope that the jitney promoters will win the case, inasmuch as the applications for permits were originally rejected on the ground that a jitney bus line is a public utility the same as a street car line, and since the filing of the mandamus suit the jitney has been declared a public utility by both a city ordinance and a State law. Taxicabs require a city license costing $10 a year for cars up to seven-passenger capacity, and there is an ordinance providing for a $500 bond for each car, but this bond feature has not been enforced. The city has not fixed any license fee or bond requirement for jitneys, on the ground that a regular franchise must be secured. The jitneys have been opposed by both street car companies and taxicab concerns.

—

Bullen with Michigan Top

DETROIT, MICH., Oct. 2—H. E. Bullen, formerly with the Rands Mfg. Co. is now in charge of the manufacturing department of the Michigan Auto Top Co., which has bought in the bankruptcy court the business and stock of the Michigan Auto Top & Painting Co. S. L. Joseph has been appointed to take care of the sales and financial department.

—

Enforce N. Y. Jitney Bus Law

ALBANY, N. Y., Oct. 3—A decision has been rendered in this city which practically compels bus lines in all cities to get city and State permission to operate. The so-called jitney bus law has been sustained in all of its principal phases. As a result of the decision, the courts have held that the following classes of vehicles must secure the consent of the local authorities and go to the commission for a certificate of public convenience and necessity: A bus line, a stage route, a vehicle in connection with a bus line, a stage or motor vehicle route, a vehicle carrying passengers at a rate of fare of 15 cents or less for each passenger within the limits of a city, and a vehicle carrying passengers in competition with another common carrier, which is required by law to obtain the consent of the local authorities of said city to operate over the streets thereof.

—

Cleveland Show Jan. 8-15

CLEVELAND, OHIO, Oct. 4—The fifteenth annual Cleveland automobile show will be held Jan. 8 to 15 in the Wigmore Coliseum. Dates and preliminary arrangements were decided on at a meeting at which was effected re-organization of the Cleveland Automobile Show Co., the dealers' organization which gives the show with the sanction of the Cleveland Automobile Club.

Fred H. Caley, who has managed the Cleveland show for four years past, was again elected to be in active charge. The Cleveland exposition comes immediately after the opening show in New York and precedes Chicago's by a week.

—

Des Moines Show Feb. 14-19

DES MOINES, IOWA, Oct. 2—The annual Des Moines show, held previously during the month of March, is scheduled for the week of Feb. 14, 1916, according to an announcement by C. G. Van Vliet, secretary of the Des Moines Automobile Dealers' Association, who is manager of the local show. The new date, three weeks earlier than in former years, is better because it puts Des Moines on a circuit of the big automobile shows in the middle west.

The Minneapolis show will be held in the week of Jan. 29 and the Kansas City show in the week of Feb. 7, while the Omaha show follows the Des Moines exhibition during the week of Feb. 21. In former years the local date always conflicted with the Boston show and as a result many factory exhibits could not be shown.

—

Lemoine Dies in Paris

PARIS, FRANCE, Oct. 1—M. Louis Antoine Lemoine died recently in this city at the age of sixty-two. He was the head of the automobile spring company bearing his name and was also president of the French Society of Makers of Motor Parts and Accessories.

Factory Miscellany

Elyria Tire to Build—The Elyria Tire & Rubber Co., Elyria, Ohio, will build a two-story 60 by 200-ft. plant.

Tayson Rubber Plant to Be Sold—The Tayson Rubber Co. plant, Wooster, Ohio, it is said, is to be sold to one of the large Akron tire concerns.

Pullman Leases 10,000 Sq. Ft.—The Pullman Motor Car Co., York, Pa., has leased 10,000 sq. ft. of additional floor space which it will occupy this month.

Milwaukee Engine to Add—The Milwaukee Auto Engine & Supply Co., Milwaukee, Wis., is preparing to enlarge its facilities and has increased its capital from $6,000 to $30,000.

New Ajax Plant—A new plant is to be built immediately by the Ajax-Grieb Rubber Co., Trenton, N. J., which will be 200 by 350 ft., three stories, and adding 210,000 sq. ft. of floor space.

Nashville Ford Plant Started—Work has been started on the three-story plant of the Ford company near Twelfth Avenue and Broadway, Nashville, Tenn. The plant will be 75 by 170 ft.

Gardner Machine Adds—The Gardner Machine Co., Beloit, Wis., manufacturing disk grinders for metal working, and supplying many car builders with its devices, is erecting a shop addition providing about 5000 additional square feet of floor-space.

Kelsey Wheel Adds—The Kelsey Wheel Co., Ltd., Windsor, Ont., has ordered the building of an addition, 42 by 112 ft., part of which will be a garage. The other part will be divided into six dry kilns.

Southern Tire to Double Capacity—The Southern Tire & Rubber Co., Augusta, Ga., will double its capacity, at present seventy-five tires per day. The number of employees, which is now fifty, will be increased to ninety.

Vandalia Co. to Make Accessories—The Midland Accessories Mfg. Co., Vandalia, Ill., has been incorporated with a capital of $150,000. The concern is a reorganization of the St. Louis Auto & Appliance Co. and plans to build a $50,000 plant at Vandalia.

Tire Plant for Sebring—A tire manufacturing plant, according to reports, will be placed in Sebring, Ohio, by the Sebring Tire & Rubber Co., recently formed with a capital of $200,000, with J. S. Hotchkiss, W. F. Smith, C. B. Smith, H. D. Weaver, and W. B. Stevenson as incorporators.

Tire Plant for Kansas City—P. E. Werner has leased a plant at Fourth and Central Streets and offices in the Commerce Building, Kansas City, Mo., to make tires. Actual production is expected to start about the first of the coming year. The company is also establishing a plant at Chester, W. Va.

New Linde Branch Plant—All contracts have been awarded for the erection of the new Milwaukee branch plant of the Linde Air Products Co., New York, and work is now well under way. The building will be of reinforced concrete and steel, to be 80 by 100 ft., and will cost $35,000. The location is at Thirty-eighth and National Avenues, West Allis, Milwaukee.

Sterling Truck Builds—The Sterling Motor Truck Co., Forty-sixth Avenue and Rogers Street, West Allis, Milwaukee, Wis., is building a large factory addition. The concern formerly was known as the Sternberg Motor Truck Co. It has been doing a large foreign business, and these demands, together with the unusually large business now being received from domestic sources, has made it necessary to nearly double the size of the works. The plant was erected only four years ago and was then expected to have a capacity for at least ten years.

The Week in the Industry

Newlin Transferred—W. D. Newlin, late of Kansas City, has been transferred to Springfield, Ill., and placed in charge of the Mitchell car as sales mananer for the Sangamon county territory.

Shay Champion Chicago Mgr.—W. J. Shay, recently with Judd & Leland Mfg. Co., and formerly with the United Manufacturers of New York, has become the Chicago manager of the Champion Spark Plug Co., Toledo, Ohio.

Keyt Heads Rockford Cadillac—The title of the Cadillac Automobile Co., Rockford, Ill., has been changed to that of the Keyt-Erb Automobile Co., of which F. P. Keyt is president; Clifford Erb, vice-president, and Walter Lamb, secretary and treasurer.

Gorman Cadillac Rep.—E. C. Gorman has been appointed a district representative for the Cadillac Motor Car Co., Detroit, Mich. He will travel Nebraska, Iowa, the Dakotas, Minnesota, and part of Canada. He was formerly in charge of the Cadillac exhibit at the Panama-Pacific Exposition.

—

Dealer

Firestone Plant for K. C.—The Firestone Tire & Rubber Co., Akron, Ohio, will equip a tire plant at Kansas City, Mo., to cost $200,000.

Moline Sells Omaha Branch—The Moline Automobile Co., East Moline, Ill., has recently sold its Omaha branch to R. E. Davis & Co. The deal includes the entire State of Nebraska and western Iowa.

Recent N. Y. Leases—The Gadabout Motor Co., Freeman & Brady, the Holden One-Man Top Co., and the United Auto Co., recently leased space in the building at the southeast corner of Broadway and Fifty-seventh Street, New York City.

St. Louis Dealers' Items—Bart S. Adams, 4701 Washington Avenue, St. Louis, Mo., has obtained the agency for Midgley tires in the St. Louis territory.

The Commercial Auto Body Co. soon will announce a cut of from $10 to $25 on all commercial bodies. This reduction in price, according to Hugh F. Cartwright, president of the company, is due to decreased cost of production since the firm has occupied its new building at Sixteenth and Pine Streets.

The new Ajax tire sign being erected by the Guenther-Methudy Sales Co., 3553 Lindell Boulevard, is said to be the largest west of the Mississippi River.

Motor Men in New Roles

Henderson Seattle Mitchell Mgr.—J. A. P. Henderson is manager of the used car department of the Mitchell Motor Car Co., Seattle, Wash.

Baumann St. Louis Mgr.—The St. Louis Auto-Drayage Co., with W. H. Baumann as manager, has opened a repair and service station at 1907 Locust Street.

Taber in Charge—E. M. Taber has been placed in charge of the truck sales department of Russell P. Taber, Reo distributor at 338 Pearl Street, Hartford, Conn.

LeFebre Returns to Tacoma—R. P. LeFebre has returned to the Tacoma (Wash.) automobile field, and will be at the head of the sales staff of the Cadillac Auto & Supply Co.

Wright Saxon Sales Mgr.—F. S. Wright, formerly with the Studebaker Corp., has been appointed sales manager of the Saxon Motor Sales Co., with headquarters in Los Angeles.

Woodruff Lexington N. Y. Mgr.—A. A. Woodruff is manager of the Lexington Motors New York Corp., which recently opened showrooms at 1840 Broadway. Mr. Woodruff is also treasurer.

Morris Springfield Hudson Sales Mgr.—Merwin Morris is in charge of the sales of the recently organized Hudson Sales Co., Springfield, Ill. The salesroom and office will be at 428 South Fourth Street.

Ernst Metz Assistant Mgr.—N. F. Ernst has gone to Omaha, Neb., where he will be assistant manager of Metz branch there. He has been for three years branch manager of the Metz Co., Utica, N. Y.

Klune in New York—C. A. Klune has opened an office at 51 West Sixty-third Street, New York City, as a manufacturers' representative. He was formerly Eastern representative for the Jones representative.

Join Indianapolis Ford—Joseph Kelly and D. V. Goodman have joined the Indianapolis, Ind., branch of the Ford Motor Co., and will devote their time to sales promotion work, which comprises advertising and publicity.

Linerd Ajax Sales Mgr.—J. B. Linerd, who has been connected with the Ajax-Grieb Tire Co., New York City, for two years, has been elected general sales manager. Mr. Linerd came from the Goodyear company two years ago to reorganize the New York City office of the Ajax. As general sales manager of the New York company he will have the direction of all the salesmen of the company.

Taylor Succeeds Marty—E. A. Taylor has been made superintendent of plants 2 and 3 of the Maxwell Motor Co., Dayton, Ohio. Mr. Taylor succeeds William Marty, who has resigned to become superintendent of plant 2 of the Studebaker Corp.

Whitney Los Angeles Sales Mgr.—R. A. Whitney, who has been identified with the Regal line in Southern California, has been appointed sales manager of the Colyear Motor Sales Co., newly appointed Regal distributor for southern California and Arizona.

Erickson Joins United Truck—F. E. Erickson has joined the United Motor Truck Co., Grand Rapids, Mich., in the capacity of general superintendent. Mr. Erickson was formerly with the Packard Motor Car Co., and later with the Universal Motor Truck Co.

—

Dealer

Opens Detroit Office—The General Drop Forge Co., Buffalo, has opened an office in the David Whitney Building, Detroit, Mich., in charge of E. H. Miller.

Bristol Dealers Make Trip—Thirteen Bristol (Tenn.) automobile dealers on Sept. 23 made a 300-mile trip to Knoxville, Tenn. The Paige, Oakland and Maxwell cars made perfect scores.

Ford Buys in Yonkers—The Ford Automobile Co. has purchased the building at 109 to 115 South Broadway, Yonkers, N. Y., and will erect a concrete and brick salesroom, garage and repair shop.

New Accessory House in Columbus—The W. E. Cody Sales Stable Co., Columbus Co., Columbus, Ga., has installed an automobile accessory department, both wholesale and retail, and will have the agency for the Firestone and Diamond tires in that territory.

Montana Garage News—New garages are to be erected in Montana cities showing growth in business as travel over the new automobile trails increases. The Ford company has taken a lease for five years. At Livingston Senator A. W. Milles will erect a brick and concrete garage in the heart of the city which is to be 75 by 140 ft. At Billings, the Barry Motor Co. has the wholesale and retail distributing agency in Montana and northern Wyoming for Oakland cars.

Recent Changes in Louisville—The Samson Engineering Co., Louisville, Ky., has moved its offices from the Snead Building to the Starks Building.

The Compression Inner Tube Co. has opened an office and salesroom at 662 South Fourth Street.

Handles Handy Carbon Remover—The Perfek Device Co., Baltimore, Md., 116 South Greene Street, Baltimore, is now handling locally the Handy, a device for cleaning carbon out of cylinders. The company also is the Eastern distributor of the Perfek steering device.

Baltimore Co. Moves—The Randall Manufacturing Co., Scripps-Booth, Trumbull and Bell distributors, is taking possession of its new quarters, 16 West Mount Royal Avenue, Baltimore. The company will maintain a service station in the rear of the showrooms and offices. W. D. Randall is at the head of the company.

Recent Wis. Trade News—John Luke, who has been conducting a garage and repair shop in the Wagner foundry group at Burlington, Wis., for some years, has formed a partnership with A. H. Voltz. The new firm of Luke & Voltz has leased the Forge garage building at Burlington and will build an addition to be used for repair shop. A complete new equipment of tools will be installed in the building.

James E. Dempsey, formerly of Manitowoc, Wis., has returned to that city from the Pacific coast to arrange for the manufacture of a dirigible headlight device controlled by the action of the steering gear. Mr. Dempsey has patented the device in the United States, Canada, France and other foreign countries.

The Ph. Gross Hardware Co., 218-222 Third Street, Milwaukee, operating one of the largest motor supply departments in the State, has been appointed Wisconsin distributor of the American Ever Ready Works, New York.

E. H. Ramm, hardware dealer, New London, Wis., who has been appointed district agent for the Ford, is building a garage addition to his store and warehouse and will also conduct a repair shop and service station.

Frederick Glines, Omro, Wis., has leased the Leighton building and is remodeling it for garage and repair shop purposes. Mr. Glines has been appointed agent for the Ford.

The stock, machinery and equipment of the Rex Gasometer Co., Beloit, manufacturing measuring devices for gasoline tanks, oil tanks, etc., has been sold to satisfy the demands of creditors.

A. D. Whipple, Frank L. Bader and Christian Doerfler have organized the Transmission Research Co., Milwaukee, with $25,000 capital, to deal in patents; develop inventions and manufacture devices. Messrs. Whipple and Bader have been engaged in design for many years and now intend to market a number of important inventions in the automobile field.

The Estberg Garage, 460 Jackson Street, Milwaukee, established about eight years ago by Emil Estberg, has been sold to C. Ducey. Mr. Estberg will devote his attention to the sale of the Oldsmobile, Chevrolet and Monroe.

The Reo Sales Co. has been organized at Eau Claire, Wis., to handle the Reo pleasure and commercial car in a large northwestern Wisconsin territory. The agency formerly was handled by the Taylor Motor Co., Eau Claire. The members of the new firm are O. G. Kinney, Colfax, Wis., and J. C. MacDonald, Eau Claire. Headquarters have been established at 701 South Barstow Street.

The Bartles-Maguire Oil Co., Milwaukee, one of the largest independents in Wisconsin, will build a large filling station at Twenty-seven Street and Grand Avenue for the accommodation of motorists. The Standard Oil Co. recently built a large station at Grand Avenue and Sixteenth Street.

Denver Trade Items—The Boss Rubber Co., 1548 Broadway, Denver, agent for Kelly-Springfield tires, has been reorganized. S. Z. Silversparre, a member of the firm for several years and recently president of the company, has sold his interest and moved to El Paso, Tex.; F. P. Lilley, formerly vice-president, has been made president; Arthur Lewis, formerly manager of the Salt Lake City branch, is vice-president, while H. G. Peters and Robert Rhea still hold their respective offices of treasurer and secretary.

J. M. Patrick, 1515 Cheyenne Place, Denver, Lewis distributor for Colorado and Wyoming, has just secured the agency for the Abbott-Detroit.

The Ford Motor Co. has closed its downtown salesroom at 1551 Broadway, Denver, and will handle all regular city sales from the assembling plant at South Broadway and Kentucky Avenue.

The Denver Ford Starter Co., 1522 Cleveland Place, manufacturer of a mechanical starter, has taken the agency for the H. & D. shock absorber in that city.

J. M. Patrick, Lewis distributor, Denver, has moved from 533 Marion Street to 1515 Cheyenne Place, where he is occupying the salesroom recently vacated by L. G. Palmer, formerly Paige distributor.

L. E. Kelton, Haynes distributor, has moved from 1616 Broadway into permanent quarters at 1622 Broadway.

A. C. Wagner, proprietor of the Wagner Garage, 1541 Cleveland Place, has taken the agency for the Denby truck.

The firm of Mulnix & Steese, 17 East Colfax Avenue, Grant distributors, has been changed to Mulnix & Rarie, the interest of Mr. Steese having been bought by Baxter Rarie, formerly Grant distributor for northern Colorado, with headquarters at Loveland.

The National Rubber Supply Co.'s Denver branch has moved from 1633 Broadway into larger quarters at 1629 Broadway.

Recent Cal. Trade Items—B. L. Remington and W. L. Maxwell, 38-40 East Miner Avenue, Stockton, Cal., have formed a partnership under the name of the Guarantee Ignition & Battery Co. They will specialize in starting systems for all makes of cars.

The Stockton Auto Ignition Co., representing the Willard storage battery, is erecting a new concrete building on Miner Avenue, Stockton. The company recently received the local agency for the Splitdorf and Bosch magnetos.

Bell & Hinman have purchased the Twelfth Street Garage, 516 Twelfth Street, Sacramento, and will specialze in used cars.

The Traveler's Garage, 521-523 First Street, has been opened by Sellinger & De Gastin, Inc., in Sacramento. The company recently received the Haynes agency.

J. E. White has opened a Mitchell salesroom and service station at 1106 K Street, Sacramento.

The Universal Specialty Co., Los Angeles, has opened a tire construction and vulcanizing plant at 1237 South Figuroa Street.

The Big Tree Auto Works, the oldest garage in Los Angeles, has moved into a modern brick building at 1732-40 West Washington Street. The proprietors have been in business in Los Angeles twenty-eight years.

The Los Angeles branch of the Savage Tire Co. has moved into the large brick building at 700 West Seventh Street. In the new building the company has room for 5000 tires and a large office and shipping force.

Washington Electric Agent Builds—Emerson & Orme, Washington, D. C., agents for the Detroit electric, have commenced the erection of a two-story fireproof building to contain salesrooms, service station and garage. It is located on M Street, between Sixteenth and Seventeenth Streets, and will have a frontage and depth of 135 ft. On the first floor there will be a salesroom, 44 by 54 ft., for new cars, and a salesroom, 19 by 54 ft., for second-hand cars. Offices and a waiting room will be located on the main floor, together with a large garage. The charging plant will be located on the second floor. Provision has been made for a third story at some future time. The building will be completed in January.

Oldfield, Burman, Wilcox, Cooper and Anderson having a breathless brush on the high banked curve

Stutz Triumphs at 102.6 M.P.H.

Anderson Wins Astor Cup—Rooney in Another Stutz Second—America Takes First Five Places

By J. Edward Schipper

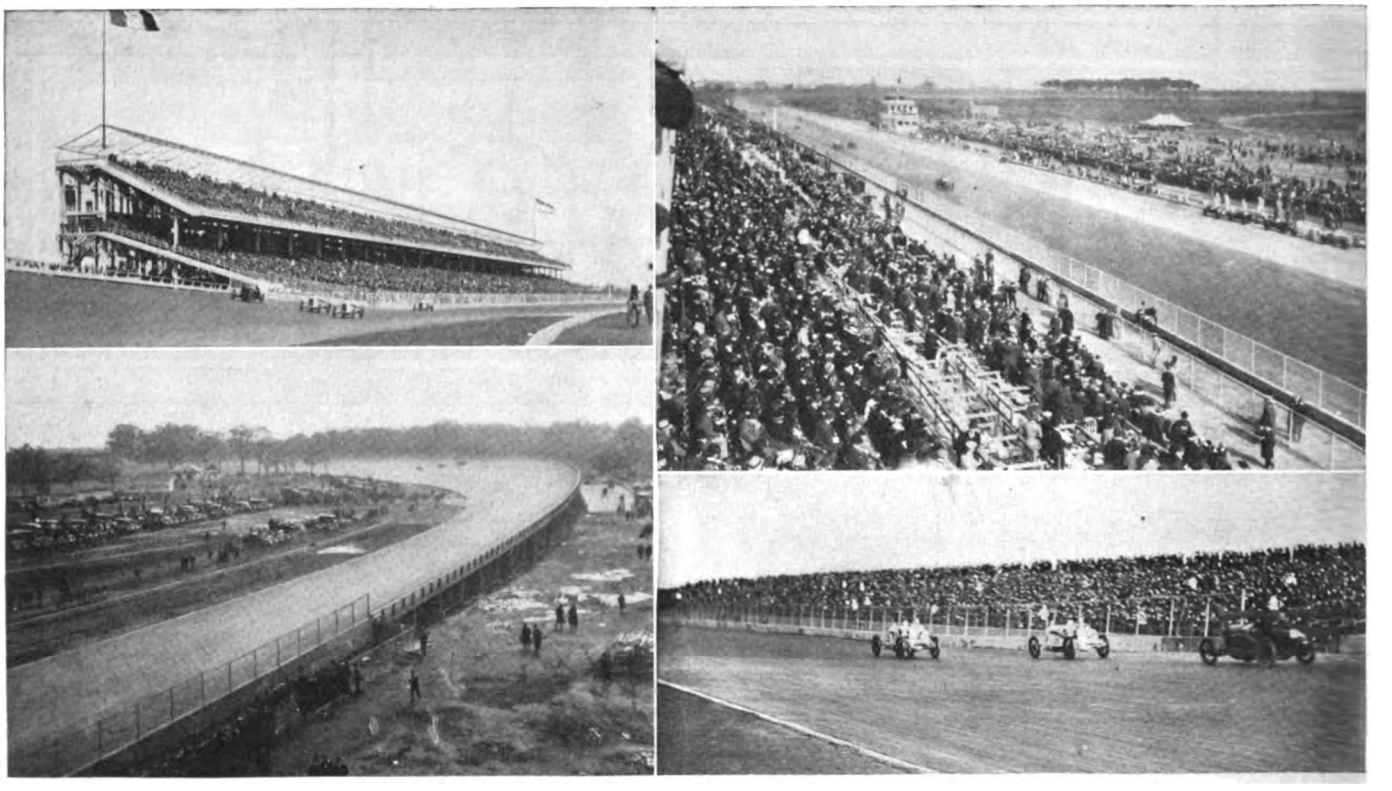
Winners in the Astor Cup Race

Car	Driver	Time	M.P.H.
Stutz	Anderson	3:24:42	102.60
Stutz	Rooney	3:25:29	102.19
Duesenberg	O'Donnell	3:39:55	95.45
Ogren	Alley	3:47:03	92.52
Duesenberg	Henderson	3:47:26	92.31
Delage	Limberg	4:09:23	84.22
Sebring	Haibe	Flagged at 298 miles	
Mulford Spec.	Vail	Flagged at 274 miles	

SHEEPSHEAD BAY MOTOR SPEEDWAY, Oct. 9—Proud is the American eagle to-day. Proud of a victory nobly won over the best that foreign lands could produce. Proud of Gil. Anderson and his triumphant Stutz that completed the 350-miles for the Astor Cup a winner at an average of 102.6 m.p.h.

The great achievement of Anderson alone was an accomplishment that marks a new era in speed competitions, but when Tom Rooney, his team mate, in another Stutz of identical design, crossed the wire 47 sec. later, he completed a victory which sets a new mark for the followers of Mercury. So close were these two white-clad team mates that until the last of the 175 laps had been covered it was impossible to say which would cross the line a winner. Rooney averaged 102.19 m.p.h.

Judgment, design and materials were the factors that lay beneath the surface of the vision of speed. All during the



Estimates of 100,000 attendance were made, the great stands were packed with spectators and the infield with parked cars which are said to have reached the number of 8000

3½-hr. contest the two racers ran with a regularity that showed a realization of what speed was necessary to win, and a determination not to deviate a particle from that speed either to catch those who set too hot a pace at the start or to lag at the finish when the race was won. Like a pair of soaring gulls the Stutz team circled the vast speedway, now gliding along the stretches and now rising like the wheeling birds they resembled high on the parabolic surface of the banked curves. Only one stop did the winner make and but two were made by the second car, the difference in time between the two cars at the finish being practically made up by the additional stop. Anderson's pause in his race to victory was to take on more fuel and Rooney stopped once for the same reason, and besides changed a tire.

Stamina was necessary, stamina of car, stamina of driver and stamina of every vital component. Tires and spark plugs had to stand the strain as well as crankshafts and connecting-rods and to the endurance of the materials Harry Stutz to-day owes the acquisition of 35 points toward the Astor Cup and his drivers the possession of $30,000 in prize money out of the $50,000 total.

Although not making such high speed, great credit for consistent running is owed to the Duesenberg motors and the six cars which they propelled, for of these six no less than five finished in the money and the sixth might have done so had not the driver earned disqualification for a petty breach of the rules.

Contest of Materials

The race was a contest of steel. The scientifically designed track provided the driver with every facility to make all the speed desired and the result, with such men as Resta, Aitken, Oldfield, Burman, De Palma, Wilcox, Mulford, Rickenbacher, Pullen, and others in the line up, was that the drivers were faster than their cars. From the very beginning it was a struggle for leadership, a continuous duel between Stutz and Peugeot, which ended only 6 miles from the finish when all five of the Peugeots had retired to their pits, and two of the Stutzes alone were running.

Harry Stutz with the two winning teams. On his right is Gil Anderson with his mechanic and on his left Tom Rooney

Prizes Won by Drivers in Astor Cup Race

Driver	Speedway Offer	Bosch Magneto	Norma	Vacuum	Total
Anderson	$20,000	$600	$100	$100	$20,800
Rooney	10,000	400	...	...	10,400
O'Donnell	5,000	300	...	...	5,300
Henderson	4,000	...	...	...	4,000
Alley	3,000	...	...	...	3,000
Limberg	2,000	...	...	...	2,000
Haibe	1,400	...	...	...	1,400
Vail	1,200	...	...	...	1,200

Mulford gets $75 for fast elimination lap, given by Vacuum Oil Co.

Resta gets $50 for fast lap during race, given by Norma Co. of America.

Aitken gets a silver trophy with $100 from Motor-Vim Sales Corp., New York City, for leading at 200 miles.

Resta, the cool calculating yet brilliant pilot of the Peugeot quintet, who in the early part of the race achieved a lap at 110 m.p.h., found his magnificent car beaten to surrender at the 104th mile. One of the overtaxed connecting-rods could support the burden no longer.

Aitken in an equally fleet Peugeot, who took up the burden of leadership after Resta had been eliminated, bore the Peugeot flag 138 miles further, at which point he was overtaken by the same fate that had befallen his team mate.

This left Burman alone to uphold the reputation of the house of Peugeot. Nobly he accepted the task and, though with a car slightly slower than the other two, he forced the Stutzes to maintain the pace they had been setting. At last within three laps of the finish, and with $5,000 prize money for third place almost within his grasp, his car too was beaten. A broken clutch removed the last of the Peugeots.

Pete Henderson and Eddie O'Donnell, Duesenberg drivers, with Fred Duesenberg

Mulford's new Peugeot ran but 16 miles, suffering then the same fate as that which later overtook Resta and Aitken. Wilcox, too, with the fifth Peugeot came to a stand on the north bank after 74 miles and could not start again.

At the start of the race there were twenty cars. When the starter's flag went down with the signal that the race was over only six had finished and two were still running, but will receive seventh and eighth prize money. Of the six who completed the 350 miles five were American cars. After the two Stutzes were two Duesenbergs driven by O'Donnell and Henderson, occupying third and fifth positions with the Ogren driven by Alley fourth, then came Limberg's Delage, sixth. Haibe's Sebring and Vail's Mulford were still running when the race was called off. Thus, with the Delage, which finished sixth, as the only foreign representative in the race when the end was reached, America's triumph was complete. Far off in the trenches of somewhere in France, Boillot, Goux and Guillot when they receive the news by the devious routes of wartime intelligence will eagerly await the day when they can once again turn the tables. For the nonce, however, American drivers and American cars reign supreme.

An Impressive Spectacle

Never has there been a more impressive scene at an automobile race than that which greeted the throng of enthusiasts when the announcing bomb was hurled high in the air unfurling the stars and stripes which was slowly wafted out to sea by the westerly breeze. The attendance has been estimated as all the way from 65,000 to 100,000 and the true figure probably lies somewhere between these two. With the tremendous inclosure capable of containing many times this number if necessary, it is hard to judge correctly; but stripped to the bare fact it is no doubt true that this Astor Cup race was witnessed by more people than ever entered an inclosure to witness a speed contest at any time in the history of the world.

From early morning New York's great network of transit facilities concentrated its offerings of humanity upon the bridges and tubes leading across the East River to the bor-

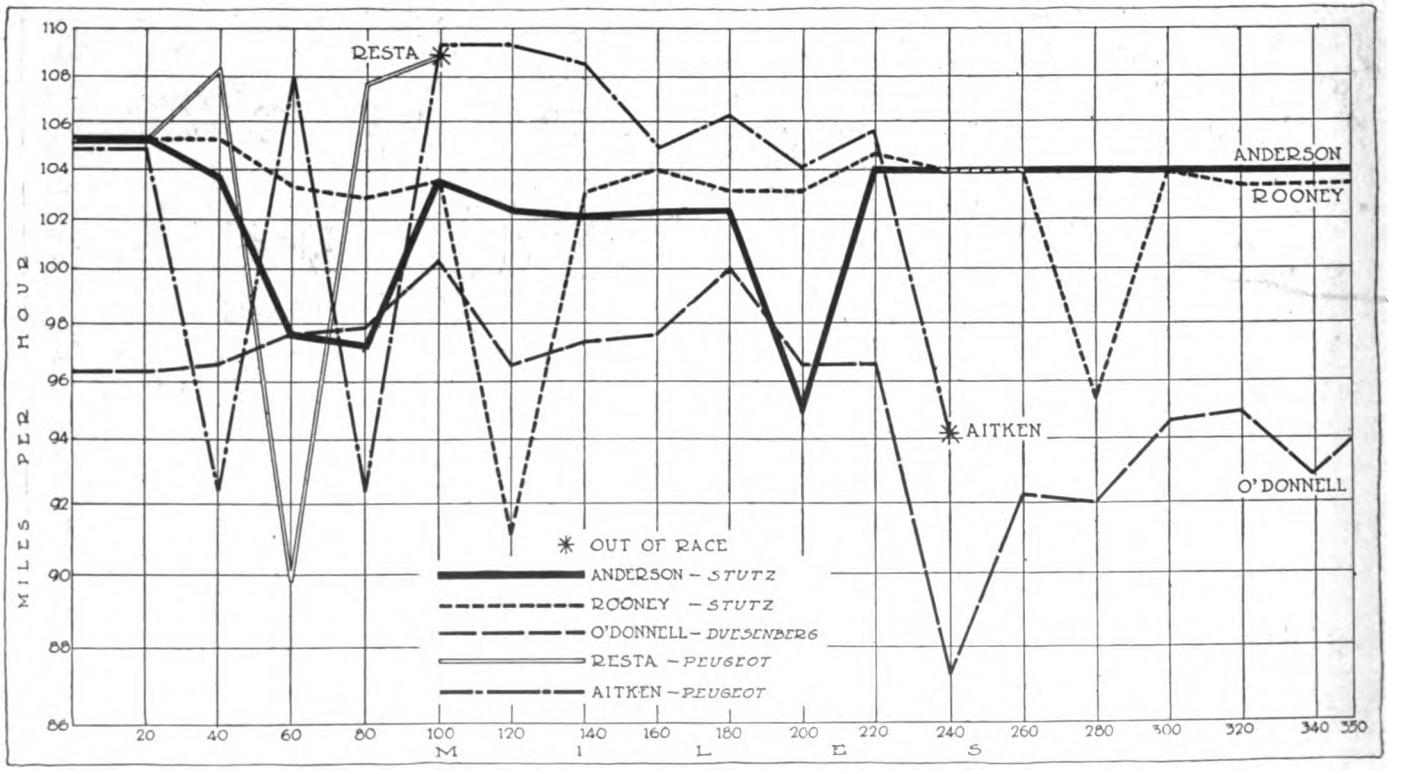
ough of Brooklyn wherein is located the great speedway. Mute astonishment was depicted on the faces of the great masses of New Yorkers, who, hardened as they are to new sensations, never had any idea that such a vast structure could have been arranged to provide a track for the speedy cars. With pictures of the Vanderbilt cup races of old still dwelling in their minds, these people who have not seen an automobile race of note since that time, were treated to a sensation that was little short of bewilderment. The atmosphere of the old Sheepshead Bay track where some of the greatest horse races in the metropolitan district were held has been superseded by the mechanical demons of speed which depend upon steel instead of pedigree.

Infield Was Packed

Packed in the infield were those who came to view the race from the reserved parking space. According to Manager Everard Thompson there were 8000 automobiles holding these spaces. Besides these every available open space held its quota of private automobiles.



Average speeds for each successive 20-mile period plotted for the five fastest cars

$50,000 Prizes Held on the New Sheepshead Bay Motor Speedway, Saturday, October 9

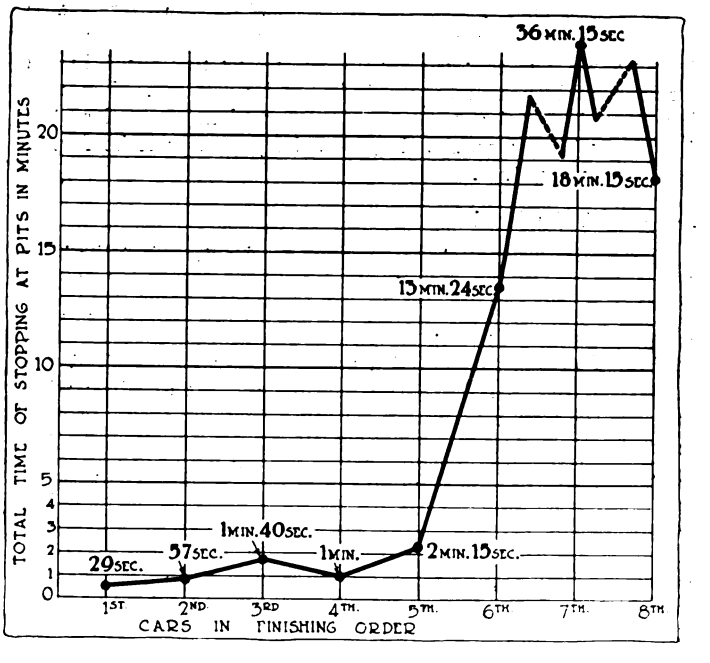
Speedway Organization Proves Good As Huge Crowd Gathers

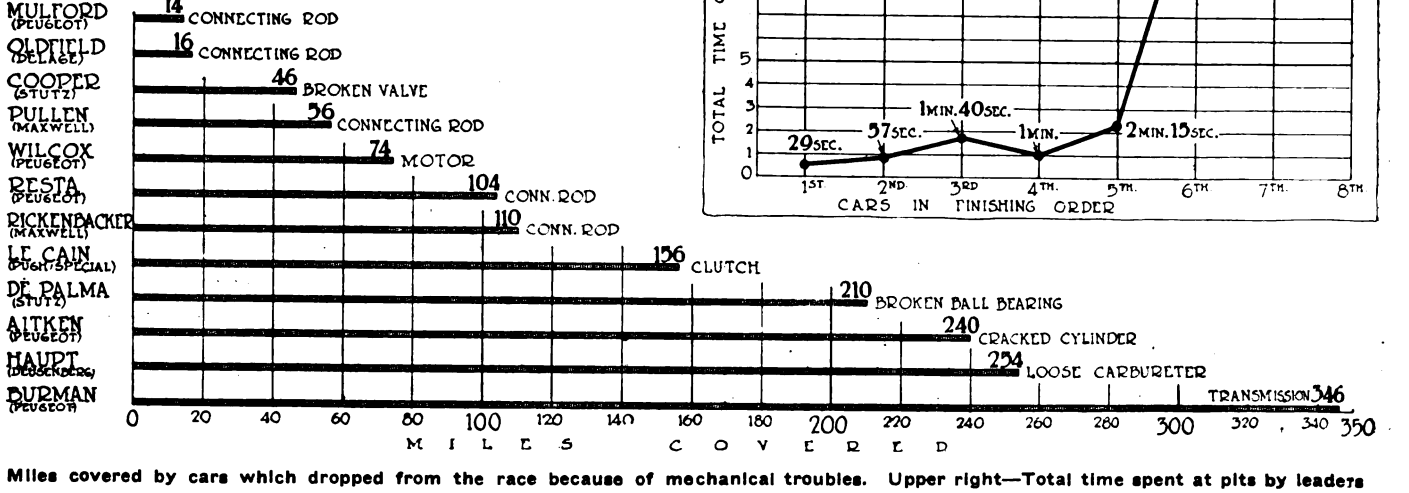
Besides the cars in the infield there were great numbers of pedestrians who preferred to view the race from on foot instead of from the bleachers. The grandstands were easily 85 per cent filled. The masses of spectators were like restless waves as they shifted and swayed, until from the infield the whole scene resembled a sea of faces and colors as the garments of men and women reflected the sun which combined with a gentle west wind to make the day ideal.

Not long after 9 o'clock in the morning the crowds began to stream through the gates. Carefully marshalled under the guardians of the Speedway, those on foot made their way into the grandstands and into the infield while those who preferred to witness the race from their cars drove into their appointed positions in the parking spaces, two deep along the home stretch. A tremendous wave of sound filled the air as the continuous roar of the crowd was punctuated from time to time with the crackling of the exhausts and the hoarse shouts of the megaphone-armed announcers who from the official stand across the track from the grandstand received word from time to time regarding the progress of events.

Race Started at Noon

Shortly before 12 o'clock, at which time the race was scheduled to start, the officials appeared for the inspection





Miles covered by cars which dropped from the race because of mechanical troubles. Upper right—Total time spent at pits by leaders

of the track, the racers were lined in the positions they had earned while in the qualifying trials and all was made ready to send the speedy cars on their way. Just at 2 minutes to twelve the cars were started around amid a great roar from the now rapidly filling stands, on their exhibition paced lap. Four deep in rank and five in file the twenty cars traveled around the track at about 60 miles an hour and as they again crossed the line Fred Wagner, official starter, sent them on their way.

Three of the four cars in the front line were dark blue Peugeots numbered from inside to outside 1, 2 and 4. Number 3 was a Delage. The second line of four cars had three Stutzes and a Peugeot, the Stutz numbers being 5, 7 and 8 with 6 the Peugeot. Thus at the very start, the three teams which were always regarded as the most dangerous contenders, were closely grouped. Resta was number 1 in his Peugeot and cars 1, 2 and 4 driven by Resta, Aitken and Burman streamed out in the order named at the end of the first lap of the race, showing that the pace was to be forced from the very start.

Peugeots Take Lead

Gradually the line of racers lengthened out. First the blue Peugeots, then the light blue Delages, the white Stutz team, the gray Duesenbergs, the green Sebring, gray and black Maxwells all streaking past so rapidly that when close at hand a blur of passing color and a vivid number was all that the eye could photograph. Gracefully as a flock of birds with wheels which seemed not to turn but to glide over the surface of the track they sped around the great board disk with its surface that resembled the smooth deck of a yacht.

Like a pack of hounds trailing the quarry the barking exhausts of the speeding pursuers forced Resta to do his utmost to hold his early acquired lead. Even among the Peugeots the rivalry for first place seemed to be forcing the leaders to speeds which were dangerously near the ultimate. Each car was possessed of so much endurance measured in speed and distance. The Peugeots took from their store in speed, the Stutz team gaged accurately what could be sacrificed in speed to gain the necessary endurance and—won.

As the minutes passed the group of massed cars gradually developed into a line punctuated by smaller groups, until finally not more than a few seconds elapsed at any time before a car would pass the stands. Singly, in twos and sometimes as many as six in a struggling group they would come gliding down the half mile level stretches and then rising like
